§ 15:1 In general

The pollution control statutes that are the subject of most of this treatise are not the only means that are available to federal and state officials whose job it is to protect human health and the environment. In some cases the end-products of the processes that generate pollutants can themselves harm humans and the environment. In past years, a number of commercial chemicals—perfluoro chemicals, PCBs, DDT, and asbestos to name a few—were discovered to be human and animal toxins, and the list continues to grow. These products, as much as, or even more than, the pollutants they generate, must be controlled if the environment is to be protected in any meaningful way.

The statutes that regulate commercial products on the basis of their environmental and health impacts are the subject of this and the following chapters. While the ultimate purpose of such statutes is the same as that of the pollution control statutes—to control undesirable side effects of human activities—the focus of the two kinds of statutes is quite different. Pollution control statutes limit substances that for the most part are unwanted and without value. By contrast, product control statutes focus on materials that are desired and—at least to those who purchase, use or otherwise benefit from them—valuable. In addition, while both types of statutes provide authority to address existing risks, product control statutes also authorize regulators to review new industrial, agricultural and consumer products before they enter commerce in order to prevent or minimize the potential for future risks. As such, product control statutes have provided a mechanism for pollution prevention years before that term became popular.

§ 15:2 Product control statutes: distinctions between environment-based and health-based regulation

A number of federal statutes regulate commercial products on the basis of potential health effects, environmental impacts or both. Among them are the Consumer Product Safety Act (CPSA),¹ the Virus-Serum-Toxin Act (VSTA),² the Federal Food, Drug, and Cosmetic Act (FFDCA),³ the Safe Drinking Water Act (SDWA),⁴ the Toxic Substances Control Act (TSCA),⁵ and the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).⁶

The following chapters treat the two statutes from the list that are most securely within the ambit of environmental protection law—TSCA and FIFRA. The purposes for which the two statutes were enacted include protecting the environment, and the statutes explicitly include risk to the environment as a basis for regulatory action.

In contrast, health-based product control statutes like the FFDCA, VSTA, and the Public Water Systems provisions of the SDWA were enacted without mention of the environment and focus almost exclusively on the direct effects of products on human and animal health. On that basis these statutes would appear to be outside the scope of a treatise on environmental protection law.

[Section 15:2]

¹15 U.S.C.A. §§ 2051 to 2089.

²21 U.S.C.A. §§ 151 to 159. *See* § 19:13.

³21 U.S.C.A. §§ 301 to 399f. *See* §§ 16:1, 18:3.

⁴42 U.S.C.A. §§ 300f to 300j-26.

⁵15 U.S.C.A. §§ 2601 to 2697. *See generally* §§ 16:1 et seq. (TSCA generally); § 19:21 (TSCA as applied to biotechnology).

⁶7 U.S.C.A. §§ 135 to 136y. *See generally* §§ 17:1 et seq. (FIFRA generally); § 19:17 (FIFRA as applied to biotechnology).

But purely health-based statutes, like the FFDCA and the Public Water Systems provisions of the SDWA, while distinguishable from environmental protection statutes in terms of their purpose and focus, nonetheless have much in common with environment-based product control statutes like TSCA and FIFRA. This is because the protection of human health is a major focus and in some cases the primary focus of the environment-based product control statutes.⁷ Thus, issues like risk assessment, the relationship between the costs and benefits of regulation, and the impact of procedure on the regulatory process arise across the spectrum of product regulation legislation.

§ 15:3 Regulation of biotechnology, nanotechnology and synthetic biology

Having acknowledged that several additional product regulation statutes could have been included in the following chapters, we must further admit that one of the following chapters—the chapter on biotechnology¹—might reasonably have been placed elsewhere. As it turns out, a chapter on the law of a new technology does not fit easily anywhere in the treatise. This is because, in the past, technologies as technologies have not been subject to separate consideration under environmental protection law. The decision to provide a separate treatment of biotechnology in this treatise was made because it is as a technology that government policymakers have been confronted with the biotechnology issue. The chapter was placed in this portion of the treatise because TSCA, FIFRA and the Plant Protection Act are three of the major statutory vehicles being used to regulate the new technology.²

The future appropriateness of this placement of the chapter could depend on the future course of the technology. Now certainly well beyond the research stage, biotechnology has not presented any truly unique risks. For the most part, the technology has been integrated into existing industries, and its products, along with its wastes and pollutants, are being governed by existing statutes. Accordingly, the need for discussion of biotechnology as a distinct regulatory subject may disappear.

Nanotechnology and synthetic biology might also have been given their own chapters in this treatise. Like biotechnology, products of these emerging technologies will still be subject to regulation based upon their intended use. For the moment, however, the primary response of the regulatory system relies upon the Toxic Substances Control Act. Nanoscale and synthetic biological materials may or may not present unique risks that call for their regulation apart from their more conventional counterpart materials.³

§ 15:4 TSCA and FIFRA

As mentioned above, TSCA and FIFRA are clearly within the ambit of environmental protection law. TSCA was originally enacted and FIFRA was completely overhauled in response to the string of environmental crises that marked the 1970s. Despite the similarity of their origins, however, these two progeny of Rachel Carson's *Silent Spring* are addressed to different subsets of the chemical universe and are dissimilar in a number of important structural respects. Below is a brief comparison of the central features of these two statutes.

⁷See § 5:2 (discussing the moral basis of pollution control laws) and § 15:5 (discussing the SDWA).

[Section 15:3]

¹Ch 19.

²See § 19:8 (discussing the various responses to biotechnology under preexisting statutes).

³See generally Bergeson & Hester, *Nanotechnology Deskbook* (2008). The Project on Emerging Nanotechnologies, Woodrow Wilson International Center for Scholars and the Pew Charitable Trusts, <http://www.nanotechproject.org/>; and The Synthetic Biology Project, Woodrow Wilson International Center for Scholars, <http://www.synbioproject.org/topics/synbio101/>.

Both FIFRA and TSCA regulate primarily commercially produced chemicals.¹ FIFRA covers products intended for a single use—pesticides—although even within that category products as diverse as insect repellants, weed killers, disinfectants, swimming pool chemicals and any other substance designed to prevent, destroy, repel or reduce pests of any sort are included. TSCA, by contrast, has an open-ended jurisdiction over commercially produced “chemical substances” from which pesticides, along with foods, drugs, cosmetics, tobacco, nuclear material and munitions, are specifically excluded. Once a potential risk to health or the environment is identified for a chemical substance, however, TSCA provides discretion for regulatory action to be taken with respect to distinct categories of products that contain that chemical substance. In a few instances, Congress has actually identified specific products for regulation, such as PCBs and lead-based paint and formaldehyde-containing composite wood products.

In underlying policy, both statutes reflect congressional judgment that as a general matter the benefits of chemicals outweigh the risks chemicals present to health or the environment. Neither recommends a flat prohibition, or even severe curtailment, of overall chemical manufacture or use. Moreover, both have adopted risk/benefit formulae as the standards for regulatory decisions.

TSCA’s regulatory regime applies to chemical substances and to mixtures of chemical substances. There are more than 84,000 commercially-produced chemical substances (not necessarily single chemicals) currently identified under TSCA with new substances being added to the list each year. Over 39,000 new chemical submissions have been made since 1979, of which approximately 10% have resulted in various restrictions, additional testing requirements, and notices withdrawn in the face of regulation.²

In contrast, FIFRA’s regime, strictly speaking, applies to products, not chemical substances. As the EPA pesticide program is organized, however, it is the so-called active ingredients of pesticides that receive the bulk of attention in the risk assessment process. Over 500 active ingredients are currently registered under FIFRA, with new active ingredients being introduced each year. Over time, a single active ingredient can be used in dozens or even hundreds of different pesticide products, with the result that there are approximately 12,000 pesticide products currently registered in the U.S.³

FIFRA and TSCA impose two different regulatory schemes on regulated products. FIFRA embodies a classical licensing scheme under which each pesticide is required to obtain a government license in the form of a registration of the product and its label.⁴ Unregistered pesticides may not be sold and with few exceptions, registered pesticides may only be used for the uses indicated on the EPA-approved label. Under FIFRA, each pesticide active ingredient and each new use of an active ingredient receives a thorough review of health and environmental impacts based on extensive data submissions from pesticide manufacturers. These reviews take as much time as EPA believes necessary—in some cases, up to 10 years. For food use pesticides, EPA also uses its authority under the FFDCA to review the safety of any

[Section 15:4]

¹Compare § 16:1 (scope of TSCA) with § 17:3 (defining “pesticide” by reference to use).

²See USEPA, Statistics for the New Chemicals Review Program under TSCA, available at: <http://www.epa.gov/reviewing-new-chemicals-under-toxic-substances-control-act-tsca/statistics-new-chemicals-review>.

³See generally Purdue University, the National Pesticide Information Retrieval System (NPIRS), available at: <http://npirspublic.ceris.purdue.edu/public.html>.

⁴See §§ 17:2 to 17:31 (pesticide registration and data collection).

pesticide residues in food that may result from the proposed uses.⁵ Existing pesticide registrations must be reviewed by EPA every 15 years.⁶

TSCA's regulatory scheme is, in one sense, more complicated than FIFRA's.⁷ New-chemical review under TSCA does not constitute a FIFRA-like licensing scheme under which all new chemicals are subject to safety reviews based on extensive data submissions. Instead, it establishes a scheme that permits, indeed forces, EPA to subject chemicals to varying levels of scrutiny based on varying amounts of data. The essential elements of this scheme are two: first, EPA is provided notice of intent to manufacture new chemicals and a brief period during which it has an opportunity, but not an obligation, to review them; second, no specific data are required to be generated by manufacturers, although any existing health and environmental data that the party submitting the notice of intent is aware of must also be submitted to EPA. The scheme also builds in incentives for the voluntary generation and submission of data. The intended and actual result of TSCA premanufacturing review is a compromise scheme that is arguably less protective of public health and the environment than a FIFRA-type licensing scheme, but also less costly to government and less burdensome on industry.

Finally, like pollution control statutes, both FIFRA and TSCA defer in some way to the *status quo* and can result in older products remaining on the market even though they may not be as safe as newer entrants. As a practical matter, depending on the degree to which industry agrees with EPA's risk assessments and proposed risk mitigation measures, the procedural hurdles under both statutes may make it more difficult for EPA to remove a product from the market or require changes in the labeling or usage of an existing product.

§ 15:5 Drinking water¹

The Safe Drinking Water Act (SDWA) regulates one product we are all exposed to, intimately, on a daily basis, as long as we are alive. Because it is intended for direct consumption and is used to prepare food and drink, tap water must be healthful. Consumers are dependent on the availability of a safe water supply, and significant hardships arise almost immediately when water quality is impaired.

The SDWA Public Water System provisions address drinking water quality and authorize federal drinking water standards and programs to enforce those standards. Only public water systems—a defined subset of all water systems—must meet drinking water standards. The regulatory scheme involves federal maximum contaminant levels or treatment techniques that are based on health goals and feasible control technology. These standards must be met unless a variance or exemption is issued. Violations of the standards or variances and exemption conditions may be enjoined or penalized by the federal government or by the state. Emergency actions to protect against imminent endangerment also are authorized.

Long ignored as a poor relative in the family of environmental laws, the drinking water law began receiving increased attention in the 1980s. In 1986, the SDWA was substantially amended and its enforcement provisions strengthened. As amended, the SDWA requires more national drinking water standards, more treatment techniques, additional monitoring for regulated and unregulated contaminants, and increased public notification. Toxic tort lawsuits have also focused attention on

⁵FFDCA § 408, 21 U.S.C.A. § 346a; *see infra* §§ 18:7 and 19:18.

⁶FIFRA § 3(g), 7 U.S.C.A. § 136a(g).

[Section 15:5]

¹By **Kenneth Fairbanks Gray** and **Jonathan T. Ryan**.

drinking water quality and SDWA health standards. The regulatory efforts of the EPA and the generally heightened concern for health will continue to underline the importance of the SDWA.

In addition to imposing requirements on the quality of water flowing through consumer taps, the SDWA requires the states to prohibit the use of lead pipe, solder, or flux in the installation or repair of any public water system or plumbing system in a residential or nonresidential facility. The SDWA also prohibits, under certain circumstances, the manufacture and sale of any pipe, plumbing fixture, solder, or flux that is not lead-free.² Amendments to the SDWA in 1996 made it unlawful for any person to introduce into commerce after August 6, 1998, any pipe, plumbing fixture, or fitting that is not lead-free.³ EPA has established a voluntary standard, NSF International's ANSI/NSF Standard 61, § 9, as the performance-based standard for lead leaching from such components.⁴ Also in 1996, a pair of amendments to the SDWA and FFDCA directed EPA to coordinate its investigation and regulation of certain estrogenic substances, also referred to as "endocrine disruptors," under the SDWA, FIFRA, FFDCA, TSCA and any other statute available to the agency.⁵

Bottled water, as distinguished from water flowing through the consumer's tap, also is subject to comprehensive regulation. Unlike tap water, which is regulated by EPA, bottled water is regulated by the Food and Drug Administration (FDA).⁶

²SDWA § 1417, 42 U.S.C.A. § 300g-6.

³SDWA § 1417(a)(3), 42 U.S.C.A. § 300g-6(a)(3).

⁴62 Fed. Reg. 44684 (Aug. 22, 1997).

⁵SDWA § 1457, 42 U.S.C.A. § 300j-17; FFDCA § 408(p), 21 U.S.C.A. § 346a(p).

⁶21 C.F.R. § 165.110. In 1996, Congress amended the bottled water provisions of the Federal Food, Drug, and Cosmetic Act, 21 U.S.C.A. § 349; § 305 of the SDWA Amendments of 1996, Pub. L. No. 104-182 (1996), 110 Stat. 1613. The 1996 SDWA Amendments require FDA, through delegation from the Secretary of Health and Human Services, to develop standards for bottled water that are no less than protective than the standards set forth by EPA for tap water.

I. INTRODUCTION

§ 16:1 History

In 1971, the newly established Council on Environmental Quality identified a need for comprehensive legislation to address potentially dangerous uses of chemicals that other statutes did not adequately regulate.¹ However, the push for legislation to address the entire life cycle of chemicals faced resistance until particular environmental concerns—polychlorinated biphenyl contamination in the Hudson River and other water bodies, polybrominated biphenyl contamination of produce in Michigan, and depletion of the ozone layer by chlorofluorocarbon emissions, among others—created an impetus for enactment of the original Toxic Substances Control Act (TSCA).

In October 1976, President Gerald Ford signed the Toxic Substances Control Act (TSCA). The statute reflects compromises reached on the eve of the national election that seemed likely to allow the Democrats to continue their control over the Senate

[Section 16:1]

¹Congressional Research Service, The Toxic Substances Control Act (TSCA): A Summary of the Act and Its Major Requirements 2 (Sept. 14, 2015), <https://crsreports.congress.gov/product/pdf/RL/RL31905>.

and the House and put Democrat Jimmy Carter in the White House. TSCA gave the United States Environmental Protection Agency (EPA or the Agency) authority to gather information regarding chemical substances and to impose regulatory restrictions on chemical substances before and following their introduction in commerce.

Four decades later, on June 22, 2016, President Obama signed into law the Frank R. Lautenberg Chemical Safety for the 21st Century Act (2016 amendments), bipartisan legislation that overhauled TSCA's core provisions.² The 2016 amendments to TSCA were intended to update and reinvigorate the 40-year-old cornerstone of federal chemical control law. They were the culmination of more than 10 years of legislative efforts to amend TSCA. Senator Frank Lautenberg, a New Jersey Democrat, had introduced TSCA reform legislation in every congressional session since 2005.³

The Government Accountability Office (previously the General Accounting Office) (GAO) had described the need for improvements in EPA's implementation of TSCA as early as 1980, when a GAO report found that "EPA had made limited progress in identifying and controlling existing chemicals and in developing a program to control new chemicals."⁴ Among other issues, the report noted that EPA had taken action to control only three existing chemicals. By at least 1994, the GAO was suggesting broad legislative changes that could strengthen EPA's ability to regulate chemicals, including by establishing a "less burdensome" framework for EPA action, allowing regulation under TSCA in preference to other laws, and increasing EPA authority to obtain information on chemicals from industry.⁵ In 2005, a GAO report recommended that TSCA be amended to grant EPA additional powers to assess environmental and health risks presented by chemicals, by increasing EPA authority to require companies to conduct testing.⁶ The 2005 report presented a range of additional options to reduce EPA's evidentiary burden for taking action (which had proven to be a hurdle when the Agency lost a challenge to its 1989 regulations prohibiting numerous uses of asbestos), to require systematic testing of existing chemicals, and to expand regulatory control options.⁷ On the same day that the GAO publicly released its 2005 report, Senator Lautenberg introduced his first bill to overhaul TSCA, which included features recommended in the GAO report.⁸ Neither this bill nor a bill introduced by Lautenberg in May 2008 moved out of the Committee on Environment and Public Works.⁹

Following the 2008 election, chemical regulation reform was at the forefront of the Obama administration's environmental agenda. Early on, EPA Administrator Lisa Jackson remarked that Americans had "lost faith" in the government's ability

to regulate chemical substances. Eight months into President Obama's first term, Jackson announced a set of principles for reforming TSCA.¹⁰ EPA also announced a new approach to its implementation efforts under the agency's existing TSCA authority. This included plans to require companies to provide additional information about chemical substances' risks, and increasing to increase public access to such information.

Congress also appeared poised to act on TSCA reform. The Senate and House held hearings on TSCA in 2009 and 2010, and in 2010 Senator Lautenberg and Congressman Bobby Rush (D-Ill.) each introduced far-reaching bills to amend TSCA.¹¹ Senator Lautenberg made another attempt, introducing a new bill in 2011.¹² The 2011 bill was reported out of the Environment and Public Works Committee on party lines in December 2012.

In April 2013, Senator Lautenberg—who had made clear that chemical regulation reform was one of his priorities before he retired from the Senate in 2014—once again introduced a bill to overhaul TSCA after the GAO had issued yet another report; this one addressed EPA's progress on its new plans for TSCA implementation.¹³ After its introduction, representatives of the chemical industry indicated that they had little to say about the bill itself, which was identical to the 2012 bill that they had opposed, but that they were waiting for a competing bill expected to be introduced by Senator David Vitter, a Republican from Louisiana. In an unexpected twist, however, Senator Lautenberg and Senator Vitter joined forces in May 2013 to introduce their Chemical Safety Improvement Act. The bill embodied significant compromises from both sides, including on preemption of state regulation of chemicals.

Just a month later, in June 2013, Senator Lautenberg passed away. Senator Tom Udall (D-N.M.) stepped in to take on the task of negotiating the bipartisan bill on the Democratic side. After more than a year of further negotiations, Senator Barbara Boxer (D-Cal.), then chair of the Environment and Public Works Committee, blocked the Chemical Safety Improvement Act due to concerns that included the bill's broad preemption provisions, which would have restricted states' ability to regulate chemicals.¹⁴ However, the potential for a federal framework for chemical regulation to replace a patchwork of state regulation was one of the main factors motivating industry to support TSCA reform.

After the Republicans took control of the Senate in 2015, a new bill from Senators Udall and Vitter proceeded through the Senate after the Environment and Public Works Committee approved it in April 2015, with amendments that responded to some of Senator Boxer's concerns about preemption, as well as to calls to accelerate

assessments of persistent, bioaccumulative, and toxic chemicals.¹⁵ Meanwhile, in June 2015, the House of Representatives passed a bill, the TSCA Modernization Act, by a 398-1 vote.¹⁶ In December 2015, the Senate passed the Udall-Vitter bill. Negotiations to harmonize the bills took place over the course of several months; an aide reportedly “sprinted” to submit the final version of the bill by a House deadline in May 2016.¹⁷ On June 22, 2016, President Obama signed the amendments into law.

§ 16:2 Overview and definitions

The core provisions of TSCA and its implementing regulations can be split into the following five categories; a more detailed section-by-section breakdown is presented at the beginning of this chapter. A section-by-section breakdown of the the statute that highlights key differences between the original TSCA and the 2016 amendments is in Appendix 16B.

- (1) EPA authority to require testing of chemical substances and mixtures
- (2) Requirements that notice be given to EPA prior to commencing manufacture of new chemical substances, and authorization for EPA to regulate new chemicals *and* significant new uses of chemical substances
- (3) Requirements for EPA to prioritize existing chemical substances for risk evaluation; to conduct such evaluations; and to issue rules regulating existing chemical substances that present an unreasonable risk
- (4) Reporting and recordkeeping requirements
- (5) Documentation requirements concerning import and export of chemical substances.

EPA also is authorized to enforce the statute, including by assessment of civil penalties and criminal sanctions for violations. EPA may assess fees to offset the costs of administering the statute, and the Agency is required to use the best available science when reaching determinations and taking actions to assess and control risks. The 2016 TSCA amendments more clearly separate the concepts of risk assessment and risk management (and when and how economic factors should be taken into account) and require EPA to give particular consideration to “potentially exposed or susceptible subpopulations.” The 2016 amendments define this phrase to refer to a group of individuals within the general population “who, due to either greater susceptibility or greater exposure, may be at greater risk than the general population of adverse health effects from exposure to a chemical substance or mixture, such as infants, children, pregnant women, workers, or the elderly.”¹

Although TSCA’s requirements generally apply to “persons who manufacture or process chemical substances or mixtures,” with manufacture defined to include import, some requirements also apply to persons who “distribute” chemical substances or mixtures. The statute and implementing regulations define the key terms that establish the scope of EPA’s jurisdiction. These terms are broadly defined and

[Section 16:2]

¹TSCA § 3(12), 15 U.S.C.A. § 2602(12).

provide EPA the authority to reach activities carried out by persons who manufacture (including import), process, use, distribute, and dispose of chemical substances and mixtures.

“Chemical substance” is defined in Section 3(2) of TSCA as any organic or inorganic substance of a particular molecular identity, including (i) any combination of such substances occurring in whole or in part as a result of a chemical reaction or occurring in nature and (ii) any element or uncombined radical.²

The definition excludes any “mixture,” which is separately defined to mean any combination of two or more chemical substances.³ Thus, each component of a mixture is subject to the TSCA requirements that apply to chemical substances.⁴ EPA interprets the definition of chemical substance to include microorganisms, and TSCA has become the primary statutory vehicle for regulating the microbial products of biotechnology used for non-agricultural and non-pesticidal purposes.⁵

To avoid overlap with other statutes, certain substances are excluded from the definition of chemical substance, including pesticides, tobacco and tobacco products, nuclear materials, foods, food additives, drugs, medical devices, and cosmetics.⁶

The terms “manufacture,” “process,” and “distribute” are broadly defined, thereby bringing many companies otherwise outside the traditional chemical “manufacturing” industry within TSCA’s scope.⁷ Thus, any manufacturing process that involves a chemical reaction is interpreted to be the manufacture of a chemical substance. Moreover, because the definition of “manufacture” encompasses import, entities that act solely as chemical products importers find themselves subject to all the TSCA requirements that apply to manufacturers.⁸ Manufactured “articles”; are generally considered by EPA to contain chemical substances. Thus, manufacturers and importers of articles are subject to some TSCA requirements. The statute does not define “article,” but the TSCA regulations define the term as a *manufactured item*, which:

- (1) is formed to a specific shape or design during manufacture;
- (2) has end use function(s) dependent in whole or in part upon its shape or design during end use; and
- (3) has either no change of chemical composition during its end use *or* only those changes of composition which have no commercial purpose separate from that of the article, and that result from a chemical reaction that occurs upon end use of other chemical substances, mixtures, or articles; except that fluids and particles are not considered articles regardless of shape or design.⁹

The term “process” generally includes activities—such as blending, formulating, and even repackaging—that are carried out in the course of preparing a chemical substance or mixture for distribution in commerce.

Consequently, TSCA regulations can apply not only to traditional chemical

²TSCA § 3(2)(A), 15 U.S.C.A. § 2602(2)(A).

³TSCA § 3(10), 15 U.S.C.A. § 2602(10).

⁴Nevertheless, various TSCA provisions discussed further below permit EPA to issue regulations and administrative orders concerning mixtures as well as individual chemicals.

⁵See § 16:25, *infra*.

⁶TSCA § 3(2)(B), 15 U.S.C.A. § 2602(2)(B). Other statutes regulate these substances, including the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA), 7 U.S.C.A. §§ 136–136y; the Atomic Energy Act of 1954, 42 U.S.C.A. §§ 2011–2297h-13; and the Federal Food, Drug, and Cosmetic Act, 21 U.S.C.A. §§ 301–399i. Chapter 17 of this treatise addresses the regulation of pesticides.

⁷TSCA § 3(5), (9), (13), 15 U.S.C.A. § 2602(5), (9), (13). The interpretation of these terms is complex and rich in regulatory history. Decisions affecting compliance should be based on close analysis of the section-specific regulations and EPA guidance documents.

⁸TSCA § 3(9), 15 U.S.C.A. § 2602(9).

⁹40 C.F.R. § 704.3; *see also* 40 C.F.R. § 720.3(b).

manufacturers, but also to producers of formulated products and even to manufacturers and importers of durable goods that incorporate chemical products. Thus, after focusing on the chemical industry during the early years of TSCA's implementation, TSCA regulations now affect diverse companies, including those engaged in manufacturing everything from chemicals and formulated products to microorganisms, appliances, and furniture, as well as complex equipment such as consumer electronics.

II. TEST RULES, ORDERS, AND CONSENT AGREEMENTS

§ 16:3 In general

One purpose of TSCA is to provide authority for EPA to gather data on chemical substances necessary to assess risks and make a determination whether regulation is needed to mitigate risks. Thus, Section 4 of TSCA authorizes EPA to issue rules and orders and to enter into consent agreements that require manufacturers (including importers) and processors of chemical substances or mixtures to test their products to determine their toxicity, chemical fate, or physicochemical properties, provided that certain conditions are met.

§ 16:4 Authority to issue testing rules

EPA Section 4 Authorities to Require Testing			
Mechanism	Circumstances When EPA May Require Testing	Statutory Provision	Original TSCA or 2016 Amendments
By rule only	Where EPA makes an "exposure-based" finding for a chemical substance or mixture	TSCA § 4(a)(1)(A)(ii), 15 U.S.C.A. § 2603(a)(1)(A)(ii)	Original TSCA
	Where EPA finds that a mixture's effects "may not be reasonably and more efficiently determined or predicted by testing the chemical substances which comprise the mixture"	TSCA § 4(a)(1)(B), 15 U.S.C.A. § 2603(a)(1)(B)	Original TSCA

EPA Section 4 Authorities to Require Testing			
Mechanism	Circumstances When EPA May Require Testing	Statutory Provision	Original TSCA or 2016 Amendments
By rule, administrative order, or consent agreement	Where EPA makes a “risk-based finding” for a chemical substance or mixture	TSCA § 4(a)(1)(A)(i), 15 U.S.C.A. § 2603(a)(1)(A)(i)	Original TSCA—for requiring by rule. 2016 amendments—for requiring by administrative order or consent agreement
	To review premanufacture and significant new use notices under Section 5 or to perform risk evaluations under Section 6(b)	TSCA § 4(a)(2)(A)(i), 15 U.S.C.A. § 2603(a)(2)(A)(i)	2016 amendments
	To implement risk management requirements imposed under Section 5(e), 5(f), or 6(a)	TSCA § 4(a)(2)(A)(ii), 15 U.S.C.A. § 2603(a)(2)(A)(ii)	2016 amendments
	At the request of a federal implementing authority, to meet regulatory testing needs regarding toxicity and exposure under another federal law	TSCA § 4(a)(2)(A)(iii), 15 U.S.C.A. § 2603(a)(2)(A)(iii)	2016 amendments
	To determine whether a chemical substance, mixture, or article intended solely for export presents an unreasonable risk of injury to health or the environment within the United States	TSCA § 4(a)(2)(A)(iv), 15 U.S.C.A. § 2603(a)(2)(A)(iv)	2016 amendments
	To establish the priority of an existing chemical substance for risk evaluation	TSCA § 4(a)(2)(B), 15 U.S.C.A. § 2603(a)(2)(B)	2016 amendments

The 1976 legislation empowered EPA to issue regulations requiring a manufacturer or processor of a chemical substance to generate new test data. EPA must first make one of two alternative findings to issue such a rule.

First, EPA may find that the manufacture, processing, distribution in commerce, use, or disposal of the substance “may present an unreasonable risk” of injury to health or the environment (a “risk-based finding”).¹ Pursuant to a 1988 holding of the D.C. Circuit Court of Appeals, EPA has taken the position that it can rely on inference to establish a hazard finding, provided that the available evidence indicates that the probability of exposure is more than just theoretical.²

[Section 16:4]

¹TSCA § 4(a)(1)(A)(i), 15 U.S.C.A. § 2603(a)(1)(A)(i).

²Chemical Mfrs. Ass’n v. U.S. E.P.A., 859 F.2d 977, 28, 28 Env’t. Rep. Cas. (BNA) 1510, 19 Env’tl. L. Rep. 20001 (D.C. Cir. 1988). Rejecting an industry challenge to a test rule requiring toxicological testing to determine the health effects of 2-ethylhexanoic acid, the court stated:

We hold . . . that EPA can establish the existence and amount of human exposure on the basis of inferences drawn from the circumstances under which the substance is manufactured and used. EPA must rebut industry-supplied evidence attacking those inferences only if the industry evidence succeeds in rendering the probability of exposure in the amount found by EPA no more than theoretical or speculative. The probability of infrequent or even one-time exposure to individuals can warrant a test rule, so long as there is a more-than-theoretical basis for determining that exposure in such doses presents an “unreasonable risk of injury to health.”

Id. at 979.

Alternatively, the Agency may make an “exposure-based finding.”³ The criteria for an exposure-based finding require first that “substantial” production occurs (which EPA interprets as production or importation of at least one million pounds of the substance or mixture). Additionally, as a matter of regulatory interpretation, EPA has followed certain practices which require that at least one of the following must occur to support the exposure-based finding: the substance or mixture enters or may reasonably be anticipated to enter the environment in “substantial” quantities (at least one million pounds or 10% of production/importation, whichever is lower), or there is or may be “substantial” human exposure (1,000 workers or 10,000 consumers or 100,000 members of the general population) or there is or could be “significant” human exposure (as determined on a case-by-case basis).⁴

In conjunction with either a “risk-based finding” or an “exposure-based finding,” EPA also must find that there is insufficient information and experience from which health and environmental effects can be determined, and that testing is necessary to develop the needed information. In making the required findings, EPA relies on publicly available information as well as information submitted to the Agency under TSCA. As of this writing, well over 200 chemical substances and mixtures have been the subject of testing requirements under TSCA Section 4.⁵

For mixtures, EPA also may require testing by rule when the health or environmental effects of the mixture cannot be reasonably and more efficiently determined or predicted by testing the chemical substances comprising the mixture.⁶

§ 16:5 Additional authority to require testing

The 2016 amendments to TSCA granted EPA additional authority to require testing not only by rule, but also by administrative order and by entering into consent agreements.¹ Specifically, EPA may now require the development of new information by rule, order, and consent agreement if the Agency makes a risk-based finding and the related findings regarding insufficiency and the necessity of testing.² In addition, and without the need for a risk- or exposure-based finding, EPA may require development of new information by rule, order, and consent agreement for a substance or mixture if the information is necessary:

- (1) to review premanufacture and significant new use notices under Section 5 or to perform risk evaluations under Section 6(b);
- (2) to implement risk management requirements imposed under Section 5(e), 5(f), or 6(a);
- (3) to meet regulatory testing needs regarding toxicity and exposure under another federal law; or
- (4) to determine whether a chemical substance, mixture, or article intended

³TSCA § 4(a)(1)(A)(ii), 15 U.S.C.A. § 2603(a)(1)(A)(ii).

⁴58 Fed. Reg. 28736 (May 14, 1993). EPA published this numerical threshold after the Fifth Circuit Court of Appeals instructed the Agency to “articulate the standards or criteria on the basis of which it found the quantities of [a chemical substance] entering the environment . . . to be ‘substantial’ and the human exposure potentially resulting to be ‘substantial.’” *Chemical Mfrs. Ass’n v. E.P.A.*, 899 F.2d 344, 360, 31 Env’t. Rep. Cas. (BNA) 1321, 20 Env’tl. L. Rep. 20837 (5th Cir. 1990).

⁵A complete list is available at *Sunset dates of chemicals subject to final TSCA section 4: test requirements and related section 12(b) actions*, EPA, <https://www.epa.gov/assessing-and-managing-chemicals-under-tsca/sunset-dates-chemicals-subject-final-tsca-section-4-test> (modified Nov. 30, 2018).

⁶TSCA § 4(a)(1)(B), 15 U.S.C.A. § 2603(a)(1)(B).

[Section 16:5]

¹TSCA § 4(a)(2), 15 U.S.C.A. § 2603(a)(2). However, EPA entered into and codified a number of negotiated testing agreements long before the 2016 amendments. 40 C.F.R. Pt. 790.

²TSCA § 4(a)(1), 15 U.S.C.A. § 2603(a)(1).

solely for export presents an unreasonable risk of injury to health or the environment within the United States.³

In 2020, EPA used this additional authority for the first time when the Agency determined new information was necessary to finalize the risk evaluation for C.I. Pigment Violet 29 (PV29)—one of the first 10 chemical substances undergoing a Section 6(b) risk evaluation after the 2016 amendments.⁴ EPA issued two administrative testing orders to two manufacturers of PV29, requiring them to generate and submit certain physical-chemical properties information concerning PV29's solubility and occupational worker inhalation exposure.

In addition, the Agency now possesses a limited ability to require development of new information for purposes of prioritizing existing chemical substances for risk evaluations, pursuant to Section 6(b).⁵ EPA may only require development of new information in this situation if the information is necessary to establish the priority of a substance. When EPA requires information for the purposes of prioritizing a chemical substance, the Agency may not require information for purposes of establishing or implementing “a minimum information requirement of broader applicability.”⁶ In addition, EPA must designate the chemical substance as high-priority or low-priority within 90 days of receiving the information.⁷ Moreover, the amended Section 4 does not authorize EPA to issue administrative orders or to enter into consent agreements to require testing if the Agency only can make an exposure-based finding. The Agency is limited to requiring testing by rule in such instances.⁸

When requiring development of new information pursuant to these additional authorities created by the 2016 amendments, EPA must identify the need for the new information, describe how reasonably available information was used to inform the decision to require new information, and explain the basis for any decision that requires the use of vertebrate animals.⁹ Furthermore, if the Agency chooses to require the development of new information by issuing an administrative order, rather than a test rule or a negotiated testing agreement, EPA must explain why issuing an order was warranted.

The 2016 amendments instituted a “tiered testing” process for the development of new information. EPA is required to use the results of screening-level tests and assessments of available information to determine whether additional testing is necessary. In some cases, however, EPA may determine that available information justifies proceeding immediately to more advanced testing of potential health or environmental effects or potential exposure.¹⁰

§ 16:6 Vertebrate testing

The 2016 amendments include provisions intended to reduce the use of vertebrate animals in testing “to the extent practicable, scientifically justified, and consistent

³TSCA § 4(a)(2)(A)(i)–(iv), 15 U.S.C.A. § 2603(a)(2)(A)(i)–(iv).

⁷TSCA § 4(a)(2)(B)(i), 15 U.S.C.A. § 2603(a)(2)(B)(i).

⁸TSCA § 4(a)(1), 15 U.S.C.A. § 2603(a)(1).

⁹TSCA § 4(a)(3), 15 U.S.C.A. § 2603(a)(3).

¹⁰TSCA § 4(a)(4), 15 U.S.C.A. § 2603(a)(4).

with the policies of [TSCA].”¹ Before EPA can request or require testing using vertebrate animals under Section 4, it must consider, “as appropriate and to the extent practicable and scientifically justified,” reasonably available existing information.² EPA must also encourage and facilitate the use of alternative scientifically valid test methods for Section 4 testing, as well as the grouping of chemical substances where appropriate and joint testing conducted by industrial consortia to avoid unnecessary duplication of vertebrate testing.³ The 2016 amendments also required EPA to take steps to promote the development of alternative testing methods, including by preparing a strategic plan within two years of the amendments’ enactment to promote the development and implementation of alternative test methods.⁴ In addition, the amendments require that development of information even for voluntary submission to EPA under TSCA involve consideration of alternative testing methods or strategies identified by EPA.⁵

In June 2018, EPA issued its strategic plan for developing and adopting alternatives to vertebrate testing—referred to as “new approach methodologies” or “NAMs”—for integration into TSCA decision-making processes for new and existing substances.⁶ The strategic plan described NAMs as any technology, methodology, approach, or combination thereof that avoids the use of intact animals and that can be used to provide information on chemical hazard and risk assessment. The strategic plan had three components: (1) identifying, developing, and integrating NAMs for TSCA decisions; (2) building confidence that the NAMs are scientifically reliable and relevant for TSCA decisions; and (3) implementing the reliable and relevant NAMs for TSCA decisions. For the first three years, EPA planned to focus on eight near-term needs and activities, including maintenance and updating of a list of NAMs. EPA published the first list of NAMs in June 2018 and released the first update in December 2019. The Agency also planned to propose a process for selecting NAMs for the list. Other near-term activities were related to identifying and cataloging existing information about NAMs, improving information technology platforms for integrating information from multiple databases, and collaborating with outside stakeholders.⁷ The strategic plan set five intermediate-term objectives for 2021 to 2024 (three to five years after issuance of the plan). The intermediate-term objectives focus on the further assessment of NAM research needs for TSCA purposes and increasing the use of NAMs to screen chemicals for prioritization, to prioritize chemicals for risk evaluation, to conduct risk evaluation, and to make other risk-based decisions under TSCA. The strategic plan’s long-term objective is to reduce and eventually eliminate vertebrate animal testing, but the plan does not set a timeframe for achieving this overall objective.

§ 16:7 Roles of Section 4 testing

EPA’s Section 4 testing authority proved an important tool for developing data

[Section 16:6]

⁴TSCA § 4(h)(2), 15 U.S.C.A. § 2603(h)(2).

⁵TSCA § 4(h)(3), 15 U.S.C.A. § 2603(h)(3).

⁶EPA, Strategic Plan to Promote the Development and Implementation of Alternative Test Methods Within the TSCA Program, EPA Doc. No. EPA-740-R1-8004 (June 22, 2018).

⁷Another near-term activity was launching a website for NAMs. EPA maintains a NAMs page on the EPA website; the page provides information on EPA’s implementation of the strategic plan. See *Alternative Test Methods and Strategies to Reduce Vertebrate Animal Testing*, EPA, <https://www.epa.gov/assessing-and-managing-chemicals-under-tsca/alternative-test-methods-and-strategies-reduce> (last updated May 28, 2020).

needed for programs the Agency administers under other environmental statutes. For example, in the 1990s, EPA proposed regulations to require testing by manufacturers and processors of more than 20 hazardous air pollutants in order to gather data to support regulatory decisions mandated under the Clean Air Act.¹ EPA did not finalize the proposed testing rule, but entered into enforceable consent agreements with some manufacturers pursuant to which the manufacturers conducted testing.²

Section 4 test rules also have been leveraged to assist other agencies, such as the Occupational Safety and Health Administration (OSHA), that may need data regarding a substance's health and environmental effects.³ To ensure that the testing performed under TSCA is responsive to the needs of other agencies, the original TSCA established the 10-member Interagency Testing Committee (ITC) to recommend chemical substances for priority consideration for such testing.⁴

The 2016 amendments to Section 4 introduced to TSCA a stronger action-forcing provision that requires EPA to initiate regulatory action upon receiving information that indicates “that there may be a reasonable basis to conclude that a chemical substance or mixture presents a significant risk of serious or widespread harm to human beings.”⁵ Within 180 days of receiving such information, EPA must initiate action under Section 5 (for new chemical substances or uses), 6 (for existing chemical substances), or 7 (for imminently hazardous chemical substances) “to prevent or reduce to a sufficient extent such risk.”⁶ Alternatively, EPA may publish a finding, “made without consideration of costs or other nonrisk factors,” that the risk is not unreasonable. The publication of a finding that a risk is not unreasonable is a final agency action for purposes of judicial review.

§ 16:8 Procedures and requirements for test rules, orders, and consent agreements

A test rule identifies the substance or mixture to be tested and sets deadlines for completion of the testing,¹ which is performed according to established test

[Section 16:7]

¹61 Fed. Reg. 33178 (June 26, 1996); *see also* 62 Fed. Reg. 67466 (Dec. 24, 1997); 63 Fed. Reg. 19694 (Apr. 21, 1998).

²68 Fed. Reg. 33125 (June 3, 2003) (final enforceable consent agreement and testing consent order for 1,2-ethylene dichloride); 64 Fed. Reg. 20298 (Apr. 26, 1999) (final enforceable consent agreement and testing consent order for methyl isobutyl ketone).

³*See* In Vitro Dermal Absorption Rate Testing of Certain Chemicals of Interest to the Occupational Safety and Health Administration, 69 Fed. Reg. 22402 (Apr. 26, 2004).

⁴TSCA § 4(e)(1), 15 U.S.C.A. § 2603(e)(1). TSCA requires the ITC to update its list of recommended chemical substances and mixtures every six months. The Committee also can designate from this list up to 50 chemical substances and mixtures for the priority testing list for which a testing or information-gathering rulemaking should be initiated within one year. TSCA § 4(e)(1)(A), 15 U.S.C.A. § 2603(e)(1)(A).

⁵TSCA § 4(f), 15 U.S.C.A. § 2603(f). At the time TSCA was enacted, Congress was particularly concerned about chemical substances that presented risks from cancer, gene mutations, or birth defects. Prior to passage of the 2016 amendments, Section 4's action-forcing provision was narrower in scope and required EPA to take appropriate regulatory action only if the “significant risk of serious or widespread harm to human beings” was from cancer, gene mutation, or birth defects.

⁶EPA may extend this 180-day period by up to 90 days if it publishes a notice of the extension with an explanation of the need for more time. TSCA § 4(f), 15 U.S.C.A. § 2603(f).

[Section 16:8]

¹The rules governing issuance of test rules, exemptions, and testing consent agreements are codified at 40 C.F.R. §§ 790.1 to 790.99.

standards.² A test rule will specify that it applies to manufacturers, to processors, or to both.³ The rule also will identify which entities will initially be required to submit letters of intent to conduct testing.⁴ This will depend on which activities are associated with the risks being evaluated (*e.g.*, manufacturing or processing).⁵ Thus, when promulgating a test rule, EPA often will identify two “Tiers” of entities subject to the test rule. While legally subject to a test rule, persons in the second Tier need not comply with the requirements of the test rule unless directed to do so in a subsequent notice. Frequently, manufacturers of a chemical substance subject to a test rule are placed in Tier 1, while processors of the substance are placed in Tier 2.⁶ However, persons in Tier 2 may be subject to claims for reimbursement by a manufacturer who actually performs the test.⁷

Entities subject to the test rule may seek an exemption if they can demonstrate that testing would be redundant.⁸ Exempted persons must, if asked by those who conducted a test, reimburse those persons for a share of the testing cost. If the parties cannot agree on a reimbursement schedule among themselves, EPA may impose one.⁹

EPA’s implementation of the test rules program was hindered in the early years by the time and resources needed to build a record to support each rule. EPA determined that case-by-case rulemaking was too burdensome and resource-intensive. The Agency therefore developed an alternative practice of negotiating consent agreements with chemical manufacturers and processors who agreed to fund or perform the needed testing. Such testing agreements can be negotiated more quickly and efficiently than a rule can be developed.¹⁰

Procedures for negotiating testing agreements had been integrated into the regulations for development and promulgation of test rules long before the 2016 amendments.¹¹ The procedures afford manufacturers, processors, and other interested parties up to six months to negotiate an agreement with EPA, though

²EPA has developed generic test guidelines on which chemical-specific test standards in TSCA Section 4 test rules and consent agreements are based. 50 Fed. Reg. 39252 (Sept. 27, 1985) (codified at 40 C.F.R. Pts. 796 to 798). In addition, EPA may base test standards on certain internationally agreed-upon test guidelines developed by the Organisation for Economic Co-operation and Development (OECD). 50 Fed. Reg. 39472 (Sept. 27, 1985) (codified at 40 C.F.R. Pt. 796). These standards are periodically reviewed and revised to keep them current. *See, e.g.*, 62 Fed. Reg. 43820 (Aug. 15, 1997) (codified at 40 C.F.R. Pt. 799, Subpt. H) (establishing 11 new health effects testing guidelines for TSCA Section 4 test rules); 65 Fed. Reg. 78746 (Dec. 15, 2000) (codified at 40 C.F.R. Pt. 799, Subpt. E) (establishing 15 new health effects testing guidelines). EPA has also prescribed good laboratory practices for conducting tests under Section 4. 40 C.F.R. §§ 792.1 to 792.195.

⁴40 C.F.R. § 790.42.

⁵40 C.F.R. § 790.42.

⁶*See, e.g.*, 40 C.F.R. § 799.5085 (chemical testing requirements for first group of high production volume chemicals).

⁷*See* 40 C.F.R. Pt. 791.

⁸TSCA § 4(c), 15 U.S.C.A. § 2603(c); 40 C.F.R. §§ 790.80 to 790.99. EPA will conditionally approve a request for an exemption if the Agency has received a letter of intent to conduct the testing from another party; if the chemical substance or mixture is equivalent to another substance or mixture for which data have been, or are being, submitted under a test rule; or if submission of required test data concerning that chemical substance or mixture would be duplicative of data that have been, or are being, submitted to EPA in accordance with a test rule. 40 C.F.R. § 790.87.

⁹TSCA § 4(c)(3)(A), 15 U.S.C.A. § 2603(c)(3)(A); 40 C.F.R. Pt. 791.

¹⁰*See, e.g.*, 47 Fed. Reg. 335 to 336 (Jan. 5, 1982); 46 Fed. Reg. 53775 (Oct. 30, 1981) (preliminary and final decisions not to propose a test rule for alkyl phthalates or benzyl butyl phthalate).

¹¹*See* Procedures Governing Testing Consent Agreements and Test Rules, 40 C.F.R. Pt. 790. EPA reviewed its testing consent order and test rule development process and expected to propose efficiency-enhancing amendments to these procedures by late 1998. *See* 63 Fed. Reg. 22690, 22694 (Apr. 27,

EPA may extend negotiations at its discretion if it seems likely that the parties can reach a final agreement. If an agreement cannot be reached, EPA will proceed to develop a test rule. If an agreement is reached, it will be implemented as a consent order specifying the required tests and a schedule for performing them, and requiring signatory manufacturers and processors to comply with other TSCA requirements that are triggered by test rules. Signatory parties also must acknowledge that they are subject to the TSCA enforcement provisions that apply to test rules.¹² EPA has posted testing results obtained using its Section 4 testing authority and voluntary testing agreements in ChemView, the Agency's publicly accessible online database for regulatory and health and safety information about chemical substances.¹³

Although the 2016 amendments to TSCA specifically contemplate negotiated testing agreements (a feature that was included in the amendments to acknowledge EPA's prior practices in this regard), as of this writing, the Agency has not entered into any negotiated Section 4 testing agreements.

§ 16:9 Voluntary testing initiatives prior to the 2016 amendments

Beginning in the late 1990s, the Agency launched several initiatives aimed at fulfilling its priority data needs through programs that encourage voluntary testing by the U.S. chemical industry. These initiatives focused primarily on (1) organic high production volume (HPV) chemical substances and (2) chemical substances of particular potential concern to children (the Voluntary Children's Chemical Evaluation Program, or VCCEP).¹ Following the HPV program's inception in 1998, chemical manufacturers and importers "sponsored," i.e., developed and submitted basic hazard data for, more than 2,200 chemical substances.² To address chemical substances that were eligible for sponsorship but were not sponsored, the first HPV test rule concerning 17 "orphan" chemical substances was published on March 16, 2006.³ EPA also utilized its authority under TSCA Section 8(a) and (d) to issue rules to gather production volume and exposure information in addition to existing health and safety data on orphan HPV chemical substances.⁴

The Chemical Assessment and Management Program (ChAMP) was a subsequent effort announced by the Agency in March 2008, intended to encourage voluntary

1998). The Agency did eventually amend its procedures, but not until a decade later. *See* 75 Fed. Reg. 56472 (Sept. 16, 2010).

¹²40 C.F.R. § 790.60(a)(13).

testing by the U.S. chemical industry.⁵ ChAMP was a voluntary program created to implement commitments that the United States made at the Security and Prosperity Partnership of North America Leaders Summit in August 2007. The United States agreed to complete screening-level hazard, exposure, and risk characterizations on an estimated 6,750 chemical substances, including HPV chemical substances and Moderate Production Volume (MPV) chemical substances.⁶ Based on these assessments, the Agency planned to prioritize the substances to indicate whether additional data or control measures were needed to address potential hazards and risks. The ChAMP effort built on EPA's prior work under the HPV Challenge Program and the data collected under the 2006 Inventory Update Rule.⁷

Following the 2008 election, the Obama administration suspended the ChAMP program, concluding that the categorization of thousands of chemicals would take years and would be based on incomplete information in the absence of mandatory data submission or testing requirements.⁸ As discussed in Section 16:29, the Obama administration instead announced a new approach to assessing existing chemical substances.

III. PREVENTION OF UNREASONABLE RISK: REGULATION OF NEW CHEMICAL SUBSTANCES

§ 16:10 Introduction

A major theme of TSCA is the anticipation and prevention of new and unreasonable risks from exposure to chemical substances and mixtures. A new risk may arise in two ways: through the manufacture of a new chemical substance or through the use of an existing chemical substance in a new way that involves increased human exposure or release to the environment. Thus, to the extent TSCA was crafted to enable EPA to gather and review test data and related information about chemical substances, the cornerstone provision of the 1976 legislation arguably was Section 5—which permits EPA to assess and take measures to prevent new risks through (1) premanufacture review and regulation of new chemical substances and (2) promulgation of “significant new use rules” or “SNURs.”

Premanufacture review permits EPA to identify and take steps to regulate and gather data concerning chemical substances for which concerns might exist before they enter the stream of commerce. SNURs identify chemical substances or categories of substances of potential concern to EPA and require notice to EPA before such substances may be used in a manner not specifically permitted by the SNUR. Section 5 was the first piece of U.S. environmental legislation to incorporate principles that would later be dubbed “pollution prevention.”

As discussed in Section 16:13, the 2016 amendments enhanced EPA's role as a gatekeeper by incorporating a requirement into Section 5 that EPA make an affirmative determination (before a new substance may be manufactured) regarding whether a substance presents or is not likely to present an unreasonable risk to

⁵Jeff Kinney, *North American Agreement Said to Provide Targeted Approach for Testing, Regulation*, 53 Daily Env't Rep. (Bloomberg BNA) A-8 (Mar. 19, 2008).

⁶HPV chemicals are those substances that are reported under the 2006 Inventory Update Reporting rule (IUR), now known as the Chemical Data Reporting rule, as being produced or imported in quantities greater than or equal to one million pounds a year. MPV chemicals are those substances that are reported under the 2006 IUR as being produced or imported in quantities greater than or equal to 25,000 and less than one million pounds per year.

health or the environment.

§ 16:11 Premanufacture review of new chemical substances—The role of the TSCA Chemical Substance Inventory

Section 5 of TSCA creates notification requirements that must be satisfied before a company may lawfully manufacture or import a “new chemical substance.” A new chemical substance is one that is subject to TSCA but does not already appear on the TSCA Chemical Substance Inventory (TSCA Inventory or the Inventory).¹ The Inventory is inclusive of all chemical substances that are manufactured or imported for industrial uses as well as substances that are used in formulating virtually every commercial and consumer product distributed in U.S. commerce and in products exported to other countries. Listed on the Inventory are organics and inorganic chemical substances; polymers; and chemical substances of unknown or variable composition, complex reaction products, and biological materials (sometimes referred to as UVCBs). Thus, the TSCA Inventory functionally constitutes a comprehensive listing of all “existing” chemical substances. The TSCA Inventory was created and is maintained pursuant to Section 8(b), which requires EPA to compile, keep current, and publish a list of each chemical substance that is manufactured or processed in the United States.²

The Inventory was created shortly after enactment of the original statute and therefore comprises all chemical substances manufactured in or imported to the United States for commercial purposes since January 1, 1975. EPA compiled the initial TSCA Inventory in 1979 based on information collected from manufacturers and importers through EPA’s initial Inventory reporting regulations.³ Naturally occurring substances are considered to have been automatically included on the Inventory.⁴

Today, more than 86,000 chemical substances are listed on the TSCA Inventory.⁵ As discussed in Section 16:35, the 2016 amendments to TSCA Section 8 required that the Inventory be updated to reflect which chemical substances are currently “active” and which are “inactive.” Following a rulemaking and exercise requiring reporting to EPA by chemical manufacturers, importers, and processors, EPA completed the process for making these designations in 2019.⁶ It is unlawful to manufacture, process, or use for commercial purposes a substance which is listed as “inactive” on the Inventory. Nevertheless, substances that are designated as “inactive” on the Inventory are not subject to the full Section 5 notification requirements for “new chemicals.” Instead, any entity that wishes to “reactivate” a substance because it intends to manufacture, import, or process it in the U.S. may do so by submitting to EPA a simplified notice, known as a Notice of Activity (NOA) Form B.⁷

An entirely new substance is added to the Inventory only when EPA receives a notice of commencement (NOC) of manufacture of the new substance following its successful completion of the Section 5 premanufacture review process, discussed in

⁷See discussion *infra* in Section 16:35.

detail below.⁸ EPA also updates and refines information it maintains concerning substances listed on the Inventory through its “Chemical Data Reporting” (CDR) rule, which requires manufacturers (including importers) to periodically submit information on the chemical substances they produce domestically or import into the United States.⁹ EPA also has issued guidance under which manufacturers and importers may request corrections to the Inventory, but in practice such corrections now are rarely sought or allowed, given how long it has been since the original Inventory was established.¹⁰

Prior to importing or manufacturing a chemical substance, an importer or manufacturer must ascertain whether the substance appears on the TSCA Inventory. There are two portions of the TSCA Inventory: a non-confidential portion, which is available to the public, and a confidential portion, which lists chemical substances whose identities have been claimed as confidential by their manufacturers and which may be reviewed only by EPA.¹¹ In conjunction with its efforts to modernize the Inventory so that it more accurately conveys the identities of chemical substances currently in commerce, the 2016 amendments require EPA to undertake a plan to systematically review existing confidentiality claims for Inventory-listed substances that are “active” in commerce (i.e., those which have been produced or processed during the preceding 10-year period).¹² The 2016 amendments also required EPA to develop a system to assign a unique identifier to each specific chemical identity that is protected from disclosure (because it is treated as confidential business information or “CBI”) and to publish a list (to be updated each year) of the unique identifiers.¹³ The TSCA Inventory posted in September 2019 was the first to include this unique identifier information. Confidential chemical identities also are represented to the general public using generic names that are intended to be as descriptive as possible while still masking the portion of the chemical’s identity that is the important trade secret.

To determine whether a substance is on the non-confidential portion of the TSCA Inventory, it is advisable to search the frequently updated electronic version of the TSCA Inventory.¹⁴ EPA will search the confidential portion of the TSCA Inventory on behalf of any person who demonstrates a *bona fide* intent to manufacture or import a chemical substance for commercial purposes.¹⁵

In some cases, potential manufacturers may intend to use reactants whose specific chemical identities are held confidential by their suppliers. Similarly, a potential importer may intend to bring into the United States a substance whose identity is known only to its foreign manufacturer. In these instances, the domestic or foreign manufacturer of the confidential substance can provide a letter of support, including specific chemical identity information, directly to EPA. Manufacturers and importers of such chemical substances should take steps to ensure that they are promptly apprised of any changes in the chemical composition of the substances they obtain to avoid inadvertently producing or importing a different substance than the one

⁸See § 16:13, *infra*.

⁹See § 16:35, *infra*. The regulations governing updates and refinements to the Inventory were formerly known as the “Inventory Update Reporting” rule. See 76 Fed. Reg. 50816 (Aug. 16, 2011).

¹⁰45 Fed. Reg. 50544 (July 29, 1980). Requests for correction must address inadvertent errors in describing the chemical identity of manufactured and imported substances.

¹¹Confidential substances are also identified on the non-confidential portion of the Inventory by generic name.

¹²See discussion *infra* § 16:35.

authorized.

Determining whether a substance is on the Inventory can involve complex issues of chemical nomenclature. Many potential violations of Section 5 arise from errors in determining chemical identity or in understanding chemical nomenclature conventions used by EPA, which may lead manufacturers mistakenly to believe that a substance is listed on the TSCA Inventory. EPA has developed numerous policy statements and guidance documents on how to identify certain chemical substances for the purpose of assigning unique and unambiguous descriptions for each substance listed on the TSCA Inventory.¹⁶ To ensure the 2016 amendments were not misinterpreted by EPA officials as a mandate to “undo” or “clean up” certain Inventory listings that have presented challenges to EPA and the regulated community alike, the legislation provided instruction to EPA regarding nomenclature. The 2016 amendments require that EPA maintain the long-established use of Class 2 chemical nomenclature and the Soap and Detergent Association Nomenclature System, and also that individual members of categories of “statutory mixtures” identified by EPA be treated as included on the Inventory.¹⁷ EPA is also given discretion to recognize multiple Inventory listings as a single chemical substance if a manufacturer or processor demonstrates that a chemical substance appears multiple times under different names.¹⁸

Polymers meeting certain criteria may be subject to a specific exemption to the Section 5 notification procedures. This can substantially simplify the ordinary requirements for new substances subject to premanufacture notification. In general, polymers are characterized as substances having a sequence of one or more types of repeating monomer units bonded to two or more other molecules and having a molecular weight distribution among the molecules present in the chemical substance that is primarily attributable to differences in the number of monomer units contained in the substance.¹⁹ Although many polymers are produced in accordance with this exemption to the premanufacture notification (PMN) requirement (discussed in more detail later) that permits them not to be identified on the Inventory, nonexempt polymers and others that manufacturers have elected to submit through the PMN process are listed. In such cases, polymers are identified on the Inventory based on their starting materials. Under the so-called “two percent rule,” all monomers and other reactants used at greater than 2% by weight in the manufacture of the polymer (based on the dry weight of the polymer manufactured) must be listed; monomers and other reactants used at 2% or less are listed only if the manufacturer so requests.²⁰

EPA revised the 2% rule in 1995 to allow alternative methods for determining the level of reactant or monomer in a polymer. The weight percentage may be based on

¹⁸TSCA § 8(b)(3)(B), 15 U.S.C.A. § 2607(b)(3)(B).

¹⁹EPA, *Toxic Substances Control Act: Inventory Representation for Polymeric Substances* (not dated), <https://19january2017snapshot.epa.gov/sites/production/files/2015-05/documents/polymers.pdf>.

²⁰40 C.F.R. § 720.45(a)(2); see also EPA, *Instruction Manual for Reporting under the TSCA § 5 New Chemicals Program* (2015), https://www.epa.gov/sites/production/files/2015-06/documents/instruction_manual_2015_5-26-2015.pdf. The decision whether to list reactants used at less than 2% affects the manufacturer’s ability to vary the formulation of the polymer. The quantities of each reactant listed on the Inventory as part of a polymer may be varied without submission of a premanufacture notice. The polymer will be considered a new chemical substance, however, if (1) any reactant included in the name listed on the Inventory is eliminated or (2) any reactant not included in the name listed on the Inventory is used at a level above 2%. See 48 Fed. Reg. 41132, 41134 (Sept. 13, 1983); 60 Fed. Reg. 16298, 16304 to 16305 (Mar. 29, 1995).

either (1) the weight of monomer or other reactant actually “charged,” or added, to the reaction vessel (which was formerly the only permissible methodology); or (2) the minimum weight of monomer or other reactant required in theory to account for the actual weight of monomer or other reactant chemically “incorporated,” or combined, in the polymer.²¹

§ 16:12 Premanufacture review of new chemical substances—The premanufacture notice (PMN) requirement

A person who intends to manufacture or import a chemical substance that does not appear on the TSCA Inventory must satisfy TSCA’s PMN requirements. Section 5(a), as amended in 2016, requires such persons to notify EPA at least 90 days before manufacturing or importing a new chemical substance for commercial purposes and to await a risk determination by EPA.¹ The PMN must be submitted electronically using software available from EPA and must contain all information specified in the form, to the extent it is known to or reasonably ascertainable by the submitter.² The required information includes the chemical name and molecular formula and structure of the chemical substance to be manufactured; categories or proposed categories of use; estimates of total amounts to be manufactured or processed for each use; a description of byproducts resulting from manufacture, processing, use, or disposal; estimates of employee exposure; and the method to be used to dispose of the substance.³

The PMN submitter is generally not required to develop any new health or safety information or test data before submitting the PMN (although EPA has authority to order the development of new information if the Agency determines the information is necessary to review the PMN).⁴ However, the submitter must provide all data in the submitter’s possession, or information known to or reasonably ascertainable by him or her, concerning the health or environmental effects of the chemical substance.⁵ Even if development of toxicity data for the purposes of PMN submission is not required, manufacturers may nonetheless wish to develop and submit such data with the PMN under certain circumstances. EPA has published informal guidance, which is available from the EPA Office of Pollution Prevention and Toxics, identifying categories of chemical substances for which the Agency is likely to

²¹60 Fed. Reg. 16304 to 16305, 16310 to 16311. The amendment, according to EPA, provides a better indicator of polymer properties while at the same time allowing manufacturers greater flexibility in commercial innovation; reducing the number of premanufacture notices, *see* § 16:12, *infra*, representing only slight variations in polymer composition; and providing greater consistency with international reporting policies. EPA warned, however, that use of the “incorporation” method could have regulatory consequences, *e.g.*, where the percentage of chemical incorporation increases from 2% or less to greater than 2% due to a modification in the manufacturing process, even though no change occurs in the amounts and identities of the reactants actually charged. *See* 60 Fed. Reg. 16304; 58 Fed. Reg. 7661, 7664 to 7665 (Feb. 8, 1993). For additional guidance, consult EPA’s Polymer Exemption Guidance Manual, EPA 744-B-97-001 (June 1997), <https://www.epa.gov/sites/production/files/2015-03/documents/polyguid.pdf>.

[Section 16:12]

¹TSCA § 5(a)(1), 15 U.S.C.A. § 2604(a)(1). As previously explained, although the PMN provision refers only to “manufacture,” this term is defined under TSCA to include importation. TSCA § 3(7), 15 U.S.C.A. § 2602(7). Thus, both manufacturers and importers are subject to the PMN requirements. *See, e.g.*, 40 C.F.R. § 720.57.

²40 C.F.R. §§ 720.40, 720.45.

³40 C.F.R. § 720.45. EPA amended the PMN rules in 1995 to require that submitters provide the currently correct Chemical Abstracts Index Name or Chemical Abstracts Preferred Name for each chemical substance included in the notice. *See* 60 Fed. Reg. 16298 to 16302.

⁴TSCA § 4(a)(2)(A)(i), 15 U.S.C.A. § 2605(a)(2)(A)(i).

⁵*See* 40 C.F.R. § 720.50.

initiate regulatory action to obtain toxicity data during the PMN review process. To avoid delays in PMN review, many companies provide the specified data with the PMN.⁶

§ 16:13 Premanufacture review of new chemical substances—EPA risk determination is required

The 2016 amendments to TSCA made modifications to the Section 5 provisions to require that EPA reviewers make an affirmative determination on all PMNs before manufacture may commence.¹ Previously, if EPA took no regulatory action on a PMN submission, the person who submitted the PMN could begin to manufacture or import the chemical substance 90 days after the PMN filing. EPA may extend this 90-day review period up to an additional 90 days “for good cause.”² If EPA does not render a determination within the 90-day review period (or extension period), the agency must refund the review fees required to be submitted with the PMN.³

If EPA issues a determination authorizing manufacture, the person who submitted the PMN may begin to manufacture or import the chemical substance. That person must submit a notice of commencement of manufacture (NOC) on a standard electronic reporting form to EPA on, or within 30 calendar days after, the first day of manufacture or importation for a nonexempt⁴ commercial purpose.⁵ The chemical substance is added to the TSCA Inventory and becomes an existing chemical substance as soon as EPA receives a complete NOC; thereafter, others may manufacture or import the substance without filing a PMN. Thus, the TSCA Inventory has the potential to change daily; EPA has been able to provide updates to the public portion periodically during recent years. Notwithstanding the investment of time and resources required to prepare and submit new chemical notifications to EPA, the Agency receives NOCs for only a fraction of the PMNs received. Between the date the amended statute went into effect and the beginning of August 2020, the rate of NOCs received represented approximately one-third of the submissions EPA received and reviewed in the new chemicals review program.⁶ Notices received by EPA for certain exemptions do not result in the chemical substance notified being listed on the Inventory; thus, substances subject to such exemptions remain “new chemicals” for purposes of the Inventory and the new chemical notification requirements.

It bears emphasis that the NOC may be filed only by the PMN submitter and only *after* nonexempt commercial manufacture begins. The first *nonexempt manufacture*—and not the first *commercial sale*—triggers the NOC requirement. An NOC should not be filed if, for example, following completion of PMN review, a company sells

⁶A comprehensive set of interpretive guidance documents on the PMN requirements is available on EPA’s website at *EPA’s Review Process for New Chemicals: Policies and Guidance*, EPA, <https://www.epa.gov/reviewing-new-chemicals-under-toxic-substances-control-act-tsca/epas-review-process-new-chemicals#policies>.

excess stocks of a chemical substance manufactured under the R&D exemption.⁷

§ 16:14 Premanufacture review of new chemical substances—EPA review and regulatory responses

After a PMN is submitted, EPA evaluates the information in the PMN, and other information available to the Agency, to make a regulatory determination. TSCA, as amended in 2016, establishes three categories of such determinations. First, EPA may determine that a new chemical substance “presents an unreasonable risk” to health or the environment.¹ If EPA makes such a finding, it must take certain regulatory actions; these include either issuing a Section 6 rule, which takes effect upon publication, or issuing an administrative order under Section 5(f), which would take effect at the end of the PMN review period. Such action would limit or prohibit the manufacture and use of the substances.² To date, no Section 5(f) or Section 6 actions have been taken in the PMN context by EPA during the period following the 2016 amendments to TSCA.³

The second category of risk determinations permits EPA to find:

- (1) that insufficient information is available “to permit a reasoned evaluation of the health and environmental effects” of the new chemical substance;
- (2) that in the absence of sufficient information to evaluate health and environmental risks, the substance “may present an unreasonable risk” to health or the environment; or
- (3) that the substance is or will be produced in “substantial quantities” and either that it may be anticipated to enter the environment in substantial quantities or that there is or may be “significant or substantial human exposure to the substance.”⁴

If EPA makes one or more of the findings in this second category of determinations—an “insufficient information” determination, a “may present an unreasonable risk” determination, or a “substantial quantities” (an “exposure-based”) determination—the Agency must issue an administrative order under Section 5(e) that prohibits or limits the manufacture, processing, distribution in commerce, use, or disposal of the substance to the extent necessary to protect against an unreasonable risk of injury to health or the environment.⁵ The order takes effect on the expiration of the applicable review period. Such Section 5(e) orders are issued “pending the development of additional information.” In such cases, the PMN submitter may commence manufacture but must comply with the order’s terms and might generate additional data intended to provide EPA with sufficient data to undertake a more thorough evaluation and perhaps amend or revoke the administrative order (or some of its restrictions). Adversarial orders under Section 5(e) can be administratively difficult for EPA. Consequently, during the PMN review process, EPA might engage actively in discussions and negotiations with the PMN submitter. Such discussions often result in the notice submitter agreeing to withdraw its notice or to voluntarily “suspend” the notice review for a period sufficient to gather information

⁷See 51 Fed. Reg. 15096, 15101 (Apr. 22, 1986).

¹TSCA § 5(a)(3)(A), 15 U.S.C.A. § 2604(a)(3)(A).

²TSCA § 5(f)(2)–(3), 15 U.S.C.A. § 2604(f)(2)–(3).

³*Statistics for the New Chemicals Review Program under TSCA*, EPA, <https://www.epa.gov/reviewing-new-chemicals-under-toxic-substances-control-act-tsca/statistics-new-chemicals-review#stats> (last updated Aug. 5, 2020).

⁴TSCA § 5(a)(3)(B), 15 U.S.C.A. § 2604(a)(3)(B).

⁵TSCA § 5(e)(1)(A), 15 U.S.C.A. § 2604(e)(1)(A).

that might alter EPA's initial findings, or to consider entering into a negotiated agreement. Thus, both prior to, and following, the 2016 amendments to TSCA, the use of negotiated Section 5(e) consent orders is a practice that continues to be the predominant mechanism for restricting uses and requiring the submission of test data on new chemical substances. Nearly 600 of the approximately 3,000 substances reviewed since the 2016 amendments have become the subject of consent orders with restrictions on manufacture.⁶

The third determination EPA may make is to conclude that the new chemical substance "is not likely to present an unreasonable risk" to health or the environment; in such instance, no regulatory action would be taken.⁷ If EPA advises the PMN submitter that the new chemical substance is not likely to present an unreasonable risk to health or the environment, the PMN submitter may commence manufacturing immediately.⁸ Although EPA also must publish its finding in the Federal Register "as soon as practicable before the expiration" of the applicable review period, Federal Register publication is not a prerequisite for the commencement of manufacturing.⁹ As of August 2020, the Agency had made a "not likely to present an unreasonable risk" determination for more than 500 of approximately 3,000 substances reviewed since the 2016 amendments.¹⁰

EPA must make these Section 5 determinations "without consideration of costs or other nonrisk factors," and must give consideration to whether there will be "an unreasonable risk to a potentially exposed or susceptible subpopulation identified as relevant by the Administrator under the conditions of use."¹¹ "Potentially exposed or susceptible subpopulations" is a term that reappears throughout the 2016 amendments to TSCA. The amended Section 3 definitions specify that the phrase refers to "a group of individuals within the general population identified by the [EPA] Administrator who, due to either greater susceptibility or greater exposure, may be at greater risk than the general population of adverse health effects from exposure to a chemical substance or mixture, such as infants, children, pregnant women, workers, or the elderly."¹²

The PMN review process consists of four distinct, successive technical phases: the chemistry review phase, the hazard (toxicity) evaluation phase, the exposure evaluation phase, and the risk assessment/risk management phase. These phases are structured to permit EPA staff to reach a determination within 90 days of receipt of the PMN. EPA has illustrated the process in the following flowchart.

⁶*Statistics for the New Chemicals Review Program under TSCA*, EPA, <https://www.epa.gov/reviewing-new-chemicals-under-toxic-substances-control-act-tsca/statistics-new-chemicals-review#stats> (last updated Aug. 5, 2020).

Source: *PMN Review Process*, EPA, <https://www.epa.gov/reviewing-new-chemicals-under-toxic-substances-control-act-tsca/pmn-review-process-0> (last updated Sept. 17, 2019).¹³

¹³Prior to the 2016 amendments, the majority of PMN chemical substances were eliminated from further technical review early in the process. EPA has established on its website summaries of PMN determinations reached following enactment of the 2016 amendments. *Premature Notices (PMNs) and Significant New Use Notices (SNUNs) Table*, EPA, <https://www.epa.gov/reviewing-new-chemicals-under-toxic-substances-control-act-tsca/premanufacture-notices-pmnns-and> (last updated June 16, 2020).

Most PMNs historically have contained little or no toxicity test data;¹⁴ for this reason, much of the toxicity evaluation has rested on structural similarity to analogous chemical substances about which more is known.¹⁵ EPA also considers the extent of human exposure to the substance or its byproducts that might occur during manufacture, processing, use, and disposal of the PMN chemical substance, as well as the likelihood and magnitude of such releases.¹⁶ Agency reviewers further evaluate the likelihood that the chemical substance may be manufactured in larger volumes or manufactured or used in ways other than those disclosed in the PMN.¹⁷ EPA staff frequently must communicate informally with the submitter to clarify information in the PMN and to obtain additional information. Such requests for information and additional data often prompt the PMN submitter to request a “voluntary” suspension of the PMN review period to gather and submit the information requested.¹⁸

The basis for this practice of EPA granting “voluntary” suspensions and engaging in negotiations during the PMN review period has been a staple of Agency practice in the new chemicals program almost since its inception and its origins can be explained as follows. The threat of issuing an adversarial “Section 5(e)” or “5(f)” Order (and the concerns that such an adversarial order might generate bad publicity for a PMN submitter) has given EPA substantial leverage over manufacturers of new chemical substances. In an effort to remain in good standing with EPA, to be responsive to information requests and hopefully ensure eventual market entry (and to simultaneously avoid being cast in an unfavorable light), most submitters try to address potential concerns about risk by providing information that addressed data gaps identified by EPA and by “agreeing” to enter negotiated “Consent” Orders as a condition of market entry. Still others elect to withdraw their PMNs voluntarily. Approximately 300 such withdrawals have occurred since the 2016 amendments and, as of mid-2020, it appears that as many as 1,000 notices might remain in suspension—perhaps with data gathering efforts or negotiations with EPA personnel ongoing.¹⁹

EPA has used Section 5(e) Consent Orders creatively to implement a variety of regulatory goals in the context of the new chemical program. This includes OSHA-like programs, such as requiring the PMN submitter to implement employee protection procedures and personal protective equipment and safety training. Consent Orders often specify the methods of disposal of production wastes and byproducts. Through an agreement with the original PMN submitter, EPA can leverage its contract manufacturers, and even impose restrictions on sales to persons who do not agree to use the same manufacturing, process, and use limitations as the manufacturer. The Agency has used Consent Orders to restrict domestic manufac-

¹⁴A 1983 study of the information content of PMNs found that 47% of PMNs contained no toxicity data at all, while those that contained at least one element of data seldom reflected more than simple acute toxicity tests. Office of Technology Assessment, *The Information Content of Premanufacture Notices* 15, 50–51 (1983), <https://www.princeton.edu/~ota/disk3/1983/8313/8313.PDF>.

¹⁵Office of Technology Assessment, *The Information Content of Premanufacture Notices* 15, 19, 51 (1983), <https://www.princeton.edu/~ota/disk3/1983/8313/8313.PDF>.

¹⁶TSCA § 5(b)(4)(A), 15 U.S.C.A. § 2604(b)(4)(A); Office of Technology Assessment, *The Information Content of Premanufacture Notices* 15, 33–37 (1983).

¹⁸Before EPA prohibits or restricts the manufacture, processing, distribution in commerce, use, or disposal of a new chemical substance to address workplace exposures, the Agency must consult “[t]o the extent practicable” with the Occupational Health and Safety Administration. TSCA § 5(f)(5), 15 U.S.C.A. § 2604(f)(5).

¹⁹*Statistics for the New Chemicals Review Program under TSCA*, EPA, <https://www.epa.gov/review-ing-new-chemicals-under-toxic-substances-control-act-tsca/statistics-new-chemicals-review#stats>.

ture of imported substances and to require that certain substances are only manufactured or processed in certain physical forms or within specific equipment or manufacturing plants.²⁰ EPA has also been adept at tailoring the use of Consent Orders to impose testing requirements on high-volume chemicals²¹ and to impose restrictions on substances that appear to be persistent and bioaccumulative chemicals.²² The 2016 amendments to TSCA have served to increase, rather than lessen, the percentage of chemical substances that undergo Section 5 reviews for which restrictions are being imposed through such “agreements.”

The 2016 amendments to the new chemical review process ultimately resulted in a backlog of PMNs, which EPA pledged to reduce.²³ In November 2017, EPA issued an initial document outlining its “Working Approach” to making determinations regarding new chemicals under Section 5 of TSCA.²⁴ In December 2019, EPA published an updated Working Approach document.²⁵ The Working Approach document describes EPA’s guiding principles and concepts as well as the decision-making logic and process for the Agency’s review of Section 5 notices, including PMNs. The document includes a flowchart showing three questions on which EPA focuses during new chemical reviews. The three questions involve: (1) identifying the intended, known, and reasonably foreseen conditions of use; (2) considering whether there is sufficient information to perform a reasoned evaluation; and (3) evaluating whether a SNUR can adequately address concerns regarding a reasonably foreseen use.

§ 16:15 Premanufacture review of new chemical substances—Exemptions from the PMN requirement

Pursuant to its authority under Section 5(h) to exempt certain substances from the PMN requirements, EPA has promulgated regulations that exempt several categories of chemical substances from all or some of the PMN notice requirements. These categories include chemical substances produced in low volumes; chemical substances used solely for research and development; chemical substances expected to have low release and low exposure; chemical substances manufactured for test marketing purposes; and certain polymers. These exempted chemical substances are not added to the TSCA Inventory.

§ 16:16 Premanufacture review of new chemical substances—Exemptions from the PMN requirement—Research and development exemption

A company that manufactures or imports a new chemical substance in small quantities solely for purposes of research and development (R&D) need not submit a PMN, provided that certain requirements are satisfied.¹ First, the chemical substance must be used by, or directly under the supervision of, a technically qualified individual.² Second, the manufacturer or importer must review and evaluate information in its possession regarding health effects associated with the chemical substance and notify all employees involved in the R&D work, as well as others to whom the chemical substance is directly distributed, of any health risks.³ Manufacturers of chemical substances used solely in laboratories operating according to “prudent laboratory practices” are exempt from this requirement.⁴ Third, the manufacturer or importer must notify in writing all nonemployees to whom the chemical substance is distributed that the substance is to be used only for R&D purposes.⁵ Finally, the manufacturer or importer must create and keep for five years specific records that document its handling of the R&D chemical substance.⁶

§ 16:17 Premanufacture review of new chemical substances—Exemptions from the PMN requirement—Low volume exemption

Under EPA’s PMN regulations, new chemical substances manufactured or imported in quantities of 10,000 kilograms or less per year are eligible for a low vol-

[Section 16:16]

¹The R&D exemption was created by Section 5(h)(3), which exempts manufacturers and processors from the significant new use and PMN provisions of Section 5(a) if they manufacture or process the substance “only in small quantities (as defined by the Administrator by rule) solely for purposes of (A) scientific experimentation or analysis, or (B) chemical research on, or analysis of such substance or another substance, including such research or analysis for the development of a product.” TSCA § 5(h)(3), 15 U.S.C.A. § 2604(h)(3). EPA has published guidance on the research and development exemption. *See, e.g.*, EPA, New Chemical Information Bulletin: Exemptions for Research and Development (Nov. 1986), <https://www.epa.gov/sites/production/files/2015-08/documents/tmeranddbulletin.pdf>; 51 Fed. Reg. 15096 (Apr. 22, 1986); 49 Fed. Reg. 50201 (Dec. 27, 1984).

²40 C.F.R. § 720.36(a)(3).

³40 C.F.R. § 720.36(a)(2). The statute requires that all persons engaged in experimentation, research, or analysis for a manufacturer or processor must be notified of any health risks that may be associated with such substances. TSCA § 5(h)(3), 15 U.S.C.A. § 2604(h)(3).

⁴40 C.F.R. § 720.36(b)(2).

⁵40 C.F.R. § 720.36(c)(2).

⁶40 C.F.R. § 720.78(b).

ume exemption (LVE) from full PMN review.¹ Manufacture or import of qualifying low volume chemical substances may commence 30 days after submission of an exemption notice, unless EPA denies the exemption request.² Certain conditions described in the exemption application submission must be maintained throughout the duration of the exemption, including the chemical substance's use, site of manufacture, production volume, and exposure and release controls. If these conditions will change, the manufacturer must submit a new exemption notice at least 30 days in advance of the change or submit a PMN for the full 90-day review process (e.g., if the 10,000 kg/yr limit might be exceeded).³

EPA will deny any exemption application if it is unable to determine that the manufacture, processing, distribution in commerce, use, or disposal of the chemical substance at issue will not present an unreasonable risk of injury to human health or the environment under the circumstances described in the application.⁴ As noted, the manufacturer will be required not to exceed the maximum annual production volume of 10,000 kilograms per year. EPA will perform its risk assessment at a lower annual production volume level stipulated in the application if the applicant also agrees to remain under the lower production ceiling and to abide by all of the conditions and terms described in the application, including those related to limits on workplace exposures and environmental releases.⁵ The regulations permit multiple exemption holders for the same substance, provided that EPA can determine that the potential human exposure to, and environmental release of, the new substance at the higher aggregate production level will not present an unreasonable risk of injury to human health or the environment.⁶

§ 16:18 Premanufacture review of new chemical substances—Exemptions from the PMN requirement—Low release and exposure exemption

The low release and exposure (LoREX) exemption is intended to encourage companies to develop manufacturing, processing, use, and disposal techniques that minimize exposures to workers, consumers, the public, and the environment.¹ Under this exemption, new chemical substances that meet certain environmental release and human exposure criteria during their manufacture, distribution in commerce, processing, use, and disposal, regardless of their production volume, may also be eligible for an expedited, 30-day PMN review period. The uses of qualifying chemical substances are restricted to those approved in the exemption notice, and submitters must maintain any exposure or release controls throughout the period of the exemption.²

§ 16:19 Premanufacture review of new chemical substances—Exemptions from the PMN requirement—Test marketing exemption

Section 5(h)(1) of TSCA authorizes EPA to consider case-by-case applications to

²40 C.F.R. § 723.50(a), (c).

test market a chemical substance without prior submission of a PMN.¹ Test marketing is the distribution, during a predetermined testing period, of a limited amount of a chemical substance, or of a mixture or article containing the chemical substance, to a defined number of potential customers for the purpose of exploring market capability before general distribution.² The TSCA regulations set forth the requirements for applying for a test marketing exemption (TME). The applicant must submit all existing data regarding the health and environmental effects of the chemical substance, describe the proposed test marketing activity, and specify the quantity of the substance to be manufactured and the number of people who may be exposed to the substance.³ The TME may be granted, following a 45-day review period, if it is demonstrated that test marketing of the chemical substance “will not present an unreasonable risk to health or the environment.”⁴

EPA has expressed concern that the simultaneous submission of a TME and a PMN for the same substance might represent an effort by the manufacturer to obtain PMN review of a chemical substance in 45 days, rather than the 90 days ordinarily provided for by the statute. To discourage such an approach, EPA closely examines simultaneous submissions to determine if genuine test marketing activity is involved. If it is not, the Agency will deny the application.⁵

§ 16:20 Premanufacture review of new chemical substances—Exemptions from the PMN requirement—Polymer exemption

Certain polymers are eligible for a full exemption from PMN review.¹ To qualify for this exemption, a polymer generally must contain, as an integral part of its composition, at least two of the atomic elements of carbon, hydrogen, nitrogen, oxygen, silicon, and sulfur, and must have a molecular weight greater than or equal to 1,000 daltons (with certain restrictions on low molecular weight species and certain reactive functional groups). Polyesters made from a specified list of reactants may also be exempt. The polymer exemption does not apply to cationic polymers; polymers that contain reactive functional groups, specifically listed elements, or reactants not already included on the TSCA Inventory; polymers that can reasonably be anticipated to substantially degrade, decompose, or depolymerize; water-absorbing polymers with a molecular weight greater than or equal to 10,000 daltons; or polymers containing as an integral part of their composition, except as impurities, certain perfluoroalkyl moieties consisting of a CF₃- or longer chain length.

A person who wishes to manufacture a new polymer that qualifies for the exemption does not need to submit an exemption notice. However, the person must maintain specific records and submit a one-time-only report to EPA notifying the Agency of the polymers subject to the exemption that were imported or manufactured during the preceding year.

§ 16:21 Premanufacture review of new chemical substances—Exclusions from the PMN requirement

In addition to the foregoing *exemptions*, various categories of chemical substances are *excluded* from PMN reporting under certain conditions: substances manufactured solely for export; certain substances unintentionally manufactured; and mixtures.

§ 16:22 Premanufacture review of new chemical substances—Exclusions from the PMN requirement—Substances manufactured solely for export

Chemical substances manufactured or imported solely for export are excluded from PMN requirements. This exclusion is subject to the condition that, when distributed in commerce, the substance bears a stamp or label stating that the substance is intended for export, and the manufacturer knows that the person to whom the substance is being distributed intends to export it or process it solely for export, as defined in 40 C.F.R. § 721.3.¹

§ 16:23 Premanufacture review of new chemical substances—Exclusions from the PMN requirement—Substances not manufactured for commercial distribution as chemical substances per se

The TSCA regulations exclude from regulation under Section 5 several categories of chemical substances that, although technically created through commercial manufacture, are not manufactured for distribution in commerce per se and have no independent commercial purpose. These include impurities; byproducts that are not used for commercial purposes; chemical substances created incidentally as a result of exposure of another chemical substance to environmental factors (such as air or moisture); chemical substances created from certain specific end uses of other chemical substances (including paints, metal finishing compounds, stabilizers, and the like); and non-isolated intermediates.¹ These exclusions are highly technical and fact-dependent, and they have been the subject of considerable interpretation and discussion. Practitioners therefore should consult and carefully scrutinize the applicable regulations and EPA's interpretive guidance.

§ 16:24 Premanufacture review of new chemical substances—Exclusions from the PMN requirement—Mixtures

Mixtures are not themselves subject to the notification requirements of Section 5. Thus, a person who mixes two or more existing chemical substances (that do not undergo a chemical reaction) need not submit a PMN. However, each new chemical substance that is manufactured or imported as part of a mixture is subject to the PMN requirement.¹ The difference between what constitutes a mixture rather than a complex reaction product that EPA considers to be a chemical substance may not be readily apparent. EPA has issued guidance to assist in such situations.²

²*See* Toxic Substances Control Act Inventory Representation for Chemical Substances of Un-

EPA's regulatory authority under TSCA extends to microorganisms, and TSCA has become the primary statutory vehicle for regulating the microbial products of biotechnology. As a matter of policy,¹ implemented by detailed regulations,² the Agency utilizes review procedures for new microbial products of biotechnology that are comparable to the procedures used for traditional chemical substances—but tailored to address the specific characteristics of the microorganisms.

Only “new” microorganisms manufactured or imported for commercial purposes are subject to premanufacture reporting requirements under TSCA. The applicable regulations define “new” microorganisms as those microorganisms formed by combining genetic material from organisms in different taxonomic genera (intergeneric).³ Thus, potentially regulated entities are persons manufacturing or importing intergeneric microorganisms for a commercial purpose. Processors who engage in significant new uses of intergeneric microorganisms also are subject to notification requirements.

Subject to limited exceptions, prior to commencing manufacture or a significant new use of certain microorganisms, a Microbial Commercial Activity Notice (MCAN) must be submitted to EPA. The MCAN review program incorporates many of the notification and review procedures developed for PMNs and the traditional chemical substances framework, with minor modifications necessary to accommodate the specific characteristics of microorganisms.⁴ EPA has 90 days to review the MCAN submission to determine whether the activities involving manufacturing, processing, and use of the subject organism may present an unreasonable risk to human health or the environment.⁵

As with the PMN procedure for traditional chemical substances, the Agency must make a specific finding in the context of its review of the MCAN; thus, commercial production or import may not commence until EPA has advised of the “not likely to present” an unreasonable risk finding or the Agency has issued an Order pursuant to Section 5(e) or 5(f). The manufacturer or importer must submit an NOC within 30 calendar days following the first day of manufacture for a nonexempt commercial purpose.⁶ Following submission of the NOC, EPA will add the new microorganism to the TSCA Inventory, and others may manufacture or import the microorganism without filing an MCAN.⁷

EPA has established two exemptions (Tier I and Tier II) from MCAN submission

known or Variable Composition, Complex Reaction Products and Biological Materials: UVCB Substances on the TSCA Inventory (not dated), <https://www.epa.gov/sites/production/files/2015-05/documents/uvcb.pdf>.

[Section 16:25]

¹Historically, EPA has regulated microorganisms pursuant to EPA's Statement of Policy: Microbial Products Subject to the Federal Insecticide, Fungicide, and Rodenticide Act and Toxic Substances Control Act, 51 Fed. Reg. 23311 (June 26, 1986), as part of the Coordinated Framework for Regulation of Biotechnology; Announcement of Policy and Notice for Public Comment, 51 Fed. Reg. 23302 (June 26, 1986).

²62 Fed. Reg. 17910 (Apr. 11, 1997) (codified at 40 C.F.R. Pt. 725).

³See 40 C.F.R. § 725.3. Consistent with TSCA's regulation of chemical substances, all microbial products of biotechnology subject to TSCA are required to be listed on the TSCA Chemical Substances Inventory (TSCA Inventory). See § 16:11, *supra*. Microorganisms found in nature, i.e., those that occur without human intervention, are not considered new, and such naturally occurring microorganisms are automatically listed on the TSCA Inventory. Thus, “new” microorganisms are those intergeneric microorganisms that do not appear on the TSCA Inventory.

⁴See 40 C.F.R. §§ 725.100 to 725.190.

⁵See 40 C.F.R. § 725.170(a). For a discussion of EPA's review procedure in the context of traditional chemicals, see § 16:14, *supra*.

⁶40 C.F.R. § 725.190.

⁷For a more detailed discussion of NOC requirements, see § 16:13, *supra*.

requirements for new microorganisms manufactured for introduction into commerce. Requirements for the Tier I exemption are less stringent than those for Tier II.

To qualify for the Tier I exemption, a manufacturer must: (1) implement specific physical containment and control technologies; (2) ensure that DNA introduced into the recipient microorganism is well characterized, limited in size to the material required to perform the intended function, poorly mobilizable, and free of certain toxin-encoding nucleotide sequences; and (3) use one of the recipient organisms listed in the regulations.⁸ Manufacturers that do qualify for the Tier I exemption need only notify EPA that they are manufacturing an exempt microorganism 10 days before commencing manufacture and keep certain records; manufacturers need not wait for EPA approval before commencing manufacture.⁹ Notably, EPA considers it unlikely that transportation of live genetically modified microorganisms to or from a site can be accomplished under the physical containment and control restrictions required to qualify for the Tier I exemption.¹⁰

The Tier II exemption applies to manufacturers that otherwise meet the requirements for the Tier I exemption but wish to modify the specified containment requirements.¹¹ In this circumstance, the manufacturer must submit an abbreviated notice describing the modified containment, which EPA then has 45 days to review.¹² The manufacturer may not proceed until EPA approves the Tier II exemption.¹³

The R&D exemption from Section 5 requirements for traditional chemical substances does not apply to intergeneric microorganisms. Thus, persons conducting commercial R&D activities involving intergeneric microorganisms that are not physically contained are not exempt from notification requirements.¹⁴ Examples of regulated activities include the commercial use of intergeneric microorganisms for biofertilizers, biosensors, production of industrial enzymes, biobased fuels, and waste treatment.¹⁵ Although the general R&D exemption does not apply,¹⁶ persons conducting such activities are not necessarily required to comply with the stringent notice requirements applicable to manufacturers of new microorganisms. Rather than filing an MCAN, eligible researchers testing new microorganisms in the environment may file a TSCA Experimental Release Application (TERA), a reporting vehicle designed to provide more flexibility and a shorter review period (60 days) than the MCAN process.¹⁷ The researcher may not proceed with the test until EPA approves the TERA, even if the review period expires, and EPA's approval is limited

⁸See 40 C.F.R. § 725.424. The characteristics of the introduced genetic material referred to in (3) above are specifically defined and/or identified within the regulations. See 40 C.F.R. § 725.421.

to the conditions outlined in the TERA notice or approval.¹⁸ In addition to the potentially less stringent reporting requirements, certain R&D activities conducted solely within a contained structure may qualify for exemption from some or all reporting requirements under TSCA.¹⁹

Like the exemption for test marketing of conventional new chemical substances, a limited exemption from the MCAN requirements has been established for test marketing activities involving microorganisms. The procedures provide for an abbreviated review period for notifications that must be provided to the Agency not later than 45 days before the proposed activity can be undertaken.²⁰

§ 16:26 Regulation of products of nanotechnology

Manufacturers and importers of nanoscale materials (i.e., materials having dimensions of one to 100 nanometers) that meet the definition of “chemical substances” under TSCA, but which do not appear on the TSCA Inventory, must satisfy TSCA’s PMN requirements.¹ EPA also has authority,² under Section 5(a)(2) of TSCA, to issue regulations providing for the notification and review of significant new uses of nanoscale chemical substances already on the TSCA Inventory.³ As of November 2017, EPA had received and reviewed more than 160 PNMs under TSCA for nanoscale materials, including carbon nanotubes. The Agency expected the number to increase in the future.⁴ A significant percentage of the PMNs received by EPA for nanoscale chemicals have been followed by Section 5(e) Consent Orders and certain follow-on rules.

EPA determines whether a substance, including a nanoscale substance, is on the

¹⁹Researchers who are in mandatory compliance with the National Institutes of Health (NIH) Guidelines for Research Involving Recombinant DNA Molecules may conduct contained research exempt from all TSCA reporting requirements. 40 C.F.R. §§ 725.234, 725.235. Other researchers seeking exemption from reporting requirements for contained testing must document to EPA that they voluntarily comply with NIH guidelines or meet other EPA-established eligibility requirements. 40 C.F.R. § 725.238.

²⁰See 40 C.F.R. § 725.300.

[Section 16:26]

¹EPA’s general position on the Inventory status of nanoscale chemical substances is set forth in a white paper posted on EPA’s website: <https://www.epa.gov/sites/production/files/2015-10/documents/nm-sp-inventorypaper2008.pdf>.

²Despite possessing statutory authority over nanoscale materials, EPA was slow to assert its authority to regulate the new technology. The lack of regulation for nanoscale materials has been criticized by both environmental organizations and industry. The Natural Resources Defense Council accused the federal government in May 2007 of a “gross failure to use its authority to protect citizens from the potentially dangerous effects of nano-scale chemistry.” Press Release, Natural Resources Defense Council, NRDC Advances Regulation of Nanotechnology to Protect Human Health (May 15, 2007). In 2006, the managing counsel for the Dow Chemical Company called on EPA to provide “effective regulatory oversight” of nanoscale materials before the public rejected the technology as inherently unsafe. See Mark Duvall, *Regulating Nanomaterials Under Section 5 of the Toxic Substances Control Act*, Chem. Reg. Rep. (BNA), Oct. 30, 2006. In November 2006, EPA invoked its authority under FIFRA to regulate consumer products containing nanoscale silver. See Rick Weiss, *EPA to Regulate Nanoproductions Sold as Germ-Killing*, Wash. Post, Nov. 23, 2006, at A1.

TSCA Inventory based on its molecular identity.⁵ If there is already a substance on the Inventory with the same molecular identity, the chemical substance is not a new chemical substance. The Agency has clarified that it has not and will not use particle size as a basis for establishing molecular identities for nanoscale or any other materials. EPA has identified multiple molecular properties that it does consider in differentiating molecules, including certain structural and compositional features. For example, allotropes (i.e., different crystalline structures) of the same element are considered to be different substances.

Notably, the Agency generally considers carbon nanotubes to be chemical substances distinct from graphite or other allotropes of carbon listed on the TSCA Inventory.⁶ Therefore, many carbon nanotubes may be new chemical substances that require a PMN, unless they are already listed on the TSCA Inventory. To eliminate any uncertainty, EPA recommends that carbon nanotube producers and importers consider submitting a bona fide intent to manufacture, which triggers an Agency assessment of a chemical substance's Inventory status. The Agency concluded in 2008 that there was likely ongoing commercial manufacturing involving carbon nanotubes that was potentially subject to Section 5. Consequently, EPA stated that it anticipated "focusing its compliance monitoring efforts to determine if companies are complying with TSCA section 5 requirements for carbon nanotubes."⁷

In an effort to address environmental health and safety data gaps, and to prevent potential risks that may be posed by nanoscale materials, EPA over the years has professed to being prepared to take a number of regulatory actions under Sections, 4, 5, and 8(a) of TSCA.⁸ Although the 2016 TSCA amendments did not specifically address nanoscale chemicals, it is possible that some number of the efforts EPA has previously said are under development could be pursued; however, the demands of putting in place the mechanisms required by the 2016 amendments significantly constrained resources, and a more modest approach ensued.⁹

In the wake of the 2016 amendments to TSCA, EPA decided to issue a rule under its Section 8(a) authority to require the submission of basic information concerning new and existing substances that are manufactured, imported, and processed on a nanoscale. In 2015, as part of the Agency's effort to acquire better information on

⁵On January 23, 2008, EPA released a paper summarizing the Agency's position on the regulation of nanoscale materials, or, more specifically, when nanomaterials are or are not new substances requiring PMNs. See EPA, TSCA Inventory Status of Nanoscale Substances—General Approach (Jan. 23, 2008), available at <https://www.epa.gov/sites/production/files/2015-10/documents/nmsp-inventorypaper2008.pdf>.

⁶73 Fed. Reg. 64946 (Oct. 31, 2008).

⁷73 Fed. Reg. 64947.

⁸EPA's prior efforts in this regard include a Nanoscale Materials Stewardship Program, launched in 2006. See 73 Fed. Reg. 4861 (Jan. 28, 2008). Participants in the basic program voluntarily submitted data on the nanoscale substances that they manufactured, imported, processed, or used. The types of data submitted included material characterization, hazard, use, potential exposures, and risk management practices. Over two dozen companies participated in the basic program, providing data on 123 different nanoscale materials. However, only four companies committed to participate in the in-depth program, which entailed the development of data over a longer time period. Based on the limited response, EPA discontinued the program in December 2009.

⁹For example, EPA previously expressed an interest in using its authority under Section 5(a)(2) to develop a Significant New Use Rule (SNUR) to ensure that any new nanoscale version of an Inventory-listed substance receives appropriate regulatory review under Section 5. EPA also contemplated Section 4 testing initiatives for nanoscale versions of Inventory-listed chemicals. However, the Agency's interest in issuing such initiatives has diminished in the period following the 2016 amendments, and EPA has not pursued them. See *Control of Nanoscale Materials under the Toxic Substances Control Act*, EPA, <https://www.epa.gov/reviewing-new-chemicals-under-toxic-substances-control-act-tsca/control-nanoscale-materials-under> (last updated Nov. 30, 2017) (describing current TSCA initiatives concerning nanoscale materials).

nanoscale materials in commerce, EPA proposed one-time-only reporting and recordkeeping requirements under TSCA Section 8(a).¹⁰ Following the 2016 presidential election and just prior to the inauguration, EPA issued the final version of its Section 8(a) rule to require companies that manufacture certain chemical substances already on the Inventory to provide basic manufacturing processing and use information if the substance is being produced on a nanoscale. The rule became effective in August 2017. Initial reports were due in August 2018.¹¹ In August 2017, EPA published guidance on complying with the reporting rule.¹² The rule requires notice to the Agency in advance of commencing manufacture of a new nanoscale substance (i.e., a substance not yet listed on the TSCA Inventory). Persons subject to the rule must provide EPA with information including production volume, methods of manufacture and processing, exposure and release information, and available health and safety data. EPA intends to use the information gathered through this reporting rule to determine whether further actions under TSCA, including additional information collection or testing requirements, might be needed.¹³

At this time, EPA also continues to review and to take actions under its Section 5 authorities on a substance-by-substance basis under the PMN and SNUR requirements for specific new nanomaterials.

§ 16:27 Significant new use rules (SNURs)

Under Section 5(a)(2), EPA may issue a Significant New Use Rule (SNUR) to require manufacturers, importers, and processors of a chemical substance identified in the rule to notify EPA at least 90 days before engaging in a “significant new use” of the chemical substance. Substances on the TSCA Inventory that are subject to SNUR requirements are designated as such by an “S” flag in the Inventory listing.¹

Under a SNUR, a person intending to manufacture, import, or process a chemical substance for a significant new use (as defined in a SNUR) must submit to EPA a notice, similar to a PMN, known as a Significant New Use Notice (SNUN).² Section 5(a)(2) provides the Agency with considerable discretion when defining the parameters of significant new uses. These parameters include: increases in production volume; changes in use that increase the type, form, magnitude, or duration of human exposure or environmental release; and the reasonably anticipated manner or method of manufacture, processing, distribution in commerce, use, and disposal of the substance.³ The 2016 amendments to TSCA specifically addressed what had been a growing EPA practice of issuing SNURs to require notification before the

³TSCA § 5(a)(2), 15 U.S.C.A. § 2604(a)(2). For applicable regulations, *see generally* 40 C.F.R. §§ 721.1 to 721.10924. EPA also incorporated SNUR procedures into its regulations governing microbial

import or processing of a chemical substance as part of an “article” or category of articles. As discussed in Section 16:2 above, an article is a manufactured item for which the end use is dependent on a specific shape or design and for which the chemical composition generally does not change during its end use.⁴ The 2016 amendments limit EPA’s authority to ensure the Agency issues a SNUR only when it can make an affirmative finding that “the reasonable potential for exposure to the chemical substance through the article or category of articles” justifies the notification requirement.⁵ As of June 2020, EPA had made this finding and issued SNURs that encompass certain articles containing three substances or categories of substances (asbestos and certain long-chain perfluoroalkyl carboxylate substances and perfluoroalkyl sulfonate chemicals).⁶

EPA often uses its SNUR authority to monitor new chemical substances that do not warrant regulation under conditions of manufacture and use described in the PMN for the chemical substance, but that might present an unreasonable risk if these conditions change. SNURs thus serve to close a potential loophole in Section 5. Prior to the enactment of the 2016 amendments, if a PMN was submitted for a chemical substance that was considered potentially harmful to humans or to environmental species, but did not present an unreasonable risk under the intended conditions of use described in the PMN, EPA might choose to take no regulatory action on the PMN, and the chemical substance would be “dropped” from further review. Once the NOC was filed and the substance was added to the TSCA Inventory, meaning the substance was no longer “new,” other entities could then manufacture or import the substance under potentially more hazardous conditions of use or in volumes greatly exceeding the estimates in the PMN or for uses leading to high exposure. The SNUR authority provided a helpful mechanism for EPA to ensure there would be notice and review of significant new conditions of use that were not considered by EPA at the time the initial PMN was submitted.⁷ Following the 2016 amendments to TSCA, which required an affirmative determination by EPA before manufacture may commence, the Agency discontinued making outright determinations that a substance had been “dropped” from further review. However, since the 2016 amendments, EPA has gradually become more comfortable relying on SNURs as part of the basis for a determination that a substance is “not likely to present” an unreasonable risk under its intended conditions of use. Increasingly, EPA has been issuing SNURs in conjunction with a “not likely to present” determination for a PMN. This enables EPA to use the SNUR reporting requirement to require that notice be given to EPA prior to the PMN submitter (or another company) undertaking manufacturing or processing activities that represent reasonably foreseen conditions of use not described in the original PMN.⁸

EPA similarly uses SNURs to close another potential loophole in TSCA. EPA interprets its Section 5(e) Orders issued for new chemical substances in response to PMNs to be enforceable only against the original PMN submitter. EPA uses SNURs to impose the conditions included in a Section 5(e) Consent Order on other

products of biotechnology. *See* 40 C.F.R. §§ 725.900 to 725.984.

⁸*See Chemicals Determined Not Likely to Present an Unreasonable Risk Following Pre-Manufacture Notification Review*, EPA, <https://www.epa.gov/reviewing-new-chemicals-under-toxic-substances-control-act-tsca/chemicals-determined-not-likely> (last updated June 3, 2020).

manufacturers (and processors) who might enter the market, or who identify new uses for the same substance. For example, if EPA is persuaded that the PMN submitter can manufacture the reported chemical substance safely, a Section 5(e) Consent Order can specify the particular practices EPA expects to be employed. A companion (or “follow-up”) SNUR can define manufacture by any other person or under any other conditions to be a significant new use. A second manufacturer must then either comply with the conditions of the Section 5(e) Order affecting the first manufacturer or submit a significant new use notice (SNUN) to EPA 90 days before engaging in the new use. SNUNs undergo the same review process (and possibility of being subject to a 5(e) Order) as do PMNs.

The 2016 amendments require EPA to determine, within 90 days of issuing a Section 5(e) Order, whether to issue such a SNUR that would require submission of a SNUN by prospective manufacturers or other entities that plan to manufacture, process, use, distribute, or dispose of a substance in a way that does not conform to the Section 5(e) Order’s restrictions.⁹ If EPA does not issue a SNUR applying a Section 5(e) Order’s restrictions to future market entrants, it must publish a statement explaining why it has not done so.¹⁰ The requirement that EPA determine whether to issue a SNUR for a new chemical substance also applies when EPA takes regulatory action either by an immediately effective rule or through a Section 5(f) Order after determining that the substance “presents” an unreasonable risk to health or the environment.

EPA has promulgated a “generic” SNUR rule to streamline the process for issuing SNURs.¹¹ The rule sets forth the process for issuing “follow-up” SNURs on new chemical substances for which EPA has issued Orders under Section 5(e) and for other new chemical substances which may present hazards to human health or the environment if exposures or releases are significantly different from those described in the initial PMNs that led to a particular substance’s inclusion in the Inventory. The generic rule defines a series of significant new use “triggers,” based on: mechanisms for protection in the workplace; hazard communication; industrial, commercial, and consumer activities; methods of disposal; and releases into water. In 2016, the Obama administration proposed changes to the generic rule provisions to align the regulations with current occupational respiratory protection requirements and with updates to the Occupational Health and Safety Administration’s Hazard Communication Standard.¹² EPA never finalized these proposed amendments.

It is important to note that EPA can use its SNUR authority to regulate substances already listed on the Inventory; the Agency is not limited to using SNURs to impose restrictions on or monitor new chemical substances after they have passed through the PMN review process. EPA can define any use of a chemical substance that is not “ongoing” at the time of a proposed SNUR to constitute a significant new use of the chemical substance (or class of substance), including a chemical substance already listed on the TSCA Inventory. This assures that EPA is notified of such uses, and can undertake a risk evaluation before the new use can occur on a commercial scale. Thus, EPA also has used SNURs to ensure that, once a chemical substance has been voluntarily phased out or taken off the market for certain uses, no company will be able to resume manufacturing or processing the chemical substance for that use without prior notice to the Agency. These regulations are

⁹TSCA § 5(f)(4), 15 U.S.C.A. § 2604(f)(4).

sometimes referred to as “dead chemical SNURs.” This action can prevent older chemical substances—regarded as hazardous—from returning to the market after other companies have voluntarily replaced them with substances that are regarded as less hazardous.

IV. REGULATION OF RISKS FROM EXISTING CHEMICAL SUBSTANCES

§ 16:28 In general

EPA’s authority to regulate existing chemical substances primarily relies on procedures and rulemaking authorities set forth in Section 6 of TSCA.

Historically, EPA did not make extensive use of this regulatory power. The pre-2016 Section 6 did authorize EPA to impose prohibitions and other types of restrictions and requirements on the manufacture and processing of existing substances. However, the original Section 6 also established criteria that circumscribed this authority. This included requirements that any risk management rules impose “the least burdensome requirements” and limits on EPA’s discretion to regulate under TSCA when a chemical substance’s risks to health or the environment could be addressed under another federal law.

Consequently, a primary purpose of the 2016 amendments was to establish a framework for evaluating the risks of existing chemical substances *without* consideration of costs. Related goals were to impose an action-forcing timetable for EPA to undertake such risk evaluations and, depending on the outcomes of the evaluations, to promulgate risk management requirements. The 2016 amendments also removed some of the major constraints on EPA authority to craft risk management requirements. The amendments eliminated the “least burdensome” requirement and struck the requirement that EPA make certain findings to support its decision to take action under TSCA instead of under another statute.

As discussed in more detail in Sections 16:30 to 16:32—and as illustrated in the figure below—the framework that the 2016 amendments established for existing substances includes three basic steps: (1) prioritization; (2) risk evaluation; and (3) risk management. First, EPA must undertake a process to “prioritize” existing chemical substances for “risk evaluation.”¹ Second, EPA must conduct a risk evaluation for each substance designated as a “high-priority” substance as a result of the prioritization process. If EPA finds, based on a risk evaluation, that the manufacture, distribution in commerce, use, or disposal of the substance “presents an unreasonable risk” of injury to health or the environment, EPA must then issue a rule imposing requirements “to the extent necessary so that the chemical substance no longer presents such risk.”²

The 2016 amendments further mandate EPA take certain expedited actions that circumvent one or two of these steps. For example, the amendments require that EPA promulgate risk management rules without undertaking the prioritization and risk evaluation processes for certain substances. These are substances that the Agency has a reasonable basis to conclude are toxic and have been determined to be persistent and bioaccumulative, and that meet other exposure criteria.³ The amendments also directed EPA to identify an initial 10 substances for which the Agency would conduct risk evaluations without the need to navigate a prioritization process.⁴

How EPA Evaluates the Safety of Existing Chemicals Under Section 6

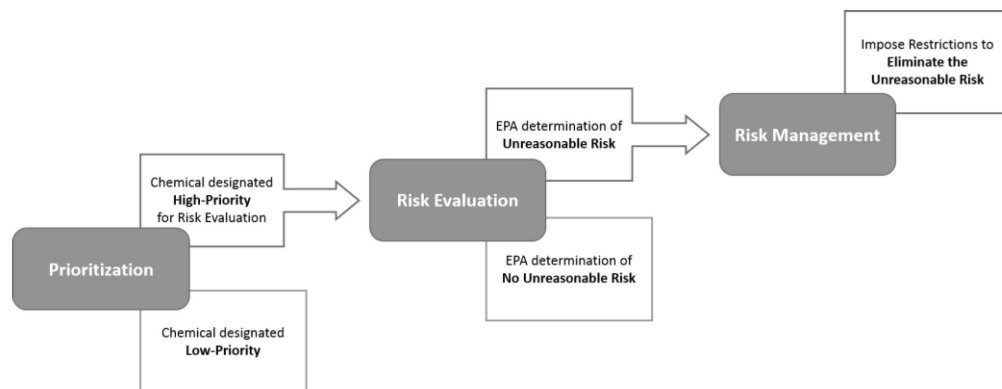

[Section 16:28]

²TSCA § 6(a), 15 U.S.C.A. § 2605(a).

³TSCA § 6(h)(1), 15 U.S.C.A. § 2605(h)(1).

⁴TSCA § 6(b)(2)(A), 15 U.S.C.A. § 2605(b)(2)(A).

Source: *How EPA Evaluates the Safety of Existing Chemicals*, EPA, <https://www.epa.gov/assessing-and-managing-chemicals-under-tsca/how-epa-evaluates-safety-existing-chemicals> (last updated June 19, 2020).

§ 16:29 EPA rulemaking and other activity under Section 6 prior to the 2016 amendments

Prior to enactment of the 2016 amendments, EPA never successfully used its Section 6 authority to completely ban a chemical substance; only a handful of final Section 6 regulations were promulgated. These regulations, which illustrate the diverse types of requirements it is possible for EPA to impose under TSCA, included: prohibiting use of chlorofluorocarbons as aerosol propellants (to protect atmospheric ozone from degradation);¹ requiring schools to inspect for asbestos-containing building materials, to conduct response actions if necessary, and to develop and implement asbestos management plans;² and prohibiting the addition of certain substances to metalworking fluids to prevent the formation of cancer-causing compounds during machining operations.³

EPA's most ambitious rulemaking under Section 6 prior to the 2016 amendments involved promulgating a final rule to phase out, over a seven-year period, the use of asbestos in almost all products.⁴ In proceedings that began in 1979 and extended over 10 years, EPA undertook a comprehensive review of health effects studies of asbestos and performed a quantitative cancer risk assessment based on various pathways of exposure. EPA also estimated the costs of substitutes for the asbestos-containing products. Based on these analyses, EPA estimated that the rule would prevent the occurrence of 148 to 202 cases of cancer, at a cost of approximately

[Section 16:29]

¹EPA has revoked its regulations concerning chlorofluorocarbons, as because chlorofluorocarbons are now regulated under Section 610 of the Clean Air Act. See 60 Fed. Reg. 31917, 31919 (June 19, 1995). The TSCA regulations were formerly codified at 40 C.F.R. §§ 762.1 to 762.70.

²40 C.F.R. §§ 763.80 to 763.99. EPA eliminated the regulations pertaining specifically to friable asbestos-containing materials in schools, 40 C.F.R. §§ 763.100 to 763.119, inasmuch as they were superseded by §§ 763.80 to 763.99. These regulatory provisions address both friable and nonfriable asbestos-containing materials. See 60 Fed. Reg. 31917, 31919 (June 19, 1995). Although the regulations cite to Section 6, among other authorities, the Agency's rulemaking implemented certain requirements, established under a separate title of TSCA enacted as the Asbestos Hazard Emergency Response Act (AHERA) in 1986 as subchapter II of TSCA. AHERA provides EPA with rulemaking authority independent of Section 6 of subchapter I of TSCA.

³40 C.F.R. §§ 747.115 to 747.200. These regulations were promulgated as immediately effective proposed rules under TSCA §§ 5(f), 6, 15 U.S.C.A. §§ 2604(f), 2605.

⁴54 Fed. Reg. 29460 (July 12, 1989).

\$450–800 million.⁵ EPA concluded that the quantifiable and unquantifiable risk reductions outweighed the costs to consumers, producers, and users, and that the proposed regulation was justified because current asbestos uses “present an unreasonable risk to human health.”⁶

The asbestos phase-out rules were vacated almost in their entirety by the U.S. Court of Appeals for the Fifth Circuit in *Corrosion Proof Fittings v. EPA*.⁷ The court found that EPA had presented insufficient evidence to justify the asbestos ban because the Agency had failed to satisfy its statutory obligation to evaluate and consider less burdensome regulatory alternatives; to analyze the availability of, and risks associated with, substitutes for the banned products; and to balance the costs of the regulations against their benefits.⁸ Citing EPA’s own estimates of the cost of each statistical life to be saved through asbestos product bans, the court observed that EPA, “in its zeal to ban any and all asbestos products, basically ignored the cost side of the TSCA equation.”⁹ The court left in place only those portions of the regulations banning products that were not being produced in the United States at the time the rule became effective.¹⁰

For many years after the *Corrosion Proof Fittings* decision, EPA did not use its regulatory authority under Section 6.¹¹ Following the presidential election in 2008, and especially during the years leading up to the 2016 amendments’ overhaul of Section 6, the Agency demonstrated renewed interest in the provision. In September 2009, EPA announced that it had adopted a new, comprehensive approach to

⁷*Corrosion Proof Fittings v. E.P.A.*, 947 F.2d 1201, 33 Env’t. Rep. Cas. (BNA) 1961, 1992 O.S.H. Dec. (CCH) P 29558, 22 Env’tl. L. Rep. 20037, 22 Env’tl. L. Rep. 20304 (5th Cir. 1991), opinion clarified, (Nov. 15, 1991). The court applied the standard of review set forth in Section 19 of TSCA, which requires that a rule promulgated under Section 6 be set aside if it is “not supported by substantial evidence in the rulemaking record . . . taken as a whole.” *Corrosion Proof Fittings v. E.P.A.*, 947 F.2d 1201, 1213–14, 33 Env’t. Rep. Cas. (BNA) 1961, 1992 O.S.H. Dec. (CCH) P 29558, 22 Env’tl. L. Rep. 20037, 20042, 22 Env’tl. L. Rep. 20304 (5th Cir. 1991), opinion clarified, (Nov. 15, 1991) (citing TSCA § 19(c)(1)(B)(i), 15 U.S.C.A. § 2618(c)(1)(B)(i)).

⁸*Corrosion Proof Fittings v. E.P.A.*, 947 F.2d 1201, 1220–23, 33 Env’t. Rep. Cas. (BNA) 1961, 1992 O.S.H. Dec. (CCH) P 29558, 22 Env’tl. L. Rep. 20037, 20045–47, 22 Env’tl. L. Rep. 20304 (5th Cir. 1991), opinion clarified, (Nov. 15, 1991). With regard to the analysis of the costs of regulation, the court stated:

While Congress did not dictate that the EPA engage in an exhaustive, full-scale cost-benefit analysis, it did require the EPA to consider both sides of the regulatory equation, and it rejected the notion that the EPA should pursue the reduction of work-place risk at any cost. *Corrosion Proof Fittings v. E.P.A.*, 947 F.2d 1201, 1222, 33 Env’t. Rep. Cas. (BNA) 1961, 1992 O.S.H. Dec. (CCH) P 29558, 22 Env’tl. L. Rep. 20037, 20046, 22 Env’tl. L. Rep. 20304 (5th Cir. 1991), opinion clarified, (Nov. 15, 1991).

⁹*Corrosion Proof Fittings v. E.P.A.*, 947 F.2d 1201, 1223, 33 Env’t. Rep. Cas. (BNA) 1961, 1992 O.S.H. Dec. (CCH) P 29558, 22 Env’tl. L. Rep. 20037, 20046, 22 Env’tl. L. Rep. 20304 (5th Cir. 1991), opinion clarified, (Nov. 15, 1991).

¹⁰*Corrosion Proof Fittings v. E.P.A.*, 947 F.2d 1201, 1228–30, 33 Env’t. Rep. Cas. (BNA) 1961, 1992 O.S.H. Dec. (CCH) P 29558, 22 Env’tl. L. Rep. 20037, 20049–50, 22 Env’tl. L. Rep. 20304 (5th Cir. 1991), opinion clarified, (Nov. 15, 1991). EPA subsequently amended the asbestos ban rule to clarify that the prohibitions apply only to asbestos-containing flooring felt, commercial paper, corrugated paper, rollboard, and specialty paper, and to new uses of asbestos. 59 Fed. Reg. 33208 (June 28, 1994).

¹¹In 1991, EPA proposed to ban the manufacture and use of acrylamide-based sewer grouts. EPA withdrew the proposal in 2002 due to the development of affordable and effective personal protective equipment for workers. See 67 Fed. Reg. 71524 (Dec. 2, 2002). If adopted, the rule would have been the first attempt by EPA to ban an industrial chemical using its authority in TSCA Section 6 since the *Corrosion Proof Fittings* decision. See Sara Thurin Rollin, EPA Readies Rule Banning Substance; Drops TSCA Subpoena on Grout Material, *Daily Env’t. Rep.* (BNA), July 30, 1998, at A-8.

enhancing the Agency's current chemicals management program.¹² Two and a half years later, in March 2012, EPA issued a TSCA Work Plan for Chemical Assessments and announced the Agency had identified 83 chemical substances for further assessment. In October 2014, EPA published an update to the TSCA Work Plan that contained 90 chemical substances.¹³ The 2016 amendments reference the Work Plan list, which continues to provide a (still) lengthy menu of options for chemical substances from which EPA is expected to select when undertaking new risk evaluations.

In December 2016 and January 2017, EPA proposed Section 6 rules for three of the substances that had been included in the 2014 update to the TSCA Work Plan. Two of the proposed rules targeted the industrial solvent trichloroethylene to address its use as a spotting agent in dry cleaning and in consumer aerosol spray degreasers and as a vapor degreasing agent. The third proposed Section 6 rule targeted NMP and methylene chloride to address risks associated with commercial and consumer paint and varnish stripping uses.¹⁴ The risk assessments for these chemical substances had been completed prior to the enactment of the 2016 amendments. The amendments—which, as discussed in the following sections, established a framework for prioritizing, evaluating, and managing the risk of existing chemicals—also permitted EPA to regulate such chemical substances under Section 6 in a manner consistent with risk assessments conducted before enactment of the 2016 amendments so long as the regulations were consistent with other applicable Section 6 requirements.¹⁵ Ultimately, EPA did not proceed with a final rule for trichloroethylene or NMP. For methylene chloride, EPA promulgated a final rule in 2019 that prohibited the manufacture, import, processing, and distribution of methylene chloride in paint removers for consumer use,¹⁶ but did not finalize a rule for the commercial uses. As discussed below, all three substances were included on EPA's initial list of 10 chemical substances for which it would perform full-fledged risk evaluations under the amended TSCA.

§ 16:30 Prioritization and identification of existing chemical substances for risk evaluation

The 2016 amendments created three means by which chemical substances are selected for risk evaluations: (1) selection of an initial 10 substances from EPA's 2014 update to its TSCA Work Plan for Chemical Assessments; (2) identification

¹²See Lisa Jackson, Administrator, EPA, Remarks to the Commonwealth Club of San Francisco (Sept. 29, 2009).

¹³EPA, TSCA Work Plan for Chemical Assessments: 2014 Update (Oct. 2014), https://www.epa.gov/sites/production/files/2015-01/documents/tsca_work_plan_chemicals_2014_update-final.pdf. Fifteen chemical substances contained in the 2012 version were removed, one chemical substance was consolidated, and 23 chemical substances were added. As of September 2016, the Agency had completed risk assessments for five TSCA Work Plan chemical substances; released both a draft assessment for one Work Plan chemical and problem formulation and initial assessments for six Work Plan chemicals; and had initiated assessments for three others. *Assessments for TSCA Work Plan Chemicals*, EPA, <https://www.epa.gov/assessing-and-managing-chemicals-under-tsca/assessments-tsca-work-plan-chemicals>.

¹⁴See 82 Fed. Reg. 7464 (Jan. 19, 2017); 82 Fed. Reg. 4825 (Jan. 17, 2017); 81 Fed. Reg. 91592 (Dec. 16, 2016).

¹⁵TSCA § 26(l)(4), 15 U.S.C.A. § 2625(l)(4). Some questions were raised about the extent to which the three proposed Section 6 rules complied with all applicable requirements of the amended Section 6. See Maria Hegstad, *Industry 'Hopeful' Trump Administration Will Drop TSCA Section 6 Rules*, Inside EPA (Nov. 18, 2016); W. Caffey Norman, *Implementation of TSCA Section 6: EPA Moving in the Wrong Direction?*, 155 Daily Env't Rep. (Bloomberg BNA) BB-1 (Aug. 11, 2016).

¹⁶84 Fed. Reg. 11420 (Mar. 27, 2019). As of June 2020, challenges to this final rule were pending in the Second Circuit. *Labor Council for Latin Am. Advancement v. EPA*, No. 19-1042 (2d Cir.).

through a “prioritization” process for designation of “high-priority” chemical substances that “may present” an unreasonable risk to health or the environment; and (3) manufacturer requests for EPA to conduct a risk evaluation.

First, the 2016 amendments required EPA to formally initiate risk evaluations for 10 chemical substances drawn from the Agency’s 2014 update of the TSCA Work Plan for Chemical Assessments by December 19, 2016 (180 days after of the 2016 amendments’ enactment).¹ As discussed above, the 2014 update contained 90 chemical substances. On November 29, 2016, EPA announced the 10 substances that would be its initial focus: 1,4-dioxane; 1-bromopropane; asbestos; carbon tetrachloride; cyclic aliphatic bromide cluster; methylene chloride; n-methylpyrrolidone (NMP); pigment violet 29 (PV29); tetrachloroethylene, also known as perchloroethylene; and trichloroethylene.²

Second, the 2016 amendments required EPA to establish, within one year of enactment (i.e., by June 22, 2017), a “risk-based screening” or “prioritization” process for identifying other existing chemical substances—or categories of chemical substances—for risk evaluation. Thus, the Act required EPA to establish a procedure and the criteria it would use for designating chemical substances as either “high-priority” substances slated for risk evaluations or “low-priority” substances for which risk evaluations were not currently warranted. The screening process was required to involve consideration of a chemical substance’s hazard and exposure potential, including consideration of persistence and bioaccumulation, potentially exposed or susceptible subpopulations and storage near significant sources of drinking water; conditions of use or significant changes in the conditions of use; and the volume or significant changes in the volume of the chemical substance manufactured or processed.³

In January 2017, EPA issued proposed procedures for prioritization of chemicals for risk evaluation.⁴ In June 2017, EPA issued a final rule (the “Prioritization Rule”).⁵ As required by the statute, the priority designation process established by the Prioritization Rule must extend between nine months and one year, measured from a notice of initiation of the prioritization process to the final priority designation. In the Federal Register notice commencing the prioritization process, but prior to proposing a priority designation, EPA requests relevant information on

[Section 16:30]

¹TSCA § 6(b)(2)(A), 15 U.S.C.A. § 2605(b)(2)(A).

²81 Fed. Reg. 91927 (Dec. 19, 2016); see discussion *infra* § 16:31 (regarding the status of these risk evaluations).

³TSCA § 6(b)(1)(A), 15 U.S.C.A. § 2605(b)(1)(A).

⁴82 Fed. Reg. 4825 (Jan. 17, 2017).

⁵82 Fed. Reg. 33753 (July 20, 2017) (final rule). Environmental and public health groups filed challenges to the Prioritization Rule in three circuit courts of appeal shortly after EPA published the final regulations. *Env’tl. Def. Fund v. EPA*, No. 17-2464 (2d Cir.); *Alliance of Nurses for Healthy Env’ts v. EPA*, No. 17-1926 (4th Cir.); *Safer Chems. Healthy Families v. EPA*, No. 17-72259 (9th Cir.). These lawsuits were consolidated in the Ninth Circuit to be heard with lawsuits challenging the Risk Evaluation Rule, discussed in Section 16:31. In November 2019, the Ninth Circuit issued an opinion that primarily addressed the Risk Evaluation Rule, including whether EPA could exclude some conditions of use from the scope of an evaluation. *Safer Chemicals, Healthy Families v. U.S. Environmental Protection Agency*, 943 F.3d 397 (9th Cir. 2019), for additional opinion, see, 791 Fed. Appx. 653 (9th Cir. 2019). The decision, which is discussed in greater detail in Section 16:31, appeared to suggest that EPA might not be able to exclude intended, known, or reasonably foreseen conditions of use from consideration in risk evaluations. The decision also indicated that related challenges to the Prioritization Rule were “entirely encompassed” within challenges to the Risk Evaluation Rule; this suggests the potential limits on EPA’s discretion to exclude conditions of use are also relevant to the scope of uses to be considered in the prioritization process. In a separate unpublished decision, the Ninth Circuit rejected other challenges to the Prioritization Rule. *Safer Chems., Safer Chemicals, Healthy Families v. U.S. Environmental Protection Agency*, 791 Fed. Appx. 653 (9th Cir. 2019).

a chemical substance and allows 90 days for submission.⁶ EPA may extend this period by up to three additional months in order to receive or evaluate information received under the related Section 4 authority created by the 2016 amendments that permits EPA to require development of information in order to prioritize a chemical substance.⁷ After conducting a screening process, EPA proposes to designate the chemical substance as high-priority or low-priority.⁸ The proposed designation is subject to a 90-day public comment period.⁹

Based on this process, EPA identifies “high-priority” chemical substances that it concludes—without consideration of costs or other nonrisk factors—“may present an unreasonable risk of injury to health or the environment because of a potential hazard and a potential route of exposure under the conditions of use, including an unreasonable risk to a potentially exposed or susceptible subpopulation identified as relevant by [EPA].”¹⁰

Chemical substances that EPA concludes, “based on information to establish, without consideration of costs or other nonrisk factors,” do not meet the “high-priority” standard will be designated as low-priority.¹¹ EPA’s designations are based on its conclusion that a chemical substance does or does not meet the high-priority threshold “under one or more activities that the Agency determines constitute conditions of use.”¹² EPA stated it would identify the circumstances that constitute each substance’s “conditions of use” early in the prioritization process.¹³ If EPA lacks sufficient information to finalize a proposed low-priority designation for a chemical substance, EPA will propose designating the substance as high-priority.¹⁴ A low-priority designation does not preclude EPA from revising the designation in the future.¹⁵

The prioritization process must give preference to certain chemical substances—those listed in the 2014 update to the TSCA Work Plan for Chemical Assessments as having a Persistence and Bioaccumulation Score of 3, and those included in the 2014 update that are human carcinogens and have high acute and chronic toxicity.¹⁶ The 2016 amendments also directed EPA to use the Framework for Metals Assessment of the Office of the Science Advisor, Risk Assessment Forum, to identify priorities for metals and metal compounds.¹⁷

The 2016 amendments imposed initial deadlines for the prioritization and risk evaluation process, requiring that risk evaluations be ongoing for at least 20 high-priority substances within three and one half years of enactment (i.e., by December 2019). In addition, at least 20 chemical substances were required to have been designated as low-priority by that time.

In September 2018, EPA published a working approach document that was

¹⁶TSCA § 6(b)(2)(D), 15 U.S.C.A. § 2605(b)(2)(D).

¹⁷TSCA § 6(b)(2)(E), 15 U.S.C.A. § 2605(b)(2)(E).

intended to guide not only the initial prioritization of 20 high-priority substances but also a longer-term approach that EPA would use to “bin” active chemical substances on the Inventory.¹⁸ This meant that “EPA would loosely group chemicals on the Inventory into pools that could inform potential prioritization based on risk-based data and information availability.”¹⁹ EPA stated the binning process would incorporate information related to human hazard relative to exposure, ecological hazard, genotoxicity, persistence, and bioaccumulation to calculate “binning scores.”²⁰

EPA’s approach to the initial 20 high-priority substances was to refer primarily to the 2014 Work Plan and to select chemicals based on three factors: “overarching Agency priorities”; quantity and quality of information; and work load (e.g., selecting chemicals to take advantage of existing expertise). EPA indicated it might look beyond the 2014 Work Plan where other agencies, the public, or the EPA administrator identified chemicals as “particularly suitable.”²¹ In regards to the initial 20 low-priority substances, EPA added that the Agency might identify substances from particular existing resources, such as: EPA’s Safer Chemical Ingredients List (SCIL); EPA’s Chemical Assessment Management Program (ChAMP); and Organisation for Economic Co-operation and Development (OECD) Screening Information Data Sets (SIDS) assessment documents.²²

In December 2019, EPA published notice of its designation of the first 20 high-priority substances, marking the initiation of their risk evaluations.²³ In February 2020, EPA finalized designation of the first 20 low-priority substances, all of which were taken from SCIL.²⁴

After the designation of the first 20 high-priority substances, the amended TSCA requires that EPA continue to designate priority substances and conduct risk evaluations “at a pace consistent with the ability of [EPA] to complete risk evaluations” in accordance with the deadlines specified in the statute.²⁵ EPA must designate at least one high-priority substance for risk evaluation whenever it completes a risk evaluation.²⁶

The third way by which a chemical substance may be selected for a risk evalua-

tion is by request of a manufacturer. In considering manufacturer requests, EPA must give preference to requests where the Agency determines that state-level restrictions on the chemical substance have the potential to have a significant impact on interstate commerce, or on health or the environment.²⁷ The number of manufacturer-requested risk evaluations must equal at least 25% (if sufficient manufacturer requests are received, but not more than 50% of the number of risk evaluations EPA is conducting for the first 10 chemical substances identified by EPA from the 2014 update and for chemical substances identified through the prioritization process).²⁸ Manufacturer-requested risk evaluations for chemical substances listed in the 2014 Work Plan update do not count towards the 50% maximum.²⁹ A manufacturer must pay fees to cover the costs of the Agency's evaluation if EPA grants the request.³⁰ The percentage of costs the manufacturer must pay is 50% for chemical substances listed on the 2014 update to the TSCA Work Plan for Chemical Assessments and 100% for other substances.³¹

As of July 2020, EPA had granted manufacturer requests for risk evaluations of diisodecyl phthalate (DIDP) and diisononyl phthalate (DINP). There was a pending manufacturer request for a risk evaluation of octamethylcyclotetra- siloxane (D4).³²

§ 16:31 Risk evaluation for existing chemical substances

The previous section noted that the amended TSCA requires EPA to conduct risk evaluations: (1) for the 10 substances the Agency initially selected from the 2014 update to the TSCA Work Plan for Chemical Assessments; (2) for substances designated as high-priority through EPA's prioritization process; and (3) for substances for which EPA grants a manufacturer's request for evaluation.¹ EPA conducts risk evaluations in accordance with a framework rule (the Risk Evaluation Rule) that it issued in June 2017, as required by the 2016 amendments.²

Consistent with the statute,³ the risk evaluation process must incorporate the following elements:

1. Integrate and assess available information on hazards and exposures for the chemical substance's conditions of use, including information relevant to specific risks of injury to health or the environment and information on potentially exposed or susceptible subpopulations identified as relevant by EPA
2. Describe whether aggregate or sentinel exposures to a chemical substance under the conditions of use were considered, and the basis for that consideration
3. *Not* consider costs or other nonrisk factors in the context of the risk evalua-

²⁷TSCA § 6(b)(4)(E)(iii), 15 U.S.C.A. § 2605(b)(4)(E)(iii). The procedures for submission and review of manufacturer requests, which includes public notice and comment, are set forth at 40 C.F.R. § 702.37.

tion phase

4. Take into account the likely duration, intensity, frequency, and number of exposures under the conditions of use, as relevant
5. Describe the weight of the scientific evidence for the identified hazard and exposure

EPA's Risk Evaluation Rule incorporated these statutory requirements into a process that includes issuing draft and final scoping documents and draft and final risk evaluations, all of which the statute requires to be completed within three years, with the possibility of a six-month extension.⁴

A final risk evaluation includes five components: scope, hazard assessment, exposure assessment, risk characterization, and risk determination.

The scope identifies the chemical substance's conditions of use, as well as potentially exposed or susceptible subpopulations, ecological receptors, and hazards to human health and the environment that EPA plans to consider and evaluate.⁵ Other components of the scope include: a description of the reasonably available information and science approaches EPA plans to use; a conceptual model to describe actual or predicted relationships between the chemical substance and receptors; an analysis plan that, among other items, identifies a strategy for using information, accepted science policies, models, and screening methodologies, and describes hypotheses about the relationships identified in the conceptual model; and a peer review plan.⁶ EPA issues a scoping document within six months of a substance being prioritized for risk evaluation.⁷ During that six-month period, EPA publishes a draft scope and makes it available for at least 45 days of public comment.⁸ No fewer than 12 months may elapse between the initiation of the prioritization process for a chemical substance eventually designated as high-priority and the publication of the final scope.⁹ This takes into account the public comment process for prioritization and the period designated for preparing the initial risk evaluation scoping document.

EPA then proceeds with development of a draft risk evaluation within the scope's parameters. The evaluation includes the other four components. The hazard assessment identifies the types of hazards to health and the environment posed by the chemical substance under the conditions of use, while the exposure assessment involves consideration of the likely duration, intensity, frequency, and number of exposures to the chemical substance under the conditions of use.¹⁰ The risk characterization integrates the hazard and exposure assessments into quantitative or qualitative estimates of risk and results in a summary of considerations addressed throughout the evaluation, including consideration of uncertainty and variability, data quality, plausible alternative interpretations where appropriate and relevant, and factors specific to environmental risk evaluations—such as spatial and temporal patterns of effects and implications at individual, species, population, and community level.¹¹

The risk evaluation culminates in a final determination of “whether a chemical substance presents an unreasonable risk of injury to health or the environment, without consideration of costs or other nonrisk factors, including an unreasonable

⁴See 40 C.F.R. § 702.41 to 702.49; *see also* TSCA § 6(b)(4)(G), 15 U.S.C.A. § 2605(b)(4)(G).

¹¹40 C.F.R. § 702.43.

risk to a potentially exposed or susceptible subpopulation identified as relevant to the risk evaluation by the Administrator, under the conditions of use.”¹² The Risk Evaluation Rule requires EPA to provide at least 60 days for public comment on a draft evaluation.¹³

The 2016 amendments required EPA to develop guidance to assist interested outside parties in developing and submitting draft risk evaluations for consideration by EPA.¹⁴ EPA’s guidance, published on June 22, 2017,¹⁵ generally indicates that such evaluations must be of the same quality and adhere to the same substantive and procedural requirements as evaluations prepared by EPA. Although the amended TSCA required the guidance, the Risk Evaluation Rule does not itself provide for the submission of risk evaluations prepared by outside parties.

As discussed in the following section, the 2016 amendments authorized EPA to forgo conducting risk evaluations for certain substances identified as persistent, bioaccumulative, and toxic chemical substances. The Agency is required to propose Section 6(a) risk management rules for these substances within three years of the enactment of the 2016 amendments.¹⁶

Lawsuits challenging the final Risk Evaluation Rule were filed in three separate courts of appeals.¹⁷ The lawsuits initially were consolidated in the Fourth Circuit but were subsequently transferred to the Ninth Circuit to be heard with the lawsuits challenging the Prioritization Rule, discussed above.¹⁸ In November 2019, the Ninth Circuit vacated portions of the Risk Evaluation Rule that excluded “legacy uses” and “associated disposals” from the conditions of use required to be considered in a risk evaluation.¹⁹ However, the Ninth Circuit found that EPA properly excluded “legacy disposal” from the conditions of use, concluding that “TSCA unambiguously does not require past disposals to be considered conditions of use.”²⁰ This ruling led EPA, which had already commenced a risk evaluation of asbestos that excluded legacy uses from its scope, to indicate its intent to undertake a supplemental risk evaluation to consider legacy uses and associated uses.²¹

The Ninth Circuit dismissed or denied two other challenges to the Risk Evaluation Rule, though the court’s decision could leave room for additional challenges to individual risk evaluations based on these issues. First, the court concluded that an argument that EPA intended to make risk determinations for individual uses rather than holistically was not justiciable because the petitioners’ interpretation of EPA’s intent was too speculative.²² Second, the Ninth Circuit rejected an argument that the rule contravened EPA’s purported obligation under TSCA to consider all of a chemical’s conditions of use. The court stated that text in the preamble suggesting EPA would exclude conditions of use was not binding and that “[e]ven assuming

TSCA requires EPA to consider all conditions of use within the scope of a chemical substance's risk evaluation, the provisions of the Risk Evaluation Rule that Petitioners challenge do not evince any contrary intent on the part of EPA.”²³ These two arguments will be revisited in litigation (discussed further below) recently filed, as of time of publication, in the Ninth Circuit. These suits challenge EPA's first final risk evaluation (for methylene chloride, one of the initial 10 risk evaluations EPA undertook following the 2016 amendments).²⁴

The 2016 amendments required swift work on risk evaluations, and EPA was out of the gate quickly. In June 2017, the Agency released draft scoping documents for the first 10 substances, and in June 2018, EPA published problem formulation documents for public comment.²⁵ Beginning in November 2018, EPA began to release draft risk evaluations for the 10 substances, starting with PV29. As the June 2020 deadline for completion of the first 10 evaluations approached, however, it became apparent that the Agency would not be able to complete the evaluations on time. The Agency issued its tenth draft risk evaluation—for perchloroethylene—in April 2020, only two months before the deadline for final risk evaluations.²⁶ In addition, the Science Advisory Committee on Chemicals raised numerous concerns regarding the draft evaluations, and EPA continued to receive new information on at least two of the chemicals: in July 2020, EPA announced it had received information about the solubility of PV29 in response to a Section 4 testing order and added that the Agency had received additional studies on NMP that were similar to a study that provided the basis for an element of the NMP draft risk evaluation.²⁷

As of the time this chapter was drafted, EPA had issued only one final risk evaluation—for methylene chloride—by the statutory deadline. EPA had also recently closed the comment periods on the draft scoping documents for its risk evaluations of the first 20 high-priority substances.²⁸

EPA's evaluation for methylene chloride risk identified no unreasonable risk to the environment from any condition of use, but the Agency did find unreasonable risk to human health arising from 47 of the 53 conditions of use considered and stated EPA would initiate risk management actions on those 47 conditions of use.²⁹ The risk evaluation set forth separate detailed findings for each condition of use. EPA considered its findings of no unreasonable risk for six conditions of use as final agency action.³⁰ In July 2020, environmental groups filed a petition for review in the Ninth Circuit challenging the final risk evaluation.³¹ Their petition asserted that EPA had “declin[ed] to consider certain uses and pathways through which members of Petitioners are exposed and face risks of exposure to methylene chloride.” The results of this litigation—and of the challenges that surely will follow issuance of other final risk evaluations that include “no unreasonable risk” findings—will shape the evolution of EPA's assessment and management of existing chemicals. It could

require certain draft risk evaluations for the first 10 chemicals be reexamined, and potentially delay development of risk management regulations for those and other substances that undergo review.

§ 16:32 Risk management for existing chemical substances

If a risk evaluation results in a determination that a chemical substance presents an unreasonable risk of injury to health or the environment, EPA must issue regulations requiring risk management actions “to the extent necessary so that the chemical substance no longer presents” the unreasonable risk to health or the environment.¹ This standard replaced the original TSCA’s directive that risk management requirements be applied “to the extent necessary to protect adequately against such risk using the least burdensome requirements.” Section 6 specifies the types of risk management actions that EPA may require, and the types of limitations identified can be combined in the same regulation. The Agency may limit risk management requirements to specified geographic areas.²

Risk Management Actions for Chemical Substances & Mixtures Under TSCA Section 6³

- *Prohibitions/restrictions on **manufacture/processing/distribution***
- *Prohibitions/limitations on **amount** manufactured/processed/distributed*
- *Prohibitions/restrictions on manufacture/processing/distribution for a **particular use** (or particular use exceeding a specified amount and/or concentration)*
- *Requirements for “**clear and adequate minimum warnings and instructions**” (including for articles)*
- ***Recordkeeping, monitoring, or testing requirements** that are “reasonable and necessary to assure compliance” with other risk management rules*
- *Prohibition or other regulation of **particular manners or methods** of commercial use*
- *Prohibition or other regulation of **particular manners or methods of disposal***
- ***Notice requirements** and **requirements to replace or repurchase** the chemical substance or mixture*

These parameters for risk management actions are largely the same as they were under the original TSCA. The 2016 amendments did, however, add a limitation on risk management rules for articles and categories of articles. The amendments specified that EPA may impose prohibitions or other restrictions on articles only “to the extent necessary to address the identified risks from exposure to the chemical substance or mixture from the article or category of articles so that the chemical substance or mixture does not present an unreasonable risk of injury to health or the environment identified in the risk evaluation.”⁴

Although EPA may not consider economic and other nonrisk factors during the prioritization and risk evaluation processes, the Agency must undertake an analysis of the risks, benefits, and costs of regulating the substance when issuing a risk management rule under Section 6(a). Section 6(c) requires the Administrator to

[Section 16:32]

¹TSCA § 6(a), 15 U.S.C.A. § 2605(a).

²TSCA § 6(a), 15 U.S.C.A. § 2605(a).

³TSCA § 6(a)(1)–(a)(7), 15 U.S.C.A. § 2605(a)(1)–(a)(7).

⁴TSCA § 6(c)(2)(E), 15 U.S.C.A. § 2605(c)(2)(E).

publish a statement based on reasonably available information regarding the magnitude of exposure and effects on health and the environment, the benefits of the substance for various uses, and “the reasonably ascertainable economic consequences of the rule.” This last item includes the likely effect on the national economy, small business, technological innovation, the environment, and public health; the costs and benefits of the proposed action and of the primary alternative actions considered by EPA; and the cost effectiveness of the proposed action and of the primary alternative actions considered by EPA.⁵ Consideration of available substitutes is required when EPA is deciding whether to impose prohibitions or restrictions in a manner that “substantially prevents” a specific condition of use of a chemical substance or mixture. Such consideration is also required when the Agency is deciding upon an appropriate transition period for phasing in such a prohibition or restriction. EPA must consider, to the extent practicable, whether there will be reasonably available technically and economically feasible alternatives that benefit health or the environment, when compared to the use proposed to be prohibited or restricted.⁶

Prior to enactment of the 2016 amendments, Section 6(c) of TSCA discouraged EPA from issuing regulations under Section 6 if other laws administered by the Agency applied. If the Administrator determined that a chemical risk could be controlled adequately by other laws administered by EPA, then the Agency could not issue a risk management rule under Section 6(a) unless the Administrator determined that it was “in the public interest” to do so.⁷ In making this determination, the Administrator was required to compare the relative costs and efficiency of proceeding under other available laws.⁸ The 2016 amendments eliminated this requirement.

EPA can grant temporary exemptions from Section 6 rules for specific conditions of use of a chemical substance or mixture if one of three criteria is met:

- (1) the use is “critical or essential” and there are no technically or economically feasible safer alternatives available, taking into consideration hazard and exposure;
- (2) compliance with the Section 6 requirement would “significantly disrupt the national economy, national security, or critical infrastructure”; or
- (3) the use provides a “substantial benefit” to health, the environment, or public safety as compared to reasonably available alternatives.⁹

Initially, EPA must set a reasonable time limit for any exemption it grants, and can subsequently extend, modify, or eliminate an exemption.¹⁰ EPA must impose conditions on the exemption to the extent necessary to protect health and the environment while achieving the exemption’s purposes. The conditions might include recordkeeping, monitoring, and reporting requirements.¹¹

TSCA also exempts replacement parts for “complex durable goods” and “complex consumer goods” (both of which are defined terms in the statute) designed prior to a final risk management rule unless the Agency finds, based on the risk evaluation,

⁵TSCA § 6(c)(2)(A), 15 U.S.C.A. § 2605(c)(2)(A).

⁶TSCA § 6(c)(2)(C), 15 U.S.C.A. § 2605(c)(2)(C).

⁷TSCA § 6(c)(1), 15 U.S.C.A. § 2605(c)(1); *see also* TSCA § 9(b), 15 U.S.C.A. § 2608(b) (containing similar language).

⁸TSCA § 6(c)(1), 15 U.S.C.A. § 2605(c)(1).

⁹TSCA § 6(g)(1), 15 U.S.C.A. § 2605(g)(1).

¹⁰TSCA § 6(g)(3), 15 U.S.C.A. § 2605(g)(3).

¹¹TSCA § 6(g)(4), 15 U.S.C.A. § 2605(g)(4).

that the replacement parts contribute significantly to the risk.¹²

The 2016 amendments impose deadlines on EPA for taking risk management actions. Thus, EPA must propose a risk management rule under Section 6(a) within one year of the publication of the final risk evaluation for a chemical substance. The Agency must publish a final rule within two years of publication of the final risk evaluation. EPA can extend these deadlines for not more than an aggregate of two years (including the period of time already consumed by any extension granted for generating the risk evaluation). Additional justification is required for EPA to extend these deadlines for chemical substances on the 2014 update to the TSCA Work Plan or for persistent, bioaccumulative, and toxic (PBT) chemical substances that meet certain criteria.¹³

In addition to the requirements imposed for rulemaking by the Administrative Procedure Act,¹⁴ EPA must publish a notice of proposed rulemaking that states “with particularity” the reason for the proposed action. The Agency must allow interested persons to submit written data, views, and arguments, all of which it must make available to the public.¹⁵

The 2016 amendments eliminated a requirement that a public hearing be held for Section 6 risk management rules. In late 2016, EPA removed regulations that specified procedural requirements for risk management rules, finding that they were “particularly outdated and no longer designed for effective implementation of section 6” and that TSCA itself, along with the Administrative Procedure Act, would provide the necessary procedural framework.¹⁶ Although the 2016 amendments required EPA to develop framework rules for prioritization and risk evaluation, it did not include such a requirement for risk management. In 2020, as EPA prepared to undertake its first Section 6(a) rulemakings under the amended statute, a handful of trade groups petitioned for EPA to initiate a proceeding to develop a risk management procedural rule, contending that “[p]rocedural guardrails” were needed to ensure that risk management “is consistently applied and appropriately tailored.”¹⁷

In addition to reshaping the general framework for regulating substances under Section 6(a), the 2016 amendments added a new Section 6(h) to TSCA requiring EPA to take accelerated action to regulate PBT chemical substances. Section 6(h) required the Agency to propose risk management rules under Section 6(a) by June 2019 for certain PBT chemical substances in the 2014 update to the TSCA Work Plan that were likely to cause exposure, under the conditions of use, to the general population, to a potentially exposed or susceptible subpopulation identified by EPA, or to the environment.¹⁸ No risk evaluation was required to precede the promulgation of risk management rules for these substances.¹⁹ The risk management rules for such substances must target the risks to health or the environment that EPA determines are presented and must “reduce exposure to the chemical substance to

the extent practicable.”²⁰ Manufacturers could remove a PBT chemical substance listed on the 2014 Work Plan from consideration for the expedited risk management process by requesting that EPA conduct a risk evaluation for the substance. Such requests were made for two substances used in fragrance mixtures.²¹

In June 2019, EPA issued a proposed risk management rule covering the five PBT substances that the Agency had determined met Section 6(h)’s criteria: decabromodiphenyl ether (decaBDE); hexachlorobutadiene (HCBd); pentachlorothiophenol (PCTP); phenol, isopropylated, phosphate (3:1) (PIP (3:1)); and 2,4,6-tris(tert-butyl) phenol.²² For many uses of four of the five substances, EPA proposed restrictions and prohibitions on manufacture, processing, and distribution. The proposed rule also included recordkeeping requirements for these four substances and a ban on downstream releases to water for PIP (3:1), as well as a requirement to notify downstream users of the PIP (3:1) restrictions. For HCBd, EPA proposed no action based on a determination that the potential for exposure from uses of HCBd was already addressed by actions taken under other federal and state statutes and that further measures were not practicable. EPA rejected the alternative of prohibiting the manufacture of HCBd because doing so also would effectively prohibit manufacture of three widely used solvents: perchloroethylene, trichloroethylene, and carbon tetrachloride (all three of which are among the initial 10 substances for which EPA was conducting risk evaluations).

At the time this chapter was being drafted, the Agency had begun to submit final Section 6 rules for the four substances to the Office of Management and Budget for interagency review to meet the December 2020 statutory deadline.²³

Section 7 steps in when a chemical substance or mixture is likely to result in widespread and serious injury *before* a rule can be promulgated under Section 6. Section 7 authorizes actions in federal district court for seizure and other relief against “imminently hazardous” chemical substances.²⁴ The relief may include notification to purchasers and public notice of risk, recall of products containing the hazardous substance, and repurchase or replacement of such products.²⁵

Regulation of Polychlorinated Biphenyls (PCBs) Under TSCA

Polychlorinated biphenyls (PCBs) were one of the two substances directly regulated by the original TSCA (the other was elemental mercury). Due to their high boiling point and low electrical conductivity, PCBs were used for many years as transformer cooling liquids and capacitor dielectric fluids. Because of their low solubility in water, high solubility in fat, and high degree of chemical stability, PCBs can remain in the environment for decades and bioconcentrate in fatty tissues. They are highly toxic to animals.

²⁰TSCA § 6(h)(5), 15 U.S.C.A. § 2605(h)(5).

²¹See Press Release, EPA, EPA Acts on New Chemical Law to Fast-Track Five Chemicals (Oct. 11, 2016). The substances are ethanone, 1-(1,2,3,4,5,6,7,8-octahydro-2,3,5,5-tetramethyl-2-naphthalenyl) and ethanone, 1-(1,2,3,4,5,6,7,8-octahydro-2,3,8,8-tetramethyl-2-naphthalenyl).

²²84 Fed. Reg. 36728 (July 29, 2019).

²³TSCA § 6(h)(3), 15 U.S.C.A. § 2605(h)(3).

²⁴TSCA § 7, 15 U.S.C.A. § 2606. The 2016 amendments did not significantly change Section 7.

²⁵TSCA § 7(b)(2), 15 U.S.C.A. § 2606(b)(2).

Section 6(e) of TSCA prohibited the manufacture, processing, distribution in commerce, use, or disposal of PCBs except “in a totally enclosed manner.”²⁶ The 1976 statute also required EPA to promulgate rules governing disposal of PCBs and requiring labeling of PCBs with clear and adequate warnings and instructions.²⁷ The statute permitted EPA to authorize the manufacture, processing, distribution in commerce, or use of PCBs other than in a totally enclosed manner if the Administrator found that such activities “will not present an unreasonable risk of injury to health and the environment.”²⁸

EPA’s regulations implementing the PCB provisions of TSCA are codified at 40 C.F.R. § 761. The regulations—which are detailed and technical—cover the following areas:

- **Prohibitions, exceptions, authorized activities, and storage for reuse.** Subpart B implements Section 6(e)’s PCB prohibition, but also sets forth a number of significant exceptions to the prohibition, including use of “excluded PCB products,” which contain less than 50 parts per million (ppm) PCBs. Subpart B also authorizes specific “non-totally enclosed PCB activities.”
- **Labeling.** Subpart C prescribes the format for warning labels that must be placed on certain items containing PCBs.
- **Disposal and storage for disposal.** Subpart D regulates PCB disposal, which includes accidental as well as intentional removal of PCBs from service. The subpart also addresses storage for disposal. The applicable disposal requirements vary according to the nature and PCB concentration of the waste.
- **Spill cleanup.** Subpart G contains EPA’s PCB Spill Cleanup Policy, including reporting requirements. Compliance with the Spill Cleanup Policy creates a presumption against an enforcement action for penalties or further cleanup. The Spill Policy is applicable only to spills that occur after May 4, 1987; this is based on EPA’s view that older spills of PCBs are likely to be more pervasive and difficult to clean up than fresh spills.
- **Recordkeeping.** Subpart J establishes recordkeeping requirements for certain handlers of PCB wastes.

Other subparts of the PCB regulations set forth requirements for waste disposal records and establish methodologies for sampling, analysis, and decontamination. EPA also has published extensive guidance on the use, cleanup, and disposal of PCBs.²⁹ These regulations remain relevant today, because equipment containing PCBs remains in use in the U.S. and PCB-containing materials and soils are still present in sites in the U.S. Such materials often contain PCBs present at such levels that they must be handled in accordance with the standards and procedures established in EPA’s TSCA regulations.

V. REPORTING AND RECORDKEEPING REQUIREMENTS

§ 16:33 In general

Section 8 of TSCA includes a number of provisions requiring regulated entities,

²⁶TSCA § 6(e)(2)(A), 15 U.S.C.A. § 2605(e)(2)(A). The 2016 amendments did not affect TSCA’s PCB-related provisions.

²⁷TSCA § 6(e)(1), 15 U.S.C.A. § 2605(e)(1).

²⁸TSCA § 6(e)(2)(B), 15 U.S.C.A. § 2605(e)(2)(B).

²⁹See *Policy and Guidance for Polychlorinated Biphenyl (PCBs)*, EPA, <https://www.epa.gov/pcbs/policy-and-guidance-polychlorinated-biphenyl-pcbs> (last updated July 27, 2020).

such as manufacturers, importers, processors, and distributors, to maintain and report information relating to chemical toxicity and exposure. Some reporting requirements pertain to particular chemical substances targeted by the Agency for information-gathering. Other recordkeeping and reporting requirements—such as the Chemical Data Reporting rule—apply generally to all chemical substances on the Inventory. The 2016 amendments to TSCA made limited modifications to Section 8 intended to permit EPA to update the TSCA Inventory in order to make several improvements. Examples include: to better reflect which substances are active in commerce; ensure certain nomenclature conventions used for Inventory listings are not modified; and encourage EPA to work collaboratively with industry to address nagging issues—concerning treatment of recycled chemicals and byproducts—that had arisen in the context of the periodic reporting conducted pursuant to the Chemical Data Reporting rule. The 2016 amendments also required EPA to collect information to aid in identifying and tracking mercury and mercury compounds in the U.S. marketplace and to use this information to prepare mercury inventories every three years. The following sections discuss Section 8 reporting obligations in greater detail.

§ 16:34 Section 8(a) reporting: Preliminary Assessment Information Rule (PAIR)

TSCA Section 8(a) grants EPA the authority to “promulgate rules under which . . . each person . . . who manufactures or processes or proposes to manufacture or process a chemical substance . . . shall maintain such records, and shall submit to the Administrator such reports as the Administrator may reasonably require.”¹ Employing the rulemaking authority in Section 8(a)(2), the Administrator may require recordkeeping and reporting of a wide variety of information, including the:

- Identity and molecular structure of chemical substances
- Categories or proposed categories of use
- Quantities manufactured or processed
- Byproducts resulting from manufacture, processing, use, or disposal
- All existing information concerning environmental and health effects
- Estimates of employee exposure
- Manner or method of disposal

In short, the Administrator can leverage Section 8(a) to obtain comprehensive information about the movement of a particular chemical substance or category of chemical substances through the chain of commerce, as well as available information about toxicity and exposure.

To implement Section 8(a), EPA has promulgated a “generic” reporting rule—the Preliminary Assessment Information Rule (PAIR).² Although focus on the PAIR requirements declined in the years preceding the 2016 amendments, EPA uses

[Section 16:34]

¹TSCA § 8(a)(1)(A), 15 U.S.C.A. § 2607(a)(1)(A).

²40 C.F.R. §§ 712.20 to 712.30. EPA also promulgated a Comprehensive Assessment Information Rule, known as CAIR. CAIR was designed to gather more detailed information on the manufacture, importation, and processing of chemical substances and mixtures, which could be used to support risk assessment of designated chemicals. However, after CAIR was promulgated in December 1988, several industry groups challenged the rule before EPA and in court, arguing, among other things, that it would require disclosure of confidential information. In response to these complaints, EPA in April 1989 temporarily stayed application of certain provisions of the rule. Notice of Temporary Administrative Relief, 54 Fed. Reg. 14324 (Apr. 10, 1989). Although EPA issued proposed amendments to the rule in 1993, 58 Fed. Reg. 63134 (Nov. 30, 1993), the rulemaking was never completed, and the Agency ultimately decided to delete the rule in its entirety given the ineffectiveness of the existing provisions

PAIR listings to obtain general production, use, and exposure information on chemical substances.³ Thus, persons who manufacture or import a chemical substance subject to the reporting requirement must submit a form for each substance and for each plant site that manufactures or imports the substance. The initial PAIR required reporting on about 250 chemical substances, and other substances have been added from time to time—for example, chemical substances recommended for testing under Section 4(e) by the Interagency Testing Committee (ITC).⁴

EPA's authority to require reporting under Section 8(a) is limited in a number of ways. First, small manufacturers and processors (as defined by rule) are exempted from reporting; Section 8(a) provides, however, that they may be made subject to recordkeeping or reporting rules for chemical substances regulated or proposed to be regulated under several sections of TSCA.⁵ Second, persons who manufacture or process a chemical substance in small quantities solely for scientific experimentation, analysis, or chemical research may be subject to a Section 8(a) rule only if the Administrator determines that “the maintenance of records or submission of reports, or both, is necessary for the effective enforcement” of TSCA.⁶ Similarly, the Administrator may not require maintenance of records or submission of reports with respect to changes in the proportion of components in a mixture without making a finding of necessity.⁷ Finally, the Administrator is directed, “[t]o the extent feasible,” to avoid unnecessary or duplicative reporting requirements, to minimize costs to small manufacturers and processors, and to apply reporting obligations to persons likely to have relevant information.⁸

In November 2017, EPA issued a final determination that the size standards for small manufacturers and processors, which had been in place since the 1980s, were “clearly outdated” and that revision was warranted.⁹ In May 2020, EPA finalized amendments to the definition of “small manufacturer” that increased thresholds for annual sales to account for inflation.¹⁰

The 2016 amendments required EPA to develop regulations through negotiated rulemaking to limit the reporting requirements for manufacturers of any inorganic

and the inactive status of the proposed revisions. 60 Fed. Reg. 31917, 31918 (June 19, 1995).

³See 40 C.F.R. § 712.30 (listing of chemicals subject to the rule). As part of the Clinton administration's “streamlining” government initiatives, EPA decided to delete from the Code of Federal Regulations all listed chemicals with a pre-1990 reporting date. See 60 Fed. Reg. 31917, 31919 (June 19, 1995). EPA has gathered information on approximately 800 chemical substances under PAIR.

⁴ITC-listed substances automatically become subject to PAIR reporting 30 days after EPA issues a regulation listing the substances for inclusion. 40 C.F.R. § 712.30(c). The required information form must be submitted 60 days thereafter. 40 C.F.R. § 712.30(c).

⁵TSCA § 8(a)(1)(A), (3)(A), 15 U.S.C.A. § 2607(a)(1)(A), (3)(A). “Small manufacturer” is defined for purposes of Section 8(a) at 40 C.F.R. § 704.3. See 40 C.F.R. § 712.25(c).

⁶TSCA § 8(a)(1)(B), 15 U.S.C.A. § 2607(a)(1)(B).

⁷TSCA § 8(a), 15 U.S.C.A. § 2607(a).

⁸TSCA § 8(a)(5), 15 U.S.C.A. § 2607(a)(5).

⁹82 Fed. Reg. 56824 (Nov. 30, 2017). The 2016 amendments required EPA to make this determination as to whether the size standards should be revised. See TSCA § 8(a)(3), 15 U.S.C.A. § 2607(a)(3).

¹⁰85 Fed. Reg. 31986 (May 28, 2020). The revised definition retained a “two-standard” structure. The first standard defines a manufacturer (including an importer) as small if its total annual sales combined with those of its parent company are less than \$120 million, but if annual production or importation volume of a particular substance at an individual site exceeds 100,000 pounds, the manufacturer or importer will not qualify for the small manufacturer exemption for purposes of that substance at that site (unless the manufacturer also meets the second standard). The second standard defines a manufacturer (including importer) as small if its total annual sales combined with those of its parent company are less than \$12 million, regardless of the quantity of a chemical substance produced or imported.

byproducts if the byproducts are subsequently recycled, reused, or reprocessed.¹¹ EPA announced in October 2017 that the negotiated rulemaking committee had determined that it could not reach consensus and concluded the negotiations.¹² EPA sought public input about approaches to reporting that would reduce the burden of reporting and maintain EPA's ability to receive information about exposure. The amendments to the Chemical Data Reporting rule incorporate changes intended to address this issue.¹³

The Agency announced in 2020 that EPA is considering a rulemaking, using its Section 8(a) authority, to gather available information on the substances which were identified in the 2014 list of Work Plan chemicals. The announcement noted EPA would seek information concerning the potential hazards and exposure pathways related to the Work Plan chemicals (in particular occupational, environmental, and consumer exposure information) to better inform EPA's prioritization and risk evaluation activities.¹⁴

§ 16:35 Inventory reporting and active and inactive substances

As discussed in Section 16:11, Section 8(b) of TSCA requires EPA to compile, keep current, and publish a list of chemical substances manufactured in the United States.¹ Initially created by EPA in 1979, the Inventory was compiled based on information collected from manufacturers and importers through EPA's reporting regulations for the initial Inventory.² To refine and update its understanding of the commercial practices involving Inventory-listed substances, EPA has relied on information collected pursuant to the Chemical Data Reporting (CDR) rule. CDR requires manufacturers and importers to report every four years on the volume of chemical substances they import or manufacture, provided that the reportable substances are manufactured or imported in quantities at or above certain thresholds.³ For the 2020 CDR, determining whether to report was based on whether, for *any* calendar year since the preceding principal reporting year, a chemical substance was manufactured (or imported) at a site in production volumes of *25,000 pounds* or greater. Manufacturers (including importers) were required to report the production volume for each of the years since the last principal reporting year, as well as certain manufacturing, processing, and use information for the most recent reporting year. A significantly lower threshold (2,500 pounds/year) was established for chemical substances subject to Section 4 orders or to proposed or final regulations or

¹¹TSCA § 8(a)(6), 15 U.S.C.A. § 2607(a)(6).

¹²See 82 Fed. Reg. 47423 (Oct. 12, 2017).

¹³See 85 Fed. Reg. 20138 (Apr. 9, 2020).

¹⁴See Reporting and Recordkeeping for Certain Chemicals Under Section 8(a) of the Toxic Substances Control Act (TSCA), Reginfo.gov (Spring 2020), <https://www.reginfo.gov/public/do/eAgendaViewRule?pubId=202004&RIN=2070-AK62>.

[Section 16:35]

¹TSCA § 8(b)(1), 15 U.S.C.A. § 2607(b)(1).

²40 C.F.R. §§ 710.1 to 710.4.

³76 Fed. Reg. 50816 (Aug. 16, 2011) (codified at 40 C.F.R. Pt. 711). Prior to 2011, the CDR was known as the "Inventory Update Reporting" rule (IUR). The CDR/IUR has been significantly amended since it was first promulgated in 1986. See 51 Fed. Reg. 21438 (June 12, 1986); 68 Fed. Reg. 848, 890 (Jan. 7, 2003); 70 Fed. Reg. 75059, 75068 (Dec. 19, 2005); 85 Fed. Reg. 20148 (Apr. 9, 2020). Today, the rule gathers basic site and manufacturing information on chemicals manufactured (including imported) in amounts of 25,000 pounds or greater at a single site. 40 C.F.R. §§ 711.8, 711.15. This information facilitates the periodic updating of the TSCA Inventory database and supports activities associated with implementing TSCA. EPA expects that the processing and use information will help it, other federal agencies, and the general public to readily screen and categorize chemicals when investigating effects on human health and the environment. Inorganic chemical substances were first subject to CDR/IUR reporting in 2006. See 70 Fed. Reg. at 75068.

orders issued under Section 5 or 6, or for which relief had been granted under TSCA Section 7.⁴

As of 2016, the Inventory included approximately 85,000 chemical substances, but EPA believed that many of these substances were no longer produced, imported, or processed in the U.S. The 2016 amendments required EPA to issue a rule, by June 2017, requiring manufacturers, and potentially processors, to notify EPA of each chemical substance on the TSCA Inventory that the manufacturer or processor manufactured or processed for a nonexempt commercial purpose during the 10-year period preceding the 2016 amendments' enactment on June 22, 2016. Substances manufactured or processed during that period were to be designated as "active substances" on the Inventory; substances that had not been manufactured or processed were to be designated as "inactive substances."⁵

Based on EPA's framework rule for "TSCA Inventory Notification (Active-Inactive) Requirements,"⁶ manufacturers and importers filed a "retrospective" notification (known as a Notice of Activity (NOA) Form A) with EPA by February 7, 2018, if they produced or imported an Inventory-listed substance during the 10-year lookback period ending on June 21, 2016.⁷ After EPA published a draft Inventory showing active designations,⁸ processors then had an opportunity to review the designations and to submit notifications for other Inventory-listed substances they processed during the lookback period.⁹ The deadline for processors to submit the retrospective notifications was October 5, 2018.¹⁰

In February 2019, EPA published the first version of the TSCA Inventory that included active and inactive designations.¹¹ The inactive designations became final on August 5, 2019.¹² Since that date, entities are required to submit a "forward-looking" notification (known as a Notice of Activity Form B) to EPA before they manufacture or process an inactive chemical substance for a nonexempt commercial

⁴40 C.F.R. § 711.8(b).

⁵TSCA § 8(b)(4)(A), 15 U.S.C.A. § 2607(b)(4)(A). Designation as "inactive" does not result in the removal of a substance from the Inventory. TSCA § 8(b)(4)(A)(iv), 15 U.S.C.A. § 2607(b)(4)(A)(iv). The 2016 amendments' provisions regarding the establishment of active and inactive categories on the Inventory followed EPA's consideration of regulatory initiatives to "clean up" the Inventory. In late 2008, EPA introduced plans to initiate an "Inventory Reset Program" but later discontinued the program. See Pat Rizzuto, *EPA Releases 'Background' Documents for Public Meeting on Chemical Inventories*, 229 Daily Env't Rep. (Bloomberg BNA) A-7 (Nov. 28, 2008). This initiative was part of EPA's ChAMP program described at § 16:9, *supra*. EPA envisioned inviting persons to certify—online via a secure EPA Web site—that they have manufactured a chemical listed on the Inventory within a specified timeframe. At the close of the certification period, EPA proposed to process the certifications and develop a new, interim reset TSCA Inventory containing only those chemical substances that had been certified. A public version of the interim reset TSCA Inventory would have been made available online. Its availability would have been announced in the Federal Register, and persons would have had a time-limited opportunity to make corrections to the interim reset TSCA Inventory.

⁶82 Fed. Reg. 37520 (Aug. 11, 2017) (final rule); 82 Fed. Reg. 4255 (Jan. 13, 2017) (proposed rule); see Lawrence E. Culleen & Eric A. Rey, *10 Key Revisions to EPA's Final TSCA Inventory Reset Rule: Trump Administration Provides Some Regulatory Relief* (June 30, 2017), <https://perma.cc/H6HS-AY58>. The D.C. Circuit largely rejected challenges to the framework rule, except for a provision related to substantiation of confidentiality claims for chemical identity information. See *Environmental Defense Fund v. Environmental Protection Agency*, 922 F.3d 446 (D.C. Cir. 2019).

⁷40 C.F.R. § 710.25(a).

⁸See 40 C.F.R. § 710.30(a)(1); 82 Fed. Reg. 37520, 37524 (Aug. 11, 2017).

⁹40 C.F.R. § 710.30(a)(2).

¹⁰40 C.F.R. § 710.30(a)(2).

¹²See 84 Fed. Reg. 21772 (May 15, 2019).

purpose.¹³ The NOA Form B must be submitted not more than 90 days before the anticipated date of commencement of the manufacturing or processing of the inactive substance.¹⁴

The regulations exempt certain activities from triggering the notification requirements: manufacturing or processing a chemical substance in small quantities solely for research or development; importing or processing a chemical substance as part of an article; manufacturing or processing a chemical substance as described in 40 C.F.R. § 702.30(g) or (h); manufacturing or processing chemical substances solely for export (except where EPA has made an unreasonable risk finding pursuant to TSCA Section 12(a)(2));¹⁵ manufacturing or processing chemical substances solely for test marketing purposes;¹⁶ manufacturing a naturally-occurring chemical substance—so long as the manufacture meets criteria described in 40 C.F.R. § 710.4(b); and processing of a naturally occurring chemical substance only by manual, mechanical, or gravitational means; by dissolution in water; by flotation; or by heating solely to remove water.¹⁷

In addition, three categories of substances were exempted from the retrospective (NOA Form A) reporting requirements because EPA had received an equivalent notice: chemical substances reported to EPA in 2012 or 2016 under the CDR rule, chemical substances added to the Inventory during the 10-year lookback period, and chemical substances for which a manufacturer has evidence (i.e., a CDX receipt) documenting EPA's receipt of a retrospective notification from another manufacturer.¹⁸

Provisions designed to substantiate the ongoing need to keep information about chemical identity confidential were incorporated into the 2016 amendments' requirements for updating the Inventory. First, the 2016 amendments required that manufacturers and processors request the maintenance of confidential status for active substances that were on the confidential portion of the Inventory and also required EPA to undertake a review of all claims to shield specific chemical identities of chemical substances from disclosure.¹⁹ In addition, when a person seeks to manufacture or process an inactive substance, the entity must substantiate any claim being made for continuing the confidential status of the specific chemical identity.²⁰ The 2016 amendments also bar entities from asserting new claims for confidential treatment of active or inactive substances that were not previously on

¹³See 40 C.F.R. § 710.25(c); *see also* TSCA § 8(b)(4)(A)(iv), (5)(B), 15 U.S.C.A. § 2607(b)(4)(A)(iv), (5)(B) (inactive substances are not removed from the Inventory and are not subject to Premanufacture Notice requirements).

¹⁴40 C.F.R. § 710.30(b)(1).

¹⁵Exempting byproducts for which the only commercial purpose is burning as a fuel, disposing as a waste, or extracting component chemical substances from it for commercial purposes, and specified categories of chemical substances that, while manufactured for commercial purposes, are not manufactured for distribution in commerce as chemical substances per se and have no commercial purpose separate from the substance, mixture, or article of which they are a part.

¹⁶40 C.F.R. § 710.27(a).

¹⁷40 C.F.R. § 710.27(b).

¹⁸40 C.F.R. §§ 710.23 (definition of interim active substance), 710.25(a) (exception for manufacturers in possession of evidence of EPA receipt of notification from another person); *see also* 82 Fed. Reg. 37520, 37523 (Aug. 11, 2017). Note that reliance on evidence that another entity submitted the notification ran the risk that the other entity would withdraw the report and the substance would be moved to the inactive list.

¹⁹TSCA § 8(b)(4)(B)–(E), 15 U.S.C.A. § 2607(b)(4)(B)–(E); *see also* 40 C.F.R. § 710.55(b).

²⁰TSCA § 8(b)(5)(B)(ii), 15 U.S.C.A. § 2607(b)(5)(B)(ii). The requirements for substantiation are set out in Section 14 of TSCA. TSCA § 14(c), 15 U.S.C.A. § 2613(c). *See discussion infra* § 16:41.

the confidential portion of the Inventory.²¹ If EPA approves a confidentiality claim, the specific chemical identity generally will be protected from disclosure for 10 years from the date on which the confidentiality claim was first asserted after June 22, 2016, though manufacturers and processors can request and resubstantiate—and EPA can grant, if the request satisfies all requirements—an unlimited number of extensions of the confidential treatment.²² In 2020, EPA announced that it had determined that the specific chemical identity of 2,812 active chemical substances on the Inventory could no longer be claimed as confidential, either because no request had been received to maintain the claim or because the claim was denied (e.g., because the substance’s chemical identity had previously been reported as non-confidential).²³

In March 2020, EPA finalized procedures for reviewing confidentiality claims for specific chemical identities of active substances that manufacturers and processors asserted during the retrospective reporting.²⁴ The statutory target completion date for EPA to finish its review of the claims is February 19, 2024—or five years after EPA compiled the initial list of active substances.²⁵ EPA stated it would post at the beginning of each year annual goals for reviews and report on the number of reviews completed in the prior year, starting in 2021 and until its review is completed.

The 2016 amendments required a separate inventory for mercury supply, use, and trade, as well as recommended actions to reduce mercury use.²⁶ Congress required the initial updated edition of the mercury inventory be published by April 1, 2017, and that the inventory subsequently be published every three years. The inventory must identify products and manufacturing processes that intentionally add mercury. EPA published the initial inventory by the deadline,²⁷ and, as required by the 2016 amendments, adopted a rule to assist the Agency in gathering information needed to prepare the inventory. The rule requires manufacturers (including importers) of mercury or mercury-added products and other persons who intentionally use mercury in manufacturing processes to submit triennial reports.²⁸ In general, the reports include information about quantities of mercury associated with applicable activities; specific compounds, categories and subcategories of products, manufacturing processes, and uses in manufacturing processes; and “contextual” information (e.g., countries of origin and destination, North American Industry Classification System, or NAICS codes).²⁹ The rule exempts certain persons from reporting, including persons not involved in the initial introduction of mercury to the market; persons who only generate, handle, or manage mercury-containing waste;

manufacturers of mercury as an impurity; manufacturers of articles that contain a mercury-added component; and persons engaged in activities involving mercury not with the purpose of obtaining an immediate or eventual commercial advantage.³⁰ The rule originally exempted importers of assembled products containing mercury-added components, but the Second Circuit vacated this exemption, finding that EPA had not provided a reasoned explanation for it.³¹ The Second Circuit concluded that reporting by importers of products with mercury-added components would not be duplicative since no other entity would be required to report the mercury in the component. The court was not persuaded by either of EPA's rationales for exempting article importers, which were based on congressional intent and the "undue burden" that reporting would place on importers. In March 2020, EPA published the first mercury inventory based on data collected under the reporting rule.³²

§ 16:36 Records of allegations

Section 8(c) requires chemical manufacturers (including importers), processors, and distributors to keep "records of significant adverse reactions to health or the environment, as determined by the Administrator by rule, alleged to have been caused" by the chemical substance.¹ The requirement applies both to chemical substances and to mixtures manufactured for commercial purposes, including byproducts and impurities.

EPA has by rule defined "significant adverse reactions," for purposes of Section 8(c) reporting, as "reactions that may indicate a substantial impairment of normal activities, or long-lasting or irreversible damage to health or the environment."² Examples of significant adverse reactions include long-lasting or irreversible damage to human health and gradual or sudden changes to animal or plant life in a given geographic area.³ A significant adverse health reaction need not be recorded if it is a "known human effect" as defined by the rule,⁴ or if it pertains to environmental effects directly attributable to an incident of environmental contamination that has already been reported to the U.S. government under any applicable authority.⁵

Allegations that must be recorded may come from a variety of sources, including employees, fenceline neighbors, customer complaints, private or company health professionals, and product liability suits. No formal proof or evidence supporting the validity of the allegations is required.⁶ Allegations that meet Section 8(c) criteria must be recorded, even if a responsible official (e.g., a company physician) believes that the chemical substance is not the source of the alleged effect. In such cases, a clarifying note can be included in the file.

[Section 16:36]

¹TSCA § 8(c), 15 U.S.C.A. § 2607(c); 40 C.F.R. § 717.1. Although Section 8(c) applies to "any person," including distributors of chemicals in commerce, the implementing regulation exempts from reporting retailers and other companies who solely distribute chemical substances. 40 C.F.R. § 717.7(c), (d).

²40 C.F.R. § 717.3(i).

³40 C.F.R. § 717.12(c).

⁴40 C.F.R. § 717.12(b) (citing 40 C.F.R. § 717.3(c)).

⁵40 C.F.R. § 717.12(d).

⁶EPA defines an allegation as "a statement, made without formal proof or regard for evidence, that a chemical substance or mixture has caused a significant adverse reaction to health or the environment." 40 C.F.R. § 717.3(a).

The record must contain the following information: the original allegation as received; an abstract of the allegation; the results of any self-initiated investigation regarding the allegation; and copies of any further required information regarding the allegation (e.g., copies of any reports required to be made to OSHA).⁷ The file of allegations must be maintained at the highest level of the company with responsibility for its chemical operations (generally corporate headquarters).⁸ The files must be organized so that the data are accessible by the alleged cause of the adverse reaction (e.g., chemical name; type of process; or site emissions, effluent, or other discharge).⁹

Allegations of significant adverse reactions to the health of employees must be retained for 30 years,¹⁰ and all other records of allegations for five years. Records of allegations need not be submitted routinely to EPA; however, an allegation required to be recorded under Section 8(c) may constitute information indicating a substantial risk, which must be reported under Section 8(e).¹¹ EPA may inspect these records of allegations and require submission of copies of them at any time.

§ 16:37 Unpublished health and safety studies

Under Section 8(d) of TSCA, EPA may require reporting of unpublished health and safety studies of chemical substances and mixtures in the possession of chemical manufacturers (including importers) and distributors.¹ Section 8(d) requirements apply only to chemical substances and mixtures identified by the Administrator by rule.² EPA has promulgated a model Section 8(d) reporting rule that defines key terms and establishes procedures for reporting health and safety studies.³

Persons who must report under the TSCA Section 8(d) rule include current manufacturers and importers; prospective manufacturers and importers; and persons who, in the 10 years preceding the effective date that a substance or mixture is added to the rule, either had manufactured or imported, or had proposed to manufacture or import, the substance or mixture. In addition, the rule may specify that processors in each of these categories (current, prospective, and past) are required to report.

“Reporting” may constitute submission of the study itself, or simply listing the study in the submission to the Agency. Generally, copies of studies possessed at the

⁷40 C.F.R. § 717.15(b).

⁸40 C.F.R. § 717.15(a).

⁹40 C.F.R. § 717.15(c).

¹⁰40 C.F.R. § 717.15(d).

¹¹See § 16:38, *infra*.

[Section 16:37]

¹TSCA § 8(d), 15 U.S.C.A. § 2607(d). EPA may require submission of studies in a company's possession even if the company does not manufacture, process, or distribute in commerce the chemical substance that is the subject of the study. See *Dow Chemical Co. v. U.S. E.P.A.*, 605 F.2d 673, 687–89, 9 Env'tl. L. Rep. 20640, 20647–48 (3d Cir. 1979).

²The 2016 amendments did not amend Section 8(d), and the regulatory framework discussed here remains in place.

³40 C.F.R. §§ 716.1 to 716.65. Chemical substances and mixtures may become subject to the rule by one of two mechanisms. First, all chemical substances selected for priority consideration for testing under Section 4(a) by the Interagency Testing Committee are automatically added to the list of chemical substances subject to the Section 8(d) reporting rule, 30 days after a notice to that effect is published in the Federal Register. Second, EPA may list other substances and mixtures after public notice and the opportunity for comment. Unless otherwise specified, the reporting requirements expire 60 days after the effective date of the rule that added a chemical substance or mixture to the Section 8(d) list. In no case may reporting obligations terminate later than two years after the effective date of the listing.

time a person becomes subject to the rule must be submitted. The following categories of studies need only be listed: (1) studies ongoing as of the date a person becomes subject to the rule; (2) studies initiated after the date a person becomes subject to the rule; (3) studies that are known as of the date a person becomes subject to the TSCA Section 8(d) rule, but not in possession; and (4) studies previously sent to U.S. government agencies without confidentiality claims. Copies of ongoing studies and later-initiated studies must be submitted once complete.⁴

The term “health and safety study” has been defined to include any information on the effects of a chemical substance or mixture on health or the environment, including toxicological and epidemiological studies, clinical and ecological effects studies, studies of occupational exposure, studies based on environmental monitoring data, data on physical and chemical properties, bioconcentration or bioaccumulation tests, and other data that bear on the effects of a chemical substance on health or the environment.⁵ Such information and data need not be part of a formal, disciplined study to be subject to the rule. However, each rulemaking proceeding adding substances to the list of chemical substances subject to the rule will specify the types of health and environmental effects studies that must be reported and the chemical grade or purity requirements that must be met or exceeded in individual studies—thus limiting the scope of the requirement.⁶ Section 8(d) reporting requirements apply to ongoing studies and studies initiated after a chemical substance becomes subject to Section 8(d), as well as to studies in existence at the time a chemical substance is listed in the rule.

Persons subject to a Section 8(d) rule⁷ must search their files for studies required to be reported.⁸ The search requirement is limited to records in which the company ordinarily keeps health and safety information and to the records of employees whose assigned duty is to advise the company of the health and environmental effects of the chemicals it handles.⁹ Persons are not required to search for reportable information dated before January 1, 1977, unless specifically required to do so in a

⁴40 C.F.R. § 716.60(b)(2); *see also* 40 C.F.R. Pt. 716.

⁵40 C.F.R. § 716.3.

⁶The revised rule limits the initiated studies that must be reported to those studies initiated within the 60-day period. 40 C.F.R. § 716.65.

⁷Under the prior rule, the Section 8(d) reporting requirements applied to all manufacturers, importers, and processors of chemical substances or mixtures listed under 40 C.F.R. § 716.120. The revised rule limits application of the reporting requirements to manufacturers and importers falling within two specific categories—Subsector 325 (chemical manufacturing and allied products) or Industry Group 32411 (petroleum refineries)—of the North American Industry Classification System, who manufactured or imported or proposed to manufacture or import a covered substance or mixture at any time during or after the 10 years preceding the effective date on which the chemical is added to the 8(d) list. 40 C.F.R. § 716.5(a). In response to industry concerns that the definition of “processor” may require routine reporting from a far broader audience than originally intended, EPA has exempted all processors of listed chemicals from the general reporting requirements. 40 C.F.R. § 716.5(c). EPA retains the right to require in a specific rule reporting by any entity not covered by the general provisions. 40 C.F.R. § 716.5(b). The terms “manufacture” and “process” are defined for purposes of Section 8 as manufacture or process “for commercial purposes.” TSCA § 8(f), 15 U.S.C.A. § 2607(f); *see also* 40 C.F.R. § 716.3. The courts have held that for purposes of Section 8(d), EPA may require listing and submission of studies on chemical substances that are manufactured in small quantities solely for the purpose of research, without an established intent to sell the chemical. *Dow Chemical Co. v. U.S. E.P.A.*, 605 F.2d 673, 682–86, 9 Env’tl. L. Rep. 20640, 20644–47 (3d Cir. 1979). Though the issue before the *Dow* court reached only reporting under Section 8(d), the interpretation of these definitions would appear to apply as well to the other reporting authorities in Section 8.

⁸40 C.F.R. § 716.25.

⁹40 C.F.R. § 716.25.

rule.¹⁰ Certain studies are exempt from reporting; for example, studies that have been published in the literature or previously reported to EPA are exempt.¹¹ Other studies previously submitted to federal agencies (with no claims of confidentiality) are exempt only from the copy submission requirement; a list of such studies must be submitted to EPA.¹²

Initially, EPA used Section 8(d) only to obtain unpublished studies on chemical substances of interest to the Agency's Office of Pollution Prevention and Toxics, which is responsible for TSCA implementation. Subsequently, the Agency began using its Section 8(d) reporting authority to obtain information needed by other EPA programs. For example, EPA published a rule requiring manufacturers, importers, and processors of listed chemical substances to report information needed to develop health-based standards for implementation of the Hazardous and Solid Waste Amendments of 1984.¹³

§ 16:38 Reporting substantial risk information

Section 8(e) requires chemical manufacturers (including importers), processors, and distributors who obtain information that "reasonably supports the conclusion" that a chemical substance or mixture presents a substantial risk of injury to health or the environment to inform the Administrator of such information, unless the person who obtains the information has actual knowledge that the Administrator has already been adequately informed of the risk.¹ The 2016 amendments did not modify this longstanding requirement that EPA considers to have been "self-implementing." Although EPA has never issued regulations implementing this requirement, it has published detailed guidance interpreting this requirement and establishing reporting procedures.²

The requirement to report applies to individuals and business entities that obtain reportable information.³ Substantial risk information generally must be received in writing by EPA within 30 calendar days after the information was first obtained.⁴ Individual employees of a company may be personally liable for failure to report

¹TSCA § 8(e), 15 U.S.C.A. § 2607(e).

²See Revised Statement of Interpretation and Enforcement Policy: Notification of Substantial Risk, 68 Fed. Reg. 33129, 33137 (June 3, 2003). With the publication of the Revised Statement of Interpretation in 2003, EPA addressed industry's longstanding complaints about the inadequacy of EPA's Section 8(e) guidance and implemented revisions that were first proposed by the Agency in 1993 and 1995. See 68 Fed. Reg. 33131 to 33137. The Revised Statement of Interpretation superseded the Agency's policy statement that had been in place since 1978. See Statement of Interpretation and Enforcement Policy: Notification of Substantial Risk, 43 Fed. Reg. 11110 (Mar. 16, 1978). EPA made slight corrections to the Revised Statement of Interpretation in 2005. See Notice of Correction to TSCA Section 8(e) Reporting Guidance, 70 Fed. Reg. 2162 (Jan. 12, 2005).

³A business organization is considered to have "obtained" any information that any officer or employee capable of appreciating the significance of the information has obtained. Revised Statement of Interpretation and Enforcement Policy: Notification of Substantial Risk, 68 Fed. Reg. 33129, 33137 (June 3, 2003).

⁴Revised Statement of Interpretation and Enforcement Policy: Notification of Substantial Risk, 68 Fed. Reg. 33129, 33138 (June 3, 2003). A person is deemed to have first obtained substantial-risk information at the time he first comes into possession of or knows of such information, including information of which a prudent person similarly situated could reasonably be expected to possess or have knowledge. 68 Fed. Reg. 33137.

substantial risk information to EPA. However, if a company establishes, internally publicizes, and affirmatively implements adequate procedures to collect substantial risk information from employees and report that information to EPA,⁵ then the internal submission of pertinent information by employees will relieve them of their statutory reporting obligation.

According to EPA's guidance, whether a chemical substance presents a "substantial risk of injury to health or the environment" that must be reported depends on the type and seriousness of the effects involved and the levels of exposure to the substance.⁶ For example, where a chemical substance causes certain human health effects, the mere fact that the substance is in commerce constitutes sufficient evidence of exposure and therefore triggers the duty to report.⁷ In contrast, where exposure to a chemical substance causes environmental effects, substantial risk information need not be reported to EPA unless the level of exposure, or potential level of exposure, is significant.⁸

For information to be reportable under Section 8(e), it need not conclusively indicate a substantial risk, but rather must "reliably ascribe the effect to the chemical."⁹ Designed, controlled studies, as well as reports and studies of uncontrolled, undesigned circumstances, may be reportable as evidence that a chemical substance causes a certain effect.¹⁰ EPA has stressed that companies should not discount the significance of risk information based upon a "weight-of-the-evidence" risk assessment.¹¹

Certain types of information that are otherwise available to EPA need not be reported. For example, substantial risk information that need not be reported to

⁵At a minimum, these procedures must: "(1) [s]pecify the information that officers and employees must submit; (2) indicate how such submissions are to be prepared and the company official to whom they are to be submitted; (3) note the Federal penalties for failing to report; and (4) provide a mechanism for promptly advising officers and employees in writing of the company's disposition of the report, including whether or not the report was submitted to EPA" (and if the report was not submitted, informing employees of their right to report the information to EPA). Revised Statement of Interpretation and Enforcement Policy: Notification of Substantial Risk, 68 Fed. Reg. 33129, 33137 (June 3, 2003).

⁶Revised Statement of Interpretation and Enforcement Policy: Notification of Substantial Risk, 68 Fed. Reg. 33129, 33138 (June 3, 2003).

⁷See Revised Statement of Interpretation and Enforcement Policy: Notification of Substantial Risk, 68 Fed. Reg. 33129, 33138 (June 3, 2003). Human health effects for which substantial risk information should be reported include any instance of, or evidence suggesting the possibility of, cancer, birth defects mutagenicity, death, or serious or prolonged incapacitation. 68 Fed. Reg. 33138.

⁸See Revised Statement of Interpretation and Enforcement Policy: Notification of Substantial Risk, 68 Fed. Reg. 33129, 33138 (June 3, 2003). The policy guidance specifies that significant levels of exposure to a chemical substance known to cause the following environmental effects must be reported using normal procedures: pronounced bioaccumulation; any non-trivial adverse effect associated with a chemical substance known to have bioaccumulated to a pronounced degree or to be widespread in environmental media; ecologically significant changes in species' interrelationships; and facile degradation or transformation of certain chemicals known to present unacceptable risks. 68 Fed. Reg. 33138. However, if the amount of environmental contamination by a chemical is so great that it seriously threatens humans with cancer, birth defects, mutation, death, or prolonged incapacitation, or threatens non-human species with large-scale population destruction, then the contamination incident must be reported to EPA by telephone as soon as possible. 68 Fed. Reg. 33138.

⁹68 Fed. Reg. 33139.

¹⁰See Revised Statement of Interpretation and Enforcement Policy: Notification of Substantial Risk, 68 Fed. Reg. 33129, 33139 (June 3, 2003). The Revised Statement of Interpretation lists a variety of study and report types that may form the basis of reportable information, including preliminary results of toxicity tests, epidemiological studies, occupational health surveys, patterns of complaints received by medical departments, and direct observations of environmental effects (e.g., changes in animal or plant populations). 68 Fed. Reg. 33139.

¹¹See 56 Fed. Reg. 4128 (Feb. 1, 1991).

EPA under Section 8(e) includes data that corroborate information already known about the adverse effects of a substance.¹² In 2015, the Environmental Appeals Board (EAB) set aside a \$2.5-million penalty that an administrative law judge had imposed on a producer of hexavalent chromium chemicals for failure to submit information to EPA under Section 8(e). The EAB stated that a study linking hexavalent chromium exposure to lung cancer was reportable information, but that the study was exempt from reporting under the exemption for corroborative information because a “consistent theme” of the Agency’s own guidance on this exemption was that information was non-corroborative only when it showed that the effects of a chemical substance or mixture were “of a more serious degree or a different kind” than previously known. In this case, “more serious” would have required either that the new study show adverse effects occurring at lower dose levels or in a shorter timeframe than an earlier study.¹³ The EAB made a point of noting that it would have affirmed the administrative law judge’s decision if it were solely guided by the text of TSCA Section 8(e), but added that the EPA guidance had constrained the statute’s “broad reach.” The EAB’s decision was also notable for its conclusion that the enforcement action was not time-barred, because the failure to comply with the reporting obligation was a continuing violation.

EPA may respond to a Section 8(e) “substantial risk” notice in a number of ways. EPA may require the submission of additional information about the chemical substance under other TSCA authority to help in assessing the risks identified in the notice. The Agency may also refer the substantial risk notice to other federal agencies that have an interest in the substance. Of course, the chemical substance also may be considered for regulation under Section 6 of the amended statute.

EPA tries to ensure public access to substantial risk information. Nonconfidential versions of Section 8(e) submissions are placed in EPA’s ChemView database.¹⁴ EPA also prepares and makes available to the public a summary of each submission. The summaries contain a brief narrative of the facts of a submission, but do not contain any Agency analysis.

Many companies submit “For Your Information” (FYI) notices, transmitting information that they believe would be of interest to the Agency, but which, in their view, does not meet the criteria for submission under Section 8(e). Although EPA historically has routinely accepted and processed FYI notices, EPA has stated that

¹²See Revised Statement of Interpretation and Enforcement Policy: Notification of Substantial Risk, 68 Fed. Reg. 33129, 33139 (June 3, 2003). In addition, substantial risk information that need not be reported to EPA under Section 8(e) includes information that is obtained from one of the following sources: (1) an EPA study or report; (2) official publications of other Federal agencies; (3) scientific publications available electronically or in hard copy; (4) scientific databases; (5) radio or television news broadcasts; (6) recorded public scientific conferences held in the United States; or (7) public scientific conferences sponsored or co-sponsored by EPA. See Revised Statement of Interpretation and Enforcement Policy: Notification of Substantial Risk, 68 Fed. Reg. 33129, 33139 (June 3, 2003). Nor need substantial risk information be reported to EPA under Section 8(e) if the same information will be reported to the Agency or a State within 90 calendar days (or fewer, depending on the situation) pursuant to a mandatory reporting requirement under another Federal statute. 68 Fed. Reg. 33139.

¹³In re Elementis Chromium, Inc., TSCA Appeal No. 13-03 (Final Decision and Order Mar. 13, 2015).

¹⁴*Introduction to ChemView*, EPA, <https://www.epa.gov/assessing-and-managing-chemicals-under-tsc/introduction-chemview> (last updated May 19, 2016). EPA will disclose to the public health and safety data submitted in a Section 8(e) notice of substantial risk that is claimed as confidential, but only to the extent allowed under EPA’s regulations concerning management of confidential business information. See Revised Statement of Interpretation and Enforcement Policy: Notification of Substantial Risk, 68 Fed. Reg. 33129, 33139 (June 3, 2003); see also 40 C.F.R. §§ 2.201 to 2.215, 2.306 (EPA regulations concerning management of confidential business information).

FYI notices do not satisfy Section 8(e).¹⁵

VI. IMPORT AND EXPORT

§ 16:39 Import certification

Persons who import chemical substances in bulk must comply with certification requirements, set forth in regulations promulgated under TSCA Section 13, but which are generally implemented and enforced by the U.S. Customs and Border Protection Service.¹

The import certification rule provides that any person who imports a chemical substance in bulk or as part of a mixture must certify that all of the chemical substances in the shipment are either: (1) subject to TSCA and comply with the applicable rules and orders thereunder (a “positive certification”); or (2) not subject to TSCA (a “negative certification”).² In effect, a positive certification is a statement that the chemical substance (or the components of a mixture) may be lawfully imported because it is listed on the TSCA Inventory (or exempt from the requirements for PMN reporting), and that the imported substance (or any component of the mixture) is in compliance with any applicable SNURs or regulations issued under Sections 6 and 7.³ A negative certification means that the substance is specifically excluded from the definition of “chemical substance” under TSCA, and is therefore exempt from TSCA regulation.⁴

The import certification rule sets forth specific language for each type of certification, which must appear on the import documentation and be signed by an employee or authorized agent of the importer. Importers of repeat shipments of the same products from the same suppliers may file a “blanket certification” with the U.S. Customs and Border Protection Service. This certification will cover all shipments of those products for one year. The import documentation for those shipments must contain a statement referencing the blanket certification, but need not be signed.⁵ As a policy matter, to date, EPA has not required certifications for imported manufactured articles, although it has the authority to do so.⁶

The 2016 amendments to TSCA did not modify Section 13 requirements. However, during 2016, U.S. Customs and Border Protection adopted amendments to the import certification rules to provide an electronic option for submission of TSCA

¹⁵TSCA 8(e) Reporting Guide (June 1991), available at <https://www.epa.gov/assessing-and-managing-chemicals-under-tsca/tsca-section-8e-reporting-guide>.

[Section 16:39]

¹The pertinent U.S. Customs and Border Protection Service regulations are set forth at 19 C.F.R. §§ 12.118 to 12.127. EPA has published an import certification policy that appears at 40 C.F.R. § 707.20.

²19 C.F.R. § 12.121(a).

³The certification does not address chemical substances subject to Section 4 test rules *per se*.

⁴These substances, which are excluded because they are regulated by other laws, include any pesticides imported for use as a pesticide; any food, food additive, drug, cosmetic, or device, as defined by the Federal Food, Drug, and Cosmetic Act; any source material, spent nuclear material, or byproduct material, as defined by the Atomic Energy Act of 1954; and firearms and ammunitions. TSCA § 3(2)(B), 15 U.S.C.A. § 2602(2)(B). Tobacco and tobacco products are special cases. Although they are exempt from TSCA, they do not require any certification, positive or negative, because there are controls on the importation of those items under other statutes.

⁵See 19 C.F.R. § 12.121(a)(2)(ii).

⁶See 19 C.F.R. §§ 12.120(a), 12.121(b). An “article” is an item manufactured to a specific shape or design for a particular end use. EPA does not consider metal ingots to be articles, because they are manufactured in a particular shape “for the purpose of shipping convenience” and their shape “has no function in the end use.” EPA, Toxic Substances Control Act: A Guide for Chemical Importers/Exporters; An Overview 17 (Apr. 1991).

import certifications.⁷

§ 16:40 Export notification

Section 12(b) of TSCA requires notification to the EPA Administrator by persons who intend to export a chemical substance or mixture for which: (1) the submission of information is required under TSCA Section 4 or 5(b); (2) an order has been issued under Section 5; (3) a rule has been proposed or promulgated under Section 5 or 6; or (4) relief has been granted under Section 5 or 7.¹ Notice is also required for exports of PCBs or PCB articles.² After receiving notice from an exporter, EPA is required to notify the importing country's government of the chemical substance's regulatory status.³

For most covered substances, the exporter need only submit a one-time notice in connection with the first export or intended export of the chemical substance to a particular country. The notice must be postmarked within seven days of forming the intent to export or actual export, whichever is earlier.⁴ A notice of intent to export must be based on a definite contractual agreement to export the regulated chemical substance, or an equivalent intracompany agreement.⁵

EPA amended its rules in 1993, and again in 2006, to streamline the notification process.⁶ Initially, annual notification to EPA was required for all covered chemical substances or mixtures. Today, one-time notification is allowed for shipments of chemical substances or mixtures subject to Section 12(b), except those triggered by actions under Section 5(f), 6, or 7. EPA's 2006 rule also adopted *de minimis* concentration levels below which notification is not required.⁷

The 2016 amendments updated and expanded provisions added previously to Section 12(c) by the Mercury Export Ban Act. Pursuant to the 2016 amendments, EPA must create and maintain a list of certain mercury compounds for which export will be prohibited and publish the initial list of mercury compounds prohibited from export by mid-September 2016.⁸ Effective January 1, 2020, the amended statute prohibits export of: mercury (I) chloride or calomel; mercury (II) oxide; mercury (II) sulfate; mercury (II) nitrate; and cinnabar or mercury sulphide. An exception exists for mercury compounds exported to member countries of the Organisation for Economic Co-operation and Development for environmentally sound disposal, on the condition that no mercury or mercury compounds so exported are to be recovered, recycled, or reclaimed for use, or directly reused, after such export.⁹

VII. PROTECTING CONFIDENTIAL BUSINESS INFORMATION

§ 16:41 In general

As discussed in Part V, TSCA gives the EPA Administrator extremely broad

⁷See 81 Fed. Reg. 94980 (Dec. 27, 2016); 81 Fed. Reg. 59157 (Aug. 29, 2016) (proposed rule).

[Section 16:40]

¹TSCA § 12(b), 15 U.S.C.A. § 2611(b); 40 C.F.R. § 707.60(a).

²40 C.F.R. § 707.60(d).

³40 C.F.R. § 707.70.

⁴40 C.F.R. § 707.65(a)(3).

⁵40 C.F.R. § 707.65(a)(3).

⁶58 Fed. Reg. 40238 (July 27, 1993) (codified at 40 C.F.R. § 707.65(a)(2)(ii)); 71 Fed. Reg. 66234 (Nov. 14, 2006).

⁷See 40 C.F.R. § 707.60(c).

⁸TSCA § 12(c)(7)(B), 15 U.S.C.A. § 2611(c)(7)(B). EPA published this list in August 2016. See 81 Fed. Reg. 58926 (Aug. 26, 2016).

⁹TSCA § 12(c)(7)(A)(i)–(iv), 15 U.S.C.A. § 2611(c)(7)(A)(i)–(v).

authority to require development, compilation, retention, and submission of information related to chemical risk. During the legislative debates that preceded TSCA's enactment, the chemical industry raised its concern that the extensive information-gathering powers created by the new law would threaten industrial trade secrets, to the detriment of business competition, research, and development of new chemicals. On the other hand, public interest organizations argued for broad disclosure of information related to chemical safety.

Congress responded to these concerns by providing that, except under limited circumstances discussed below, the Administrator may not publicly disclose information obtained under TSCA that the Freedom of Information Act exempts from disclosure as confidential commercial, financial, or trade secret information. Implementation of the confidential business information (CBI) provision was controversial. Much of the information submitted under some TSCA programs was claimed to be confidential. Public interest organizations charged that many of the claims appeared to be spurious, although industry representatives defended their practices as necessary to ensure their competitive position.¹

EPA by regulation established criteria for determining when information designated as confidential by a submitter is entitled to protection.² These criteria involve consideration of measures taken by the submitter to protect the information, a satisfactory showing that competitive harm would result from disclosure, and a finding that the information is not obtainable by other persons by legitimate means. EPA also established, for each of TSCA's information-gathering provisions, specific procedures for asserting business confidentiality claims.³

The 2016 amendments substantially revised TSCA's provisions concerning

[Section 16:41]

¹See generally Toxic Substances Control Act Oversight: Hearings Before the Subcomm. on Toxic Substances and Env'tl. Oversight of the Senate Comm. on Env't and Pub. Works, 98th Cong. (1983). Beginning in 2009, EPA undertook a reform effort to reduce the number of inappropriate confidentiality claims. The reforms were intended to support a general effort by the Agency to make information gathered under TSCA available to the public in useful form. In connection with this effort, the Agency systematically reviewed confidentiality claims in certain programs and stated it would generally deny confidentiality claims for health and safety studies which it determined were unnecessary to protect proprietary information. See 75 Fed. Reg. 29754 (May 27, 2010). The Agency subsequently issued guidance and rules revising the procedures for asserting confidentiality claims to require more up-front substantiation of claims, see, e.g., 76 Fed. Reg. 50816, 50830 (Aug. 16, 2011) (explaining change to regulations that requires submitters who assert a confidentiality claim for chemical identity also to provide substantiation for the claim at time of filing), and "challenged" industry to voluntarily declassify prior confidentiality claims. See, e.g., EPA Letter to the Fragrance Materials Association (June 4, 2010), available at https://www.epa.gov/sites/production/files/2015-07/documents/declassify_cbi1.pdf. EPA also made non-confidential and "declassified" confidential material more readily available to the public. The Agency's Chemical Data Access Tool contains significant amounts of health and safety data submitted by manufacturers under TSCA Sections 4, 5, 8(d), and 8(e), and includes many documents previously classified as confidential. Chemical Data Access Tool (CDAT), EPA, http://java.epa.gov/oppt_chemical_search.

²See 40 C.F.R. § 2.208. The Agency has discretion to update its regulations and may do so as it continues to implement the 2016 amendments.

³See, e.g., 40 C.F.R. §§ 704.7 (General Reporting and Recordkeeping Provisions for Section 8(a) Information-Gathering Rules), 707.75 (Section 12(b) export notices), 711.30 (Chemical Data Reporting), 712.15 (procedures for chemical manufacturers and processors to report production, use, and exposure-related information on listed chemical substances), 716.55 (health and safety data information), 717.19 (records of significant adverse reactions to health or the environment), 720.80 to 720.95 (premanufacture notifications), and 725.80 to 725.90 (reporting requirements and review processes for microorganisms). These procedures continue to apply after enactment of the 2016 amendments. EPA has also issued a manual, to supplement its confidentiality rules, setting forth the procedures for EPA employees, other federal employees, contractors, and contractors' employees to follow in handling information claimed as confidential under TSCA. EPA, TSCA Confidential Business Information Security Manual (Apr. 1995). The manual was revised by EPA in 2004. See 69 Fed. Reg. 20007 (Apr. 15, 2004).

confidential business information. The 2016 amendments made the process for shielding such information from disclosure more arduous, including by generally requiring that substantiation and certification be provided to EPA for new claims seeking to protect information from disclosure.⁴ The confidentiality claims will generally lapse unless the claims are re-substantiated every 10 years.⁵ In addition—as noted above in the discussion of the TSCA Inventory in Section 16:35—the 2016 amendments required that manufacturers or processors of chemical substances currently listed on the confidential portion of the Inventory provide notice to EPA if they wished to continue to shield the specific chemical identity of active substances from disclosure; EPA must review such claims.⁶ EPA must additionally screen all new claims seeking to protect the specific chemical identity of chemical substances from disclosure, as well as a “representative subset” of at least 25% of other new confidentiality claims.⁷

The 2016 amendments further specify certain types of information that are not protected from disclosure. As under the original TSCA, protection from disclosure generally does not extend to health and safety studies, except that information revealed in the context of a health and safety study should not disclose “any information, including formulas (including molecular structures) of a chemical substance or mixture, that discloses processes used in the manufacturing or processing of a chemical substance or mixture or, in the case of a mixture, the release of data disclosing the portion of the mixture comprised by any of the chemical substances in the mixture.”⁸

In addition, general information about manufacturing volumes and general descriptions of manufacturing processes or functions and uses of a substance, mixture, or article are not shielded from disclosure.⁹ For the most part, information about chemical substances or mixtures that EPA has decided to ban or phase out is no longer protected from disclosure, though requests for exceptions or delays in such disclosures can be made.¹⁰ EPA may grant such requests only if the Agency determines that a requestor has rebutted the presumption that “the public interest in the disclosure of the information outweighs the public or proprietary interest in maintaining the protection for all or a portion of the information.”¹¹

A company must assert a claim to protect information from disclosure concurrent with submission of the information to EPA.¹² To assert the claim, a company must substantiate the claim¹³ and include a statement that the company has:

1. Taken reasonable measures to protect the confidentiality of the information;
2. Determined that the information is not required to be disclosed or otherwise made available to the public under another federal law;
3. A reasonable basis to conclude that the information’s disclosure is likely to cause substantial harm to the company’s competitive position; and
4. A reasonable basis to believe that the information is not readily discoverable

⁴TSCA § 14(a), (c), 15 U.S.C.A. § 2613(a), (c).

⁵TSCA § 14(e)(1)(B)(i), 15 U.S.C.A. § 2613(e)(1)(B)(i).

⁶TSCA § 8(b)(4)(B)–(E), 15 U.S.C.A. § 2607(b)(4)(B)–(E).

⁷TSCA § 14(g)(1)(C), 15 U.S.C.A. § 2613(g)(1)(C).

⁸TSCA § 14(b)(2), 15 U.S.C.A. § 2613(b)(2).

⁹TSCA § 14(b)(3), 15 U.S.C.A. § 2613(b)(3).

¹⁰TSCA § 14(b)(4), 15 U.S.C.A. § 2613(b)(4).

¹¹TSCA § 14(g)(1)(E), 15 U.S.C.A. § 2613(g)(1)(E).

¹²TSCA § 14(c)(1)(A), 15 U.S.C.A. § 2613(c)(1)(A).

¹³TSCA § 14(c)(3), 15 U.S.C.A. § 2613(c)(3).

through reverse engineering.¹⁴

An authorized official of the company must certify that this required four-part statement and any information provided to substantiate the claim are true and correct.¹⁵

For information that was not already subject to up-front substantiation requirements prior to the 2016 amendments, EPA recommends that companies look to the following generally applicable substantiation questions set forth in the Agency's confidentiality regulations.¹⁶

Substantiation Questions¹⁷

- The portions of the information which are alleged to be entitled to confidential treatment;
- The period of time for which confidential treatment is desired by the business (e.g., until a certain date, until the occurrence of a specified event, or permanently);
- The purpose for which the information was furnished to EPA and the approximate date of submission, if known;
- Whether a business confidentiality claim accompanied the information when it was received by EPA;
- Measures taken by the business to guard against undesired disclosure of the information to others;
- The extent to which the information has been disclosed to others, and the precautions taken in connection therewith;
- Pertinent confidentiality determinations, if any, by EPA or other Federal agencies, and a copy of any such determination, or reference to it, if available;
- Whether the business asserts that disclosure of the information would be likely to result in substantial harmful effects on the business' competitive position, and if so, what those harmful effects would be, why they should be viewed as substantial, and an explanation of the causal relationship between disclosure and such harmful effects; and
- Whether the business asserts that the information is voluntarily submitted information as defined in § 2.201(i), and if so, whether and why disclosure of the information would tend to lessen the availability to EPA of similar information in the future.

EPA indicates that the answers to these substantiation questions typically form the basis of EPA final confidentiality determinations.¹⁸

The amended TSCA also requires that a claim to protect a specific chemical identity from disclosure include a structurally descriptive generic name for the chemical substance that may be disclosed.¹⁹ The generic name can protect the confidentiality of features of the chemical structure but must describe the chemical

¹⁴TSCA § 14(c)(1)(B), 15 U.S.C.A. § 2613(c)(1)(B).

¹⁵TSCA § 14(c)(5), 15 U.S.C.A. § 2613(c)(5).

¹⁶See 82 Fed. Reg. 6522, 6524 (Jan. 9, 2017) (referring to 40 C.F.R. § 2.204(e)).

¹⁷40 C.F.R. § 2.204(e)(4).

¹⁸82 Fed. Reg. at 6524. EPA indicates it is in the process of developing TSCA-specific substantiation questions that submitters could elect to use in support of CBI claims. See *What to Include in CBI Substantiations—General Substantiation Questions*, EPA, <https://www.epa.gov/tsc-cbi/what-include-cbi-substantiations#general> (last updated June 16, 2020).

¹⁹TSCA § 14(c)(1)(C), 15 U.S.C.A. § 2613(c)(1)(C).

structure “as specifically as practicable.”²⁰ The 2016 amendments required EPA to issue guidance for development of generic names. EPA issued the guidance in 2018.²¹

Information Generally Not Subject to Substantiation Requirements²²

- Specific information describing the processes used in manufacture or processing of a chemical substance, mixture, or article
- Marketing and sales information
- Information identifying a supplier or customer
- Details of the full composition of a mixture and the respective percentages of constituents
- Specific information regarding the use, function, or application of a chemical substance or mixture in a process, mixture, or article
- Specific production or import volumes
- Prior to the date on which a chemical substance is first offered for commercial distribution, the specific chemical identity of the chemical substance, including the chemical name, molecular formula, Chemical Abstracts Service number, and other information that would identify the specific chemical substance, if the specific chemical identity was claimed as confidential at the time it was submitted in a notice under Section 5

EPA must approve, deny, or approve in part and deny in part a confidentiality claim within 90 days of receipt of the claim.²³ If EPA denies a claim, the Agency must provide a written statement of reasons.²⁴ EPA cannot disclose information until 30 days after a company receives notification of EPA’s intent to disclose the information.²⁵

If EPA approves a claim, information not subject to substantiation requirements is protected until the person that asserted the confidentiality claim withdraws it or EPA becomes aware that the information does not qualify for protection.²⁶ Information subject to substantiation requirements is protected for a 10-year period from the date a confidentiality claim was asserted.²⁷

Failure to comply with the procedures established by EPA may result in waiver of the confidentiality claim. In 2019, EPA announced that, as of August 15, 2019, it would no longer send notices of deficiency when TSCA submissions do not satisfy EPA requirements—including substantiation requirements—for asserting a confidentiality claim.²⁸ EPA had followed the practice of issuing notices of deficiency and allowing 30 days for correction of the deficiencies since March 2017, in the early days of the implementation of the 2016 amendments’ enhanced requirements for confidentiality claims. In its announcement of the change in policy, EPA said the 2016 amendments’ requirements, including the requirement for up-front substantiation, were no longer new and that regulated parties had “ample notice” of these

²⁵TSCA § 14(g)(2)(A)–(B), 15 U.S.C.A. § 2613(g)(2)(A)–(B).

²⁶TSCA § 14(e)(1)(A), 15 U.S.C.A. § 2613(e)(1)(A).

²⁷TSCA § 14(e)(1)(B)(i), 15 U.S.C.A. § 2613(e)(1)(B)(i). A person can withdraw the confidentiality claim before the end of the 10-year period, or EPA may become aware that the information does not qualify for protection and take action to require reassertion and substantiation or to disclose the information. TSCA § 14(e)(1)(B)(ii), 15 U.S.C.A. § 2613(e)(1)(B)(ii).

²⁸84 Fed. Reg. 33939 (July 16, 2019).

obligations.

If EPA has approved a claim to protect information from disclosure, the Agency must notify the person who asserted the claim 60 days prior to the expiration of the 10-year confidentiality period.²⁹ The person then has an opportunity to request an extension. EPA may grant an unlimited number of 10-year extensions so long as the requestor establishes that extensions are needed and all EPA requirements are met.³⁰

EPA may, at its discretion, require the reassertion and substantiation of confidentiality claims in three situations:

1. After a chemical substance is designated as a high-priority substance under Section 6(b)³¹
2. For inactive substances “reactivated” as active substances on the Inventory under Section 8(b)³²
3. If EPA determines that disclosure of certain currently confidential information would be important to assist the Agency in conducting risk evaluations or promulgating rules under Section 6.³³

There are also three situations in which EPA *must* review confidentiality claims and require reassertion and substantiation or resubstantiation:

1. The Agency has received a FOIA request and review is “necessary to determine whether the information qualifies for an exemption from disclosure”³⁴
2. The Agency has a reasonable basis to believe that the information does not qualify for protection from disclosure under Section 14
3. The Agency determines that a chemical substance presents an unreasonable risk of injury to health or the environment under Section 6(b).³⁵

If EPA determines in these situations that the confidentiality claim is still valid, the information is protected for 10 years from the date of EPA’s determination, though EPA may impose subsequent requirements for resubstantiation within the 10-year period if the statutory criteria are met.³⁶

TSCA has always permitted confidential information to be disclosed to certain people and in certain situations. The 2016 amendments amended and expanded these exceptions. Although EPA generally may not disclose information claimed as confidential until 30 days after providing notice to the person who asserted the claim,³⁷ TSCA provides for exceptions to the 30-day notice requirement, including in circumstances that constitute exceptions to protection from disclosure. The following table sets forth exceptions to protection from disclosure and the notification requirement associated with the exception.

²⁹TSCA § 14(e)(2)(A), 15 U.S.C.A. § 2613(e)(2)(A).

Exceptions to Protection from Disclosure and Applicable Notice Requirements		
Notice Requirement	Reason for Disclosure³⁸	Statutory Provision
15 days	Disclosure is necessary to protect health or the environment against an unreasonable risk	TSCA § 14(d)(3), (g)(2)(C)(i), 15 U.S.C.A. § 2613(d)(3), (g)(2)(C)(i)
	Disclosure to a state, local, or tribal entity that has an agreement with EPA to ensure that the entity will take appropriate measures to protect confidentiality	TSCA § 14(d)(4), (g)(2)(C)(i), 15 U.S.C.A. § 2613(d)(4), (g)(2)(C)(i)
	Disclosure to a federal, state, or tribal health or environmental professional or a treating physician or nurse in a nonemergency situation where individuals are exposed to or there has been an environmental release of or exposure to a substance, for purposes of diagnosis or treatment or response to an environmental release or exposure	TSCA § 14(d)(5), (g)(2)(C)(i), 15 U.S.C.A. § 2613(d)(5), (g)(2)(C)(i)
	Disclosure in response to a request from a congressional committee	TSCA § 14(g)(2)(C)(i), (j), 15 U.S.C.A. § 2613(g)(2)(C)(i), (j)
“As soon as practicable after disclosure of the information”	Disclosure in the event of an emergency to a treating or responding physician, nurse, agent of a poison control center, public health or environmental official of a state, local, or tribal government, or first responder if other criteria are met	TSCA § 14(d)(6), (g)(2)(C)(ii), 15 U.S.C.A. § 2613(d)(6), (g)(2)(C)(ii)
No notice	Disclosure is necessary to protect health or the environment against an imminent and substantial harm to health or the environment	TSCA § 14(d)(3), (g)(2)(C)(i), 15 U.S.C.A. § 2613(d)(3), (g)(2)(C)(i)
	Disclosure to a federal officer or employee in connection with that person’s official duties under a federal law for protection of health or the environment or for a specific federal law enforcement purpose	TSCA § 14(d)(1), (g)(2)(C)(iii)(I), 15 U.S.C.A. § 2613(d)(1), (g)(2)(C)(iii)(I)
	Disclosure to a federal contractor and the contractor’s employees where necessary for the contractor’s satisfactory performance of the contract	TSCA § 14(d)(2), (g)(2)(C)(iii)(I), 15 U.S.C.A. § 2613(d)(2), (g)(2)(C)(iii)(I)
	Disclosure relevant to a proceeding under TSCA	TSCA § 14(d)(7), (g)(2)(C)(iii)(I), 15 U.S.C.A. § 2613(d)(7), (g)(2)(C)(iii)(I)
	Disclosure as required by another federal law	TSCA § 14(d)(8), (g)(2)(C)(iii)(I), 15 U.S.C.A. § 2613(d)(8), (g)(2)(C)(iii)(I)
Not specified in TSCA	Disclosure as required pursuant to discovery, subpoena, other court order, or any other judicial process under federal or state law	TSCA § 14(d)(9), 15 U.S.C.A. § 2613(d)(9)

TSCA provides for criminal penalties against individuals who obtain protected information pursuant to Section 14 and willfully disclose the information to anyone not entitled to receive it.³⁹

VIII. ENFORCEMENT AND JUDICIAL REVIEW

§ 16:42 Prohibited conduct

Section 15 of TSCA, which defines the conduct prohibited by the statute, makes it

³⁸For disclosure requirements to apply, Section 14 in some cases specifies other criteria beyond those described in this table.

³⁹TSCA § 14(h)(1), 15 U.S.C.A. § 2613(h)(1).

unlawful to fail to comply with any requirement of TSCA's core statutory provisions, as well as to fail to comply with any rule promulgated, order issued, or consent agreement entered into under the core provisions, or with any requirement of or rule promulgated or order issued under the Asbestos Hazard Emergency Response Act (Title II of TSCA).¹ Failure to maintain, submit, or permit inspection of required records, reports, notices, or other information, and refusal to permit entry for inspection, also constitute violations.² The enforcement provision similarly makes it unlawful "to use for commercial purposes" any chemical substance while knowing, or having reason to know, that the substance was manufactured, processed, or distributed in commerce in violation of Section 5 or 6 of TSCA or a rule or order issued under Section 5 or 6, or in violation of an order issued in a judicial action brought under Section 5 or 7.³

§ 16:43 Civil and criminal enforcement

Administrative civil penalty assessments are EPA's primary tools for enforcing TSCA. Civil penalties of up to \$40,500 per day,¹ for each violation, may be levied by administrative order.² Civil penalty proceedings, which are governed by EPA's Consolidated Rules of Practice,³ are initiated by service of a complaint. The respondent may, in the answer, demand a hearing before an administrative law judge (ALJ). The respondent may also request a settlement conference. Orders assessing civil penalties are enforceable by federal district courts and are reviewable by the federal courts of appeals.⁴ Most civil penalty proceedings are resolved without hearings, by entry of consent orders.

A knowing or willful violation of TSCA constitutes a criminal offense, punishable by a fine of up to \$50,000 per day for each day of the violation, a term of imprisonment of one year, or both.⁵ In practice, criminal sanctions are normally reserved for the worst cases of misconduct, considering the violator's intent, the impact of the violation on human health or the environment, the effect on EPA's regulatory functions, and the violator's compliance record.⁶ The 2016 amendments created a new category of sanctions for knowing and willful TSCA violations where the person "knows at the time of the violation that the violation places an individual in im-

[Section 16:42]

⁴TSCA § 16(a)(3)–(4), 15 U.S.C.A. § 2615(a)(3)–(4).

⁵TSCA § 16(b)(1), 15 U.S.C.A. § 2615(b)(1).

⁶Criminal cases under TSCA have been rare; however, at least one PMN violation was prosecuted criminally and other examples of criminal cases have focused on lead and asbestos abatement projects that have been improperly performed, resulting in potential risks to human health and the environment.

minent danger of death or serious bodily injury.”⁷ Such violations are punishable by a fine of up to \$250,000, imprisonment for up to 15 years, or both. Organizations convicted of such violations can be penalized up to \$1,000,000 per violation.

The EPA Administrator may seek injunctive relief from ongoing violations of TSCA. Federal district courts are authorized to restrain violations and to compel persons, who manufacture chemical substances or mixtures in violation of TSCA, to notify chemical distributors and other persons, to give public notice of risk of injury, and to replace or repurchase their products.⁸ The court also may order seizure of such substances and mixtures.⁹

§ 16:44 Civil penalty calculation

The vast majority of TSCA cases are resolved through civil penalty proceedings. In imposing civil penalties, EPA is required by statute to consider the nature, circumstances, extent, and gravity of the violation, as well as the violator’s ability to pay, the effect of the penalty on the violator’s ability to do business, any history of prior similar violations, the degree of culpability, and “such other matters as justice may require.”¹ To implement this provision, EPA has issued general penalty assessment guidelines,² as well as specific enforcement response policies for certain sections of TSCA, which it uses to calculate the penalties it will seek in a civil administrative complaint.³ In negotiating settlements with EPA, it is advantageous to justify the reductions sought based on specific provisions of the policy. It is important to understand, however, that in a contested enforcement proceeding, the ALJ is not bound by EPA’s penalty calculations or its penalty policy.⁴

The enforcement policies provide specific rules for determining a “gravity-based penalty,” which varies according to the circumstances and extent of the violation, as defined by the enforcement policy. The gravity-based penalty for a single violation of TSCA can range from a notice of warning to a high of \$45,500 for significant offenses. The enforcement policies also specify how the gravity-based penalty will be multiplied for violations that persist beyond one day.

Once determined, the gravity-based penalty, may be reduced substantially based on a number of other factors. Many of these adjustments depend on the company’s actions after discovering the violation. If a company voluntarily discloses a violation to EPA, it may receive a reduction of the assessed penalty of 25%. Immediate disclosure of the violation (i.e., within 30 days of discovery) earns an additional 25% reduction in penalties. A further reduction of 15% may be granted if the company takes steps to mitigate the violation—for example, by immediately ceasing

⁴See, e.g., In the Matter of Caschem, Inc., Docket No. TSCA-PMN-89-0106 (EPA Oct. 30, 1992), at 8 (“[ALJs] have not uncommonly departed from provisions in penalty policies . . . where the need to do so appeared clear[.]”).

manufacture and distribution and quarantining existing stocks of chemical substances manufactured in violation of Section 5. Finally, further penalty reductions may be made depending on the company's attitude, culpability, prior compliance history, and ability to pay.⁵ Beyond the reductions for voluntary disclosure, EPA generally will not further reduce penalties when the entity involved received an economic benefit from the violation.

§ 16:45 EPA's investigatory power

Section 11 of TSCA gives the Administrator broad authority to inspect any facility or conveyance in which chemical substances, mixtures, or products subject to TSCA are manufactured, processed, stored, or transported.¹ The inspector must first present appropriate credentials and a written notice. The inspection may extend to all records, processes, and facilities relating to compliance with TSCA. Financial, sales, pricing, and personnel and research data not required by TSCA may be inspected only if described with specificity in the written notice.² Refusal to permit entry for inspection is a violation of TSCA.

The Administrator also may issue subpoenas requiring the attendance of witnesses and the production of reports, papers, documents, answers to questions, "and other information that the Administrator deems necessary."³ The recipient of a subpoena issued under Section 11 may refrain from complying with it, without penalty, until directed otherwise by a federal court order obtained by the Administrator.⁴ The potential breadth of EPA's subpoena power under Section 11 is illustrated by the 1994 issuance of subpoenas to 95 U.S. firms operating manufacturing plants along the border between the United States and Mexico. These subpoenas demanded that the firms submit comprehensive chemical release data.⁵

More recently, EPA used its Section 11 subpoena authority to gather information from producers of chlorinated paraffins (resulting in an enforcement case settled for \$1.4 million), and in the same year sought information from Halliburton concerning chemical substances used in hydraulic fracturing.⁶

§ 16:46 Petitions for rulemaking

Under Section 21 of TSCA, private parties may petition the Administrator to is-

⁵EPA may also increase the penalty by up to 15% if the violator displays an unsatisfactory attitude.

sue, amend, or repeal any rule under TSCA. If the Administrator denies the petition or fails to act on it within 90 days, the petitioner may commence a civil action in federal district court to compel the Administrator to initiate the requested rulemaking proceeding.¹ EPA has issued guidance on preparing citizens' petitions under this provision.²

Section 21 rulemaking petitions have been filed by a variety of interested parties, ranging from environmental groups seeking to control the sale of lead fishing sinkers, to labor unions requesting testing of chemical substances to which workers are exposed, to members of the regulated community seeking relaxation of rules that apply to them.³ For example, a coalition of environmental justice groups, as well as a county board of supervisors, filed a series of rulemaking petitions attempting, through novel uses of TSCA, to address pollution along the border between the United States and Mexico. Although each of the petitions was denied or withdrawn, EPA nonetheless agreed to help fund monitoring efforts and to seek chemical release information from area industries under TSCA Section 11.⁴

Recent Section 21 petitions include those asking the Agency to prohibit fluoridation of drinking water,⁵ and to bar oil refineries from using hydrofluoric acid in manufacturing processes.⁶ Other petitions requested that EPA address risks associated with cadmium in consumer products,⁷ formaldehyde emissions from composite wood,⁸ lead in fishing tackle,⁹ ingredients used in household air fresheners,¹⁰ substances used in oil and gas exploration and hydraulic fracturing,¹¹ anthropogenic emissions of carbon dioxide,¹² and mercury, mercury compounds, and mercury-added products.¹³ EPA maintains an online database of the Section 21 petitions it has received.¹⁴

If EPA denies a petition or does not grant or deny a petition within 90 days, the petitioner may file a lawsuit to compel EPA to initiate a rulemaking proceeding.¹⁵ If the action sought in the petition is a rulemaking proceeding under Section 4, 6, or 8 or a Section 4 or 5(e) order, the petitioner “shall be provided an opportunity to have such petition considered by the court in a de novo proceeding” where the petitioner must demonstrate by a preponderance of the evidence—which may include expert

witness testimony—that the standard for taking the requested action is met.¹⁶ De novo review is not available where a petition seeks modifications to an existing rule.¹⁷ The court may allow EPA to defer initiating the requested action if “the extent of the risk to health or the environment alleged by the petitioner is less than the extent of risks to health or the environment with respect to which the Administrator is taking action under [TSCA] and there are insufficient resources available . . . to take the action requested by the petitioner.”¹⁸

Courts may award fees for attorneys and expert witnesses in these lawsuits.¹⁹

§ 16:47 Citizen suits

TSCA’s citizen suit provision empowers a private party to bring an action to restrain an ongoing violation of TSCA, or to compel performance of a nondiscretionary duty by EPA.¹ The court has discretion to award the costs of the suit and reasonable attorneys and expert witness fees to either party.² However, civil penalties may not be applied against the defendant in a citizen suit.³ The citizen suit provision has rarely been used, potentially due to this lack of monetary relief.

§ 16:48 Judicial review of EPA rulemaking

Section 19 of TSCA creates exclusive jurisdiction in the federal courts of appeals for judicial review of EPA TSCA rulemaking and for review of testing orders under Section 4, orders imposing risk management requirements for new chemical substances under Section 5(e) or 5(f), and orders designating chemical substances as low-priority pursuant to Section 6.¹ A petitioner must file its request for review within 60 days after promulgation of the challenged rule. Venue is proper in the District of Columbia Circuit or in the circuit in which the petitioner resides or has a principal place of business, although actions challenging a low-priority designation under Section 6(b)(1)(B)(ii) may be brought only in the D.C. Circuit.²

The statute specifies the standard of review applicable to TSCA rulemaking. Test rules promulgated under Section 4, significant new use rules issued under Section 5, and rules regulating chemical substances under Section 6 (including rules regulating PCBs) must be set aside “if the court finds that the rule is not supported by substantial evidence in the rulemaking record taken as a whole.”³ The “substantial evidence” standard also applies to judicial review of testing orders under Section 4,

orders imposing risk management requirements for new chemical substances under Section 5(e) or 5(f), and orders designating chemical substances as low-priority pursuant to Section 6.⁴ This standard is “generally considered to be more rigorous” than the arbitrary and capricious standard typically applied to review of agency action.⁵ All other rulemaking and orders under TSCA are subject to the standard of review set forth in the Administrative Procedure Act.⁶

IX. RELATIONSHIP TO OTHER LAWS

§ 16:49 Coordination with other federal laws

Congress was well aware that the broad reach of TSCA’s regulatory jurisdiction would overlap with other statutes that could be used to control chemical risk, including laws administered by agencies other than EPA. Reflecting an effort to avoid confusing and duplicative rulemaking, Section 9(a) of TSCA defines procedures for coordinating action with other agencies. When EPA identifies a risk that can (in the Administrator’s discretion) be controlled by another agency, the Agency must issue a report to the other agency detailing the risk and asking the other agency to determine if the described risk can be regulated under the other agency’s statutes.¹ If the receiving agency issues an order rejecting EPA’s finding of risk, or initiates action to control the risk within 90 days, EPA may not take action under Section 6(a) or 7 to mitigate the risk.²

This provision has been controversial. EPA has sometimes interpreted it to require deferral of regulatory matters to other agencies, while at other times EPA policy has been to retain regulatory authority when it has determined that rulemaking under TSCA would be more efficient than “piecemeal” rulemaking under other statutes.³

The 2016 amendments to TSCA mandate EPA take appropriate or applicable action under Section 6(a) or 7 if the receiving agency does not either issue a timely (i.e., within a timeframe specified by EPA) order rejecting EPA’s risk finding or timely respond to EPA’s report and initiate action to protect against the risk.⁴ The 2016 amendments also attempt to clarify that EPA’s referral of an identified risk to another agency does not relieve EPA of its obligation to take actions to address risks not identified in EPA’s report to the other agency.⁵

EPA has executed Memoranda of Understanding with both OSHA and the Consumer Product Safety Commission (CPSC) that define the administrative procedures to be used in coordinating the respective agencies’ duties under Section

⁴TSCA § 19(c)(1)(B)(i)(II), 15 U.S.C.A. § 2618(c)(1)(B)(i)(II).

⁵TSCA § 9(a)(5), 15 U.S.C.A. § 2608(a)(5).

9.⁶ The memoranda call for EPA to semiannually issue written notices that identify chemical substances undergoing risk assessment that may later be referred to the other agency. Actual Section 9 referral of a particular chemical substance by EPA will be preceded by informal notice and exchange of information, as will the subsequent formal response by the other agency. The agreements aim to ensure better coordination of the regulatory agendas.

In 2008, Congress passed the Consumer Product Safety Improvement Act (CPSIA), which overlaps with TSCA's regulation of lead. The CPSIA generally classifies children's products with more than 600 parts per million of lead as banned hazardous substances under the Federal Hazardous Substances Act.⁷ Under the CPSIA, children's products were required to contain less than 300 parts per million of lead by August of 2009. That limit dropped to 100 parts per million in August of 2011. The CPSIA additionally required CPSC to lower the permissible level of lead in lead-based paint from .06% to .009% by August of 2009.⁸ These new requirements have resulted in indirect controls on the use of a substance that is also regulated under TSCA.

TSCA also addresses coordination of EPA actions under TSCA with actions taken under other statutes administered by EPA.⁹ Where health and environmental risks associated with a chemical substance or mixture can be eliminated or sufficiently reduced with actions taken under other federal laws, EPA is instructed to use those authorities unless the Agency determines that it is in the public interest to take action under TSCA.¹⁰ The 2016 amendments specify that the "public interest" determination must be based on consideration of "all relevant aspects of the risk" and "a comparison of the estimated costs and efficiencies of the actions to be taken."¹¹

§ 16:50 Preemption of state law

The 2016 amendments to TSCA expanded its preemptive effect on state laws but left openings for state action. In general, final EPA regulatory actions on chemical substances will preempt state regulation of such substances, as well as regulation by political subdivisions of states such as counties and cities. Yet this preemptive effect is subject to various exceptions and opportunities for state requests for waivers.¹

In particular, TSCA now prohibits states from establishing or continuing to enforce statutes, regulations, and other administrative actions that prohibit or restrict a chemical substance after EPA has determined that the substance does not present an unreasonable risk or after EPA issues a final risk management rule to address the substance's risks.² In addition, states cannot require development of information about a chemical substance if the requirement is reasonably likely to produce the same information already required by an EPA rule, consent agreement, or

order under Section 4, 5, or 6.³ States also are barred from requiring notification of a use of a chemical substance that EPA has specified as a significant new use and for which EPA has required notification.⁴

EPA's formal announcement of the scope of a risk evaluation the Agency is undertaking for an existing chemical substance will initiate a period of temporary preemption. During this period, states may not impose new requirements that affect activities within the scope of the EPA's assessment.⁵ States may, however, continue to enforce existing requirements during the temporary or "pause" preemption period. The preemptive effect will continue until either EPA completes its evaluation or 30 months have elapsed, whichever first occurs. When this pause preemption period concludes, a state may impose a new chemical-regulatory requirement unless EPA has determined that the substance does not present an unreasonable risk to human health or the environment under the intended and foreseeable conditions of use.⁶ If EPA issues a final risk management rule limiting or prohibiting a chemical substance under certain intended or foreseeable uses, state actions would again be preempted as of the effective date of the new EPA rule.

State statutory and regulatory actions taken prior to April 22, 2016, are not preempted. Nor are new actions taken under an existing state law that was in effect on August 31, 2003—Congress selected this date to ensure the continued viability of actions under California's Proposition 65.⁷

States will still be permitted to adopt regulations identical to federal standards issued pursuant to TSCA.⁸ Thus, both EPA and the states may enforce their respective regulations if the state rule is identical, but penalties will be capped at the federal statutory maximum.⁹ In addition, state requirements that implement a "reporting, monitoring, or other information obligation" are not preempted.¹⁰ States may also take actions under the authority of another federal law or, in certain circumstances, under a state law related to water quality, air quality, or waste management.¹¹

States may seek waivers from either the permanent or temporary preemptive effect of an EPA decision under certain conditions.¹² Applications for waivers are subject to public notice and comment, and EPA's determinations on waiver applications are subject to judicial review.¹³

TSCA explicitly provides that common law rights of action are not affected by EPA actions under TSCA.¹⁴

§ 16:51 Administration of TSCA: fees and scientific standards

Prior to the 2016 amendments to TSCA, the statute authorized modest fees (up to \$2,500) for submission of premanufacture and significant new use notices under Section 5. Such fees could also be collected from persons submitting data under Sec-

tion 4. The 2016 amendments authorized EPA to collect significantly higher (although unspecified) fees for the purpose of defraying up to 25% of EPA's costs of implementing the testing, new chemical notification, and existing chemical risk evaluation and management programs under Sections 4, 5, and 6, as well as the costs of collecting, processing, reviewing, and providing access to confidential information, and for protecting confidential information from disclosure.¹ When a manufacturer requests an EPA risk evaluation for an existing chemical substance, it must pay up to 100% of the costs for conducting the review (50% of the costs if the substance was among those listed on the 2014 Work Plan).² Lower fees are to be assessed for small businesses, a category for which EPA prescribes standards in coordination with the Small Business Administration.³

The amended statute required that any fees be established by rule, and also required EPA to consult with parties potentially subject to the fees prior to establishing or amending the fees.⁴ EPA's initial Fees Rule,⁵ which took effect in October 2018, set fees for fiscal years 2019 through 2021 and also established a formula for calculating the fees for 2022 and beyond on a three-year cycle.⁶ The Fees Rule sets forth the following fees for fiscal years 2019 through 2021.

TSCA Fees for Fiscal Years 2019 to 2021⁷		
Action	Fee for small business concerns	Fee for other entities
Section 5 premanufacture notifications or significant new use notifications	\$2,800	\$16,000
Section 5 exemption requests (LoREX, LVE, TME, TERA, and Tier II) and modifications to previous exemption requests	\$940	\$4,700
Instant photographic film article exemption notices	\$940	\$4,700
Microbial commercial activity notices (MCANs)	\$2,800	\$16,000
Section 4(a) test rules	\$1,960 ⁸	\$9,800
Section 4(a) test orders	\$5,900 ⁹	\$29,500

[Section 16:51]

¹TSCA § 26(b)(4)(B)(i), 15 U.S.C.A. § 2625(b)(4)(B)(i). The maximum amount that EPA may collect is \$25 million, subject to adjustment for inflation. EPA's authority to assess fees for a given fiscal year is contingent upon the amount of appropriations for the Chemical Risk Review and Reduction program project being equal to or exceeding the 2014 appropriations amount. TSCA § 26(b)(5), 15 U.S.C.A. § 2625(b)(5).

²TSCA § 26(b)(4)(B)(ii), (D), 15 U.S.C.A. § 2625(b)(4)(B)(ii), (D). The percentage of costs the manufacturer must pay is 50% for chemical substances listed on the 2014 update to the TSCA Work Plan for Chemical Assessments and 100% for other substances.

³TSCA § 26(b)(2), (4)(A), 15 U.S.C.A. § 2625(b)(2), (4)(A); *see also* 40 C.F.R. § 700.43 (defining "small business concern").

⁴TSCA § 26(b)(1), (4)(E), 15 U.S.C.A. § 2625(b)(1), (4)(E).

⁸The Fees Rule specifies that the fee for a small business concern is 20% of the fee specified for other entities. 40 C.F.R. § 700.45(c)(1)(vi).

⁹The Fees Rule specifies that the fee for a small business concern is 20% of the fee specified for

TSCA Fees for Fiscal Years 2019 to 2021 ⁷		
Action	Fee for small business concerns	Fee for other entities
Section 4(a) enforceable consent agreements	\$4,560 ¹⁰	\$22,800
EPA-initiated Section 6 risk evaluations	\$270,000 ¹¹	\$1,350,000
Manufacturer-initiated Section 6 risk evaluations of Work Plan chemicals	initial fee of \$1,250,000, and final payment totaling 50% of the actual costs	initial fee of \$1,250,000, and final payment totaling 50% of the actual costs
Manufacturer-initiated Section 6 risk evaluations of non-Work Plan chemicals	initial fee of \$2,500,000, and final payment totaling 100% of the actual costs	initial fee of \$2,500,000, and final payment totaling 100% of the actual costs

Manufacturers may form consortia to pay fees under Section 4 or 6(b).¹² The Fees Rule also made processors of chemical substances subject to fees for Section 5 Significant New Use Notices and Test Marketing Exemptions¹³ and for Section 4 test orders, test rules, and enforceable consent decrees, when the Section 4 activity relates to a Significant New Use Notice submitted by a processor.¹⁴

The Fees Rule also established processes for identifying manufacturers subject to the fees for Section 4 test rules and for EPA-initiated risk evaluations.¹⁵ EPA will prepare preliminary lists of manufacturers subject to the fees, based on information that EPA has received via reporting and notification programs, as well as other information available to EPA. For test rules, the preliminary lists will be made available with proposed rules and, for risk evaluations, the preliminary lists will be released at the time of final designation of a high-priority substance. Manufacturers who have manufactured or imported the chemical substance in the past five years then have an obligation to “self-identify,” regardless of whether they are on the preliminary list. The self-identification notice must provide contact information and, if a manufacturer has ceased manufacture prior to a specified cut-off date or has not manufactured the substance during the five-year period, the manufacturer must include a certification to that effect in its notice. EPA intends to publish final lists of manufacturers subject to the fees when it issues a final scope document for risk evaluations and with final Section 4 test rules. In 2020, after EPA designated the first 20 high-priority substances and released preliminary lists of manufacturers of those substances, it became apparent that EPA interpreted the self-identification obligation to extend not only to manufacturers and importers of the substances in bulk for use and distribution in the U.S. but also to importers of articles containing the substances and manufacturers of the substance as a byproduct or an impurity.¹⁶ Prior to the deadline for self-identification, however, EPA announced that it intended to propose amendments to the Fees Rule to exempt three categories of “manufacturers” from the Fees Rule’s self-identification obligation:¹⁷ importers of articles containing a high-priority substance; producers of a high-priority substance as a byproduct;

other entities. 40 C.F.R. § 700.45(c)(1)(vi).

and producers or importers of a high-priority substance as an impurity.

The 2016 amendments also set forth, for the first time, statutory mandates for the scientific standards to which EPA must adhere as it implements TSCA's core information collection, risk evaluation, and risk management provisions. In its decision making, EPA must employ scientific information, technical procedures, measures, methods, protocols, methodologies, or models "in a manner consistent with best available science."¹⁸ Factors that must be considered include: the extent to which scientific information is reasonable for and consistent with the intended use of the information; the information's relevance; the degree of clarity and completeness with which the methods used to generate the information are documented; the evaluation and characterization of variability and uncertainty in the information; and independent verification and peer review of the information. EPA must also make decisions "based on the weight of the scientific evidence,"¹⁹ and must take into consideration information about a chemical substance or mixture that is "reasonably available" to EPA.²⁰

The 2016 amendments further mandate that certain types of information be made available to the public, including information and studies that form the basis for EPA decision making, and require EPA to produce nontechnical summaries of every risk evaluation it conducts.²¹

In addition, the 2016 amendments require EPA to develop and regularly review policies, procedures, and guidance for the amendments' implementation.²² In particular, the amendments stated such policies, procedures, and guidance that are applicable to testing chemical substances and mixtures should address how and when exposure would factor into EPA decisions to require new testing. Such policies, procedures, and guidance should also describe how EPA would determine its need for additional information to implement the Agency's functions, including information related to potentially exposed or susceptible populations.²³

EPA must also establish a Science Advisory Committee on Chemicals (SACC), composed of representatives of outside groups, to provide advice and consultation on the scientific and technical aspects of TSCA implementation.²⁴ The SACC reviewed each of the first 10 draft risk evaluations and issued reports with comments and recommendations reflecting the views of its members. EPA officials have indicated that the Agency may change the SACC's role so that, rather than performing peer review of each individual evaluation, the SACC would address overarching principles and methodologies.²⁵

§ 16:52 Relationship to international laws

In the past, there has been some discussion about amending TSCA to provide for the implementation of the following three international environmental agreements:

25, 2020). EPA also issued a "no action assurance" to the three categories of manufacturers indicating the Agency would not enforce the self-identification requirements against them. 85 Fed. Reg. 20275 (Apr. 10, 2020).

- (1) Stockholm Convention on Persistent Organic Pollutants (POPs Convention),¹ which commits parties to eliminate or reduce the production, use, and release of 12 critical persistent organic pollutants, and others that are added to the various annexes to the Convention.²
- (2) Protocol on Persistent Organic Pollutants to the 1979 Convention on Long-Range Transboundary Air Pollution (LRTAP POPs Protocol),³ which similarly aims to control, reduce, or eliminate discharges and emissions of persistent organic pollutants.
- (3) Rotterdam Convention on the Prior Informed Consent Procedure for Certain Hazardous Chemicals and Pesticides in International Trade (PIC Convention),⁴ which promotes communication of health and safety information, so that countries can make informed decisions in the trade of hazardous chemicals and pesticides.

The United States has signed, but not ratified, each of the aforementioned treaties.⁵ If the United States does ratify the agreements, legislation would be necessary to resolve inconsistencies between provisions of these agreements, TSCA, and FIFRA,⁶ and to ensure that EPA has the authority to fully enforce U.S. obligations under the agreements.⁷ Legislators have introduced bills in Congress that would amend TSCA to implement these treaties; however, none have passed.⁸

In June 2007, the Registration, Evaluation, Authorization and Restriction of Chemicals (REACH) regulation went into effect in Europe. REACH requires companies that produce chemicals in Europe or import them to Europe in large volumes to register those chemicals with the European Chemicals Agency (ECHA).⁹ The law has had a substantial effect on industry, as multinational corporations changed their policies to comply with REACH.¹⁰ For example, REACH required companies to preregister their chemical substances with the ECHA by December 1,

2008.¹¹ Companies that failed to meet the preregistration deadline, and that did not qualify for late preregistration, were prohibited from producing or importing substances into the European Union market until they submitted a full registration dossier.¹² Compliance with the REACH requirements has been a particular concern for small- and middle-sized companies that export chemicals to Europe.¹³

X. TSCA TITLE II—ASBESTOS HAZARDS IN SCHOOLS AND PUBLIC BUILDINGS

§ 16:53 In general

In 1986, Congress enacted Title II of TSCA. Title II, also known as the Asbestos Hazard Emergency Response Act (AHERA), mandated that EPA develop regulations to respond to asbestos¹ in schools. Title II requires local educational agencies (LEAs) to inspect their schools for asbestos-containing materials; develop a plan to manage the asbestos for each school building that contains asbestos; update this plan every three years; provide asbestos awareness training to school maintenance and custodial workers; keep school staff and parents apprised of inspections and abatement actions; and implement timely actions to address dangerous asbestos situations. To implement this mandate, EPA promulgated the Asbestos-Containing Materials in Schools Rule.² The implementing Rule provides details regarding how LEAs must conduct inspections for asbestos-containing building materials, prepare asbestos management plans, and perform asbestos response actions to prevent or reduce asbestos hazards in schools.³ Title II requires persons who conduct the mandated activities to be properly accredited.⁴ Pursuant to statutory mandate, EPA has developed a model accreditation plan for use by state agencies.⁵ LEAs include not only public schools and charter schools, but also religious schools and nonprofit private schools.⁶

EPA and state regulators inspect LEAs to determine compliance with the regulations by reviewing documents, inspecting the schools, and collecting physical evidence to document compliance or noncompliance. Private citizens are empowered to request a state or federal investigation of a particular school building.⁷ Reasonably founded citizen allegations must be investigated by EPA or the state where the school is located.⁸

AHERA further tasked EPA with studying the extent of danger to human health

posed by asbestos in other public and commercial buildings and means to address such danger,⁹ and with developing a model plan for states for accrediting persons conducting asbestos inspection and corrective-action activities at schools.

Congress empowered EPA to enforce the provisions of Title II by granting the Agency the authority to impose civil penalties on LEAs that fail to conduct inspections and abatement as required.¹⁰ Contractors who conduct these activities without proper accreditation are also subject to penalties. Finally, AHERA provides protections for whistleblowers,¹¹ as well as worker protection requirements for state and local government employees not protected by OSHA.¹²

Some asbestos products also are regulated under Section 6 of TSCA, and EPA identified asbestos as one of the 10 chemical substances on which it has focused in its initial risk evaluations pursuant to the 2016 amendments to TSCA.¹³ In 2018, the EPA Office of the Inspector General (OIG) published a report that found that EPA had disinvested from the AHERA program, prioritizing other TSCA programs instead.¹⁴ OIG cited a lack of compliance inspections, without which “the EPA cannot know whether schools pose an actual risk of asbestos exposure to students and personnel.”¹⁵ OIG recommended that EPA require regions to document asbestos strategies to the Office of Enforcement and Compliance Assurance as part of their TSCA compliance monitoring planning efforts, and that EPA work with regions to develop compliance assistance materials for LEAs.¹⁶

XI. TSCA TITLE III—RADON ABATEMENT

§ 16:54 In general

TSCA Title III, the Indoor Radon Abatement Act, establishes the long-term goal of reducing radon levels in buildings to the level of the ambient air outside of buildings. It does not, however, mandate achievement of this goal. Instead, it authorizes funding for a range of programs designed to mitigate radon exposure.¹ A majority of states have developed radon reduction programs as a result of the implementation of Title III.

[Section 16:54]

¹TSCA § 301, 15 U.S.C.A. § 2661.

- Publish a “Citizen’s Guide to Radon” containing certain specified information about health risks, risk thresholds, and mitigation approaches²
- Develop model construction standards and techniques for controlling radon levels in new buildings³
- Develop and implement, or require another federal agency to develop and implement, activities designed to assist state radon programs⁴
- Establish regional radon training centers⁵
- Evaluate the extent of radon contamination in federally owned buildings⁶
- Survey and, where necessary, develop strategies to mitigate radon contamination in schools nationwide⁷

XII. TSCA TITLE IV—LEAD EXPOSURE REDUCTION

§ 16:55 In general

Residential use of lead-based paint was banned in 1978. TSCA Title IV, also known as the Residential Lead-Based Paint Hazard Reduction Act of 1992, is primarily concerned with risk identification and hazard abatement in dwellings constructed before this period, especially in the course of renovations and remodeling. Title IV’s goal is the development of regulations designed to reduce the hazards associated with exposure—particularly of children and residents of low-income housing—to lead-based paints in private housing.

EPA Requirements Under TSCA Title IV

- Issue guidelines for risk assessments, inspections, interim controls, and abatement of lead-based paint hazards in consultation with the Secretary of Housing and Urban Development (HUD)¹
- Promulgate regulations that identify thresholds for lead-based paint hazards, lead-contaminated dust, and lead-contaminated soil for purposes of Title IV as well as the Residential Lead-Based Paint Hazard Reduction Act of 1992²

²TSCA § 303, 15 U.S.C.A. § 2663.

³TSCA § 304, 15 U.S.C.A. § 2664.

⁴TSCA § 305, 15 U.S.C.A. § 2665.

⁵TSCA § 308, 15 U.S.C.A. § 2668.

⁶TSCA § 309, 15 U.S.C.A. § 2669.

⁷TSCA § 307, 15 U.S.C.A. § 2667.

[Section 16:55]

¹TSCA § 402(a)(1), 15 U.S.C.A. § 2682(a)(1). EPA has developed training and certification programs for these activities, along with related accreditation requirements for such programs. 40 C.F.R. §§ 745.220 to 745.239; *see also Lead Renovation, Repair and Painting Program*, EPA, <http://www2.epa.gov/lead/renovation-repair-and-painting-program>.

²TSCA § 403, 15 U.S.C.A. § 2683; *see* 40 C.F.R. §§ 745.61 to 745.65. The current regulations establish a hazard threshold of 10 micrograms of lead per square foot in floor dust; 100 micrograms per square foot in windowsill dust; 400 parts per million in bare soil in children’s play areas; and 1,200 parts per million in other soils. *See* 40 C.F.R. § 745.65(a) to (c); 84 Fed. Reg. 32632 (July 9, 2019). Under the Residential Lead-Based Paint Hazard Reduction Act of 1992, sellers or lessors of most pre-1978 housing must disclose the presence of any lead-based paint hazard. *See* 42 U.S.C.A. § 4852d. The thresholds for lead-based paint hazards also are used to “calibrate” activities under Title IV such as risk assessments, inspections, and abatements. *See* 84 Fed. Reg. at 32636.

- Conduct a program to promote the safe, effective, and affordable monitoring, detection, and abatement of lead exposure hazards, including by: (1) establishing laboratory protocols; (2) conducting studies on lead exposure; (3) sponsoring public education and outreach efforts concerning lead hazards; (4) establishing a clearinghouse of information on lead-based paint; and (5) establishing a hotline for public inquiries about lead hazards³
- Publish a lead hazard information pamphlet in consultation with the HUD Secretary and the Secretary of Health and Human Services, and promulgate regulations requiring a person performing renovation of residential property to provide the pamphlet to the owner and occupant of the property prior to commencing the renovation⁴

In addition, Title IV extends all federal, state, and local requirements associated with lead-based paint hazards to federal government entities that own or manage property or engage in any activity that may create lead-based paint exposure hazards.⁵ This section expressly waives federal government immunity with respect to these provisions.⁶

Failure to comply with TSCA Title IV requirements is subject to civil and criminal liability, injunction, and monetary penalties.⁷

XIII. TSCA TITLE V—HEALTHY HIGH PERFORMANCE SCHOOLS

§ 16:56 In general

The Energy Independence and Security Act of 2007 amended TSCA to include Title V, known as “Healthy High Performance Schools.” The title is directed to enhancing environmental health and energy efficiency in schools. In addition to the requirements enumerated below, Title V authorizes EPA to provide grants to states to address environmental issues, and to develop and implement environmental health programs.¹ Funding under the terms of Title V expired in 2013,² and further funds have not been appropriated.

EPA Requirements Under TSCA Title V

- Publish and submit to Congress an annual report on EPA activities pursuant to Title V³
- Issue, in consultation with other agencies, voluntary school site selection guidelines, taking into account potential contaminants, modes of transportation available to students and staff, energy efficiency, and the potential use of the school site as an emergency shelter⁴

³TSCA § 405, 15 U.S.C.A. § 2685.

⁴TSCA § 406, 15 U.S.C.A. § 2686; *see* 40 C.F.R. §§ 745.80 to 745.92.

⁵TSCA § 408, 15 U.S.C.A. § 2688.

⁶TSCA § 408(2), 15 U.S.C.A. § 2688(2).

⁷TSCA § 409, 15 U.S.C.A. § 2689.

[Section 16:56]

¹TSCA § 501, 15 U.S.C.A. § 2695. This authority expired December 2012.

²TSCA § 505, 15 U.S.C.A. § 2695d.

³TSCA § 503, 15 U.S.C.A. § 2695b(a). This requirement expired in 2012.

⁴TSCA § 502, 15 U.S.C.A. § 2695a.

- Provide for information-sharing concerning the exposure of children to environmental hazards in school facilities⁵
- Issue, in consultation with other agencies, voluntary guidelines for the development of school environmental health programs⁶

XIV. TSCA TITLE VI—FORMALDEHYDE IN WOOD PRODUCTS

§ 16:57 In general

The Formaldehyde Standards for Composite-Wood Products Act, enacted in 2010, added a Title VI to TSCA. This title establishes limits for formaldehyde emissions from composite wood products: hardwood plywood, medium-density fiberboard, and particleboard.¹ The definitions of these products include certain notable exemptions. For instance, “hardwood plywood” includes only indoor uses,² and items including structural products and wooden packaging (including pallets) are excluded.³ Certain products made without no-added-formaldehyde-based resins and ultra-low-emitting formaldehyde resins are exempted from Title VI.⁴

In 2016, EPA published final regulations aimed at protecting the public from the risks associated with exposure to formaldehyde.⁵ In September 2017, the EPA extended compliance dates for the rule after receiving comments from stakeholders, trade groups, and other regulated entities declaring that conditions involving supply chain, global business, and factory supply logistics necessitated additional time to comply.⁶ However, a court vacated the extension for formaldehyde standards, concluding that the extension was beyond the scope of EPA’s authority.⁷ Earlier in 2017, EPA had eliminated a provision of the rule that prohibited early labeling of compliant products.⁸

The regulations implement formaldehyde emission standards and apply to hardwood plywood, medium-density fiberboard, particleboard, and finished goods containing such products that are sold, supplied, offered for sale, or manufactured (including imported) in the United States. The regulations also establish a framework for a third-party certification program to ensure that composite wood panel producers comply with the formaldehyde emission limits established under TSCA Title VI. By law, these regulations included a sell-through period for non-conforming composite wood products manufactured (but not stockpiled) no later than one year after publication of the final regulations.⁹

In February 2018, EPA updated voluntary consensus standards incorporated by reference into the regulations and changed certain quality control testing

⁵TSCA § 503(b), 15 U.S.C.A. § 2695b(b).

⁹15 U.S.C.A. § 2697(d)(3).

requirements.¹⁰ In August 2019, EPA adopted technical amendments to further align the regulations with the California Air Resource Board's Airborne Toxic Control Measure.¹¹

XV. CONCLUSION

§ 16:58 Conclusion

The 2016 amendments to TSCA imposed immense new responsibilities on EPA during an era in which there was uncertainty concerning the incoming Trump administration's (and a Republican-controlled Congress's) commitment to providing the resources and political support that would be necessary for the Agency to meet critical near-term deadlines and achieve some early successes under the revamped statute. In the waning days of the Obama administration, EPA was timely and efficient in meeting the several 90-day and 180-day responsibilities.¹ The enthusiasm and determination of the Agency's staff and leadership in 2016 was palpable.² Notwithstanding a change in administrations, the commitment of EPA political leadership to meeting the statutory deadlines imposed by the requirements of the 2016 amendments has not waned. However, the many challenges presented by the complexities of these tasks, and the numerous efforts that must be performed by the Agency at its current staffing levels, appear to be affecting the timing and perhaps the quality of certain actions. Litigation challenges and certain judicial decisions may further complicate and impede EPA's progress.

EPA released final framework rules on schedule, in June 2017. These rules defined how the Agency would perform a myriad of tasks under TSCA. The framework rules largely withstood judicial review, but challenges to EPA's actions with respect to specific chemical substances are just beginning to make their way to the courts as EPA completes its first risk evaluations. As the current update to this chapter was written, EPA had just missed the June 2020 statutory deadline for completing risk evaluations for the first 10 substances from the 2014 Work Plan. EPA issued one final risk evaluation—for methylene chloride—before the statutory deadline, but the process for finalizing other risk evaluations may be drawn out for months, if not further. As another example of the Agency under pressure, EPA has commenced work on the next 20 risk evaluations for the first set of high-priority substances while also facing deadlines for development of risk management regulations for methylene chloride (while also defending the risk evaluation in court) as well as any other of the first 10 risk evaluation substances for which it makes a final unreasonable risk determination. Many Agency scientists and regulatory personnel are simultaneously engaged in aspects of other ongoing tasks that EPA lacks discretion to delay or postpone. These deliverables include new chemical reviews and reviews of confidentiality claims for the specific chemical identity of active substances.

A potential change in administrations at the beginning of the 2021 could lead to a substantial shift in EPA's direction as the Agency continues its work implementing

¹⁰83 Fed. Reg. 5340 (Feb. 7, 2018) (final rule); 82 Fed. Reg. 49302 (Oct. 25, 2017) (proposed rule). Although EPA had also published the updates to the consensus standards as a direct final rule, the Agency withdrew the direct final rule after receiving an adverse comment. 82 Fed. Reg. 57874 (Dec. 8, 2017).

¹¹84 Fed. Reg. 43517 (Aug. 21, 2019).

[Section 16:58]

¹For example, EPA took action regarding the new inventory of mercury compounds, identified high-priority PBTs, and selected the initial 10 substances prioritized for risk evaluation.

²See *The Frank R. Lautenberg Chemical Safety for the 21st Century Act: First Year Implementation Plan*, EPA, <https://www.epa.gov/assessing-and-managing-chemicals-under-tsca/frank-r-lautenberg-chemical-safety-21st-century-act-2>.

the 2016 amendments. Regardless of shifts in the political landscape, the regulated community and environmental group constituencies all will expect the Agency to continue making progress and to meet its commitments under the 2016 amendments. These expectations are unlikely to be tempered by EPA's need to identify new talent and rapidly fill vacancies being created by routine attrition and retirements among senior career personnel. The resource challenges EPA faces while simultaneously pivoting to adjust the Agency's draft risk evaluations and methodologies—responding to both unexpected outcomes in scientific peer reviews and contentious lawsuits—could further tax the Agency and impede progress, potentially, and ironically, leading to further litigation.

APPENDIX 16A

Table of Acronyms

AHERA	Asbestos Hazard Emergency Response Act
CBI	Confidential Business Information
CDR	Chemical Data Reporting
ChAMP	Chemical Assessment and Management Program
CPSC	Consumer Product Safety Commission
CPSIA	Consumer Product Safety Improvement Act
DecaBDE	Decabromodiphenyl Ether
EAB	Environmental Appeals Board
ECHA	European Chemicals Agency
FIFRA	Federal Insecticide, Fungicide, and Rodenticide Act
FOIA	Freedom of Information Act
EPA	United States Environmental Protection Agency
GAO	Governmental Accountability Office (previously General Accounting Office)
HCBD	Hexachlorobutadiene
HPV	High Production Volume
ITC	Interagency Testing Committee
IUR	Inventory Update Reporting
LEA	Local Educational Agency
LoREX	Low Release and Exposure (Exemption)
LRTAP	Long-Range Transboundary Air Pollution
LVE	Low Volume Exemption
MCAN	Microbial Commercial Activity Notice
MPV	Moderate Production Volume
NIH	National Institutes of Health
NMP	N-Methylpyrrolidone
NOA	Notice of Activity
NOC	Notice of Commencement
OECD	Organisation for Economic Co-operation and Development
OIG	Office of the Inspector General
OSHA	Occupational Safety and Health Administration
PBT	Persistent, Bioaccumulative, and Toxic
PCB	Polychlorinated Biphenyl
PCTP	Pentachlorothiophenol
PIC	Prior Informed Consent
PIP (3:1)	Phenol, Isopropylated, Phosphate (3:1)
PMN	Premanufacture Notice
POPs	Persistent Organic Pollutants
ppm	Parts per million
PV29	C.I. Pigment Violet 29
R&D	Research and Development

REACH	Registration, Evaluation, Authorization and Restriction of Chemicals
SACC	Science Advisory Committee on Chemicals
SCIL	Safer Chemical Ingredients List
SIDS	Screening Information Data Sets
SNUN	Significant New Use Notice
SNUR	Significant New Use Rule
TERA	TSCA Experimental Release Application
TME	Test Marketing Exemption
TSCA	Toxic Substances Control Act
UVCBs	Chemical Substances of Unknown or Variable Composition, Complex Reaction Products, and Biological Materials
VCCEP	Voluntary Children's Chemical Evaluation Program

APPENDIX 16B

Key Changes to Core TSCA Provisions in the 2016 Amendments

Key Changes to Core TSCA Provisions in the 2016 Amendments

TSCA Provision	Overview of Provision	Key Changes in 2016 Amendments
Section 4 (15 U.S.C.A. § 2603), Testing of chemical substances and mixtures	Provides EPA with authority to gather and require development of test data and information about chemical substances	<ul style="list-style-type: none"> Grants EPA authority to issue administrative orders or enter into consent agreements to require testing in certain circumstances (in addition to previously existing authority to issue rules to require testing) Adds a subsection on reduction of testing on vertebrate animals
Section 5 (15 U.S.C.A. § 2604), Manufacturing and processing notices	Requires EPA review of new chemical substances and new uses of substances prior to commencement of manufacture, import, or processing	<ul style="list-style-type: none"> Requires an affirmative determination by EPA before manufacture, import, or processing may commence
Section 6 (15 U.S.C.A. § 2605), Prioritization, risk evaluation, and regulation of chemical substances and mixtures	Provides EPA with authority to issue regulations to limit manufacture, processing, use, and disposal activities to manage the risk of existing chemical substances	<ul style="list-style-type: none"> Requires EPA to identify and prioritize chemical substances for risk evaluations, conduct risk evaluations, and, if necessary, promulgate risk management rules within specified timeframes Establishes a regulatory framework that includes a prioritization/risk evaluation phase that does not take cost and other nonrisk factors into account Requires that EPA issue risk management regulations when a substance is determined through the risk evaluation process to present an unreasonable risk Replaces the directive that risk management requirements be applied “to the extent necessary to protect adequately against such risk using the least burdensome requirements” with a directive that such requirements be applied “to the extent necessary so that the chemical substance no longer presents” the unreasonable risk identified in the risk evaluation Eliminated a requirement that EPA make a determination that a risk management rule was “in the public interest” based on a comparison of the relative costs and efficiency of proceeding under all available laws if the Agency determined that a chemical risk could be controlled adequately by other EPA-administered laws
Section 8 (15 U.S.C.A. § 2607), Reporting and retention of information	Imposes reporting and recordkeeping obligations	<ul style="list-style-type: none"> Added a one-time reporting requirement to identify which chemical substances on the TSCA Inventory are “active” Enhanced requirements for shielding information from public disclosure, especially information about specific chemical identity Added mercury reporting and mercury inventory requirements

TSCA Provision	Overview of Provision	Key Changes in 2016 Amendments
Section 14 (15 U.S.C.A. § 2613), Confidential information	Sets parameters for what information is protected from disclosure and establishes procedures for confidentiality claims	<ul style="list-style-type: none"> ● Requires “up-front” substantiation of confidential business information (CBI) claims ● Permits EPA to protect information for which a substantiated confidentiality claim is properly asserted for up to 10 years (with extensions thereafter) ● Requires EPA to develop a program to implement reviews of all CBI claims for specific chemical identities for “active” chemical substances
Section 18 (15 U.S.C.A. § 2617), Preemption	Sets forth the circumstances in which state regulation of chemical substances will be preempted	<ul style="list-style-type: none"> ● Permanently preempts state prohibition of or restrictions on a chemical substance if EPA determines the substance does not present an unreasonable risk after conducting a risk evaluation or after the effective date of a final risk management rule issued by EPA for a substance ● Preempts new state prohibitions of and restrictions on a high-priority substance while EPA conducts a risk evaluation ● Preserves state and local prohibitions and restrictions that were imposed before April 22, 2016 and does not preempt state and local actions with respect to chemical substances and uses of chemical substances that EPA has not yet addressed ● Establishes a process and criteria for preemption waivers
Section 26 (15 U.S.C.A. § 2625), Administration	Provides for fees to be paid by regulated entities to offset EPA’s costs of administering the statute, sets forth standards for implementing the statute, addresses administrative functions related to TSCA implementation	<ul style="list-style-type: none"> ● Authorizes EPA to collect significantly higher fees to defray its costs of administering TSCA ● Establishes scientific standards for EPA decision-making under Sections 4, 5, and 6 ● Requires establishment of the Science Advisory Committee on Chemicals ● Requires EPA to make certain documents and information available to the public

I. INTRODUCTION

§ 17:1 In general

The growth in environmental awareness and protection of human health that has

typified the last four decades is clearly reflected in the history of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA), originally enacted in 1947.¹ Since the first Insecticide Act was enacted in 1910,² the regulation of pesticides in the United States has been implemented through a statutory requirement that pesticides be registered with the federal government. In the 1910 and 1947 statutes, the emphasis was on consumer protection; the primary factor to be considered by the U.S. Department of Agriculture (USDA) in determining whether to register a pesticide was whether “the composition of the article is such as to warrant the proposed claims for it.”³

In 1970, the responsibility for registering pesticides was transferred from USDA to the newly created U.S. Environmental Protection Agency (EPA).⁴ Two years later, the statute was rewritten as a health and environmental protection statute.⁵ Subsequent amendments⁶ have retained environmental protection as its primary orientation, but more recent focus has centered on health risks for agricultural workers, so-called bystanders, and those who consume treated agricultural commodities.

The standard for registration of a pesticide, while continuing to take into account the product’s ability to perform as claimed, now focuses chiefly on whether the proposed use of the pesticide will cause unreasonable adverse effects on the environment,⁷ defined to include any unreasonable risk to man or the environment, including human dietary risk from pesticide residues.⁸ The Food Quality Protection Act of 1996 (FQPA) significantly revised the provisions of the Federal Food, Drug, and Cosmetic Act (FFDCA) and related FIFRA provisions that govern pesticide residues in food, and made certain other changes to FIFRA.⁹

Companies with pesticides registered under FIFRA are referred to as *registrants*, and they form the majority stakeholder commercial interest in the pesticide industry. Pesticide registrants and other companies with interests in the pesticide industry (e.g., manufacturers, distributors, growers, and other users) have formed consortia and other associations to address jointly issues of mutual interest. Environmental and non-governmental organizations (NGO) also are stakeholders advocating their interests. According to the most recent EPA report, released in 2017 and covering pesticide production and usage from 2008 to 2012, world pesticide expenditures at the producer level totaled nearly \$56 billion in 2012 while U.S. pesticide expenditures at the producer level totaled nearly \$9 billion in 2012.¹⁰ EPA also estimates the following regarding the size of this industry in 2012: (1) Major

Pesticide Producers—12; (2) Other Pesticide Producers—100; (3) Major Pesticide Formulators—120–150; (4) Other Pesticide Formulators—1,550; (5) Distributors—24,686; and (6) Establishments—42,160.¹¹

This chapter, in the sections to follow, will provide and discuss the criteria for determining whether a product is a pesticide requiring registration or exempt from registration requirements. For pesticide products requiring registration, there are significant regulatory requirements, including the development of data, that EPA will review in making a decision whether to register that pesticide product and its use. The regulatory requirements applicable to a pesticide impose requirements on registrants that affect all aspects of that product, including but not limited to production, labeling, distribution, import/export, and disposal. EPA is required to periodically review existing registered pesticides to ensure that each product continues to meet the FIFRA standard for registration. If that standard cannot be met, EPA is authorized to take regulatory actions to prohibit or limit the use of registered pesticides and is likewise authorized to pursue civil or criminal enforcement actions against those registrants that violate FIFRA requirements. This chapter will also discuss state/tribal roles in regulating pesticides. A list of commonly used acronyms is provided as an appendix to this chapter.

II. PESTICIDE REGISTRATION

§ 17:2 The registration requirement

[SUMMARY BOX] Companies must determine whether a product is a “pesticide” and, if so, register that product with EPA (unless an exemption applies).

FIFRA § 3(a)¹ makes it unlawful to “distribute or sell to any person any pesticide that is not registered.” Further, “the Administrator may by regulation limit [pesticide] distribution, sale, or use in any State.” The registration process is at the heart of EPA’s regulation of pesticides. Through its requirement and review of data submitted to support a registration, EPA determines whether use of the pesticide may be allowed and, if so, under what limitations. Limitations on the use of a pesticide are incorporated into the product’s label; the product’s registered label is the key document that discloses whether, and how, the pesticide may lawfully be used and for what purposes it may be sold. EPA also regulates pesticide “devices” on a more limited basis,² but registration of such devices is not required.

§ 17:3 The registration requirement—What is a “pesticide”?

The statute defines “pesticide” as “(1) any substance or mixture of substances intended for preventing, destroying, repelling, or mitigating any pest, (2) any substance or mixture of substances intended for use as a plant regulator, defoliant, or desiccant, and (3) any nitrogen stabilizer,” except for new animal drugs regulated under FFDCA, and liquid chemical sterilant products used on “critical or semi-critical devices”; such sterilants are to be regulated by the U.S. Food and Drug

²FIFRA § 2(h), 7 U.S.C.A. § 136(h).

Administration (FDA).¹

The term “pest,” as used in FIFRA’s definition of “pesticide” is further defined as “(1) any insect, rodent, nematode, fungus, weed, or (2) any other form of terrestrial or aquatic plant or animal life or virus, bacteria, or other micro-organisms . . . which [EPA] declares to be a pest” excluding viruses, bacteria, or microorganisms found on or in man or other living animals.² EPA has broadly exercised its authority to declare other organisms to be pests, and has declared virtually all of the listed organisms to be pests when they exist “under circumstances that make [them] deleterious to man or the environment.”³ For some types of pesticides, FIFRA and regulations under EPA have provided more specific definitions. For example, FIFRA specifically defines “antimicrobial pesticide” as, with certain exceptions, “a pesticide . . . intended to (i) disinfect, sanitize, reduce, or mitigate growth or development of microbiological organisms; or (ii) protect inanimate objects, industrial processes or systems, surfaces, water, or other chemical substances from contamination, fouling, or deterioration caused by bacteria, viruses, fungi, protozoa, algae or slime,” other than any such product that is subject to regulation as a food additive or to a tolerance under the FFDCA.⁴ This definition, an amendment made to FIFRA by the FQPA, resulted in negotiations between EPA and the FDA over which agency should have jurisdiction for various food-related uses of antimicrobials and the issuance of a notice regarding how the agencies expected to allocate their jurisdiction.⁵

In addition, in 1994, EPA released a set of five proposals that collectively explained EPA’s approach to the regulation of substances produced in plants that enable them to resist pests and disease. These proposals called for these substances to be treated as “pesticides,” as appropriate, under § 2(u) of FIFRA,⁶ “regardless of whether the pesticidal capabilities evolved in the plants or were introduced by breeding or through the techniques of modern biotechnology.”⁷ EPA published, in 2001, a set of final rules that changed the term for this type of pesticide from “plant

[Section 17:3]

¹FIFRA § 2(u), 7 U.S.C.A. § 136(u). The inclusion of nitrogen stabilizers in the definition of “pesticide” and the exclusion of liquid chemical sterilants for critical and semi-critical devices were among the amendments to FIFRA made by the 1996 FQPA. A “nitrogen stabilizer” is a substance or mixture that acts on soil bacteria to “prevent [] or hinder [] the process of nitrification, denitrification, ammonia volatilization, or urease production.” FIFRA § 2(hh), 7 U.S.C.A. § 136(hh). The statute excludes certain specific compounds from the nitrogen stabilizer definition and “grandfathers” certain substances in use prior to 1992. FIFRA § 2(hh), 7 U.S.C.A. § 136(hh). “Critical” and “semi-critical” devices are medical devices introduced directly into the human body, that are in contact with the bloodstream or normally sterile areas of the body (“critical devices”), or that contact intact mucous membranes but do not ordinarily penetrate the bloodstream or other sterile areas (“semi-critical devices”). FIFRA § 2(u), 7 U.S.C.A. § 136(u). *See also* Pesticide Registration (PR) Notice 98-2 (Jan. 1998).

pesticide” to “plant-incorporated protectant.” In these final rules, EPA exempted from FIFRA requirements and FFDCA tolerance requirements plant-incorporated protectants derived through conventional breeding from sexually compatible plants.⁸ Accordingly, virtually any substance intended to prevent, destroy, repel, mitigate, or control some form of plant or animal life, fungus, microorganism, virus, or bacteria, is subject to the registration requirements of FIFRA. Products as seemingly innocuous as garlic oil and citric acid are generally required to be registered if used to control insects, microorganisms, or other pests,⁹ although EPA has acted to exempt some of these substances from most FIFRA requirements.¹⁰ EPA regulations provide that a substance is intended for a pesticidal purpose if the person who sells or distributes the substance makes express or implied claims that the substance (either by itself or in combination with any other substance) can or should be used as a pesticide, or that it contains a pesticidal ingredient and can be used to make a pesticide.¹¹ Pesticidal intent will also be found if the substance contains a pesticidal ingredient and has no commercially valuable uses except pesticidal ones. In addition, pesticidal intent will be found if the person who sells or distributes the substance has actual or constructive knowledge that it will be or is intended to be used as a pesticide.¹² Courts have held that the intent for a product to be used for pesticidal purposes may be inferred from the normally anticipated use of a product, even if the manufacturer does not subjectively intend its customers to use the product as a pesticide.¹³

Products intended for use as pesticides after reformulation or repackaging are also considered to be pesticides that must be registered. Thus, there are two broad categories of pesticides: (1) “manufacturing use products,” which are further formulated before sale to those who will use the product for pest control, and (2) “formulations” or “end-use products,” which contain pesticidally active ingredients, generally in combination with inert ingredients (for example, carriers, solvents, surfactants, and so on) and which are intended for sale to end users for controlling pests.

As suggested by the statutory definition of a pesticide as “any substance or mixture” used for pest control, every individual manufacturing use and end-use product must be separately registered under FIFRA. It is not enough that products containing the same active ingredient have previously been registered by another—or even the same—company; each separate manufacturing use product and end-use formulation must have its own registration.

§ 17:4 Registration application process

An applicant for registration must submit the registration application, draft label, and Confidential Statement of Formula (CSF) for the product, along with the data or data citation materials required by EPA regulations.¹

First, an applicant must complete a registration application form. This form

⁸See 40 C.F.R. pt. 174.

contains basic information about the requested registration, such as the names of the applicant and the product, how the product will be packaged, and whether the applicant proposes that the product be classified for restricted use.² Second, the applicant must submit a CSF, containing detailed information concerning the pesticide's formula and certain of its chemical properties. The CSF must also identify the purpose and supplier of each of the components of the applicant's product.³

As indicated above, it is the pesticide label that actually reflects the uses approved by EPA for the specific registered product. Thus, an applicant must submit a draft of its proposed label for the Agency's review.⁴ EPA regulations specify in detail the information that must be contained on a pesticide product label.⁵ In addition to prohibiting any false or misleading statements,⁶ the labeling regulations require that certain specified information appear on product labels.⁷

use).

²See FIFRA § 3(c)(1)(A), (B), (F), 7 U.S.C.A. § 136a(c)(1)(A), (B), (F); 40 C.F.R. § 152.50. *See* § 17:49 (classification for restricted use).

³FIFRA § 3(c)(1)(D), 7 U.S.C.A. § 136a(c)(1)(D); 40 C.F.R. § 152.50. The requirements and instructions for filing the CSF appear on the application form (EPA Form 8570-4).

⁴FIFRA § 3(c)(1)(C), 7 U.S.C.A. § 136a(c)(1)(C); 40 C.F.R. § 152.50(e).

⁵*See generally* 40 C.F.R. § 156.10. In 1984, EPA proposed new labeling regulations reflecting a comprehensive revision and updating of the existing labeling provisions. 49 Fed. Reg. 37960 (Sept. 26, 1984). That proposal was never finalized, and EPA withdrew it from its regulatory agenda. *See* 58 Fed. Reg. 25013 (Apr. 26, 1993). EPA, rather than rework the existing proposal, proposed some labeling regulation revisions in conjunction with its proposed regulations to govern registration of antimicrobial products. *See* 64 Fed. Reg. 50672. Some of the proposed revisions have been finalized. *See* 66 Fed. Reg. 64759 (Dec. 14, 2001); 71 Fed. Reg. 47330, 47420 (Aug. 16, 2006).

As part of a Consumer Labeling Initiative, EPA issued various Pesticide Registration Notices (PR Notice) to facilitate labeling improvements. *See, e.g.,* EPA, Consumer Labeling Initiative, at <https://archive.epa.gov/pesticides/regulating/con-labels/web/html/consumer-labeling.html> (last updated Feb. 22, 2016); PR Notices 97-4 (Sept. 1997) (consumer access numbers); 97-5 (Sept. 1997) (use of common names for active ingredients); 97-6 (use of the term "inert" in the label ingredients statement); 2000-3 (April 2000) (first aid statements), updated in 2001-1 (Jan. 2001) (first aid statements on pesticide product labels); 2000-5 (May 2000) (guidance for mandatory and advisory labeling statements); 2001-3 (Jan. 2001) (insect repellents; labeling restrictions for use on infants and children and restrictions on food fragrances and colors); 2001-6 (Sept. 2001) (disposal instructions on non-antimicrobial residential household use pesticide product labels). Some of EPA's labeling regulation revisions incorporated Consumer Labeling Initiative recommendations. *See* 64 Fed. Reg. 50672, 50701 to 50702; 66 Fed. Reg. 64759.

⁶40 C.F.R. § 156.10(a)(5).

⁷40 C.F.R. § 156.10(a)(1).

Required Information for Product Labels

- ✓ Product name
- ✓ Company name, address
- ✓ Net weight/volume
- ✓ EPA-assigned registration number (product and facility)
- ✓ Ingredient statement (each active ingredient's identity and percentage, inert ingredients' combined total percentage)
- ✓ Warning and precautionary statement (including appropriate human hazard signal word)
- ✓ Safety statements (product should be kept out of the reach of children, first aid measures for certain toxic pesticides, any hazards to humans, domestic animals, or the environment, and hazards resulting from the physical or chemical properties of the product)
- ✓ Directions for use of the pesticide, including a statement that it is a violation of federal law to use the product in a manner inconsistent with its labeling
- ✓ A statement as to whether the product is classified for restricted use; and
- ✓ Worker protection information

Once a pesticide label is registered and approved by EPA, a company generally may not change the label language without obtaining an amended registration, except in the case of certain minor changes that may be made by notification to EPA.⁸ In addition, all promotional claims made on behalf of the product, whether they appear on the product packaging or in separate literature or advertising, must be consistent with the registered label.⁹

§ 17:5 Registration application process—Data requirements

For EPA to make the judgment that a pesticide will not cause unreasonable adverse effects, and may therefore be registered,¹ it must review a wide variety of chemistry, health and safety, and environmental effects data.² Agency regulations list the types of data required to support pesticide registrations.³ The two ways that applicants may satisfy these data requirements are by either generating new data or citing existing data.⁴

If an applicant seeks to register a product containing a new active ingredient not previously registered (or for some reason cannot or does not wish to rely on previously submitted data on the active ingredient), the applicant will be required to

⁸See § 17:16 (amended registration).

⁹FIFRA § 12(a)(1)(B), 7 U.S.C.A. § 136j(a)(1)(B). See also PR Notice 2014-1 Web-Distributed Labeling for Pesticide Products (Apr. 2014).

[Section 17:5]

¹See § 17:9.

²See FIFRA § 3(c)(1)(F), (2)(A), 7 U.S.C.A. § 136a(c)(1)(F), (2)(A); 40 C.F.R. § 152.50(f).

³40 C.F.R. pt. 158. See also 72 Fed. Reg. 60934 (Oct. 26, 2007), as amended by 78 Fed. Reg. 26936 (May 8, 2013) (codified at 40 C.F.R. §§ 158.2200 to 2290) (revising data requirements for registration of conventional pesticides, as well as the data requirements for biochemical and microbial pesticides); 66 Fed. Reg. 37772 (July 19, 2001) (codified at 40 C.F.R. pt. 174) (addresses product performance data requirements and new data requirements for plant-incorporated protectants).

EPA also has been reviewing certain data requirements to determine if there are alternatives that can reduce animal testing. See, e.g., Interim Science Policy, *Use of Alternative Approaches for Skin Sensitization as a Replacement for Laboratory Animal Testing*, available at <https://www.regulations.gov/document?D=EPA-HQ-OPP-2016-0093-0090>.

⁴See 40 C.F.R. pt. 152. There may also be exemptions from some of the data requirements for particular applicants or pesticides. See § 17:28.

generate and submit all of the data required by EPA regulations. Generating such data and registering a pesticide containing a new active ingredient is a time-consuming and expensive process that limits the number of new pesticide active ingredients registered each year.⁵

By far, the more common situation is that of a company seeking to register a pesticide formulation that is identical or substantially similar to pesticide formulations previously registered by other companies. Applicants for such “me-too” registrations typically rely on previously generated data that have already been submitted to support prior registrations. An applicant may cite and rely on its own previously submitted data, government data, or data appearing in public scientific literature. An applicant may also satisfy applicable data requirements by citing and relying on relevant registration data previously submitted to EPA by another registrant.⁶ The new applicant may rely on such data with the data submitter’s permission; unless the data are protected by the “exclusive use” provision,⁷ the applicant may also rely on the data without the data submitter’s permission, but must offer to pay compensation to the data submitter for any data that were submitted to EPA within fifteen years prior to the new application.

A registration application must be accompanied by forms listing each applicable data requirement. The forms must state how the applicant is satisfying that requirement,⁸ for example, by submitting its own study, citing public literature references, citing all relevant data previously submitted to EPA files, or citing individual studies that have been submitted to the Agency. The applicant must certify that it has complied with the requirements necessary to rely on other companies’ data.⁹

§ 17:6 Registration application process—Reliance on human research

An ongoing and controversial issue is whether applicants may satisfy registration data requirements by relying on third-party studies in which humans were intentionally dosed with pesticides. Although applicants have relied on human studies in the past, the issue came to the forefront after the FQPA mandated that EPA apply an additional 10-fold safety factor for infants and children—in addition to the interspecies and intraspecies factors ordinarily used—when calculating safe levels of exposure for purposes of setting tolerances.¹ To offset the need for the application of various safety factors, many applicants began to rely on human studies that demonstrated that their pesticide posed little risk to humans, even at relatively high

⁵For example, according to EPA, the Agency registered 42 new active ingredients in fiscal year 2016, 53 in fiscal year 2017, and 136 in 2018. The notable uptick in 2018 appears to be due to a large number of new microbial pesticides registered for food use. New conventional and antimicrobial active ingredients totaled 24 in 2018. EPA, Implementing the Pesticide Registration Improvement Extension Act—Fiscal Year 2018, available at <https://www.epa.gov/pria-fees/implementing-pesticide-registration-improvement-extension-act-fiscal-year-2018#appendix> and Appendix A, Table 3, available at <https://www.epa.gov/sites/production/files/2020-01/documents/fy18-pria-annualrpt-table3.pdf>.

⁶See § 17:35.

⁷See § 17:35.

⁸Under certain circumstances, it is possible to obtain a conditional registration with less than the full data package prescribed by 40 C.F.R. pt. 158. See § 17:15.

⁹See PR Notice 2011-3 (Nov. 30, 2011) (Standard Format for Data Submitted Under FIFRA and Certain Provisions of FFDCA) (updating and replacing PR Notice 98-5 (June 1998) (announcing EPA registration support forms 8570-34 and 8570-35)). See generally 40 C.F.R. pt. 152.

[Section 17:6]

¹See National Research Council, Intentional Human Dosing Studies for EPA Regulatory Purposes: Scientific and Ethical Issues 30-35 (The National Academies Press 2004), available at <http://www.nap.edu>; Katharine Q. Seelye, *E.P.A. Reconsiders Human Tests of Pesticides*, N.Y. Times, Dec. 15, 2001, at A14.

exposure levels.² After struggling with the issue for several years, EPA asked the National Academy of Sciences (NAS) in 2001 to advise the Agency on the scientific and ethical issues associated with the consideration of such human studies.³ At the same time, EPA issued a press release stating that, during the interim period while NAS studied the matter, the Agency would not consider or rely on intentional human dosing studies in its regulatory actions, unless consideration of such data were legally required or necessary to protect public health.⁴

The policy EPA announced in its press release was immediately challenged by the registrant community as an unlawful regulation that was not issued through notice and comment rulemaking as required by the FFDCA.⁵ The U.S. Court of Appeals for the District of Columbia Circuit agreed. In a June 2003 decision, the court vacated the policy and stated that “the agency’s previous practice of considering third-party human studies on a case-by-case basis, applying statutory requirements, the Common Rule, and high ethical standards as a guide, is reinstated and remains in effect unless and until it is replaced by a lawfully promulgated regulation.”⁶ The following year, NAS issued its report on the scientific and ethical issues associated with the consideration of intentional dosing human studies. Congress carefully reviewed the NAS report, and in 2005 it prohibited EPA from using funds to consider or rely on third-party intentional dosing human studies for pesticides until the Agency adopted a rule consistent with the recommendations proposed in the report.⁷

The rule Congress mandated was promulgated by EPA in early 2006. Among other things, the rule established an independent Human Studies Review Board for the purpose of performing science and ethics reviews of applicant proposals to conduct human research and of the results of human research that EPA intended to rely on in its decision-making under the pesticide laws.⁸ The rule also banned all third-party intentional dosing research on pesticides involving children and pregnant women intended for submission to EPA; extended the provisions of the Common Rule to cover all third-party intentional dosing studies intended for submission to EPA under the pesticide laws;⁹ and established enforceable ethical safeguards to protect individuals who volunteer to participate in third-party intentional dosing research.¹⁰ EPA also included nursing women in the ban on third-party intentional dosing research.¹¹

In 2017, EPA, together with a host of other federal agencies, announced revisions

⁹The Common Rule, or Federal Policy for the Protection of Human Subjects of Research, was adopted in 1991 by 17 federal departments and agencies that conduct, support, or otherwise regulate research involving human subjects. See *Federal Policy for the Protection of Human Subjects*, 56 Fed. Reg. 28003 (June 18, 1991).

¹⁰See 71 Fed. Reg. 6138, 6148 to 6155 (Feb. 6, 2006) (codified at 40 C.F.R. §§ 26.1101 to 26.1507).

¹¹71 Fed. Reg. 36172 (June 23, 2006) (codified at 40 C.F.R. §§ 26.203, 26.1203, 26.1703, and 26.1705). The direct final rule went into effect on August 22, 2006.

via a final rule to modernize, strengthen, and make more effective the Federal Policy for the Protection of Human Subjects that was originally promulgated as a Common Rule in 1991.¹² The *Federal Register* publication states that this final rule is intended to “better protect human subjects involved in research, while facilitating valuable research and reducing burden, delay, and ambiguity for investigators” and that the revisions “are an effort to modernize, simplify, and enhance the current system of oversight.” The effective date of the final rule was January 21, 2019.¹³

§ 17:7 Registration application process—Tolerances and tolerance exemptions

Pesticides that will be used on or around crops or processed foods are also covered by certain requirements of the FFDCA.¹ FFDCA § 408 requires that a “tolerance” be established for pesticide active ingredients that will be used on or around food. As discussed in more detail below, the 1996 FQPA substantially revised the FFDCA provisions governing pesticide residues, adopting a single safety standard applicable to residues on raw agricultural commodities and on processed foods, in contrast to the differing standards that previously applied.² A tolerance will specify the maximum residue of the pesticide’s ingredients that may be left in food as a result of use of the pesticide. Alternatively, an “exemption from tolerance” may be obtained for pesticides that are shown to be sufficiently safe that maximum residues need not be established.³ A tolerance or tolerance exemption is obtained by submitting a petition and supporting data to EPA.⁴ Unlike registrations, tolerances and tolerance exemptions are not tied to individual commercial products.⁵ Thus, once a tolerance or exemption has been established for a particular use of an active ingredient, it need not be reestablished by subsequent registrants of the same pesticide for the same use.

§ 17:8 EPA review and decision—Agency review

The EPA will conduct a review of the application package. As EPA’s Office of Pesticide Programs (OPP) is currently organized, the application package is submitted first either electronically through the Central Data Exchange (CDX) or in hard copy to the “Document Processing Desk” to be screened for completeness, proper formatting of data, and the like.¹ It is then forwarded to the “Product Manager” assigned to the class of pesticides to which the product belongs.² The Product Manager and any assistants serve as the Agency’s liaison with the applicant and handle the

¹See EPA, Pesticide Registration Manual: Chapter 21—Directions for Submitting Applications and Contacting EPA, available at <https://www.epa.gov/pesticide-registration/pesticide-registration-manual-chapter-21-directions-submitting-applications>; EPA, Submission of Incomplete Applications for Registration of Pesticides Under § 3 of FIFRA, PR Notice 86-4 (1986); EPA, Standard Format for Data Submitted Under FIFRA and Certain Provisions of FFDCA, PR Notice 2011-3.

²The product managers and their staffs are assigned to different divisions within OPP. The Registration Division (and its Fungicide, Herbicide, Insecticide and Insecticide/Rodenticide Branches) handles most conventional pesticides, the Biopesticides and Pollution Prevention Division handles a

administrative process, including ensuring that all data requirements have been satisfied, and all of the required language appears on the draft label. If new scientific data are submitted with the application, they will be referred to EPA scientists to determine whether the studies were conducted in accordance with appropriate protocols³ and whether they indicate the existence of any health or environmental risks that may pose an obstacle to registration. Initially, the scientists will conduct a preliminary technical screen to confirm that the supporting data are accurate, complete, and consistent with the proposed labeling and any tolerance or exemption petition such that, subject to full review, the information could result in the granting of the application.⁴ If the application is rejected during the technical screen, the applicant has ten (10) business days to address the deficiencies or the application will be rejected.⁵ If the application proceeds to full review, the scientific review of new data can substantially increase the time needed for EPA to act upon an application for registration. Accordingly, the type of submission dictates its Pesticide Registration Improvement Act of 2003 (PRIA) review category, with an associated review time and fee intended to be proportional to the scope of work needed to review the amount of data typically required to support the specific type of submission.⁶

Several categories of pesticide registration applications may be eligible for expedited review by EPA, pursuant to either Agency policy or the FQPA's amendments to FIFRA. These include end-use products whose ingredients and uses are identical or substantially similar (*i.e.*, "me-too") to those of a currently registered product,⁷ minor use pesticides,⁸ reduced-risk pesticides,⁹ and antimicrobial

variety of products that typically have reduced data requirements (*e.g.*, biochemicals and other products with nontoxic modes of action), and the Antimicrobial Division is responsible for all regulatory activities associated with antimicrobial pesticides.

³See 40 C.F.R. § 158.70.

⁴FIFRA § 33(f)(4)(B), 7 U.S.C.A. § 136w-8(f)(4)(B).

⁵*Id.*

⁶FIFRA § 33(b)(3), 7 U.S.C.A. § 136w-8(b)(3).

⁷See EPA, Pesticide Registration Manual: Chapter 21—Directions for Submitting Applications and Contacting EPA.

⁸FIFRA § 3(c)(3)(C), 7 U.S.C.A. § 136a(c)(3)(C). A "minor use" is one for which total U.S. crop acreage is 300,000 acres or less, or one that does not provide sufficient economic incentive to support the use nor one or more specific benefits set forth in the statute attributed to the product. FIFRA § 2(l), 7 U.S.C.A. § 136(l). The minor use designation is intended to incentivize registrants to develop and market products that may have low expected returns. FQPA amendments to FIFRA authorized EPA to provide greater flexibility with respect to waivers of data requirements and extensions of deadlines for data supporting minor uses, as well as additional exclusive-use protection for data on minor-use pesticides. See FIFRA § 3(c)(1)(F), FIFRA § 3(c)(2)(B)(vi) to (viii), FIFRA § 3(c)(2)(E), FIFRA § 3(c)(3)(C) to (D), 7 U.S.C.A. § 136a(c)(1)(F), 7 U.S.C.A. § 136a(c)(2)(B)(vi) to (viii), 7 U.S.C.A. § 136a(c)(2)(E), 7 U.S.C.A. § 136a(c)(3)(C) to (D); FIFRA § 4(d)(4)(B), FIFRA § 4(d)(6), FIFRA § 4(e)(2), FIFRA § 4(f)(2)(B), FIFRA § 4(f)(3), 7 U.S.C.A. § 136a-1(d)(4)(B), 7 U.S.C.A. § 136a-1(d)(6), 7 U.S.C.A. § 136a-1(e)(2), 7 U.S.C.A. § 136a-1(f)(2)(B), 7 U.S.C.A. § 136a-1(f)(3). In 2018, EPA issued guidance to clarify and revise its interpretation of "minor use" under FIFRA section 2(l) by: (1) setting forth new guidance to determine crop acreage; and (2) providing three tests of economic incentive to determine whether a registration qualified for an economic minor use: the net present value, the discounted revenue to cost ratio, and the internal rate of return. PR Notice 2018-1 (Mar. 2018), available at <https://www.regulations.gov/document?D=EPA-HQ-OPP-2015-0814-0016>.

⁹FIFRA § 3(c)(10), 7 U.S.C.A. § 136a(c)(10). The FQPA amendments to FIFRA required EPA to develop procedures and guidelines for expedited registration of reduced-risk pesticides. FIFRA § 3(c)(10), 7 U.S.C.A. § 136a(c)(10); 58 Fed. Reg. 5854 (Jan. 22, 1993). EPA released revised reduced-risk guidelines. See PR Notices 97-2 (Apr. 1997), 97-3 (Sept. 1997), and 97-7 (Aug. 1998). See also EPA, Conventional Reduced Risk Pesticide Program, available at <https://www.epa.gov/pesticide-registration/conventional-reduced-risk-pesticide-program>.

products.¹⁰

If the proposed registration would be for an active ingredient not previously registered, or would authorize a changed use pattern for a previously registered pesticide, EPA must publish notice of the application in the *Federal Register* and provide an opportunity for public comments.¹¹ Historically, a pesticide registration decision by EPA could take several years or longer, depending on the pesticide's class and the priority assigned to the application by the Agency. The slow pace of EPA's review process prompted the registrant community, environmentalists, and labor groups to advocate for PRIA's enactment.¹² The intent of the various groups that supported PRIA was to create a more predictable evaluation process for certain pesticide decisions, to couple the collection of fees with specific timeframes within which EPA must make a regulatory decision, and to promote shorter decision review periods for reduced-risk applications. These goals were largely realized; PRIA added a new section to FIFRA that, among other changes, establishes a fee schedule for pesticide registration requests and lists time periods within which EPA must make a regulatory decision on specific pesticide registration and tolerance actions submitted to the Agency for review.¹³ PRIA was due to expire in September 2008.¹⁴ However, it proved so successful that, in 2007, Congress reauthorized PRIA for five more years and increased the number of actions covered by PRIA's fees.¹⁵ The expanded, reauthorized version of PRIA (commonly referred to as PRIA 2) applied to registration applications received by EPA between October 1, 2007, and September 30, 2012. PRIA 2 was followed by PRIA 3, which was effective October 1, 2012, through September 30, 2017, with a subsequent extension through September 30, 2018.¹⁶ After being extended by serial federal budget Continuing Resolutions, PRIA 4 was thereafter signed into law, effective on March 8, 2019, and applicable to registration applications for five years (*i.e.*, through 2023).¹⁷

§ 17:9 EPA review and decision—The standards for registrations and tolerances

FIFRA directs EPA to register a pesticide if, under any restrictions that may be imposed on the pesticide's use, the product's composition warrants the claims made for the product, its labeling and other materials comply with the requirements of the statute, it will perform its intended function without "unreasonable adverse effects on the environment," and, when used in accordance with "widespread and

¹⁰FIFRA § 3(h), added by FQPA in 1996, requires EPA to revise procedures for the registration of antimicrobial pesticide products with a goal of reducing the time periods needed to review applications to register such products. 7 U.S.C.A. § 136a(h). In response, EPA in 2013 established a new Antimicrobials Division, responsible for all regulatory decisions concerning antimicrobials and designed to provide expedited review of all types of antimicrobial applications, *see* PR Notice 97-3 (Sept. 1997), and issued new antimicrobial data requirements. 78 Fed. Reg. 26936, 26978 (May 8, 2013) (codified at 40 C.F.R. §§ 158.2200 to 2290).

commonly recognized practice it will not generally cause unreasonable adverse effects on the environment.”¹

The key concept is that of “unreasonable adverse effects on the environment,” which FIFRA has generally defined to mean “any unreasonable risk to man or the environment,² taking into account the economic, social, and environmental costs and benefits of the use of any pesticide.”³ Thus, since 1972, FIFRA has explicitly required consideration and weighing of the benefits as well as the risks of a pesticide in determining the product’s registrability, and it is against this risk-benefit standard that the scientific data on products are evaluated.

The 1996 FQPA made two changes to the definition of “unreasonable adverse effects on the environment.” First, the statute required EPA, in considering regulatory action against public health pesticides,⁴ to weigh the pesticide’s risks against the health risks prevented by the pesticide, *e.g.*, the diseases transmitted by vectors controlled by the pesticide.

Second, and more significantly, if the pesticide is a food-use pesticide and cannot satisfy the safety standard established by the FQPA amendments to FFDCA § 408 for pesticide residue tolerances in food, the pesticide will be considered to have unreasonable adverse effects, making it ineligible for registration as well as for a tolerance.

The FFDCA § 408 standard is not a risk-benefit standard. It requires that tolerance levels for pesticide chemical residues be set at levels that are “safe”;⁵ pesticides with residues above “safe” levels will be considered adulterated.⁶ A “safe” level is one at which EPA has determined that there is a reasonable certainty that no harm will result from aggregate exposure to the pesticide chemical residue, including all anticipated dietary exposures and all other exposures for which there is reliable information.⁷ Thus, when considering a petition to establish a tolerance for pesticide residues on a particular crop or food product, EPA must consider not only the exposure to that crop or food, but also exposure to other crops on which that pesticide is used.⁸ In addition, EPA must also consider numerous other factors, including dif-

[Section 17:9]

¹FIFRA § 3(c)(5), 7 U.S.C.A. § 136a(c)(5); 40 C.F.R. § 152.112.

²FIFRA § 2(j) broadly defines the term “environment” to include “water, air, land, and all plants and man and other animals living therein, and the interrelationships which exist among these.” 7 U.S.C.A. § 136(j).

³FIFRA § 2(bb), 7 U.S.C.A. § 136(bb). The full definition of “unreasonable adverse effects on the environment” is as follows:

The term “unreasonable adverse effects on the environment” means (1) any unreasonable risk to man or the environment, taking into account the economic, social, and environmental costs and benefits of the use of any pesticide, or (2) a human dietary risk from residues that result from a use of a pesticide in or on any food inconsistent with the standard under section 346a of Title 21. The Administrator shall consider the risks and benefits of public health pesticides separate from the risks and benefits of other pesticides. In weighing any regulatory action concerning a public health pesticide under this subchapter, the Administrator shall weigh any risks of the pesticide against the health risks such as the diseases transmitted by the vector to be controlled by the pesticide.

⁴A “public health pesticide” is a minor-use pesticide used in public health programs “for vector control or for other recognized health protection uses.” FIFRA § 2(nn), 7 U.S.C.A. § 136(nn).

⁵A “pesticide chemical residue” is a residue on raw agricultural commodities or processed foods of any pesticide within the meaning of FIFRA, including active and inert ingredients and metabolites and degradation products of a pesticide. *See* FFDCA § 201(q), 21 U.S.C.A. § 321(q).

⁶FFDCA §§ 402(a), 408(a), 21 U.S.C.A. §§ 342(a), 346a(a).

⁷FFDCA § 408(b)(2), 21 U.S.C.A. § 346a(b)(2).

⁸When issuing its “plant-pesticide” proposal in 1997, *see* § 17:3, EPA called for certain classes of these substances to be exempt from tolerance requirements under the FFDCA. *See, e.g.*, 66 Fed. Reg. 37817 (July 19, 2001) (Exemption From the Requirement of a Tolerance Under FFDCA for Residues of

fering sensitivities among major subgroups of consumers and cumulative risks posed by exposure to other pesticides that share a common mechanism of toxicity with the pesticide under review.⁹

This standard represents a marked change from the previous § 408 standard, which allowed a consideration of benefits in establishing maximum residue levels for raw agricultural commodities. Processed foods, however, were previously subject to § 409, including the Delaney Clause, which generally mandated a zero-risk standard for pesticides found to induce cancer in humans or animals if the pesticide concentrated during processing was applied during or after processing. The inconsistent treatment of pesticides under these two sections was controversial and was a major impetus for passage of the FQPA.¹⁰

The “reasonable certainty of no harm” standard is intended by Congress to embody then-existing EPA approaches to acceptable levels of risk at the time FQPA was enacted.¹¹ The statute also requires the Agency to make a finding regarding the safety of tolerance levels for infants and children, and to impose an additional tenfold safety factor where there are not sufficient reliable data to demonstrate that a tolerance without the added safety factor will be adequately protective of infants and children.¹² Consideration of a pesticide’s benefits is not permitted, except in extremely limited circumstances.¹³

The additional 10X safety factor for infants and children that is required in determining whether a pesticide tolerance is “safe” under FQPA is commonly referred to as the “FQPA Safety Factor.” When a tolerance determination is based on animal data, the FQPA Safety Factor is utilized in addition to conventional 10X safety factors that account for interspecies differences and intraspecies variability. Thus, an aggregate safety factor of 1000 may be employed in determining whether a pesticide residue is safe for infants and children under the FQPA, and pesticide residue levels this low are not always attainable. When EPA concludes that there are “reliable data” demonstrating that a different safety factor “will be safe for infants

Nucleic Acids that are Part of Plant-Incorporated Protectants); 66 Fed. Reg. 37830 (July 19, 2001) (Exemption From the Requirement of a Tolerance Under FFDCA for Residues Derived Through Conventional Breeding From Sexually Compatible Plants of Plant-Incorporated Protectants).

⁹FFDCA § 408(b)(2)(D), 21 U.S.C.A. § 346a(b)(2)(D). EPA has issued a guidance document discussing how it will identify pesticides with a “common mechanism of toxicity.” See Pesticides; Science Policy Issues Related to the Food Quality Protection Act, 64 Fed. Reg. 5796 (Feb. 5, 1999) (announcing the availability of the revised version of the pesticide science policy document entitled “Guidance for Identifying Pesticide Chemicals and Other Substances That Have a Common Mechanism of Toxicity”).

¹⁰Under previous law, for example, the same pesticide residue could be legal on a raw agricultural product and result from a lawful FIFRA registration under the applicable risk-benefit standards of FIFRA and FFDCA § 408, but could render a food processed from that product adulterated under FFDCA § 409 and the Delaney Clause. The resulting inconsistent treatment of pesticide residues became known as the “Delaney paradox.” A 1992 court decision upheld the zero-risk standard in processed foods in response to challenges to an EPA policy interpreting the Delaney clause as containing an exception for pesticide uses posing only *de minimis* risks. *Les v. Reilly*, 968 F.2d 985 (9th Cir. 1992). FQPA did not repeal the Delaney Clause, which remains in effect for various food additives, but made the clause inapplicable to pesticide residues.

¹¹For example, a one-in-a-million lifetime risk for “nonthreshold” effects (those for which EPA cannot determine a level at which the substance will not cause or contribute to an adverse health effect) and the use of a 100-fold safety factor for “threshold” effects. See H.R. Rep. No. 104-669, at 40-45 (1996).

¹²FFDCA § 408(b)(2)(C), 21 U.S.C.A. § 346a(b)(2)(C).

¹³Benefits may be considered to maintain in effect an existing tolerance that does not meet the safety standard for nonthreshold effects, if the pesticide protects consumers from health risks greater than those posed by the pesticide, or the pesticide’s use is needed to avoid a “significant disruption in domestic production of an adequate, wholesome, and economical food supply,” so long as specified aggregate exposure risk requirements are also satisfied. FFDCA § 408(b)(2)(B), 21 U.S.C.A. § 346a(b)(2)(B).

and children,” the FQPA Safety Factor may be reduced or eliminated.¹⁴ EPA typically determines that there are “reliable data” permitting the default FQPA Safety Factor to be waived in those instances where there is a clearly established threshold for an adverse effect and EPA concludes that infants or children will not be more susceptible to this adverse effect than adults.

There was and continues to be considerable debate as to how EPA should implement these FQPA requirements. Controversy remained, despite the Agency’s issuance of notices and guidance regarding its interpretation of its FQPA obligations.¹⁵ Both industry and environmental groups petitioned EPA to conduct rulemaking and/or issue directives on some key issues,¹⁶ and both filed lawsuits challenging EPA’s implementation (or non-implementation) of FQPA requirements. EPA entered into a consent decree and settlement agreement that established a series of deadlines for agency action on the reassessment of pesticide tolerances and the re-registration of older pesticides.¹⁷

Procedurally, a tolerance may be established in response to a petition or on EPA’s own initiative, pursuant to the same rulemaking and objection procedures that apply to the modification or revocation of tolerances.¹⁸

§ 17:10 EPA review and decision—The registration decision

If EPA determines that the FIFRA requirements for registration have not been met, it must first provide the registrant with an opportunity to correct the deficiencies.¹ Sometimes, the deficiencies can be easily remedied; it may be necessary only to revise the language of the product label or to submit a minor piece of data to replace a study that the Agency has determined to be invalid. Even with straightforward revisions, the applicant may need to negotiate an extension of the PRIA review period with EPA. In other cases, however, there may be serious problems. For instance, if a major long-term study, such as a chronic feeding study, is determined to be invalid, and the application was not rejected on this basis during the technical screen, EPA may require the registrant to conduct and submit a replacement study, thus delaying issuance of the registration by a year or more.

¹⁴FFDCA § 408(b)(2)(C), 21 U.S.C.A. § 346a(b)(2)(C).

¹⁵See, e.g., PR Notices 97-1 (Jan. 1997), 97-2 (Apr. 1997), 97-3 (Sept. 1997), 98-7 (Aug. 1998), 98-10 (Oct. 1998); EPA, “Guidance for Identifying Pesticide Chemicals and Other Substances That Have a Common Mechanism of Toxicity” (Jan. 29, 1999); and various EPA notices regarding exposure assessments and science policy issues raised by the FQPA. 63 Fed. Reg. 58038 (Oct. 29, 1998); 63 Fed. Reg. 59780 (Nov. 5, 1998); 63 Fed. Reg. 67063 (Dec. 4, 1998); 64 Fed. Reg. 5796 (Feb. 5, 1999); 64 Fed. Reg. 37002 (July 8, 1999); and 64 Fed. Reg. 42372 (Aug. 4, 1999). EPA issued a report detailing the Agency’s efforts to implement FQPA requirements. See EPA, Progress Report: Implementing the Food Quality Protection Act (1999). EPA was required by FIFRA, as amended by FQPA, to publish annually a report describing its progress in meeting goals for reregistration and tolerance reassessment. See EPA, Pesticide Reregistration Performance Measures and Goals (1997-2008), available at <https://www.epa.gov/pesticide-reevaluation/pesticide-reregistration-performance-measures-and-goals-1997-2008>.

¹⁶See Natural Resources Defense Council (NRDC) *et al.*, Petition for a Directive That the Agency Fulfill Its Duty to Retain the Child-Protective Tenfold Safety Factor Mandated by the Food Quality Protection Act (1998); American Farm Bureau Federation *et al.*, Petition for Rulemaking to Develop Policies and Procedures for Implementing the Food Quality Protection Act of 1996 (1998). EPA has also interpreted various FQPA provisions in documents prepared for its Tolerance Reassessment Advisory Committee.

¹⁷See Natural Resources Defense Council v. Whitman, 53 Env’t. Rep. Cas. (BNA) 1673, 2001 WL 1221774 (N.D. Cal. 2001), judgment entered, 2001 WL 1456783 (N.D. Cal. 2001) (approving proposed consent decree and dismissing certain complaints).

[Section 17:10]

¹FIFRA § 3(c)(6), 7 U.S.C.A. § 136a(c)(6); 40 C.F.R. § 152.118(b) to (c).

EPA may alternately require the applicant to withdraw the application, forfeit part of its registration fee, and resubmit the application when the data are complete. Or EPA may determine, after reviewing the relevant data, that, because of its acute or chronic toxicity or its environmental effects, the product would cause unreasonable adverse effects. In that case, EPA will notify the registrant and publish in the *Federal Register* its decision to deny the application for registration.² If EPA issues a formal decision to deny a registration application, the applicant may request a formal adjudicatory hearing.³

Rather than issuing a formal denial decision that would trigger adjudicatory procedures, EPA typically prefers to work with an applicant to address unresolved issues and to remedy perceived deficiencies. Most applicants also prefer this iterative approach, even though it may require that the applicant agree to one or more extensions of the applicable PRIA deadline. In the event that EPA concludes there are irreparable problems with an application, EPA typically will send a letter advising the applicant that the application cannot be granted, rather than issuing a formal denial decision. Except for a few instances where a hearing concerning the denial of pending applications was consolidated with a related cancellation hearing, EPA has never convened an adjudicatory hearing concerning the denial of an application for a FIFRA registration.

If EPA determines that the standards for registration have been met, it issues a notice of registration to the applicant. The company is then free to market its pesticide upon submission to the Agency of a copy of the final printed labeling for the product, which must incorporate any label revisions required by EPA.

§ 17:11 Registration application process—Registration of pesticide products containing nanomaterials

The application of nanotechnology to pesticides raises a number of regulatory challenges that EPA is in the early stages of tackling. A wide range of consumer products containing nanoparticles of active pesticide ingredients, such as silver, are already available to consumers.¹ At the same time, pesticide manufacturers are working on enhanced nanotechnology delivery systems and other new products. All of these applications will be encompassed within FIFRA and, thus, EPA's regulatory authority, but applying FIFRA authority to nano-pesticides raises a number of issues. One is whether new registrations and product risk assessments are required for nanoscale versions of already-registered conventional pesticides. If new registrations are necessary for these products or other new nanoscale active ingredients, then what, if any, new data requirements should be imposed?

The Nanotechnology Workgroup of EPA's Science Policy Council released a draft "Nanotechnology White Paper" in December 2005. A final version of the white paper was issued in February 2007.² Although the paper generally discusses the application of FIFRA to pesticide products containing nanomaterials, it does not recom-

²FIFRA § 3(c)(6), 7 U.S.C.A. § 136a(c)(6); 40 C.F.R. § 152.118(d).

³See FIFRA §§ 3(c)(6), 6(d), 7 U.S.C.A. §§ 136a(c)(6), 136d(d); 40 C.F.R. § 152.118(e); 40 C.F.R. pt. 164; § 17:55 (hearing procedures).

[Section 17:11]

¹Elemental silver has been an approved active ingredient in FIFRA registered products for decades (*e.g.*, use in bacteriostatic water filters, swimming pool algicides). Silver and nanosilver have demonstrated antimicrobial effects on a variety of bacteria, fungi, and viruses.

²EPA, Science Policy Council, Nanotechnology White Paper (Feb. 2007), available at https://www.epa.gov/sites/production/files/2015-01/documents/nanotechnology_whitepaper.pdf.

mend or address any specific regulatory issues.³

Pesticide products containing “colloidal” silver particles that meet the EPA definition of a nanomaterial have been registered under FIFRA for decades, but such products are now subject to greater scrutiny. EPA conditionally approved two nanosilver pesticide registrations, each considered a new “active ingredient” and subjected to the most stringent review under FIFRA. On December 1, 2011, EPA announced the conditional registration of HeiQ AGS-20, a nanosilver-based antimicrobial pesticide product approved for use as a preservative for textiles.⁴ On May 15, 2015, EPA announced a second conditional registration for a nanosilver-containing antimicrobial pesticide product named “Nanosilva.”⁵ In the decision documents approving these registrations, EPA states the following regarding potential data requirements for nanopesticides:

Historically, EPA has considered applications for pesticide products that claim to be identical or substantially similar in composition to a registered product as so-called “me-too registrations” under FIFRA registration authorities. Until recently, EPA generally has not focused on the size or surface coating of an ingredient as attributes relevant to determining if the product in an application is identical or substantially similar in composition to a registered pesticide product. However, a nanoscale ingredient may have properties that are different from those of conventionally-scaled ingredients and properties that differ from the atoms or molecules from which the nanoscale ingredient is constructed. Therefore, a nanoscale ingredient may also have different environmental health and safety properties. Accordingly, for a product containing an ingredient that is a nanoscale version of a conventionally-sized active or inert ingredient contained in an already-registered product or a different nanoscale version of a nanoscale material that is an active or inert ingredient in an already registered pesticide product, EPA may require additional data to assess the nanoscale material and to make the requisite statutory findings.

In 2013, the U.S. Court of Appeals for the Ninth Circuit granted in part and denied in part NRDC’s challenge to HeiQ Materials AG’s registration, but did not vacate the registrations.⁶ On May 30, 2017, the U.S. Court of Appeals for the Ninth Circuit responded to two petitions for review of EPA’s conditional registration of the Nanosilva pesticide product and vacated the conditional registration.⁷ On February 12, 2020, EPA announced that it is seeking public input on a proposal to incorporate a new nanosilver pesticide product into textiles to combat odors, discoloration, and other signs of wear.⁸ This is the same active ingredient in the previously vacated registration, although in the current proposal, the uses are more limited and the exposure may be more limited, as this nanosilver would be embedded within plastic beads or pellets, in contrast to the previous product registration, which was in the form of a liquid suspension.

Although EPA has yet to form a definite approach to regulating nano-pesticides under FIFRA, it made progress in 2018 when it released a Final Work Plan as part

of the nanosilver registration review process.⁹ Subsequent data call-ins (DCI) were issued in December 2019 for data requirements described in the Final Work Plan as “comprehensive.” EPA’s eventual review of new or existing data in response to the DCIs should provide informative guidance as to how nano-pesticides will be evaluated.

§ 17:12 Registration application process—Related applications and procedures

The process described above is the paradigm of the registration application process envisioned by the statute. There are, however, a number of variants of the process that constitute a substantial portion of the product regulation carried out under FIFRA.

§ 17:13 Registration application process—Reregistration and tolerance reassessment

Because of the increased emphasis on health and environmental protection required by the major amendments of 1972 and 1978, and the corresponding increase in the data needed to support a pesticide registration, Congress directed that all previously registered products be reregistered so that EPA can determine whether old products meet the current standards for registrability.¹ To accomplish that objective, and to reduce the duplicative efforts by EPA in reviewing applications to register products that are similar or even identical to other registered products, EPA initially developed a system of “registration standards” to govern reregistration of previously registered pesticides.²

As of December 1988, EPA had issued 194 registration standards affecting 350 individual active ingredients. Congress was dissatisfied with this progress and, in the 1988 FIFRA amendments, mandated that EPA reregister over 600 active ingredients that had been initially registered before November 1, 1984, through a five-phase process over a nine-year period.³ During Phase 1, EPA was required to publish four lists of active ingredients to be reregistered (Lists A, B, C, and D).⁴ In Phase 2, registrants of the listed active ingredients were required to submit notices as to whether they would seek reregistration, and were required to identify missing or inadequate data on the pesticides. During Phase 3, registrants were required to submit summaries of previously submitted data, identify any other information that would support the registrations or that may indicate unreasonable adverse effects, and make commitments to submit data to fill the outstanding data requirements or offer to share in the cost of developing such data. Under Phase 4, which was

⁹Nanosilver Final Work Plan (FWP) Registration Review: Initial Docket Case Number 5042 (Oct. 2018), available at <https://www.regulations.gov/document?D=EPA-HQ-OPP-2011-0370-0021>.

[Section 17:13]

¹FIFRA § 3(g), 7 U.S.C.A. § 136a(g). This section was repealed by Pub. L. No. 100-532, tit. VIII, § 801(b)(9), 102 Stat. 2681 (1988), and replaced by FIFRA § 4, 7 U.S.C.A. § 136a-1.

²The registration standards system was authorized by the 1978 FIFRA amendments. *See* FIFRA § 3(c)(2)(C), 7 U.S.C.A. § 136a(c)(2)(C); *see also* H.R. Rep. No. 95-343, pt. 1, at 11 (1977), 1977 U.S.C.C. A.N. 1966, 1976; H.R. Rep. No. 663, 95th Cong., 1st Sess. 16, 19, 26 (1977), 1977 U.S.C.C.A.N. 1966, 1989, 1992, 1999.

³The 1988 FIFRA amendments were codified at FIFRA § 4, 7 U.S.C.A. § 136a-1.

⁴EPA completed Phase 1 in 1989. *See* 54 Fed. Reg. 7740 (Feb. 22, 1989) (List A published active ingredients for which registration standards had been issued prior to December 24, 1988). Lists B, C, and D include the other chemicals subject to reregistration that were first registered prior to November 1984 and did not fall under the registration standards program. *See* 54 Fed. Reg. 22706 (May 25, 1989); 54 Fed. Reg. 30846 (July 24, 1989); 54 Fed. Reg. 43388 (Oct. 24, 1989). Chemicals on these lists were subject to all phases of the reregistration process.

completed in 1993, EPA reviewed the information submitted by the registrants. During Phase 5, EPA was required to determine whether to reregister the pesticides.⁵ As EPA began its Phase 5 review, the number of active ingredients to be considered for registration had declined from over 600 in 1988 to approximately 400 in the mid-nineties.⁶ The decline may in part have been attributed to registrants of manufacturing pesticides that pose higher risks who chose to voluntarily remove their products from the marketplace rather than pay for studies that may not support the products' continued use.

During Phase 5, EPA reviewed all the studies submitted in support of an active ingredient and determined if the products containing the active ingredient were eligible for reregistration and whether any applicable tolerances or tolerance exemptions met current standards.⁷ When an active ingredient, or set of related active ingredients ("chemical cases") became eligible for reregistration, EPA issued a Reregistration Eligibility Document (RED). A RED summarized the studies reviewed and the findings reached as well as requests, when necessary, for additional generic data, product-specific studies, and revised labeling.⁸ Once the RED requirements were fulfilled and accepted, EPA reregistered the appropriate pesticide products. At the completion of Phase 5, EPA reported that approximately 1,150 pesticide active ingredients organized into 613 "cases" or related groups were subject to reregistration. In September 2008, EPA completed the last REDs for 384 of these cases, while the remaining 229 cases were canceled (cases were canceled if all the pesticide registrations were canceled before the reregistration decision was completed).⁹

As noted above, the 1996 FQPA significantly revised the statutory standard for the issuance of tolerances for pesticide residues in food. To ensure that existing as well as new tolerances meet the new standard, the FQPA amended the FFDCA to require that EPA conduct a review of existing tolerances and exemptions, which was to be completed within ten years.¹⁰ Under the FQPA amendments to FIFRA, the Agency must act to modify or revoke tolerances that do not meet the current safety standard, and is to give priority in its review to the tolerances and exemptions "that appear to pose the greatest risk to public health."¹¹ In 2007, EPA completed its review of all the tolerances that were in effect at the time the FQPA

amendments to the FFDCA were enacted.¹²

§ 17:14 Registration application process—Registration review

Congress and EPA recognized that the five-phase reregistration program mandated by the 1988 FIFRA amendments and the tolerance reassessment program mandated by § 408 of the FFDCA, which were to be completed in 2008 and 2006, respectively, did not eliminate the need for continual reassessment of a pesticide's safety. In particular, Congress realized that the FIFRA standards for registration are likely to change over time as the scientific ability to assess risk evolves, and that such changes could lead EPA to adopt a different view of a given pesticide's risks and benefits from the view that prevailed when the pesticide was first registered.¹ Therefore, with the enactment of the FQPA in 1996, Congress amended FIFRA to require EPA to implement a registration review program that would assure that pesticides continue to meet the FIFRA standards for registration over their commercial lives. In pertinent part, the FQPA amended FIFRA by adding a new provision to FIFRA § 3 that directs EPA to establish by regulation procedures for the continuous review of all pesticide registrations—not just old registrations—with a goal of reviewing each pesticide's registration every fifteen years.² Congress revised this section in 2007 to clarify that the initial registration review for all existing pesticide registrations must be completed by October 1, 2022, and that subsequent registration reviews should be completed no later than 15 years after the date on which the initial registration review is completed and each 15 years thereafter.³ To ensure EPA's ability to achieve its goals, the new provision added by FQPA authorizes EPA to use its DCI authority to require registrants to submit data that are necessary for a registration review.⁴ If the data indicate that a pesticide no longer meets the standard for registration, EPA may cancel that pesticide's registration.⁵

EPA promulgated regulations to implement the registration review program in 2006.⁶ Under the Agency's regulations, registration review cases are to be composed of chemically related active ingredients and all the products containing such ingredient(s),⁷ with cases scheduled chronologically based on the date of initial registration of the oldest pesticide product in the case or the date of reregistration, which-

⁴See FIFRA § 3(g)(2), 7 U.S.C.A. § 136a(g)(2). EPA's DCI authority is discussed in §§ 17:31 to 17:32.

⁵See FIFRA § 3(g)(1)(A), 7 U.S.C.A. § 136a(g)(1)(A). The procedures for cancelling a pesticide's registration under FIFRA are discussed in § 17:50.

⁶See Final Rule: Pesticides; Procedural Regulations for Registration Review, 71 Fed. Reg. 45720 (Aug. 9, 2006) (codified at 40 C.F.R. §§ 155.40 to 155.58).

⁷40 C.F.R. § 155.42. Congress incorporated this portion of EPA's regulations into FIFRA in 2007. See Pesticide Registration Improvement Renewal Act at § 3, 121 Stat. 1000. Additionally, under EPA's regulations, a pesticide product that contains multiple active ingredients can belong to multiple registration review cases. See 40 C.F.R. § 155.42.

ever is later.⁸ Also, in contrast to the comprehensive five-phase approach to pesticide reregistration mandated by the 1988 FIFRA amendments, the approach set forth in EPA's regulations allows the Agency to tailor the scope and depth of a registration review to the circumstances of each case.⁹ The initiation of a registration review case and announcement of EPA's decision in a review case are published in the *Federal Register* with opportunity for public comment.¹⁰

EPA began the registration review program in fiscal year 2007. As of July 1, 2017, there are about 725 registration review "cases" that include approximately 1,140 pesticide active ingredients. Of these, over 700 registration review cases are past the public docket opening stage, over 595 registration review cases are in active review, and over 200 registration review interim and final decisions have been completed.¹¹

§ 17:15 Related applications and procedures—Conditional registration

"Conditional registrations" were authorized by the 1978 amendments to FIFRA, permitting the Agency to register a pesticide even if the applicant does not submit all of the data required to support a full unconditional registration.¹ The provisions authorizing conditional registrations were enacted to remove a "double standard" that had arisen when FIFRA was rewritten in 1972 as a safety and environmental statute, with the resulting substantial increase in the data requirements to be satisfied to obtain a registration. Because the Agency was not able to reregister existing products under the new statutory standards and supported by new data as quickly as the 1972 Act had contemplated, products registered prior to 1972 were still registered with what would now be regarded as an inadequate data base, while identical products could not be registered because of a need to generate and submit substantial new data, which can be time-consuming to generate.²

Thus, FIFRA authorizes EPA to conditionally register "me-too" products and to conditionally amend existing registrations to permit new uses, if EPA has, either in its files or as a result of the applicant's submission, enough data to determine that the registration would not significantly increase whatever risk of unreasonable adverse environmental effects may already be posed by the existing registrations of the same or similar products.³ Thus, in determining whether to issue a conditional registration, EPA looks at the incremental risks and benefits of the proposed conditional registration or amendment, rather than assessing the risks and benefits of the product itself.

In practical terms, this means that an applicant for registration need not satisfy any data requirement that has not been satisfied by previous registrants of products containing the same active ingredient registered for the same use. Under EPA's data compensation regulations, if an applicant can show that a "data gap" exists

³FIFRA § 3(c)(7)(A), (B), 7 U.S.C.A. § 136a(c)(7)(A), (B); 40 C.F.R. §§ 158.30(b)(3), (4), 152.113, 152.115(a).

with respect to one or more data requirements,⁴ it need not satisfy those data requirements at the time that it applies for its registration and the registration it receives will be conditional rather than unconditional. Such a registration for a me-too product or the new use of a previously registered product will be contingent upon the conditional registrant's agreement to submit, at the same time as other registrants of the same chemical, data to satisfy requirements not previously filled.⁵ The vast majority of the registrations granted since 1978 have been conditional ones, as the data bases for many previously registered active ingredients continue to be brought up to current standards. PRIA 3 (now PRIA 4) amended FIFRA to provide, among other things, funding to support enhancing the EPA information system capacity to track pesticide registration decisions, including the status of conditional registration decisions. EPA has developed a table, that it will update periodically, providing information regarding all pesticide active ingredients that were initially registered under the conditional registration authority in FIFRA Section 3(c)(7)(C) from fiscal year 2000 to the present.⁶

FIFRA also permits the conditional registration of a pesticide containing a new active ingredient, but the restrictions imposed on this type of conditional registration are much tighter than on those discussed above and, as a practical matter, conditional registrations of previously unregistered chemicals are granted less frequently than other conditional registrations. The conditional registration of a new chemical may be issued only for a period reasonably sufficient to generate and submit the missing data and only if the data are missing because there has not been sufficient time since the relevant data requirement was first imposed for the data to be generated. The conditional registrant must submit the data at the end of the specified period and the data must not meet or exceed risk criteria specified by EPA. In addition, EPA must determine that the use of the pesticide during the conditional registration period will not cause any unreasonable adverse effects on the environment and that use of the pesticide is in the public interest.⁷

A conditional registration raising interesting issues is that for dicamba. Herbicides containing dicamba are registered for use to control broadleaf weeds and woody plants. In this case, EPA's first conditional registrations of new dicamba formulations were time-limited and included expiration dates, unless EPA acted to extend the registration. EPA did act in 2018 to extend the registration for an additional two years, with expiration currently set for December 20, 2020.

§ 17:16 Related applications and procedures—Amended registration

In general, a registrant wishing to make changes to its registered label must submit an application for amended registration. Such an application would be submitted, for instance, to change active ingredient concentrations, dosage rates, use directions, or precautionary statements, or to obtain approval of additional uses (for example, in additional facilities, on additional crops, or against additional

⁴See § 17:29 (data gaps).

⁷FIFRA § 3(c)(7)(C), 7 U.S.C.A. § 136a(c)(7)(C). EPA has issued *Federal Register* notices setting forth its interpretation of § 3(c)(7)(C) and the policies it will follow in issuing conditional registrations for new chemicals. 51 Fed. Reg. 7628 (Mar. 5, 1986); 51 Fed. Reg. 12199 (Apr. 9, 1986); 53 Fed. Reg. 15952 (May 4, 1988).

pests).¹

Some minor label amendments, such as changes in brand names, may be made simply upon notification to the Agency. No EPA approval is required.² Other minor changes, such as corrections of typographical errors, require no Agency notification.³

For virtually all amendments, except approval of additional brand names,⁴ new draft labeling must be submitted with the application. Depending upon the type of change, other supporting documents may also be required. For instance, if changes in the formulation are made, a new CSF will be required. Similarly, if an amendment seeks approval of new uses of the pesticide, supporting data must either be submitted or cited so that EPA can determine whether the uses will pose unreasonable risks to the environment. Thus, compensation offers must be sent to those companies that submitted any data relied upon to support the registration amendment. The EPA review process for registration amendments is essentially the same as that for registration applications.⁵ As noted above,⁶ new use amendments, like initial registrations, may be made on a conditional basis with less than a full set of supporting data being submitted.

§ 17:17 Related applications and procedures—Supplemental registrations

An abbreviated procedure is available for a supplemental registration, or “subregistration,” which permits a company to distribute another company’s registered pesticide under the distributor’s brand name. A subregistration requires only a notification form, which is submitted to EPA by the registrant and signed by both the registrant and the proposed distributor. The name of the basic registered product and the brand name proposed to be used by the distributor must be provided. With the exception of the distributor’s proposed brand name, the product label as marketed by the distributor may not vary from the label approved for the basic registered product, except that it need not contain all of the uses for which the basic product has been approved. The product to be distributed must also be manufactured and packaged by the same person who manufactures and packages the basic registered pesticide for the original registrant. No EPA response to the subregistration notification is required for the distributor to begin marketing the product.¹ EPA considers a distributor to be the agent of the registrant and both may be held liable for violations of FIFRA.²

§ 17:18 Related applications and procedures—Experimental use permits—EUP requirements

Experimental use permits (EUP) are issued by EPA pursuant to FIFRA § 5 to

²40 C.F.R. § 152.132.

permit testing of unregistered pesticides or testing of registered pesticides for unregistered uses.¹ An application for an EUP may be filed at any time and must be acted upon by EPA within 120 days after receipt of the application and any required supporting data. EPA may issue an EUP only if it determines that the applicant needs the permit to develop information necessary to obtain a pesticide registration.² For a pesticide not previously registered for any use, the Agency may require data showing that use under the EUP will not cause unreasonable adverse effects.³ If the experimental use may result in pesticide residues on food or feed, the applicant must show that there is a tolerance or tolerance exemption for residues of the pesticide on such food or feed,⁴ petition for the establishment of a temporary tolerance or tolerance exemption, or certify that food or feed resulting from the testing program will either be destroyed or fed only to experimental animals for test purposes.⁵

The use of the pesticide under an EUP shall be for such length of time and under such terms and conditions as EPA may require, and EPA may revoke an EUP if it finds the conditions of the permit are being violated or are inadequate to avoid unreasonable adverse effects on the environment.⁶ EPA regulations provide that permits will generally be effective for one year, and impose labeling, supervision, and reporting requirements with respect to pesticide use under a permit.⁷

FIFRA also authorizes, and EPA has promulgated regulations governing, the issuance of EUPs for certain limited purposes by state governments in accordance with plans submitted to and approved by EPA.⁸ Certain laboratory or greenhouse tests or limited field trials intended only to determine a pesticide's properties generally may be conducted without an EUP. Such tests generally include tests conducted on experimental animals, and, with some exceptions, field trials conducted on a cumulative total of not more than ten acres and aquatic tests conducted on not more than one surface acre of water.⁹

§ 17:19 Related applications and procedures—Experimental use permits—Procedures

Upon receipt of an application for an EUP that EPA determines may be of regional or national significance, EPA must publish notice of the application in the *Federal Register* and may hold a public hearing if there is sufficient interest to warrant one. EPA must also publish *Federal Register* notices when EUPs are issued. Applicants may apply to renew EUPs under the same requirements that govern the initial grant of a permit. If EPA determines that an EUP application must be denied or an

⁹40 C.F.R. § 172.3. One such exception is for certain biotechnology-based microbial pesticides. EPA must be notified of the application of these pesticides so that the Agency may determine whether an EUP is required for small-scale testing. 40 C.F.R. § 172.45. *See also* § 17:34.

existing EUP revoked, the applicant or permittee may contest the denial or revocation by submitting a written request for an opportunity to confer with EPA. The Agency must make its final decision within twenty days after such conference.¹

§ 17:20 Related applications and procedures—Special local needs registrations

Under FIFRA § 24(c),¹ state governments may register uses of a pesticide that have not been federally registered if the pesticide itself is federally registered for other uses. The state must determine that the use is necessary to meet “special local needs” (SLN) and the use in question must not have been previously denied, disapproved, or canceled by EPA. The SLN registration will authorize distribution and use only within the granting state and is subject to disapproval within ninety days by EPA. An SLN registration may not be issued for a food or feed crop use unless there is an applicable tolerance or tolerance exemption.²

EPA may suspend a state’s authority to issue SLN registrations if it determines that the state is not capable of exercising or has not exercised adequate controls to ensure that SLN registrations will be consistent with the purposes of FIFRA. Such a suspension of the state’s authority must be subject to advance notice to the state and an opportunity for the state to respond.³

§ 17:21 Related applications and procedures—Transfers of registrations and data rights—Registrations

Pesticide registrations may be transferred from one company to another. EPA must receive a request that the registration be transferred; a transfer agreement from both parties documenting their agreement to the transfer and containing terms specified by EPA regulations; and a notarized statement from the transferor that states that the transfer is legally authorized and that the person signing the transfer agreement on behalf of the transferor is authorized to do so. EPA will notify the companies in writing when the transfer has been completed, and will assign a new pesticide registration number to the product in order to reflect the transfer that has been made.¹

§ 17:22 Related applications and procedures—Transfers of registrations and data rights—Data rights

Recognizing that the data that support registrations often have a value independent of the registrations themselves, EPA has promulgated a regulation governing the transfer of exclusive use and compensation rights.¹ The submitter of the data must provide EPA with a document stating the name, address, and state of

incorporation (if any), of the transferor and transferee, and identifying in detail (for example, name of the study, date of submission, name of the laboratory that conducted the study, etc.) each piece of data being transferred; a statement of intent irrevocably to transfer all rights in the identified data and that the parties understand legal proscriptions of false statements; and the names and signatures of the transferor and transferee. In addition, the transferor must submit a notarized statement documenting its authority to make the transfer and that the transfer will not violate applicable laws, court orders, or corporate or partnership documents. The Agency will notify the parties of the effective date of the transfer, at which point the transferee will be considered the “original data submitter” for exclusive use and data compensation purposes.²

III. EXEMPTIONS

FIFRA and EPA regulations provide for several exemptions from the basic requirement that pesticides be registered and from the requirement that data be submitted to support registration or amendment applications.

§ 17:23 Exemptions—Exemptions from registration requirement— Experimental use permits

A pesticide is not required to be registered if it is being transferred in accordance with an EUP.¹

§ 17:24 Exemptions—Exemptions from registration requirement— Transfers between registered establishments operated by same company or under contract

A pesticide need not be registered if it is being transferred from one registered establishment¹ to another operated by the same producer solely for packaging or use as a component of another pesticide product.² EPA’s existing regulations define the term “operated by the same producer” to mean that the establishments are owned by, or leased for operation by and under the control of, the same person.³ Although this definition excludes facilities owned or operated by persons who merely have contractual arrangements, the transfer of pesticides between facilities not operated by the same producer is authorized under certain circumstances.⁴ An unregistered pesticide may be transferred between establishments not operated by the same producer if the transfer is solely for purposes of further formulation, packaging, or labeling of a final product, and if each active ingredient present in the pesticide (at the time of transfer) either is registered or is produced by the registrant of the final

product. In addition, the transferred product must be appropriately labeled.⁵

§ 17:25 Exemptions—Exemptions from registration requirement—Export-only

Under FIFRA § 17(a),¹ a pesticide need not be registered if it is being produced solely for export to a foreign country. In 1993, prompted by increased concern about the exportation of unregistered pesticides, and about pesticide residues, particularly on imported food, EPA revised its final policy statement on pesticide exports.² To qualify for this exemption from registration, the pesticide must be prepared or packaged according to the directions of the foreign purchaser and the exporter must obtain from the foreign purchaser a statement acknowledging that the pesticide is not registered for use in, and cannot be sold in, the United States.³ EPA transmits a copy of that statement to the appropriate official of the importing country's government. In addition, producers of pesticides intended for export must comply with the establishment registration and related reporting requirements of FIFRA, and must comply with specified labeling requirements designed to prevent misbranding of pesticide products as set forth in FIFRA § 2(q).⁴ In a related provision, FIFRA provides that EPA must, through the State Department, notify governments of other countries and appropriate international agencies when a pesticide registration—or the cancellation or suspension of a registration—becomes effective or is terminated. Upon request, EPA's notification shall include supporting information and information regarding other registered pesticides that could be used instead of the pesticide that is the subject of the notification.⁵ EPA also has provided guidance on the circumstances under which unregistered pesticides may be imported into the United States for formulation into export products.⁶

§ 17:26 Exemptions—Exemptions from registration requirement—Emergency exemptions

FIFRA § 18¹ authorizes EPA to exempt federal or state agencies from any provision of FIFRA in the event that emergency conditions require such an exemption. EPA regulations specify when state or federal government agencies will be permit-

ted to use unregistered pesticides in response to an emergency.² The Agency's regulations provide that an emergency exists when there is an "urgent, non-routine" situation requiring the use of a pesticide to control a new pest not previously prevalent in the United States, to control significant risks to health, the environment, beneficial organisms, or endangered species, or to prevent specified types of economic loss, and there is no registered pesticide or economically or environmentally feasible alternate method of control available.³ The exemptions granted can be very specific and time-limited; EPA has developed a database so companies can search (by chemical, site, pest, applicant, or date range) to determine if an emergency exemption has been issued and its expiration date.⁴

As a result of FQPA, FFDCA now requires EPA to establish a tolerance or exemption from tolerance when approving a § 18 emergency exemption.⁵ EPA may establish the tolerance without providing for public notice and comment, but the tolerance must have an expiration date and must meet the safety standard of FFDCA § 408.⁶

§ 17:27 Exemptions—Exemptions from registration requirement—Other exemptions authorized by EPA

EPA may exempt pesticides from FIFRA provisions if the Agency determines the pesticides are adequately regulated by another federal agency or are of a type that need not be subject to FIFRA to carry out the purposes of the statute (e.g., because the pesticides pose a negligible risk to human health or the environment, and the burden imposed by regulation is not justified).¹

Substances exempted from the very *definition* of a pesticide include the following substances, provided they meet the criteria set forth in the regulations: (1) liquid chemical sterilants; (2) nitrogen stabilizers; (3) human drugs; (4) animal drugs; (5) animal feeds; (6) vitamin hormone products; and (7) products intended to aid the growth of desirable plants, namely plant nutrient products, plant inoculant products, and soil amendments.² On March 25, 2019, EPA released draft guidance entitled Draft Guidance for Plant Regulator Label Claims, Including Plant Biostimulants in an attempt to "reduce confusion, in both the regulatory community and regulatory agencies, as to whether specific products are or are not subject to registration as a pesticide under FIFRA."³

Pesticides exempted by EPA regulations from some or all of the statute's registration requirements include: (1) pesticides transferred solely for purposes of disposal, subject to certain prohibitions on misbranding and certain Agency regulations recommending procedures for pesticide disposal; (2) certain biological control agents; (3) new drugs within the jurisdiction of FDA under FFDCA; (4) pheromones used in pheromone traps; (5) preservatives for biological specimens; (6) foods (without active ingredients) used to attract pests; (7) certain uses of natural cedar products; and (8)

articles or substances treated with or containing pesticides intended to protect the articles or substances themselves.⁴

EPA has developed guidance clarifying the scope of the “treated article” exemption and the types of claims that may be made for articles treated with or containing pesticides without registering the treated article itself.⁵ EPA has brought a number of enforcement actions attempting to control the claims, in the marketing of unregistered treated products, that the treated product has health protective effects.⁶ In discussing its enforcement priority for the “marketing of unregistered pesticide-treated products with illegal, unsubstantiated public health claims” that do not meet the treated article exemption criteria, EPA states it “is concerned about these claims because, in addition to being unlawful, they are also potentially harmful to the public (*e.g.*, if people believe that a product has a self-sanitizing quality, they may become lax in their hygiene practices).”⁷

EPA also has issued “minimum risk” pesticide regulations under a Section 25(b) rule exempting a number of nontoxic active ingredients (many of them natural substances) from most FIFRA requirements.⁸

§ 17:28 Exemptions—Exemptions from data requirements—Waivers

In listing the data requirements that must be satisfied to obtain a pesticide registration, EPA has recognized that the generally applicable requirements may not be appropriate for each type of product to which they apply.¹ Accordingly, EPA has provided for case-by-case review of applicant requests that data requirements be waived, either because the data would be impossible to generate or because they would not be useful to EPA’s risk-benefit evaluation.² A waiver request must be made in writing, generally after a preliminary discussion with the appropriate EPA product manager, and must justify the waiver, describe any unsuccessful attempts to generate the required data, and supply any other information that the applicant believes appropriate, along with suggesting alternative means of obtaining data that would address the concern underlying the requirement.³

Although EPA states that it cannot specify all of the circumstances in which a waiver might be appropriate, the Agency will consider factors such as the anticipated use of and exposure to the pesticide, the impact of the data costs on the incentives for pesticide registrants to develop the data, the differences between various classes of pesticides, particularly differences between agricultural and nonagricultural pesticides, and similar factors. The Agency will notify the applicant in writing of its

³40 C.F.R. § 158.45(b).

decision on a waiver request and may provide public notice of the decision.⁴

§ 17:29 Exemptions—Exemptions from data requirements—Data gaps

As noted in the discussion of conditional registrations, a registration applicant need not satisfy a data requirement at the time the application is submitted when that data requirement has not yet been satisfied by previous registrants of the same or a similar product.¹ Certain applicants cannot defer a data requirement on the basis of such a “data gap,” for example, when the applicant is seeking the registration of a product containing a new active ingredient or is seeking to add a new use pattern to a registered product and data are needed to demonstrate whether the new use would substantially increase the risk of unreasonable adverse effects on the environment.²

§ 17:30 Exemptions—Exemptions from data requirements—Formulator’s exemption

Under the “formulator’s exemption” of FIFRA § 3(c)(2)(D),¹ as interpreted by EPA regulations,² a registrant need not submit, cite, or pay compensation for data relating to the safety of an active ingredient in the registrant’s product if that active ingredient is purchased from another company in a form that is already registered with EPA.

Originally, the statute limited eligibility for the formulator’s exemption to applications for registration of end-use products. EPA’s data compensation regulations, however, extended the exemption and made it available to intermediates and technical products that contain purchased, registered pesticides.³ A judicial challenge to EPA’s expansion of the exemption as unauthorized by FIFRA was unsuccessful.⁴ The 1988 FIFRA amendments redrafted § 3(c)(2)(D), bringing its language into line with the EPA regulations and the judicial interpretation.⁵

A company eligible for the formulator’s exemption will still be required to submit or cite some data (product chemistry and acute toxicity) on the end-use formulation. It can either cite and offer to pay for such data if another company has submitted data on an end-use formulation like the applicant’s, or it can itself generate and submit these less expensive types of data. If a registrant who obtained a registration in reliance on the formulator’s exemption subsequently changes its source of supply so that it no longer qualifies for the formulator’s exemption, it is required to comply with the data compensation procedures, including compensation offers.

IV. ADDITIONAL INFORMATION REQUIREMENTS

§ 17:31 Data call-ins—Requirement to submit additional data on previously registered pesticides

⁴See 40 C.F.R. § 158.45; FIFRA §§ 3(c)(2)(A), 25(a)(1), 7 U.S.C.A. §§ 136a(c)(2)(A), 136w(a)(1).

[Section 17:29]

[Section 17:30]

¹7 U.S.C.A. § 136a(c)(2)(D).

²40 C.F.R. § 152.85.

³40 C.F.R. § 152.85.

⁴See *PBI-Gordon Corp. v. Thomas*, 609 F. Supp. 135 (W.D. Mo. 1985).

⁵Specifically, the words “an end-use product” were deleted and replaced with “the pesticide that is the subject of the application.”

FIFRA § 3(c)(2)(B)¹ authorizes EPA to require from registrants the submission of additional data, beyond the data that were initially required to obtain the registrations, when the Agency determines that such additional data are necessary to maintain the registrations in effect. Such DCIs are generally part of EPA's continuing effort to bring existing pesticide data bases up to modern standards, but they also may be initiated when EPA learns of a potential risk posed by a registered pesticide and concludes that additional data are needed to evaluate the risk.

When a DCI is issued, a notice of the new data requirements is sent to each company holding a registration for the active ingredient in question. Within ninety days of receipt of the notices, affected registrants must provide to EPA evidence that they are taking appropriate steps to satisfy the additional data requirements.² The Agency is authorized to suspend the registration of any company that does not take such appropriate steps toward producing the new data.³

Data that have been submitted pursuant to a DCI may be cited, subject to compliance with applicable data compensation requirements,⁴ by subsequent applicants for registration.⁵

§ 17:32 Data call-ins—Methods for satisfying

There are several methods by which affected registrants may satisfy DCI requirements. Obviously, any affected company can generate and submit the required data on its own. The statute also authorizes, but does not require, two or more registrants to develop the data jointly or to share the cost of developing the data.¹ The pesticide industry has taken advantage of this provision by forming task forces to share the costs of developing generic exposure data required by EPA DCIs. EPA has stated that data generated by the task forces may be acceptable for many pesticide registrations in the United States and has informed all pesticide registrants of the task forces' existence.²

In addition, DCI notices typically specify other steps that a registrant may be able to take to comply with a DCI. Such steps include demonstrating that the registrant is eligible for the formulator's exemption;³ requesting a voluntary cancellation of the product registration or the registered use to which the additional data pertain; submitting existing data that the registrant believes will satisfy the new requirements; or requesting and obtaining either a waiver of the requirements as unnecessary or inappropriate,⁴ or an extension of the deadline for submitting the data.

In addition, EPA has taken the position that it will not suspend the registration of any company that makes a "bona fide offer" to share in the costs of developing the data, even if that offer is not accepted by the company or group of companies actu-

Prior to that, EPA announced the formation of the Spray Drift Task Force to develop and satisfy data requirements for virtually all pesticide products. PR Notice 90-3 (Apr. 1990).

³*See* § 17:30 (formulator's exemption).

⁴*See* § 17:28 (data waivers).

ally taking the lead in producing the data. To make a bona fide offer, in EPA's view, a company must offer to share costs (a specific dollar amount need not be offered), to negotiate over the terms of the sharing arrangement, and to be bound by arbitration under § 3(c)(2)(B)(iii);⁵ and the offer must be irrevocable. Many data generators believe that, as a practical matter, EPA's position effectively makes data sharing mandatory, although at least one court has found no inconsistency between EPA's policy and the voluntary nature of joint data development under the DCI provisions of FIFRA.⁶

§ 17:33 Reporting of new adverse effects information

FIFRA § 6(a)(2)¹ provides: "[i]f at any time after the registration of a pesticide the registrant has additional factual information regarding unreasonable adverse effects on the environment of the pesticide,² the registrant shall submit such information to [EPA]."

EPA previously described its view of the obligations imposed by this requirement in a 1978 interpretive memorandum,³ a 1979 enforcement policy,⁴ and a 1985 rule codifying, in regulation form and with a few changes, the views expressed in the memorandum and enforcement policy.⁵ In 1997, EPA published a final rule, reflecting its current—and broader—view of § 6(a)(2) reporting obligations and the parties subject to them.⁶

EPA has long taken the position, upheld in federal court,⁷ that it is the Agency rather than the registrant that must determine the reliability and regulatory significance of a particular piece of information pertaining to the adverse effects of a pesticide. Accordingly, a registrant may not withhold information indicating that adverse effects are associated with a pesticide, even if the registrant believes that the information is unreliable or insufficient to support a change in the terms or conditions of its registration. In short, EPA takes a very broad view of § 6(a)(2) as

⁵7 U.S.C.A. § 136a(c)(2)(B)(iii). See § 17:37 (arbitration).

⁶Mobay Chemical Corp. v. Costle, 517 F. Supp. 254, 273-75 (W.D. Pa. 1981), judgment aff'd in part, vacated in part, 682 F.2d 419 (3d Cir. 1982).

[Section 17:33]

¹7 U.S.C.A. § 136d(a)(2).

²See § 17:9 (unreasonable adverse effects on the environment).

³43 Fed. Reg. 37611 (Aug. 23, 1978).

⁴44 Fed. Reg. 40716 (July 12, 1979).

⁵50 Fed. Reg. 38121 (Sept. 20, 1985). Although this rule appeared in the C.F.R., it was never made effective.

⁶62 Fed. Reg. 49370 (Sept. 19, 1997) (effective June 16, 1998) (codified at 40 C.F.R. pt. 159, subpt. D). In response to a number of questions and criticisms regarding the new rule, EPA made some technical corrections to the rule and issued additional guidance clarifying the Agency's position on some issues raised by the rule. See 63 Fed. Reg. 41192 (Aug. 3, 1998); 63 Fed. Reg. 33580 (June 19, 1998); PR Notice 98-4 (Aug. 1998); PR Notice 98-3 (Apr. 1998). Among other things, EPA corrected the definition of "registrant" from the September 19, 1997, regulation and delayed the date of compliance.

⁷With one exception, the Agency's 1978 interpretation was upheld as within EPA's statutory authority under § 6(a)(2) in *Chemical Specialties Mfrs. Ass'n v. U. S. Environmental Protection Agency*, 484 F. Supp. 513, 14 Env't. Rep. Cas. (BNA) 2103, 10 Env'tl. L. Rep. 20430 (D.D.C. 1980). The court held that because § 6(a)(2) requires only the submission of factual information, EPA's 1978 memorandum was incorrect in requiring the submission of certain expert opinion information. *Id.* at 518. In the 1997 rule, with additional interpretations in PR Notice 2000-8, EPA takes the position that the court's statement regarding opinion evidence was merely dicta and the Agency continues to regard such information as reportable under certain circumstances. See 40 C.F.R. § 159.158(a); 62 Fed. Reg. 49370, 49377 to 49378; PR Notice 2000-8 (Sept. 2000). This position was upheld in *American Crop Protection Ass'n v. U.S. E.P.A.*, 182 F. Supp. 2d 89, 54 Env't. Rep. Cas. (BNA) 1059, 32 Env'tl. L. Rep. 20442 (D.D.C. 2002).

requiring the submission of information in the registrant's possession, pertaining to a pesticide for which the registrant holds a registration, that (in the words of the 1978 interpretive memorandum) "would be relevant to an Agency decision regarding the risks and benefits of the pesticide, *i.e.*, an Agency decision regarding the registrability of the pesticide *or* regarding the proper terms and conditions of the registration."⁸

In general, EPA's current regulations provide more detailed guidance than the 1978 and 1979 interpretations regarding the particular types of information that the Agency believes must be reported under § 6(a)(2). The regulations address the reporting of study results, incidents, and other information and describe toxicity, environmental effects, contamination, toxic constituents or breakdown products, and product performance failure information that must be reported.⁹ The regulations also discuss the mechanics of reporting, discussing when information must be reported (generally within thirty calendar days except for certain incident reports, which must be submitted more quickly if they involve human fatalities, but may be reported over longer time periods if they involve specified, less serious effects),¹⁰ and how the information is to be submitted.¹¹ There are limited exemptions from reporting, including when the information is "clearly erroneous" or is already available to the Agency.¹²

Other requirements codified in the regulations include the following:

- Reporting requirements apply to former as well as current registrants, although the obligations of former registrants may be more limited in scope.¹³
- Future registrants are also covered, as an applicant for registration must submit at the time of application all information that would be reportable under § 6(a)(2) if the pesticide were already registered.¹⁴
- Reporting obligations may be triggered by information received by a registrant's agents—including, according to EPA, supplemental distributors, consultants, contract laboratories, and attorneys—as well as by its employees.¹⁵
- Provisions required the submission of certain information obtained prior to the promulgation of the final rule.¹⁶
- Regulations clarify the scope of registrants' responsibilities and liabilities.
- EPA takes the position, disputed by some, that serious failures to comply with

⁸43 Fed. Reg. 37611 (emphasis added); 62 Fed. Reg. 49370, 49371 to 49372; 40 C.F.R. § 159.158(a).

⁹See 40 C.F.R. §§ 159.165 and 159.167 (toxicological and ecological studies; preamble discussion, 62 Fed. Reg. 49370, 49380; 40 C.F.R. § 159.170) (human epidemiological and exposure studies; preamble discussion, 62 Fed. Reg. 49370, 49380); 40 C.F.R. § 159.178 (pesticides detected in food, feed, or water; preamble discussion, 62 Fed. Reg. 49370, 49380 to 49381); 40 C.F.R. § 159.179 (information on metabolites, degradates, contaminants, and impurities; preamble discussion, 62 Fed. Reg. 49370, 49381); 40 C.F.R. § 159.184 (toxic or adverse effect incident reports; preamble discussion, 62 Fed. Reg. 49370, 49381 to 49384); 40 C.F.R. § 159.188 (failure of performance; preamble discussion, 62 Fed. Reg. 49370, 49384 to 49386); 40 C.F.R. § 159.195 (other reportable information not otherwise described; preamble discussion, 62 Fed. Reg. 49370, 49386). Despite a district court opinion's statement in *Chemical Specialties Mfrs. Ass'n v. EPA* that benefits information is beyond the scope of § 6(a)(2), EPA continues to require certain "benefits" information (*i.e.*, information regarding failures of products to perform as claimed) and characterizes the district court opinion as "clearly incorrect." See 40 C.F.R. § 159.188; 62 Fed. Reg. 49370, 49386; 484 F. Supp. at 513.

§ 6(a)(2) requirements could result in a pesticide's cancellation, not simply because the information itself suggests that cancellation is justified but as a sanction for non-reporting.¹⁷

EPA issued a guidance document clarifying its position with regard to privileged information.¹⁸ EPA does not consider an attorney's professional legal judgment as an opinion or conclusion and therefore does not require reporting of such judgments: "[o]pinions and conclusions rendered as the professional legal judgment of an attorney are not relevant to EPA's assessment of the risks or benefits of a pesticide and are not required to be reported under part 159."¹⁹ However, "[t]o the extent that the attorney engages in activities that do not necessarily call for the professional legal judgment of an attorney, the attorney's opinions and conclusions may become reportable under part 159."²⁰

§ 17:34 Other new data requirements

The FQPA authorizes—or requires—EPA to use its data collection authorities to obtain certain additional information relating to pesticides. First, it authorizes EPA to require the submission of additional information determined to be necessary to support the continuation of a pesticide tolerance or tolerance exemption.¹ The Agency may do so under its FIFRA § 3(c)(2)(B) DCI authority,² its authority to issue rules requiring testing of chemical substances pursuant to § 4 of the Toxic Substances Control Act (TSCA),³ or by means of an order issued as prescribed in FFDCA § 408(f)(1)(C).⁴

In addition, FQPA requires EPA to develop and implement a program to screen all pesticide chemicals (active and inert ingredients) for “estrogenic effects,” *i.e.*, effects in humans similar to those produced by naturally occurring estrogens, or other endocrine effects designated by EPA. EPA may exempt substances from the screening program if it determines that they are not anticipated to produce estrogenic effects.⁵ EPA has published notices describing the major elements of its planned Endocrine Disruptor Screening Program (EDSP).⁶ In 2009, EPA issued the final list of the first group of 67 chemicals that were screened under EDSP for Tier 1 testing, including pesticide active ingredients and High Production Volume (HPV) chemicals used as pesticide inert ingredients, and announced the second list of 109 chemicals in 2013.⁷ EPA continues to develop policies and procedures, review screening results, and develop test guidelines under the EDSP.

**§ 17:35 Mandatory data licensing and exclusive use under § 3(c)(1)(F)—
The statutory provisions**

EPA's consideration of previously submitted data cited by a subsequent registration applicant is governed by the "data compensation" and "exclusive use" provisions of FIFRA § 3(c)(1)(F).¹ FQPA expressly provided that data submitted to support pesticide tolerances and exemptions are protected by these provisions.² FIFRA Section 3(c)(1)(F) permits an applicant for a new or amended registration to support its application by citing relevant data previously submitted to EPA by another registrant (or registrants) instead of generating a new set of data. The data submitters' permission is not required for an applicant to rely on the previously submitted data, but EPA may not consider the data to support the new applicant's registration application unless the applicant has offered to compensate the data submitters for reliance on the data. A registration applicant can identify the companies to which compensation offers must be sent by consulting EPA's "Data Submitters List," which lists data submitters according to the active ingredient on which they have submitted data. A company is entitled to receive compensation for a period of fifteen years following the submission of the data to support the subsequent registrants.³

EPA may issue a me-too registration once the applicant has extended the required offers of compensation, even if the applicant and the data submitter have not yet agreed upon, or an arbitrator determined, the amount of compensation that is appropriate. Thus, compensation disputes do not delay issuance of a registration.⁴

Under the "exclusive use" provision,⁵ data submitted in support of a pesticide containing a new active ingredient first registered after September 30, 1978, may not be used to support the application of any other registration applicant for a period of ten years following the registration of the new pesticide. Additional exclusive-use protection may be available if the registrant submits data supporting minor uses of a pesticide.⁶ An applicant seeking to register a product on which there are exclusive use data in EPA's files will therefore either have to generate its own new data or obtain the exclusive use data submitter's permission to rely on the earlier, protected data.

EPA has promulgated regulations to implement data submitters' data compensation and exclusive use rights.⁷ The regulations include procedures by which data submitters can challenge subsequent registrations on the grounds of failure to comply with applicable data submission, compensation, and exclusive use provisions.⁸

**§ 17:36 Mandatory data licensing and exclusive use under § 3(c)(1)(F)—
The *Monsanto* decision**

The mandatory data licensing provisions were controversial upon their enactment in 1972. Because the data compensation provisions were linked to the statutory pro-

visions governing disclosure and confidentiality of information submitted to EPA, a data submitter that claimed its data to be trade secret could make those data unavailable for citation by subsequent applicants. In 1978, however, Congress amended § 3(c)(1)(F) to add the exclusive use provisions and to sever the link between FIFRA's compensation and confidentiality provisions.¹ Thus, the 1978 statute made all data other than those protected by the exclusive use provisions subject to citation by subsequent applicants without the data submitter's permission.

Many data submitters were critical of FIFRA's mandatory licensing scheme, arguing that it failed to provide an adequate incentive for innovation and the development of new products. As a result, a number of legal challenges were filed, alleging that FIFRA effected an unconstitutional taking of the data submitters' property rights in their data without just compensation. All of these challenges were rejected by the courts until April 1983,² when the Eastern District of Missouri declared FIFRA's mandatory data licensing provisions unconstitutional in *Monsanto Co. v. Acting Administrator, EPA*.³ The issuance of registrations in reliance on previously submitted data without the permission of the submitter was enjoined while the Supreme Court reviewed the case.

In June 1984, the Supreme Court unanimously reversed the district court's decision and held that the data compensation scheme of § 3(c)(1)(F) is constitutional.⁴ Relying on an evaluation of data submitters' "reasonable investment-backed expectations," the Court held that there could not have been such expectations that data submitted before 1972 could not be cited because the practice followed by USDA and EPA before 1972 had apparently been to consider existing data in acting on new applications for registration. Similarly, registrants could not reasonably expect to protect from citation data submitted after 1978, when FIFRA made it clear that all non-exclusive use data would be subject to citation. Thus, for pre-1972 and post-1978 data, the Court found that there would be no taking.

§ 17:37 Arbitration—The statutory provisions

Under both §§ 3(c)(1)(F) and 3(c)(2)(B), disputes over appropriate compensation or cost-sharing are to be resolved by binding arbitration.¹ Although the 1972 version of FIFRA had provided that compensation disputes were to be resolved by EPA through adjudicatory hearing procedures, the Agency advocated a change when the law was amended in 1978. EPA cited its lack of experience and expertise in resolving the economic and competitive questions raised by compensation disputes,² and Congress responded by amending the law to provide for arbitration of such disputes. Under

¹7 U.S.C.A. §§ 136a(c)(1)(F)(ii), (c)(2)(B)(iii).

²See, e.g., H.R. Rep. No. 95-343, pt. 1, at 8 (1977), 1977 U.S.C.C.A.N. at 1974.

§ 3(c)(1)(F), arbitration may be requested if the parties have not agreed on the amount and terms of compensation for the use of data after ninety days from delivery of the offer to compensate.³ Section 3(c)(2)(B) provides that, within sixty days of notifying EPA that they have agreed to develop additional data jointly, the registrants are to agree on the terms of the data development arrangement or on a procedure for reaching such an agreement. If such a further agreement is not reached within that time period, any of the registrants may initiate binding arbitration proceedings.⁴

The statute provides that arbitration is initiated by filing a request with the Federal Mediation and Conciliation Service (FMCS) to appoint an arbitrator from the roster of such arbitrators maintained by FMCS.⁵ In actuality, because FMCS has delegated its authority to the American Arbitration Association (AAA), the arbitration requests are filed with AAA. FIFRA arbitrations are conducted pursuant to rules based on AAA's Commercial Arbitration Rules that were promulgated by FMCS.⁶

FIFRA provides that the findings and determinations of the arbitrator shall be final and conclusive, and are not subject to judicial review except for fraud, misrepresentation, or other misconduct by one of the parties to the arbitration or the arbitrator. A lawsuit seeking review of an arbitration award must be based on a verified complaint with supporting affidavits attesting to specific instances of the alleged fraud, misrepresentation, or other misconduct.⁷

Under FIFRA § 3(c)(1)(F), EPA is to deny the registration application (or cancel the registration, if already issued) of a registration applicant that fails to participate in a procedure for reaching an agreement on compensation, fails to participate in an arbitration, or fails to comply with an agreement or arbitration award. A data submitter who fails to comply shall forfeit its right to compensation.⁸ Similarly, under § 3(c)(2)(B), if EPA determines that a registrant has failed to take appropriate steps to participate in a procedure for reaching an agreement concerning the joint data development arrangement or in an arbitration proceeding decision concerning a joint data development agreement, EPA may issue a notice of intent to suspend the registration for which the additional data are required.⁹

§ 17:38 Arbitration—The *Union Carbide* decision

In addition to challenging the basic concept of mandatory data licensing,¹ data submitters also challenged FIFRA's reliance on binding arbitration to resolve data compensation disputes. As in *Monsanto*, they were successful in district court, but the district court decision was subsequently overturned by a unanimous Supreme Court.

In *Thomas v. Union Carbide Agricultural Products Co.*,² the arbitration features of FIFRA were challenged on the grounds that they delegate federal judicial power

to individuals, *i.e.*, the arbitrators, who do not have the constitutional attributes of federal judges (such as presidential appointment and lifetime tenure) and whose decisions in most instances are not reviewable by federal courts. Although this issue had been raised in *Monsanto*, the Supreme Court did not decide it in this case, finding it not yet ripe for review. In *Union Carbide*, however, the Court found the issue ripe and held that the arbitration remedy was a sufficient mechanism for implementing the statutorily created right to data compensation. The Court found that FIFRA provided sufficient judicial review to escape constitutional infirmity. The Court reserved judgment on another issue, *i.e.*, whether the statute unconstitutionally delegated legislative powers without establishing adequate standards to govern the exercise of those powers. However, the Court noted that “the legislative history . . . is far from silent,” citing portions of that history that indicate compensation should be based on study costs.³ The plaintiffs did not pursue this issue further.

§ 17:39 Compensation decisions

Compensation decisions tend to be very fact specific, making it difficult to generalize about such cases, and arbitration decisions do not, by their very nature, establish binding precedent. Moreover, the vast majority of data compensation and cost sharing matters are resolved without arbitration, and many arbitration decisions are not made public. It thus is not particularly meaningful to cite “trends” in the decisions, other than to observe that, as the system has matured, claimants have focused on recovery of what they assert to be data production costs and largely stopped seeking patent-like royalties. Nonetheless, citation to arbitrators of decisions in previous disputes often occurs in arbitration proceedings, and thus a review of some of the decisions is informative.

§ 17:40 Compensation decisions—Decisions by EPA under 1972 act

Two compensation cases were brought under the 1972 law, under which an EPA Administrative Law Judge (ALJ), rather than the arbitrators provided for by the current law, decided proper compensation in substantive decisions. In the first, *Ciba-Geigy Corp. v. Farmland Industries, Inc.*, Ciba-Geigy’s actual data production costs were divided on the basis of market shares.¹ The ALJ rejected its claim for royalties for the benefits Farmland gained by not having to spend the time to generate its own data.

In *Union Carbide v. Thompson-Hayward Chemical Co.*,² the ALJ again found that compensation should be determined by the cost to the data producer rather than the value of the benefits accruing to the follow-on registrant. The ALJ disallowed compensation for costs that were not adequately shown to be attributable to generating the particular data relied on by Thompson-Hayward. Also disallowed was compensation for “losses”—the cost of research on noncommercialized products—that were allocable to the development of the commercially successful pesticide use supported by the data in question. In contrast to the *Ciba-Geigy* decision, *Union Carbide* divided the compensable costs on a per capita, equal sharing basis rather than according to market shares.

²*Union Carbide v. Thompson-Hayward Chem. Co.*, FIFRA Comp. Docket No. 27, Initial Decision (EPA 7-13-82).

§ 17:41 Compensation decisions—Subsequent arbitration decisions

Under the 1978 amendments to FIFRA, more than 30 arbitration decisions have been made public (in some cases with some information redacted); other decisions and settlement agreements are nonpublic by agreement of the parties. The reported decisions are a mix of final awards and preliminary decisions, some involving cases brought under § 3(c)(1)(F), others involving data cost-sharing under § 3(c)(2)(B), and some addressing compensation under both provisions.

The costs recognized as compensable in the public arbitration decisions vary depending on the facts, with some decisions allowing compensation for costs denied and other cases allowing compensation only for costs incurred. Additionally, compensable costs may be subject to adjustments, the permissibility and adjustment factors of which also vary among cases. Finally, the arbitrators in these cases have chosen various allocation methods to divide data costs, including per capita allocation, modified per capita and market share allocations, and pure market share allocation.

§ 17:42 Compensation decisions—Arbitration decisions under current act—Compensable costs

[SUMMARY BOX] Data compensation involves several elements: study costs, study managements costs, inflation/financing costs, and risk premiums. Those costs must then be allocated among the parties

In the first § 3(c)(1)(F) case under the 1978 amendments, *Stauffer Chemical Co. v. PPG Industries, Inc.* (PPG), the data submitter, Stauffer, received a substantial compensation award.¹ The tribunal concluded that direct study costs and overhead costs were compensable. The tribunal generally rejected direct compensation for efficacy studies because such studies were not required to be submitted to EPA. However, the tribunal awarded Stauffer compensation for the “slavish copying” of Stauffer’s labels by PPG, because “the incorporation of their substance in PPG’s own approved labels presupposes EPA’s use of the underlying Stauffer data in their approval.”

A royalty was denied in the next fully-arbitrated decision, *DuPont v. Griffin*.² That case was the first case to address compensation and cost-sharing under both § 3(c)(1)(F) and § 3(c)(2)(B), and the award simply allocated study costs among the registrants based on “the realities of the marketplace”—essentially, a market share based allocation with a ten percent floor. The arbitration panel also concluded that the costs of “supplemental” or “unacceptable” studies were not compensable unless such costs concerned “core supplemental data” filed before the registration was granted. With regard to § 3(c)(2)(B) cost-sharing, the panel decided that the follow-on registrants need share only the costs of studies required and “accepted” by EPA. The panel’s § 3(c)(1)(F) award provided that compensation would be limited to data originally submitted after December 31, 1969, and that neither efficacy data nor data submitted at the registrant’s initiative for purposes of defending a product under special review would be compensable.³

Subsequent cases have largely institutionalized awards for direct study and

[Section 17:42]

¹*Stauffer Chem. Co. v. PPG*, Docket No. 16-199-077-82 FIFRA (1983) (Birch, Smolka, and Vassil, Arbs.).

²*Dupont v. Griffin Corp. and Drexel Chem. Corp.*, Docket No. 16-171-0080M (1988) (Birch, Juten, Foy, Arbs.).

³*In Abbott Laboratories v. Agtrol Chemical Products, Inc.*, Docket No. 16-171-00536-89G (1991),

overhead costs, but employed several different methods of cost calculation and allocation. Only one conclusion has been consistent: costs must be adequately established in order to be compensable. For example, in *Enviro-Chem, Inc. v. Lilly Industries, Inc.*, the arbitrator rejected “replacement value” as a basis for data costs, concluding that Enviro-Chem was entitled to compensation only for data costs it actually incurred.⁴ The arbitrator also reasoned that replacement costs would be equally inappropriate if introduced by a follow-on registrant: “the underlying purposes of FIFRA are best effectuated by awarding data compensation costs in accordance with actual, historic costs of the original data submitter rather than speculative assertions as to the replacement value of such studies to the subsequent registrant.” Similarly, in *DowElanco & the Trifluralin Data Development Consortium v. Albaugh, Inc.*, the panel noted that arbitration claims may legitimately be pursued on the basis of estimated costs, but that claimants should recognize that such costs are likely to be less persuasive than those supported by more detailed contemporaneous records and may therefore be subject to discounting.⁵ In *Spray Drift Task Force v. Burlington Industries*, the arbitrator applied a 25 percent reduction to claimant’s asserted costs.⁶

Certain claims are routinely rejected in the body of reported arbitrations. Claims for the costs of efficacy studies have generally been denied in the cases that have considered the issue subsequent to *Stauffer Chemical*.⁷ Moreover, costs associated with the testing of formulations or crop applications differing from the follow-on registrant’s intended use have been denied,⁸ with a limited exception when the data either relate to the follow-on’s product or a product substantially similar to the follow-on’s product or its active ingredient.⁹

The importance of particular facts to arbitration outcomes is demonstrated by the decision in *American Cyanamid Co. v. Aceto Co.*, in which the panel included two arbitrators who had decided the *DuPont* case.¹⁰ Nonetheless, the decision departed from the reasoning in *DuPont* with regard to future studies. Whereas in *DuPont* the

two arbitrators believed that royalties based on early market entry and opportunity costs were legally permissible under FIFRA, but that evidence in the case did not support such an award. The third arbitrator, in a separate opinion, expressed the view that such royalties are not recoverable under FIFRA’s data compensation provisions, but no other opinions have adopted this view.

Termilind Ltd.*, Docket No. 23-171-00002-96 (1998) (Aldock, Butterfield, and Wilson, Arbs.) (allowing compensation where EPA announced that data on one product could be used to satisfy requirements for another product, but denying compensation for studies done on other related products because follow-on did not register these products and EPA did not designate the data as satisfying requests for the registered products).

¹⁰*American Cyanamid Co. v. Aceto Co.*, Docket No. 13-171-0800-85 (1989) (Juten, Foy, and Mathis, Arbs.).

follow-on registrants were not required to contribute to § 3(c)(2)(B) costs until EPA had “accepted” the studies, the *American Cyanamid* decision required the follow-on to pay their share of future costs when the producer incurred them.

§ 17:43 Compensation decisions—Arbitration decisions under current act—Risk and cost avoidance

Several claimants have successfully convinced arbitrators that compensation awards should include, or may be adjusted to account for, such factors as risk, opportunity costs, and early market entry costs avoided by the follow-on registrant. In *Stauffer Chemical Co. v. PPG*,¹ the tribunal awarded Stauffer running royalties on PPG’s profits on the pesticide for the ten years following the arbitration to compensate Stauffer for the “opportunity costs” and early market entry costs avoided by PPG. A few years later, the *American Cyanamid Co. v. Aceto Co.* decision stated that a basic producer may have to forego research opportunities because of diverting its resources to generating data on behalf of both registrants who received a DCI under FIFRA § 3(c)(2)(B).² The panel did not award separate compensation for these lost opportunities, however; instead, the panel stated that it took them into consideration in arriving at the total compensation figure.

In recent years, considerable attention has been directed to whether “risk” is a cost incurred by data submitters that should be reflected on an award. A number of arbitration panels have awarded adjustments for risk avoidance.³ These adjustments range from five percent to a high of 60 percent.⁴ The factors cited in support of the awards have varied from case to case, but common or related factors include: the original registrant’s potential inability to recoup costs from future sales, the assumption of testing risks by the original registrant, the original registrant’s advancement of capital to fund tests, the value to the follow-on of early entry into the market, the follow-on’s avoidance of regulatory delay, and the inclusion of risk

[Section 17:43]

¹*Stauffer Chem. Co. v. PPG*, Docket No. 16-199-077-82 FIFRA (1983) (Birch, Smolka, and Vassil, Arbs.). PPG avoided opportunity costs not only by avoiding the normal regulatory delay, but also by copying Stauffer’s product labels. Additionally, the arbitrators determined that PPG avoided an investment of five years’ time, for which Stauffer was entitled to compensation. The award of royalties was challenged unsuccessfully in court by PPG. *See American Cyanamid Co. v. Aceto Co.*, Docket No. 13-171-0800-85 (1989).

surcharges in industry task force agreements.⁵ Other arbitrators, faced with different fact circumstances, have refused to make such adjustments.⁶

§ 17:44 Compensation decisions—Arbitration decisions under current act—Adjustments for inflation and interest

Two recurring issues in the body of reported arbitrations are whether the follow-on applicant must: (1) pay for the present value of the historic costs (*i.e.*, an “inflation” adjustment), and (2) pay an interest charge (inflation-free when the follow-on pays present value) for the “carrying” costs of the data submitted by the original registrant. Such adjustments typically have been made.¹

In *FMC Corp. v. Tricon International*, the second case to arise under the 1978 amendments and the first to address FIFRA § 3(c)(2)(B), the panel concluded that the allocation should be adjusted for the cost of capital (*i.e.*, interest) between the time the costs were incurred and the time of the compensation award.² In the next case to consider the issue, *DuPont v. Griffin Corp. & Drexel Chemical Corp.*, the panel reasoned that the cost to all existing registrants of data required under FIFRA § 3(c)(2)(B) includes interest from the time the data were submitted to EPA to the time of reimbursement.³ The *DuPont* panel fixed the interest rate at ten percent, accruing from the submission of the data to EPA until thirty days after the invoice date. Many subsequent decisions have maintained one of these two approaches.⁴ More recent decisions now focus on the adjustment factor to be applied (*e.g.*, prime rate interest, inflation, GDP implicit price deflator) and a few arbitra-

Lonza, Inc.*, AAA Case No. 23-171-

tors have found interest adjustments unjustifiable.⁵

§ 17:45 Compensation decisions—Arbitration decisions under current act—Cost allocation methods

Having determined the compensable costs and applicable adjustments, the arbitrator or panel must fashion a method of allocating the award. As a threshold matter, arbitrators generally must decide whether to allocate costs on a per capita, market share, or other basis. Under a pure per capita approach, the costs of the original registrant's data are shared equally by all registrants with active technical registrations, including the original registrant. Follow-on registrants, who often have smaller market shares than the data submitters, generally favor the competing market share approach, which allocates costs based on the parties' relative shares of the relevant market.

In *Stauffer Chemical Co. v. PPG*—in which the citing company was considerably larger than the data submitter—the panel allocated costs on a per capita basis, awarding one-half of the cost of testing, adjusted for inflation, although it offered no rationale for the allocation method it selected.¹ Decisions since have sometimes used a per capita approach and sometimes invoked market shares or similar considerations in making less-than-per-capita awards.

In *Enviro-Chem, Inc. v. Lilly Indus., Inc.*, the arbitrator reasoned that the per capita method best effectuates the purposes of FIFRA and the realities of EPA registration.² Under the per capita approach, all registrants bear the same costs and receive the same rights, thereby ensuring that each competitor will bear an equal cost for their equal right. Similar reasoning was employed in *Proem v. Grapetek*, wherein the arbitrator allocated costs based on the “number of entrants in the field.”³ The arbitrator held that there is a rebuttable presumption against a market share approach to allocation and that Grapetek had failed to rebut the presumption by offering only historical market share data and an estimate of future market share. In *Bayer CropScience LP v. Albaugh, Inc.*, the panel also applied a per capita allocation, stating: “FIFRA’s health and safety data requirements apply equally to all registrants, and the cost of satisfying these common obligations do not vary depending on a registrant’s ultimate product sales or market share.”⁴

Of the reported data compensation cases under the 1978 amendments, few have allocated costs under a pure market share theory. In *Ciba-Geigy Corp. v. Drexel Chemical Co.*, a case brought under FIFRA § 3(c)(2)(B), the primary issue was whether the data costs, which had been stipulated by the parties, should be al-

00003-96 (2000) (applying a six percent annual interest rate from the date of the follow-on's application to EPA until the time of the arbitration award); *BASF Corp. v. Albaugh, Inc.*, AAA No. 23 171 00040 00 (Sept. 25, 2002) (applying gross domestic product (GDP) implicit price deflator); *Syngenta Crop Protection, Inc. v. Oxon Italia, S.p.A.*, FIFRA Case No. 16 171 00180 05 (Aug. 13, 2007) (applying prime rate); *Monsanto Co. v. Tacoma Ag, LLC*, FIFRA Case No. 16 171 Y 00228 10 (Mar. 1, 2012) (applying GDP implicit price deflator).

⁵*Spray Drift Task Force v. Burlington Indus.*, Docket No. 16-171-Y-00474-03 (2005) (Mercurio, Arb.); *1996 Phosphine Task Force v. Bernardo Chem., Ltd.*, AAA No. 22-171-00029-96P (1998) (Green, Arb.).

⁴*Bayer CropScience LP v. Albaugh, Inc.*, Partial Final Award (Oct. 21, 2015), Final Award (Dec. 8, 2015).

located based on the number of registrants or on Drexel's market share.⁵ The arbitrators determined that a market share allocation was appropriate given the circumstances of the case, recognizing that Drexel's market share, although small compared to Ciba-Geigy's at the time of the award, would likely increase in the future.

In *Syngenta Crop Protection, Inc. v. Drexel Chemical Co.*, the panel found that the specific facts of the case—Syngenta's strength in the market, the barriers to Drexel's entry, and the market share calculations used by the parties in initial settlement discussions—warranted a market share allocation of costs.⁶

In *DuPont v. Griffin Corp. & Drexel Chemical Corp.*, the arbitration panel adopted a modified market share theory, observing that a proper formula for § 3(c)(1)(F) compensation must consider "the realities of the marketplace."⁷ Accordingly, the panel's award provided that each follow-on registrant would bear a minimum of ten percent of the cost of data, regardless of its market and each would make additional payments based on its maximum market share for each of the first five years after its initial technical registration. With regard to § 3(c)(2)(B) cost-sharing, the panel decided that the follow-on registrant's share of costs would be based on its highest annual market share in the first five years after issuance of the EPA data requirement, except that if this market share exceeded a per capita share, the lower per capita share would govern.

Arbitrators are not limited to pure per capita or market share theories when selecting a method of allocation.⁸ The need for such modified approaches to allocation was highlighted in the 1998 case of *DowElanco & the Trifluralin Data Development Consortium v. Albaugh, Inc.*, wherein the arbitrators declined to adopt either the claimants' per capita approach (which, given the number of registrants, would have required the follow-on to pay 20 to 25 percent) or the respondent's market share approach (which would have required payment of seven to 20 percent of the test costs).⁹ Instead, the decision required Albaugh to pay a fixed share (15 percent) of the costs. The *DowElanco* arbitrators noted that "[t]he problems with sharing costs on a per capita basis center on how many companies are involved; what to do about multiple registrants; what to do about unused or slightly used registrations with few sales or little or no activity; [and] what to do to adjust for future settlements, registrations or parties." While a per capita approach was "too uncertain," predicting the future sales and profitability of the follow-on registrant was "too speculative." Additionally, the arbitrators in *DowElanco* reasoned that a market share approach would effectively allow the follow-on to avoid the risk of being unsuccessful: "[i]f it was a poor competitor with a low market share it would only have to pay a small share of the data cost." By paying a higher cost, the successful registrant with the larger market share would be required to subsidize the study costs of the unsuccessful follow-on.

VI. REGULATORY ACTIONS TO PROHIBIT OR LIMIT THE USE OF

REGISTERED PESTICIDES

§ 17:46 EPA authority

EPA has wide authority to take regulatory actions to prohibit or limit the sale or use of a registered pesticide or to modify or revoke a pesticide's tolerance. As discussed below, the Agency may act to prevent unreasonable adverse effects on the environment as well as to respond to a registrant's failure to provide information required by a DCI or the conditions of a conditional registration.

§ 17:47 EPA authority—The “unreasonable adverse effects” standard

The standard to be applied by EPA in taking regulatory action against a pesticide on safety grounds is whether the pesticide “generally causes unreasonable adverse effects on the environment.” As previously described, a pesticide will be considered to cause “unreasonable adverse effects” if its risks outweigh its benefits or if it does not meet the FFDCA safety standard for pesticide residues in food that will result from its use.¹ Thus, for food-use products, a pesticide's registration may be canceled and its tolerance revoked if the food residues resulting from its use cannot be reduced to a “safe” level, without consideration of the pesticide's benefits (except in very limited circumstances).² When food uses are not involved, the “unreasonable adverse effects” standard requires a risk-benefit analysis to determine whether a pesticide may become and remain registered. In such cases, EPA may not cancel a registration solely on the basis of tests indicating adverse health or environmental effects, but must consider whether the risks are “unreasonable” when considered in light of the extent of exposure to the product, the chemical's benefits, and other relevant considerations.

EPA must make a similar determination before classifying a product for restricted use: the Agency must determine that the product will pose “unreasonable” risks or will not satisfy the FFDCA § 408 safety standard if its use is not restricted.³

§ 17:48 EPA authority—The *Diazinon* decision

The risk-benefit prong of the “unreasonable adverse effects” standard was reviewed in *Ciba-Geigy Corp. v. EPA*.¹ There, a pesticide manufacturer challenged EPA's decision to cancel the registration of the pesticide diazinon for use on golf courses and sod farms due to a risk of harm to birds. The manufacturer argued that the Administrator had misapplied the § 6(b) standard for cancellation by ignoring the word “generally” in the phrase “generally causes unreasonable adverse effects on the environment.”² The court held that the Administrator had in fact read the word “generally” out of § 6(b) and that the proper standard includes a determination that a pesticide not only causes unreasonable risks, but that it does so “with considerable frequency.”³ The court further held that because FIFRA defines “adverse effects” as “unreasonable risks,” the Administrator need not find that a

³*Ciba-Geigy Corp. v. U.S. E.P.A.*, 874 F.2d 277, 278, 280, 29 Env't. Rep. Cas. (BNA) 1721, 19

pesticide causes actual adverse consequences, but only that it creates a significant probability that adverse consequences could occur.⁴ While granting the manufacturer's petition to set aside the cancellation order, the court remanded the case to the Administrator for application of the proper legal standard.⁵

§ 17:49 EPA authority—Restricted use classification

If EPA determines that a pesticide may pose some unreasonable adverse effects but that those effects could be controlled by limiting the ways in which the pesticide is used, it may classify the pesticide as being for “restricted use.”¹ A restricted use classification means that the pesticide may only be applied by, or under the supervision of, a “certified applicator,” *i.e.*, a person who has been certified by federal or state government as being qualified by training to handle and apply restricted use pesticides.² Additional limitations on the use of a restricted use pesticide may be imposed by regulation.³

§ 17:50 EPA authority—Cancellation

If EPA determines that a pesticide generally poses unreasonable adverse environmental effects, EPA may decide to cancel the pesticide registration. EPA may also decide to cancel a registration unless the registrant agrees to delete one or more uses, or to make other revisions in the approved labeling or the other terms and conditions of registration. In the event of such a decision, the registrant has considerable procedural protection, including the right to request a formal evidentiary hearing on the substantive rationale for the proposed cancellation.¹ Nevertheless, these adjudicatory rights may have little practical utility in any instance where a tolerance is required because use of the pesticide will result in residues in food or feed, and EPA has adopted a final rule revoking the required tolerance under the FFDCA.² Moreover, because participating in an evidentiary hearing requires the registrant to expend substantial resources, and there is no assurance that such a hearing will not culminate in an adverse decision, such hearings are infrequent and the registrant will often reach an accommodation with EPA before a final decision.

FIFRA § 6(e) requires EPA to cancel a conditional registration when the registrant fails to satisfy the conditions imposed on the registration, such as the requirement that the registrant provide missing data at the same time that other registrants of

Env'tl. L. Rep. 21281 (5th Cir. 1989). To illustrate what it meant by “considerable frequency,” the court stated that a 30 percent risk that children might be killed by use of a pesticide would plainly be an unreasonable risk. However, a finding that diazinon posed an unreasonable risk of killing birds on ten percent of the golf courses on which it was used would not necessarily meet the considerable frequency test; instead, EPA should more narrowly define the class of golf courses on which to prohibit diazinon use. *Id.* at 279–80.

²*See* §§ 17:47 and 17:59.

the same active ingredient are required to do so.³ A conditional registrant who receives a notice of intent to cancel under § 6(e) is entitled to a hearing, but the procedures are more summary than those for a cancellation hearing initiated because of safety questions.⁴

A registrant may, for whatever reason, voluntarily cancel a registration or amend a registration to cancel one or more pesticide uses.⁵ The Administrator is required to publish a notice of the request in the *Federal Register* and allow thirty days for public comment. If the pesticide is registered for minor agricultural uses, EPA must publish the request to cancel, but may not act on the request for a ninety-day period if it is determined that the cancellation would adversely affect the availability of the pesticide for those uses.⁶

§ 17:51 EPA authority—Suspension

If EPA decides that the product creates an “imminent hazard,” *i.e.*, that it is so harmful that adverse effects during the time it would take to hold a cancellation hearing would be unreasonable, EPA may decide to suspend the pesticide registration pending the outcome of the cancellation hearing.¹ Except in the case of an emergency suspension (*see below*), a notice of intent to suspend must be preceded or accompanied by a notice initiating a proceeding to cancel the pesticide’s registration or to change its classification.² The registrant is entitled to an adjudicatory hearing on the question of the risks posed by the pesticide during the time it would take to hold a cancellation hearing, with the more general risk/benefit discussion deferred until the full cancellation hearing.³

The suspension on “imminent hazard” grounds of a pesticide that is ultimately canceled may give rise to a right to indemnification from EPA. A person owning the pesticide and suffering losses because of the suspension or cancellation may receive payments based on the cost of the pesticide unless the person had knowledge of facts showing that the pesticide did not meet the standards for registration and thereafter continued to produce the pesticide without notifying EPA of those facts.⁴

Additionally, as noted above,⁵ EPA may suspend the registration of a registrant that fails to take appropriate steps to comply with a DCI. The registration will remain suspended until the registrant has satisfied the DCI requirements. Affected registrants are entitled to hearings, which are subject to statutory time limits and restrictions on the scope of the issues to be addressed.⁶

⁵*See* §§ 17:30 and 17:51.

⁶FIFRA § 3(c)(2)(B)(iv), 7 U.S.C.A. § 136a(c)(2)(B)(iv). *See* § 17:56.

If EPA determines that an emergency prevents the holding of a hearing prior to suspension, the Agency may issue an emergency suspension order. The order will take effect immediately and will remain in effect during the suspension hearing, which will be somewhat more limited in scope than a normal suspension hearing.¹ The order will expire if EPA does not issue a notice of intent to cancel the registration or change its classification within ninety days of issuing the emergency order.²

§ 17:53 Regulatory procedures—Special review

Although infrequently if ever used in recent years, EPA has the ability, except in cases requiring expedited action, to use the “Special Review” process to evaluate the available data on a pesticide and determine whether use restrictions, cancellation, or other regulatory action is appropriate. Section 3(c)(8) provides that EPA may not initiate a Special Review except on the basis of a “validated test or other significant evidence raising prudent concerns of unreasonable adverse risk to man or to the environment.” This “Grassley-Allen” amendment was intended to ensure that EPA would take into account the risks and benefits of a product before taking regulatory action, and to require the Agency to communicate with the affected registrant about EPA concerns and obtain the registrant’s input before initiating a public review of the pesticide.¹

EPA’s Special Review regulations, which incorporate the requirements of the Grassley-Allen amendment, specify the “risk criteria” used to initiate a Special Review.²

If EPA determines that proceeding with a Special Review is appropriate, it will publish a Notice of Special Review in the *Federal Register* and provide an opportunity for public comments. After the period for public comment, the Agency publishes a “preliminary determination” of what regulatory action (for example, cancellation, restricted use classification, etc.) EPA proposes to take. There is another opportunity for public comment, during which EPA’s proposed action is referred to USDA and the Agency’s FIFRA Scientific Advisory Panel (SAP) for review.³ EPA’s final decision is then published, and accompanied by a notice of intent to cancel, change classification, or hold a hearing, and so on, as appropriate. If the Agency determines that regulatory action is required, the registrant is entitled to a *de novo* adjudicatory hearing, during which it can raise new issues as well as those previously raised during the Special Review.⁴

The regulations allow the Agency to combine the Notice of Special Review and Preliminary Determination stages in order to shorten the process.

EPA has conducted approximately 100 Special Reviews, but at present has only three pending completion (*i.e.*, aldicarb, triazines (atrazine, propazine, simazine),

³The FIFRA SAP is established by FIFRA § 25(d) to serve as an independent source of expert advice to EPA on scientific questions pertaining to pesticide regulatory decisions. It consists of seven members appointed by EPA from a list of candidates nominated by the National Institutes of Health and the National Science Foundation.

⁴*See* § 17:55 (cancellation hearing procedures).

ethylene oxide).⁵ EPA has instead concentrated its resources on completing existing Special Reviews, and attempting to resolve risk concerns through negotiations with registrants.⁶ While negotiations to reduce the risks of a specific pesticide require significantly less time and fewer resources than a formal Special Review, EPA has no formal guidance on conducting these negotiations. Furthermore, EPA's use of informal negotiation has been criticized because it decreases public involvement in the risk reduction process.⁷

§ 17:54 Regulatory procedures—Restricted-use classification procedures

There are two basic procedures available to EPA once it has determined that a pesticide must be classified for restricted use in order to prevent unreasonable adverse effects to the environment. If the pesticide has previously been classified as a general use pesticide (not subject to the requirement that it be applied only by or under the supervision of a certified applicator),¹ EPA must provide the registrant with at least forty-five days' notice of the proposed change to a restricted use classification, and must publish notice of the proposed change in the *Federal Register*.² A registrant (or other interested party with the registrant's concurrence) may contest the proposed classification by requesting a hearing, which will be conducted in accordance with the procedures that govern cancellation hearings.³

Because of the time-consuming nature of such hearings, FIFRA provides for an alternate procedure that may be followed if the pesticide has not previously been formally classified for either general or restricted use. As the restricted use provisions were not added to FIFRA until 1972, many pesticides remain unclassified, the practical effect of which is the same as being classified for general use. Such previously unclassified pesticides may be reclassified for restricted use by the promulgation of a regulation by EPA.⁴ Although EPA must issue a proposed regulation and provide an opportunity for public comment before promulgating a final regulation, this process enables EPA to avoid the lengthy, individual trial-type hearings that are available to registrants when a general use classification is changed to a restricted use classification.

§ 17:55 Regulatory procedures—Cancellation hearing procedures

In order to initiate cancellation based on dietary risks, EPA must determine that the risks exceed the "reasonable certainty of no harm" standard applicable to pesticide residues in food under FFDCA Section 408. In order to initiate cancellation based on other risks (such as residential, occupational, or ecological risks), EPA must determine that the risks are unreasonable in light of the benefits associated with the pesticide use.

If EPA concludes that a pesticide registration must be canceled, that registered

²FIFRA § 3(d)(2), 7 U.S.C.A. § 136a(d)(2).

³FIFRA § 3(d)(2), 7 U.S.C.A. § 136a(d)(2). See § 17:55 (cancellation hearing procedures).

⁴FIFRA § 3(d)(1)(A), 7 U.S.C.A. § 136a(d)(1)(A); 40 C.F.R. §§ 152.160, 152.164.

uses must be deleted or the approved labeling must be revised to avoid cancellation of the pesticide, or that the classification of the pesticide must be changed from general to restricted use to prevent unreasonable adverse effects, EPA may issue a notice of intent either to cancel (or change the classification of) the registration or to hold a hearing to determine whether the registration should be canceled (or the classification changed). The notice must set forth the basis for EPA's determination and must be sent to the registrant and made public.¹

Prior to issuing such a notice, EPA must consider, among other factors, the effect of the proposed regulatory action on the agricultural economy and must submit the proposal to USDA for comments. At the same time (sixty days prior to issuance of the notice unless otherwise agreed), the proposed notice must also be submitted for review by the FIFRA SAP.² EPA's response to comments received from USDA and SAP must be reflected in the final notice issued by the Agency.

If EPA issues a notice of intent to cancel, the cancellation will take effect unless, within thirty days, either the registrant makes changes in its registration that eliminate the basis for the cancellation, or a person adversely affected by the notice requests a hearing and files objections to the notice of intent to cancel. In the second situation, a hearing is conducted before an EPA ALJ. If EPA issues a notice of intent to hold a hearing, a hearing automatically will be held with respect to the issues specified in the Agency's notice. In either case, the hearing is a full, adjudicatory hearing, with witnesses, cross-examination, and briefing of the issues by the parties. EPA regulations also provide for an opportunity for discovery and prehearing conferences, as appropriate, and the statute authorizes the referral of questions of scientific fact to a NAS committee. The ALJ is to render an initial decision, supported by detailed findings of fact, on the basis of the evidence in the record of the hearing. The ALJ's decision will become final unless appealed to the Environmental Appeals Board (EAB) in accordance with Agency regulations.³

§ 17:56 Regulatory procedures—Modified hearing procedures

Under FIFRA and EPA regulations, the hearing procedures described above are modified for certain types of proceedings. As a general rule, the modifications are intended to expedite the process and limit the scope of the issues that are addressed in the hearing.

If EPA determines that suspension of a registration is necessary to prevent an "imminent hazard" during the time required for cancellation proceedings,¹ the notice of intent to cancel may be accompanied by an order immediately suspending the registration. The suspension then takes effect unless a hearing is requested within five days for the purpose of determining whether an imminent hazard exists. If a hearing is requested, it must begin within five days. The ALJ has ten days from the conclusion of the hearing to submit recommended findings and conclusions to the EAB, which will then have seven days to issue a final order with respect to suspension. A final order on the question of suspension is subject to judicial review,

[Section 17:56]

¹*See* § 17:50.

even if related cancellation proceedings have not been completed.²

If EPA determines that an emergency suspension order is required,³ the suspension goes into effect pending the “expeditious completion” of a suspension hearing. In addition, no party other than the registrant and EPA may participate in the hearing, except that anyone adversely affected by the suspension order may file briefs and, upon doing so, will be considered a party to the hearing for purposes of judicial review.⁴ The hearing procedures are also modified in the case of a suspension hearing initiated because of the registrant’s failure to satisfy a DCI.⁵ In such an instance, the proposed suspension will take effect unless a hearing is requested within thirty days. The hearing is conducted in accordance with the procedures that govern cancellation hearings, except that the only matters to be heard at the hearing are whether the registrant failed to take the action that served as the basis for EPA’s notice of intent to suspend, and whether any EPA decision with respect to the disposition of existing stocks of the pesticide is consistent with FIFRA. The hearing must be completed and a decision made within seventy-five days of the Agency’s receipt of the request for a hearing.⁶

Modified hearing procedures also apply in the event EPA decides to cancel a conditional registration because the registrant did not initiate and pursue appropriate action toward fulfilling a condition of registration, or has not met a condition of registration within the applicable time period. If EPA issues a notice of intent to cancel a conditional registration, the registration will be canceled unless a hearing is requested within 30 days. As in the case of a suspension hearing for failure to satisfy a DCI, the scope of the issues that may be considered in the hearing is limited and the hearing must be held and a final determination made within 75 days. The only issues to be considered are whether the registrant has initiated and pursued appropriate action to comply with the condition(s) in question, or has met the condition(s) in question within the specified time period, and whether EPA’s determination concerning existing stocks is consistent with FIFRA.⁷

EPA has strictly construed the limitations on the scope of the adjudicatory hearing that a registrant may obtain if EPA issues a notice of intent to cancel a conditional registration for failure to satisfy a condition of registration. In 2016, EPA sought to cancel the registrations for pesticides containing flubendiamide because the registrants did not satisfy a condition of registration that required them to voluntarily cancel the registrations following a formal determination by EPA that continued registration of the products would cause “unreasonable adverse effects.” The registrants sought a hearing concerning the legality of this termination condition, but the EAB found that the registrants had agreed to accept the condition when it was originally imposed, and that the registrants could have challenged the legality of the condition at that time by requesting a denial hearing.⁸

§ 17:57 Other matters related to suspension and cancellation— Indemnification

FIFRA provides for indemnification of registrants, consumers, and dealers and distributors who suffer financial loss as the result of EPA’s suspension and cancella-

tion of a pesticide registration.¹ Registrants and consumers are to be indemnified by the government; dealers and distributors are to be reimbursed by pesticide sellers, or, under limited circumstances, by the government.

EPA may not indemnify pesticide registrants unless Congress approves, in advance, a specific line item appropriation of funds.² Consumers (end users) are entitled to indemnification from the government's Judgment Fund without such an appropriation.³ Dealers and distributors are to be reimbursed by the parties from whom they purchased the pesticide (*e.g.*, registrants, wholesalers, and other dealers and distributors) unless the seller at the time of distribution or sale notified the dealer or distributor in writing that it would not provide reimbursement. The government will indemnify dealers and distributors only if (1) a dealer or distributor did not receive written notice from its seller that the pesticide was not subject to reimbursement, and (2) the seller, as a result of insolvency or bankruptcy, is unable to provide the reimbursement. In such cases, indemnification will come from the Judgment Fund without the requirement of a specific advance appropriation by Congress.⁴

The amount of indemnification will be based on the cost of the pesticide owned by the person to be indemnified immediately prior to issuance of the suspension notice, but is not to exceed the fair market value of the pesticide.⁵

§ 17:58 Other matters related to suspension and cancellation—Storage, disposal, and existing stocks

The 1988 FIFRA amendments reflect growing concern with the storage and disposal of suspended or canceled pesticides. EPA is now authorized to require (1) data on methods of safe storage and disposal of suspended or canceled pesticides; (2) label language specifying procedures for transport, storage, and disposal of pesticides and pesticide containers; and (3) sufficient financial and other resources to carry out a recall of the pesticide. In addition, EPA may issue regulations or orders governing persons who store, transport, or dispose of suspended or canceled pesticides.¹ Using its authority under FIFRA § 19(e) and (f) granted to it by the 1988 Amendments to the Act, EPA in 2006 issued extensive new regulations governing container design and residue removal.² These regulations set forth requirements for registrants, refillers (retailers, distributors) and pesticide users related to nonrefillable containers, refillable containers, repackaging pesticide products, and container labeling. There are also requirements for compliance by agricultural retailers, agricultural commercial applicators, and agricultural custom blenders regarding containment structures.³

EPA may institute a recall of a suspended or canceled pesticide if the Agency determines that such a recall is “necessary to protect health or the environment.”

³*Id.*; EPA, Pesticide Containers, available at <https://www.epa.gov/pesticide-worker-safety/pesticide-containers>.

EPA may determine that the recall can be on a voluntary basis, subject to an approved plan, when a voluntary recall would be as effective as a mandatory recall.⁴ EPA may require a person subject to a recall to: (1) provide storage facilities for the recalled pesticide; (2) inform the Agency of the locations of such facilities; (3) accept and store existing stocks tendered by any other person who obtained the pesticide from that person; (4) provide transportation to the storage facilities; and (5) take reasonable steps to inform persons holding pesticides subject to the recall of how they can tender the pesticides and arrange for transportation to the storage facilities.⁵

A registrant who provides storage facilities may be partially reimbursed for the costs associated with such storage if it submits a storage and disposal plan that meets criteria established by EPA regulation.⁶

EPA has the authority to decide whether, and under what conditions, to permit the continued sale, distribution, and use of existing stocks of pesticides whose registrations are amended, canceled, or suspended.⁷ FIFRA does not specify a standard for EPA to apply when making these decisions; however, an Agency policy statement outlines the standards it intends to use.⁸ In general, if there are significant risk concerns related to the pesticide, EPA will not allow its continued sale, distribution, or use unless the benefits associated with such sale, distribution, or use exceed the risks.⁹ Where there are no significant risk concerns, the Agency will generally allow unlimited use of existing stocks, and unlimited sale by persons other than the registrant. The registrant will generally be allowed to continue to sell existing stocks for one year after the date of cancellation.¹⁰ EPA, in 1997, issued a PR Notice establishing a uniform date for implementing certain Agency-directed label changes. Under this PR Notice EPA allows registrants (and supplemental distributors) at least a year, and sometimes more, to make those changes.¹¹

§ 17:59 Tolerance modification and revocation

A tolerance thought not to comply with the FFDCA § 408 safety standard may be modified or revoked either as a result of a petition filed by any interested party or upon EPA's initiative.¹ If the Agency acts on its own initiative, it must do so through issuance of a proposed and final regulation with an opportunity for public comment.² In response to a petition, EPA may issue a final regulation modifying or revoking the tolerance, a proposed regulation followed by a final regulation, or an order denying the petition.³ Within sixty days of the issuance of a final regulation modifying or revoking a tolerance (whether in response to a petition or on the Agency's own initiative), any person may file objections and request a hearing; however, the filing of objections will not prevent the regulation from taking effect unless EPA stays the regulation's effectiveness. EPA may hold a public evidentiary hearing if the Agency

determines that such a hearing is necessary to obtain evidence on material issues of fact.⁴ EPA will then issue a final order in response to the objections to the regulation.⁵

A final regulation modifying or revoking a tolerance, or a final order in response to objections to such a regulation, may be reviewed by the U.S. courts of appeals in response to petitions filed within sixty days after publication of the regulation or order.⁶

VII. PUBLIC AVAILABILITY OF DATA

§ 17:60 General provisions

Section 10 of FIFRA governs the protection and disclosure of trade secrets and other confidential information related to pesticide registrations and tolerances.¹ Section 10(b) prohibits EPA from making public information that “contains or relates to trade secrets or commercial or financial information . . . and [is] privileged or confidential,” except that information relating to product formulas may be revealed to other federal agencies, or at a public hearing or in findings of fact issued by the Administrator.²

The general prohibition on disclosure of confidential information is limited by § 10(d), which provides that virtually all data pertinent to the potential risks associated with a pesticide are disclosable.³ More specifically, “[a]ll information concerning the objectives, methodology, results, or significance of any test or experiment performed on or with a registered . . . pesticide or its separate ingredients, impurities, or degradation products, and any information concerning the effects of such pesticide . . . shall be available for disclosure to the public.” Limited exceptions protect against disclosure of manufacturing or quality control processes, methods for testing or measuring deliberately added inert ingredients, or the identity or quantity of deliberately added inert ingredients, unless EPA has determined that such disclosure is necessary to protect against an unreasonable risk of injury to health or the environment. However, a federal district court has held that information regarding the identity of inert ingredients is not trade secret information per se, and that a registrant seeking to prevent disclosure of such information—in response to a Freedom of Information Act request, for example—must be able to make a showing that the information is truly confidential and not available from other sources, as well as a showing of the competitive harm that would result from disclosure.⁴

Before EPA releases information that the submitter has claimed to be protected, it must provide thirty days’ advance notice to the submitter by certified mail. During this thirty-day period, the submitter may initiate a federal district court action

⁴FFDCA § 408(g), 21 U.S.C.A. § 346a(g).

³7 U.S.C.A. § 136h(d); *see also* FIFRA § 3(c)(2)(A), 7 U.S.C.A. § 136a(c)(2)(A); 40 C.F.R. § 152.119 (requiring EPA to make available to the public, except as prohibited by § 10, the data and other scientific information supporting the registration of a pesticide).

⁴*Northwest Coalition for Alternatives to Pesticides v. Browner*, 941 F. Supp. 197 (D.D.C. 1996). On June 29, 2016, the U.S. District Court for the Northern District of California issued an opinion dismissing the complaint and denying plaintiffs’ motion for summary judgment challenging EPA’s 2014 denial of a 2006 rulemaking petition to require the labeling of 371 inert ingredients in pesticides. *Center for Environmental Health v. McCarthy*, 192 F. Supp. 3d 1036, 82 Env’t. Rep. Cas. (BNA) 2056 (N.D. Cal. 2016).

for a declaratory judgment or an injunction to prevent disclosure, depending on the nature of the information and the circumstances under which EPA proposes to release it.⁵

Like the mandatory data licensing provisions of FIFRA, the statutory authorization of public disclosure of registration data was upheld in *Ruckelshaus v. Monsanto Co.*⁶ against a challenge that such disclosure would be an unconstitutional taking of registrants' property rights in their data.

§ 17:61 Prohibition on disclosure to multinationals

The otherwise broad public availability of pesticide registration data is limited by § 10(g). That provision prohibits EPA from making such data available to foreign or multinational business entities without the data submitter's consent, unless such information is relevant to an EPA determination as to whether the pesticide causes unreasonable adverse effects and the disclosure is made in connection with a public proceeding under FIFRA or the Agency's regulations.¹ The purpose of Congress in enacting § 10(g) was to prevent one company from using data submitted to EPA by another company to obtain registrations abroad.² EPA requires anyone requesting access to pesticide registration data to sign an affirmation that he or she is not acting on behalf of a multinational corporation.

§ 17:62 Penalties

FIFRA § 10(f) provides for criminal penalties of up to \$10,000 and/or one year's imprisonment for any federal employee who, knowing that such disclosure is prohibited, willfully discloses protected information to anyone not entitled to receive it. This remedy is provided in lieu of the less severe criminal penalty that would otherwise be available under the Trade Secrets Act,¹ but does not preempt any civil remedy under state or federal law that a company might have for wrongful disclosure of its trade secrets.²

VIII. ESTABLISHMENT REGISTRATION

§ 17:63 In general

[SUMMARY BOX] Pesticide production includes labeling, relabeling, packaging, and repackaging, all of which can only take place in facilities that are registered with FIFRA as "establishments."

Pursuant to § 7 of FIFRA,¹ every establishment at which pesticides or pesticide

[Section 17:63]

¹FIFRA § 7, 7 U.S.C.A. § 136e.

devices are produced must be registered with EPA.² An application for establishment registration must inform the Agency of the name and address of the establishment and must identify the producer operating the establishment. Within a month after an establishment is registered, EPA must be given certain information concerning the types and amounts of pesticides produced at the establishment and the active ingredients used in pesticides produced, sold, or distributed during the past year. A report containing similar information is then submitted to EPA on an annual basis by each registered establishment.³

Under FIFRA § 8 and EPA regulations,⁴ pesticide producers are required to maintain records concerning the types and quantities of pesticides they produce. Records are also to be maintained with respect to the production of pesticide devices, receipt of pesticide deliveries, pesticide shipments, and inventories. Copies of domestic advertising of restricted use pesticides, and copies of guarantees given with respect to pesticides, are also to be retained. Finally, records of pesticide exports, disposal, and testing, and reports of adverse effects caused by pesticides are to be maintained. All required books and records are to be retained for periods of time specified in the regulations, during which time they may be inspected by Agency enforcement personnel.⁵

IX. IMPORTS AND EXPORTS

§ 17:64 In general

FIFRA Section 17 and EPA policy set requirements for the export of registered pesticides, devices, and unregistered pesticides intended solely for export.¹ For registered pesticides to be exported, EPA requires those products to bear the product label approved by EPA for its registration or collateral labeling. EPA also requires that certain labeling language be in English and in the language(s) of the imported country(ies).²

Pesticides and pesticide devices that are imported into the United States must comply with FIFRA.³ An importer, or an agent for the importer, must submit to the appropriate EPA Regional Office a Notice of Arrival of Pesticide and Devices.⁴ The notice must be submitted (electronically or paper version) prior to the shipment's arrival in the United States.⁵ Following EPA's direction, U.S. Customs and Border

²FIFRA § 2(w), 7 U.S.C.A. § 136(w), defines "produce" to mean "to manufacture, prepare, compound, propagate, or process." EPA's regulations expand this definition to include repackaging "or otherwise chang[ing] the container of any pesticide or device." 40 C.F.R. § 167.3. In 1988, EPA revised its establishment registration regulations to provide that a producer must register its establishment if it has actual or constructive knowledge that its product will be used as a pesticide or as an active ingredient in a pesticide. 53 Fed. Reg. 35056 (Sept. 8, 1988).

⁵19 C.F.R. §§ 12.112 to 12.113. See also 65 Fed. Reg. 35069 (June 1, 2000) (guidance on pesticide import tolerances and residue data for imported food); PR Notice 99-1 (Mar. 1999) (regarding the import of unregistered pesticides for the purpose of export).

Protection (CBP) will release or refuse entry.⁶ EPA may request samples of the imported pesticides and, if it determines that the pesticide is adulterated,⁷ misbranded,⁸ or otherwise in violation of FIFRA, the pesticide may be refused entry into the country. Prior to EPA's decision, the consignee of the imported pesticide has the opportunity to appear before the Agency with respect to the import's compliance with FIFRA. A pesticide that is denied entry and is not exported by the owner within ninety days may be destroyed by the CBP. The pesticide may be delivered into the custody of the consignee pending a decision on the question of the entry, subject to the consignee's execution of an appropriate bond and payment of all relevant storage, transportation, and labor charges.⁹

X. ENFORCEMENT

§ 17:65 Unlawful acts

FIFRA makes it unlawful for any person to distribute, sell, or offer for sale any pesticide that is not registered, that differs in composition from the composition submitted to EPA to obtain a registration, that is adulterated or misbranded,¹ or that is distributed pursuant to claims on its behalf that differ substantially from the claims that were made for it in obtaining a registration.² The statute lists a variety of other actions that are also unlawful, including using a pesticide in a manner inconsistent with its registered labeling;³ violating any orders, including cancellation or suspension orders, issued under the Act; violating the terms of an EUP, restricted use classification, or the recordkeeping requirements applicable to registered establishments; falsification of materials submitted to the Agency pursuant to the Act; and the like.⁴

§ 17:66 Inspection and penalties

EPA is authorized to conduct inspections for purposes of FIFRA enforcement. Such inspections may be conducted at any place where pesticides or devices are held for distribution or sale, and may involve the collection of samples of pesticides, devices, containers, or labeling. Inspectors must present their credentials and a justification for the inspection, including a statement as to whether a violation of the law is suspected.¹ The Agency is also empowered to obtain search warrants authorizing the inspection or copying of pesticide records and the seizure of pesticides or devices that are in violation of the statute.²

¹FIFRA § 9(a), 7 U.S.C.A. § 136g(a).

²FIFRA § 9(b), 7 U.S.C.A. § 136g(b).

Section 14 of FIFRA authorizes the assessment of civil penalties,³ following an administrative hearing, against registrants, commercial applicators, wholesalers, dealers, retailers, or other distributors that violate the Act.⁴ Penalties may be assessed against other people, including private pesticide applicators.⁵ Although FIFRA's statutory language refers to maximum civil penalties of \$5,000 and \$1,000, EPA amended the specified statutory maximum penalty amounts pursuant to the Debt Collection Improvement Act of 1996, which requires periodic adjustment of maximum penalties to account for inflation.⁶ The 2015 amendments to the Federal Civil Penalties Inflation Adjustment Act of 1990 required agencies to adjust civil penalties and annually adjust thereafter, resulting in significantly increased penalty amounts (*e.g.*, 2020 maximum civil penalty of \$20,288).⁷ The statute directs the Agency, in assessing a penalty, to consider the size of the business, the effect of the penalty on the violator's ability to continue in business, and the gravity of the violation, and authorizes EPA to issue warnings instead of assessing penalties where the violation occurred despite due care or did not significantly harm health or the environment.⁸ The majority of enforcement actions are resolved through settlement with the issuance of a consent agreement and final order (CAFO). While some cases settle with no or minimal civil penalties, penalties have exceeded \$500,000 in some cases, depending on the nature and number of violations at issue.⁹

For knowing violations of the statute by registrants, producers, or applicants, EPA may seek criminal penalties of up to \$50,000 and/or one year's imprisonment. For knowing violations by commercial applicators, wholesalers, dealers, retailers, and other distributors, EPA may seek criminal penalties of up to \$25,000 and/or one year's imprisonment. A fine of up to \$10,000 and/or up to three years' imprisonment may be imposed on anyone who uses or reveals confidential product formula information with intent to defraud.¹⁰ As discussed above, criminal penalties may also be assessed against federal employees who willfully disclose confidential information in violation of the Act.¹¹

§ 17:67 Stop sale, use, or removal orders

The statute authorizes EPA to issue written “stop sale, use, or removal” orders to anyone controlling or possessing pesticides that the Agency determines may be in violation of FIFRA or have been or are intended to be distributed in violation of either the Act or final cancellation or suspension orders. However, EPA must follow the procedural mandates of the statute before undertaking cancellation proceedings.¹ EPA may also proceed in federal district court to seize and confiscate pesticides that

are in violation of the registration, labeling, misbranding, or other key requirements of the statute.²

§ 17:68 State enforcement authority

Section 26 of FIFRA gives state governments the primary authority to take enforcement action with respect to pesticide use violations, if they adopt adequate pesticide use laws and regulations and implement adequate procedures for enforcing them.¹ Most states have their own authority to enforce state pesticide requirements. States must keep records and reports to demonstrate compliance with these requirements. States may also enter into cooperative agreements with EPA with respect to pesticide enforcement; states, along with those that have been delegated authority for the certification of pesticide applicators,² will also have primary enforcement responsibility with respect to pesticide use violations.³

EPA retains primary enforcement responsibility in those states that have not complied with the above requirements, and may rescind a state's primary enforcement responsibility if it determines, after a notice and an opportunity for the state to take corrective action, that a state is not adequately enforcing pesticide use provisions.⁴ EPA has promulgated regulations implementing and governing the state enforcement provisions of FIFRA.⁵ Historically, California and New York have been among the most aggressive states for enforcement. Civil penalty levels are equivalent to those imposed under FIFRA.

§ 17:69 No FIFRA citizen suit

Unlike many environmental statutes, FIFRA does not authorize private citizen suits.¹ Rather, it grants enforcement authority solely to EPA and authorized states and tribes.² In light of the absence of a citizen suit provision, some plaintiffs have tried leveraging citizen suit provisions in other environmental statutes to challenge pesticide application practices. These suits have had mixed results.³

not mandate that a rodenticide manufacturer make changes to its product or that its product be labeled misbranded without first conducting full cancellation proceedings).

Talent Irrigation Dist.*, 243 F.3d 526 (9th Cir. 2001) (finding standing for environmental group under the Clean Water Act's (CWA) citizen suit provision; compliance with FIFRA registration and labeling requirement did not absolve herbicide user of obligation to obtain permit under CWA for application of product to water). See also § 17:73. Endangered Species Act.

XI. STATE/TRIBAL AUTHORITY AND PREEMPTION

§ 17:70 In general

The 1972 amendments to FIFRA transformed the statute from a pesticide licensing and labeling law into a comprehensive regulatory statute, and greatly increased the enforcement authority of EPA. This transformation gave rise to the issue of whether FIFRA preempts state and local regulation of pesticides. The issue has arisen primarily in two contexts. The first involves the regulation of the use and application of pesticides through state and local laws and ordinances. The second is related to the authority of courts to entertain claims of inadequate labeling under state tort law.

A number of provisions in FIFRA contemplate the coordination of federal, state, and local authorities.¹ FIFRA Section 23, for example, authorizes EPA to enter into cooperative agreements with States and tribes. These agreements may include provisions for States and tribes to ensure FIFRA compliance by conducting inspections and enforcement actions.² These agreements establish compliance monitoring and enforcement programs in 49 authorized states, 6 territories, and 23 tribes. EPA also approves applicator certification plans proposed by states, tribes, and federal agencies.³ With regard to tribes, EPA has developed specific guidance for funding tribal pesticide programs and tribal cooperative agreements, as well as restricted use pesticide (RUP) applicator certifications.⁴

FIFRA also expressly provides that a state may regulate the sale or use of any federally registered pesticide to the extent that it does not permit a sale or use otherwise prohibited by FIFRA.⁵ This language generated a number of legal challenges relating to local pesticide use ordinances, and courts have been divided on whether local regulation of pesticides is preempted.⁶ The controversial issue reached the Supreme Court, which unanimously upheld the authority of cities and towns to control and ban the use of pesticides through permits, licenses, and other requirements that focus on the use of pesticides.⁷ It stated that “even when considered together the language and the legislative [history] . . . are insufficient to demonstrate the necessary congressional intent to preempt.”⁸

The statute expressly provides that no state shall impose any requirements for

labeling in addition to or different from those required under FIFRA.⁹ Some states have been able to effectively circumvent this general prohibition by refusing to grant a state pesticide registration unless the registrant obtains EPA approval for specific modifications in the product labeling. In this scenario, the labeling that is ultimately approved by EPA and the state remains the same. Another permissible state regulatory measure includes imposing limitations on the use of pesticides on certain crops or within certain areas. States also may establish programs to require permits before a person may apply a federally registered pesticide. It additionally is permissible for a state to require point of sale posting on restrictions, but the state may not impose requirements on the content of product labeling or the size or types of packaging used.

One recent preemption case involves warning language required under California's Proposition 65 (Prop 65) on pesticide labels, in which a court issued a preliminary injunction enjoining California from enforcing its requirement that products containing glyphosate provide a warning that the glyphosate is a chemical known to the state to cause cancer.¹⁰ The California Office of Environmental Health Hazard Assessment (OEHHA) in 2017 listed glyphosate based on an International Agency for Research on Cancer (IARC) classification of glyphosate as "probably carcinogenic to cancer." EPA disagreed with IARC's assessment, however, and issued a letter to glyphosate registrants that it would consider a Prop 65 warning on a glyphosate label to constitute a false and misleading claim.¹¹ This case illustrates the controversy concerning the application of OEHHA's Prop 65 warning requirements to FIFRA-regulated pesticide labels and the express and implied preemption of California duty to warn claims on pesticide labels generally.

Prior to the Supreme Court's decision in *Bates v. Dow AgroSciences LLC*, the courts were divided on whether FIFRA's language, prohibiting a state from requiring pesticide labeling that differs from the EPA approved labeling, prevents a court from entertaining state tort law claims of inadequate labeling (*i.e.*, failure to warn) or other related common law claims, such as misrepresentation, breach of warranty, and product liability.¹² Some held that such claims could not be entertained because a verdict in favor of a plaintiff would suggest that a pesticide manufacturer would have to alter its federally approved label in contravention of FIFRA.¹³ Others, however, did not believe that a verdict in favor of a plaintiff would command the manufacturer to alter its label, but would only force it to absorb the liability as part of the cost of doing business in the given state.¹⁴

In short, states retain significant authority to regulate pesticides under FIFRA. A state may refuse to register a federally registered pesticide. No state is required to

have a pesticide registration program, but all do. Most states operate on a calendar year and require little more than the payment of a registration fee. California and New York have the most extensive programs. Other aspects of state pesticide regulatory programs can include the certification and licensing of pesticide applicators, pesticide dealer licensing, and the imposition of use restrictions.

§ 17:71 Preemption decisions

A 1992 Supreme Court decision had a significant impact on the preemption issue. In *Cipollone v. Liggett Group, Inc.*,¹ the Supreme Court ruled on the preemptive effect of the Federal Cigarette Labeling Acts of 1965 and 1969 (FCLA) on state common law tort claims. After examining the preemption section of the FCLA, a plurality of the Court found that the express language of the 1969 version preempted any state common law which would affect cigarette advertising or promotion. Most significantly, the Court rejected the notion that allowing litigants to maintain tort actions can be considered a mere cost of doing business in a given state, instead finding that tort claims are premised upon a legal duty and that the tort system is a “‘potent method of governing conduct and controlling policy.’”²

On specific directions from the Supreme Court,³ two circuits, the Tenth and the Eleventh, expressly considered FIFRA preemption in the context of *Cipollone*. Each court determined on remand that FIFRA expressly preempts any state common law tort claim for inadequate warning or breach of warranty.⁴ Five other circuits that ruled on the issue after *Cipollone* came to the same conclusion.⁵ The Fourth Circuit had ruled similarly before the *Cipollone* decision.⁶

The Supreme Court finally resolved the scope and breadth of FIFRA preemption in *Bates v. Dow AgroSciences LLC*.⁷ In *Bates*, a group of Texas peanut farmers alleged that their crops were severely damaged by the application of a newly-marketed

⁶*Worm v. American Cyanamid Co.*, 970 F.2d 1301, 18 U.C.C. Rep. Serv. 2d 410 (4th Cir. 1992) (*Worm I*) (finding that FIFRA preempts claims such as failure to warn, which could only be avoided by the altering of a federally approved label, but that FIFRA does not preempt claims for negligent product design or testing, and that the states may enhance federal penalties for violation of federal labeling requirements). On appeal from the district court's decision on remand from *Worm I*, the Fourth Circuit reaffirmed its holding on the preemptive effect of FIFRA after the *Cipollone* decision. *Worm v. American Cyanamid Co.*, 5 F.3d 744 (4th Cir. 1993) (*Worm II*). The Fourth Circuit subsequently held that FIFRA does not preempt state law claims if the registrant's advertising materials make claims substantially different from claims made by the registrant and approved by EPA in connection with the product's registration. *Lowe v. Sporicidin Intern.*, 47 F.3d 124, 26 U.C.C. Rep. Serv. 2d 87 (4th Cir. 1995).

⁷544 U.S. 431.

herbicide. The farmers brought claims against the herbicide's manufacturer for breach of express warranty, fraud, defective design, defective manufacture, negligent testing, and negligent failure to warn.⁸ The Fifth Circuit held that all of the farmers' claims were expressly preempted by FIFRA.⁹ The Supreme Court reversed, finding that none of the farmers' claims were definitively preempted by FIFRA.

In *Bates*, the Supreme Court clarified that FIFRA preempts state statutes or common law rules only if the following two conditions are satisfied: (i) the state law or rule must concern "labeling or packaging" requirements and (ii) the state law or rule must be "in addition to or different from" requirements imposed by FIFRA.¹⁰ Applying the test to the farmers' claims, the Court found that two of the claims—fraud and negligent failure to warn—concerned "labeling or packaging" requirements. The Court noted, however, that state-law labeling requirements are preempted only if they impose additional or different requirements from FIFRA.¹¹ Thus, the Court reversed and remanded the farmers' fraud and negligent failure to warn claims to the Fifth Circuit for a determination of whether those common-law claims imposed duties on manufacturers that were equivalent to FIFRA's misbranding standards.¹²

Regarding the farmers' other claims—breach of express warranty, defective design, defective manufacture, and negligent testing—the Court reversed the Fifth Circuit outright because those claims did not concern labeling or packaging requirements.¹³ In particular, the Court rejected the conclusion by the Fifth Circuit that a breach of express warranty claim imposed a labeling or packaging requirement on manufacturers under FIFRA Section 24(b), "because success on such claims would necessarily induce [a manufacturer] to alter its product label."¹⁴ According to the Supreme Court, lower courts should not consider a manufacturer's speculation about its future response to a jury verdict to be a "requirement."¹⁵ Thus, the *Bates* decision makes clear that, FIFRA's provisions notwithstanding, pesticide

⁸*Id.* at 433 n.15.

⁹*Dow Agrosciences LLC v. Bates*, 332 F.3d 323, 331, 56 Env't. Rep. Cas. (BNA) 1652, Prod. Liab. Rep. (CCH) P 16658, 51 U.C.C. Rep. Serv. 2d 384, 2 A.L.R. Fed. 2d 645 (5th Cir. 2003), vacated and remanded, 544 U.S. 431, 125 S. Ct. 1788, 161 L. Ed. 2d 687, 60 Env't. Rep. Cas. (BNA) 1129, 35 Env'tl. L. Rep. 20087 (2005). The court read FIFRA § 24(b), 7 U.S.C.A. § 136v(b), to pre-empt any state-law claim in which "a judgment against Dow would induce it to alter its product label." The court also held that because petitioners' fraud, warranty, and deceptive trade practices claims focused on oral statements by the herbicide manufacturer's agents that did not differ from statements made on the product's label, success on those claims would give the manufacturer a "strong incentive" to change its label.

¹⁰544 U.S. at 444. The Court explained that the term "requirements" in FIFRA § 24(b), 7 U.S.C.A. § 136v(b), "reaches beyond positive enactments, such as statutes and regulations, to embrace common-law duties." *Id.* at 443 (citing 505 U.S. at 521).

¹¹*Id.* at 447 (explaining that "a state-law labeling requirement is not pre-empted by § 136v(b) if it is equivalent to, and fully consistent with, FIFRA's misbranding provisions [FIFRA § 2(q), 7 U.S.C.A. § 136(q)]"). The Court took lower courts to task for "too quickly conclud[ing] that failure-to-warn claims were pre-empted under FIFRA, as they were in *Cipollone*, without paying attention to the rather obvious textual differences between the two pre-emption clauses." *Id.* at 446.

¹²*Id.* at 453–54 ("We emphasize that a state-law labeling requirement must in fact be equivalent to a requirement under FIFRA in order to survive pre-emption [; however] . . . [t]o survive pre-emption, the state-law requirement need not be phrased in the *identical* language as its corresponding FIFRA requirement.").

¹³*Id.* at 444 ("None of these common-law rules requires that manufacturers label or package their products in any particular way. Thus, petitioners' claims for defective design, defective manufacture, negligent testing, and breach of express warranty are not pre-empted.").

¹⁴332 F.3d at 333.

¹⁵*See* 544 U.S. at 445 ("[A]n event, such as a jury verdict, that merely motivates an optional decision is not a requirement. The proper inquiry . . . does not call for speculation as to whether a jury verdict will prompt the manufacturer to take any particular action.").

manufacturers are potentially liable under state law for injuries due to a product's design or marketing.

With respect to pesticide tolerances, the FQPA amended FFDCA § 408 to provide that states may not impose tolerances different from federal tolerances that meet the current safety standard unless authorized by EPA on the basis of "compelling local conditions" and a finding that the state regulation would not cause any food to violate federal law. This tolerance "uniformity" provision does not preempt state authority to require warnings or other statements regarding the presence of pesticide residues in food.¹⁶

XII. JUDICIAL REVIEW OF EPA ACTION UNDER FIFRA

§ 17:72 In general

FIFRA divides judicial review responsibility between the federal district courts and the courts of appeals. The validity of any order issued by EPA following a public hearing may be reviewed in the courts of appeals. Any person who is adversely affected by the order and who was a party to the administrative proceeding may obtain review by filing a petition in the circuit where that person resides or has a place of business. The petition must be filed within sixty days after the entry of the order. EPA's order will be sustained by the court if it is supported by substantial evidence when considered on the record as a whole.¹ The D.C. and Ninth Circuits have liberally interpreted the provision that the court of appeals has jurisdiction when there has been a prior "public hearing," holding that a formal hearing with witnesses, cross-examination, and so on, may not be necessary if the proceeding that took place generated an administrative record adequate for review by a court of appeals.² The general effect of these decisions broadly construing those procedures that constitute a "public hearing" has been to expand those EPA actions that are subject to judicial review solely in the courts of appeals. This is important both because review in the courts of appeals is generally confined to the administrative record compiled by EPA during those procedures constituting the "public hearing," and because any judicial review in the courts of appeals must be commenced within 60 days of the action being reviewed.

Other final agency actions not committed to agency discretion, including refusals to cancel or suspend registrations or change classifications not following a hearing, are judicially reviewable in the district courts.³ The district courts also have jurisdiction specifically to enforce and to prevent and restrain violations of the Act.⁴ This latter provision has been held not to confer standing on private citizens to bring "citizen suits" to enforce the Act.⁵

LAWS

§ 17:73 Endangered Species Act

The Endangered Species Act (ESA), enacted in 1973, was designed by Congress to provide for the conservation of threatened and endangered plants and animals and the habitat they depend on to survive.¹ The scope of the ESA is expansive and has been described as “the most comprehensive legislation for the preservation of endangered species ever enacted by any nation.”² FIFRA is not exempt from its reach.³

Unlike FIFRA, and most other major environmental statutes, the ESA is not administered by EPA. While the Departments of Interior and Commerce were originally vested with the authority to implement the ESA,⁴ they subsequently delegated authority for terrestrial species to the U.S. Fish and Wildlife Service (FWS) and authority for marine species to the National Marine Fisheries Service (NMFS) (collectively “Services”).⁵

The ESA generally prohibits persons, including individuals, corporations, and the government,⁶ from “taking” species that are protected under the Act as threatened or endangered.⁷ The concept of a “taking” is broad and has come to mean virtually any negative impact on a threatened or endangered species.⁸

Federal agencies have a special obligation under § 7 of the ESA to consult with the Services to insure that their actions are “not likely to jeopardize the continued existence of any endangered species or threatened species.”⁹ In general, consultation is required when the agency action “may affect” a threatened or endangered species.¹⁰ An agency is not required to proceed formally with consultation when the federal action is “not likely to adversely affect” (NLAA) a protected species or its habitat and the responsible Service is in agreement.¹¹ Formal consultation ends with the issuance of a biological opinion by the relevant Service that states whether the proposed action is likely to jeopardize the continued existence of a protected species or its impact on critical habitat.¹² If jeopardy is likely, the biological opinion will include any reasonable and prudent alternatives aimed at avoiding the effect.¹³ When jeopardy is not likely, but a taking is, the responsible Service may exempt the

take by issuing an incidental take statement that specifies reasonable and prudent measures to minimize impact.¹⁴ An agency, therefore, must have an incidental take statement before proceeding with an action.¹⁵

Pesticide registrations actions by EPA are subject to both the ESA's taking prohibition and consultation requirement. For example, the Eighth Circuit has held for some time now that EPA's continued registration of strychnine that resulted in the poisoning of endangered species (*e.g.*, black-footed ferret) constituted a taking under the ESA.¹⁶

More recently, the focus has turned to EPA's consultation obligations. District and circuit courts have held that EPA is required to consult with the Services when a pesticide registration decision may affect a protected species.¹⁷ Notably, the Ninth Circuit also sanctioned the use of injunctive relief in the form of pesticide-free buffer zones around endangered species' habitats as protective measures, pending compliance with the ESA's consultation requirement.¹⁸

In an effort to comply with its consultation obligation imposed by the courts, EPA has completed several "may affect" determinations and initiated consultation with the Services on several pesticide registrations.¹⁹ Because of a general lack of resources, however, the Services have been unable to complete pesticide consultations on a timely basis. Addressing the backlog, one court set NMFS on a stipulated schedule to complete consultations on 37 pesticides regarding impacts on endangered salmon and steelhead populations in the Pacific Northwest by February 2012.²⁰ One of the first pesticide biological opinions issued by NMFS, as a result of this schedule, was immediately challenged by the registrants in district court. The case was initially dismissed on jurisdictional grounds, holding that registrants were required to bring their challenge directly in the court of appeals and only after completion of a cancellation proceeding under FIFRA was completed.²¹ On appeal, the Fourth Circuit overruled the district court, remanding the case and holding that a pesticide biological opinion could be immediately challenged under the Administrative Procedure Act in district court and was ripe for review.²²

Recognizing the additional burden caused by consultation, the Services, with EPA's help, promulgated counterpart consultation regulations,²³ in an effort to streamline the consultation process when required for pesticide registration and re-

²³The counterpart regulations are authorized by 50 C.F.R. § 402.04, which provides that "[t]he consultation procedures set forth in this Part may be superseded for a particular Federal agency by joint counterpart regulations among that agency, the Fish and Wildlife Service, and the National

registration actions.²⁴ These regulations generally permitted EPA to rely entirely on its own NLAA determination regarding a protected species without concurrence from the Service if it entered into an “alternative consultation agreement” with the Service.²⁵ The regulations also provided for an optional formal consultation process whereby EPA is permitted to perform its own effects determination that the Service can either adopt, modify with explanation, or reject altogether and draft its own biological opinion.²⁶ Finally, the regulations permitted EPA to delay formal consultation involving emergency actions under FIFRA § 18, based on the similarity of the definition for emergency under both FIFRA and the ESA.²⁷

The counterpart regulations were subsequently challenged in the Western District of Washington.²⁸ The district court set aside, as arbitrary and capricious and contrary to law, the provisions allowing EPA to make unilateral NLAA determinations and to postpone formal consultation in cases of FIFRA § 18 emergencies. However, the court let stand the optional formal consultation process.²⁹ In 2019, the Services issued three final rules (one rule issued by FWS and two rules issued jointly by FWS and NMFS) amending ESA implementing regulations that, in part, change the standards under which listings, delistings, reclassifications, and critical habitat designations are made.³⁰

An issue that has become increasingly important in recent years is the proper venue for review of claims that EPA failed to consult concerning pesticide registration decisions. Recent cases have held that when a party seeks judicial review of a failure by an agency to consult under the ESA before taking an administrative action that is itself susceptible to judicial review, the ESA consultation claim can only be reviewed in the court where the agency action is reviewable.³¹ As a practical matter, this precludes review of any ESA claims that involve a specific pesticide registration decision, concerning which EPA has provided sufficient notice and comment to constitute a “public hearing,” unless the ESA claims are brought in the court of appeals within 60 days of the decision.

One illustrative case is the so-called “Mega ESA” case, in which the Ninth Circuit analyzed the reviewability of four distinct categories of claims concerning 31 pesticides for which the plaintiffs had alleged a failure to consult under the ESA.³² The court affirmed a decision by the District Court to dismiss category one claims that EPA failed to consult concerning a RED, either because these claims either were time-barred by the general six-year statute of limitations, or because jurisdiction to review these claims was only available in the court of appeals and the claims

were not brought within 60 days of the issuance of the RED. The court also affirmed the District Court's dismissal of category two claims for the same pesticidal active ingredients, which asserted that EPA's continued "discretionary control" over these pesticides constituted "ongoing action."³³ The court further rejected category three claims based on EPA's completion of the reregistration process for a pesticide, because this event does not itself constitute a discrete administrative action requiring consultation. However, the court allowed the case to proceed for category four claims that alleged a failure by EPA to consult concerning registration of specific pesticide products, rejecting the assertion that these claims were barred as collateral attacks on the underlying RED.

There are a number of other cases that are ongoing, or where settlements have been reached, in which ESA claims concerning pesticide registration decisions are still being adjudicated.³⁴

§ 17:74 Clean Water Act

The Clean Water Act (CWA) prohibits the discharge of pollutants from a point source into waters of the United States, except as authorized by EPA via a National Pollutant Discharge Elimination System (NPDES) permit.¹ A "point source" is very broadly defined to include "any discernible, confined and discrete conveyance."² "Pollutant" is likewise broadly defined to include wastes that are discharged into water.³

Despite the fact that pesticides are applied using sprayers, hoses, nozzles, and other discrete conveyances, it has been EPA's longstanding policy not to require a NPDES permit for pesticide applications in or near waterbodies.⁴ This position was called into question by a series of arguably confusing cases in the Ninth Circuit. In the first of these, *Headwaters, Inc. v. Talent Irrigation District*,⁵ the court held that application of an herbicide directly to irrigation canals to control aquatic weeds did not foreclose the need for an NPDES permit because of the residues remaining after the pesticide's intended effect were a pollutant.⁶ In a seeming departure from *Talent*, the Ninth Circuit subsequently held in *Fairhurst v. Hagener*,⁷ that an NPDES permit was not required where pesticides were intentionally applied to a lake to

³³These claims were based primarily on language in the 2005 Washington Toxics Coalition v. EPA decision, but the viability of claims concerning ongoing discretionary control based on that case was subsequently clarified by *Karuk Tribe of California v. U.S. Forest Service*, 681 F.3d 1006, 74 Env't. Rep. Cas. (BNA) 1737 (9th Cir. 2012). The *Karuk* case held that an ESA consultation claim only can be brought when an agency takes a discretionary affirmative action. Thus, a claim that EPA failed to consult under the ESA cannot be based solely on the hypothetical ability of EPA to revisit a prior reregistration decision.

control invasive fish species. The court reasoned that a permit was not required because the pesticides were not pollutants where there were no residues or unintended consequences from the application.⁸

In an attempt to thread the holdings of these cases together and to provide some clarity to the regulated community, EPA issued a final rule generally excluding applications of pesticides to waters of the United States in two circumstances when the application is consistent with all relevant requirements under FIFRA.⁹ The first of these is the direct application of pesticides to waters of the United States to control pests, such as mosquitoes and aquatic weeds.¹⁰ The second covers the application of pesticides over or near waters of the United States, where it is unavoidable in order to effectively target pests. This expressly includes the situation where insecticides are aerially applied to forest canopy for control of mosquitoes or other pests.¹¹

Both environmental and industry groups petitioned for review of EPA's Final Rule, and the cases were ultimately consolidated before the Sixth Circuit. In *National Cotton Council of America v. EPA*, the Sixth Circuit vacated EPA's Final Rule, finding it contrary to the text of the CWA.¹² In vacating the rule, the Sixth Circuit reconciled *Fairhurst* and *Talent* by holding that, "[if a chemical pesticide] leaves no excess portions after performing its intended purpose, then that chemical's use need not be regulated. If, on the other hand, a chemical pesticide is known to have lasting effects beyond the pesticide's intended object, then its use must be regulated under the CWA."¹³

To comply with the Sixth Circuit's decision in *National Cotton Council*, EPA developed an NPDES Pesticide General Permit that took effect on October 31, 2011.¹⁴ Despite repeated attempts (e.g., Reducing Regulatory Burdens Act of 2011, Agriculture and Nutrition Act of 2018, H.R. 890, 116th Cong.), NPDES permitting for FIFRA-compliant pesticide applications is still required.

§ 17:75 Toxic Substances Control Act

While registered pesticides are clearly exempt from TSCA,¹ it has been EPA's position for some time that inert ingredients and isolated intermediates used in the manufacture of pesticides are nonetheless subject to regulation under TSCA.² TSCA jurisdiction detaches and FIFRA jurisdiction attaches once the inerts are formulated

into a registered pesticide product.³

A pesticide that is still undergoing research and development testing presents a different problem. EPA's position is that such pesticides are subject to TSCA (including the requirement for premanufacture notice under § 5 and the requirement under § 8(e) to report substantial risk information) until the manufacturer demonstrates its intent "to create a pesticide by submitting an application for an experimental use permit . . . or an application for registration under . . . FIFRA."⁴ However, if the intent is to import small quantities of an active ingredient for clinical testing solely to determine if a registration can be obtained under FIFRA, TSCA § 5 does not apply.⁵ There is no exemption under TSCA § 8(e)⁶ for research and development or for small production or import volumes.

XIV. HOT TOPICS

Several disputes in recent history present novel or controversial issues with regard to pesticide registrations and use, demonstrating issues related to pesticide labels, adverse effects, tolerances, cancellations, and the relationship between federal and state agencies.

§ 17:76 Worker Protection Standard

As discussed above, information required to appear on product labels includes worker protection information.¹ Final regulations, known as the Worker Protection Standard (WPS), revised standards for protecting agricultural workers from exposure to pesticides.² The revised regulations expand the scope of previous worker protection standards by including employees in forests, nurseries, and greenhouses and other agricultural employees who handle pesticides. The regulations require registrants to add appropriate labeling statements referencing the worker protection regulations and specifying application restrictions, restrictions on entry into treated areas, and personal protection equipment requirements.³

EPA issued additional revisions to the WPS in 2015 intended to "enhance the protections provided to agricultural workers, pesticide handlers, and other persons under the Worker Protection Standard (WPS) by strengthening elements of the existing regulation, such as training, notification, pesticide safety and hazard communication information, use of personal protective equipment, and the providing of supplies for routine washing and emergency decontamination."⁴ Controversy regarding these new requirements is longstanding. In 2017, EPA announced that it is initiating a process to revise (1) certain requirements in the agricultural WPS;⁵ and (2) to revise the minimum age requirements in the Certification of Pesticide Ap-

plicators rule.⁶ In 2019, EPA proposed additional changes to “clarify and simplify” the application exclusion zone requirements.⁷

§ 17:77 Cannabis/Hemp

Cannabis presents pesticide registration challenges between the federal government and states,¹ as an increasing number of states have legalized cannabis (*e.g.*, medical marijuana, recreational use). So long as cannabis remained regulated on a federal level under Schedule 1 of the Controlled Substances Act of 1970, EPA would not approve any pesticides for use on cannabis, nor would it approve any tolerances for use of a pesticide on these crops.

Some changes are evolving in this area, as the 2014 federal Farm Bill allows for industrial hemp production, provided: (1) “industrial hemp is grown or cultivated for purposes of research conducted under an agricultural pilot program or other agricultural or academic research”; and (2) state law allows such research.² Nevertheless, when four states in 2017 attempted to issue SLN registrations for tolerance-exempt products to use on cannabis, EPA notified those states that it would disapprove the registrations. This results in state withdrawal of those registrations.³

The 2018 federal Farm Bill (the Agricultural Improvement Act of 2018) removed industrial hemp from its earlier classification as a controlled substance, again providing new opportunities for EPA to approve pesticides for use by growers of this newly legally available commodity. On August 21, 2019, EPA announced its receipt of 10 applications seeking to add new hemp uses to pesticide products already registered under FIFRA.⁴ EPA has not, however, established tolerances for these crops.

§ 17:78 Neonicotinoids

In the past several years, pesticides’ adverse impacts on bees and other pollinators have gained national attention. The global pollinator crisis and colony collapse disorder in honey bee populations have raised concerns whether certain pesticides, specifically the class of pesticides known as the neonicotinoids, are linked to large-scale bee mortality. The U.S. federal government began to develop strategies to address the risk to pollinators from pesticide use in 2013, when EPA finalized a new policy that required certain pesticides to be labeled with warnings and specific directions for use designed to minimize harm to pollinator species and notified registrants to report under Section 6(a)(2) incidents involving pollinators within an accelerated time frame.¹

In early 2017, EPA issued another policy to protect commercial honey bees used

See also § 17:33 (Reporting of new adverse effects information).

to provide pollinator services from agricultural pesticide spray and dust applications.² In addition to the policy, EPA also instituted an expedited re-evaluation of the neonicotinoid family of pesticides, as well as certain other pesticides, and temporarily halted the approval of new outdoor neonicotinoid pesticide uses until new bee data are submitted and pollinator risk assessments are complete.³ In January 2020, EPA took its next steps in its regulatory review of neonicotinoid pesticides and released proposed interim decisions for acetamiprid, clothianidin, dinotefuran, imidacloprid, and thiamethoxam. EPA states that these decisions contain new measures to reduce potential ecological risks, particularly to pollinators, and to protect public health.

§ 17:79 Chlorpyrifos

Chlorpyrifos is a widely used organophosphate insecticide that has been subject to lawsuits, brought by NGOs, challenging EPA's continued registrations of products containing chlorpyrifos. In an opinion issued on August 10, 2015, the U.S. Court of Appeals for the Ninth Circuit granted a writ of mandamus requested by Pesticide Action Network North America and the Natural Resources Defense Council (Petitioners) to require EPA to respond to a 2007 administrative petition to cancel the registrations of all pesticides containing chlorpyrifos. The Court imposed an October 31, 2015, deadline for EPA's action (later extended to March 31, 2017). In response, EPA proposed a rule to revoke all tolerances which, if issued as a final rule, would result in the cessation of all agricultural uses of chlorpyrifos.¹ Two years later, under President Trump's administration, EPA declined to act on EPA's prior proposal to revoke chlorpyrifos tolerances, and instead denied the 2007 petition, stating that it would continue to review the safety of chlorpyrifos and would make a further determination as part of the registration review of the pesticide. Although EPA initially stated that its registration review of chlorpyrifos would continue until 2022, EPA has now stated that it will expedite the review and issue a proposed registration review decision by October 2020.

The significance of any further EPA review of chlorpyrifos is now in doubt because the most prominent manufacturer and defender of chlorpyrifos has announced it will discontinue all production by the end of 2020. This decision follows its agreement to end sales of chlorpyrifos in California by February 2020, the European Union announcement that it will no longer permit sales of chlorpyrifos after January 31, 2020, and Canada's proposed cancellation of most chlorpyrifos uses.²

I. INTRODUCTION

§ 18:1 In General

Congress, EPA, and the public have logically assigned drinking water a high priority and it is understandably a focus of several statutes. For example, the laws controlling hazardous waste management and the cleanup of hazardous substances were enacted, in part, to prevent and remediate the contamination of underground sources of drinking water. Congress also passed laws controlling discharges to surface water with an eye toward protecting water bodies used as drinking water supplies.

The Safe Drinking Water Act (SDWA) was one of a suite of environmental laws that Congress passed in the early 1970s, including the National Environmental Policy Act of 1970, the Clean Air Act Amendments of 1970, the Pesticide Control Act of 1972, the Ocean Dumping Act of 1972, the Federal Water Pollution Control Act Amendments of 1972, the Endangered Species Act of 1973, the Clean Air Act of 1974, the Resource Conservation and Recovery Act of 1976, the Toxic Substance Control Act of 1976, and the Federal Land Policy and Management Act of 1976. The SDWA is unique because it directly regulates drinking water quality.

Congress passed the SDWA in response to nationwide studies that demonstrated a range of concerns over water quality and management and operation of treatment facilities. Since 1974, it has been amended numerous times, with the most significant amendments dating to 1986, 1996, and 2016.¹

Under the 1974 law, states were delegated implementation and enforcement authority for the drinking water program, pursuant to a cooperative federalism model. Under the Public Water Supply Supervision (PWSS) Program, 49 of the states and one tribe—the Navajo Nation—have assumed this authority.² Nevertheless, the SDWA reflects a level of discomfort with state and tribal sovereignty, as evidenced by the prescriptive requirements for states and tribes.³

While much of the Act is necessarily *sui generis*, some portions mirror provisions in the Clean Air Act (for example, in its distinction between primary and secondary

²Mary Tiemann, Cong. Research Serv., RL 31243, *Safe Drinking Water Act (SDWA): A Summary of the Act and Its Major Requirements* 1 (2017).

³Some Federal Courts have held that the SDWA constitutes a comprehensive federal statutory scheme so as to occupy the field of drinking water regulation and preempt some constitutional and other claims that individuals might have under federal law. *See Mattoon v. City of Pittsfield*, 980 F.2d 1, 37 Env't. Rep. Cas. (BNA) 1471, 24 Fed. R. Serv. 3d 330, 23 Env'tl. L. Rep. 20361 (1st Cir. 1992); *Nitao v. Pacific Gas and Electric Company*, 2016 WL 4154932, at *3 (C.D. Cal. 2016) (“SDWA preempts all other forms of federal relief for SDWA violations—including claims under Sections 1983 and 1985(3)”; *Missey v. City of Staunton, Ill.*, 2008 WL 4911877 (C.D. Ill. 2008) (rejecting claim of violation of constitutional rights arising from alleged failure to provide warnings with a “boil water” order); *but see Boler v. Earley*, 865 F.3d 391 (6th Cir. 2017), cert. denied, 138 S. Ct. 1285, 200 L. Ed. 2d 469 (2018) and cert. denied, 138 S. Ct. 1281, 200 L. Ed. 2d 469 (2018) and cert. denied, 138 S. Ct. 1294, 200 L. Ed. 2d 469 (2018) (reversing the lower court’s dismissal of plaintiffs’ section 1983 claim due to contaminated drinking water).

standards) and the Clean Water Act (for example, in many aspects of its citizen suit provisions).

After an initial push to publish interim regulations in the middle 1970s,⁴ EPA made a concerted effort to grant primary enforcement authority to states and began to encounter more difficult implementation problems. This included reluctance by other bureaucracies to cooperate in the standard setting process,⁵ and difficulties some public water systems encountered in meeting existing regulations.⁶

In the early 1980s, the pace of regulation slowed. In keeping with the trends prevalent at that time, several bills were introduced in Congress to limit EPA's ability to regulate drinking water,⁷ and the Agency primarily issued Health Advisories and Advance Notices of Proposed Rulemaking.⁸ In the middle 1980s, however, EPA began to implement an ambitious program to promulgate additional drinking water regulations.⁹ In addition, under renewed congressional scrutiny, state and EPA enforcement efforts were viewed as inadequate.¹⁰ In 1986, after several years of effort, Congress amended the SDWA to require EPA to increase its regulatory and enforcement efforts.¹¹ The 1986 Amendments gave EPA "precise marching orders," specifying that a significant number of new drinking water standards be issued within strict deadlines.¹²

With the 1986 amendments to the SDWA, Congress charted EPA's course in setting standards. Many new standards were required within the first few years, followed by 25 additional standards every three years thereafter.¹³ While EPA endeavored to meet these new demands and to increase compliance and enforcement, the resource demands it encountered were substantial, and the Agency missed several deadlines. Moreover, the compliance costs to local water suppliers were rapidly increasing, thereby raising questions about the need for so many new standards and associated monitoring requirements.¹⁴

As a result of those pressures and the desire to provide financial assistance to wa-

⁴Congress expected EPA to adopt interim regulations based on its review of existing U.S. Public Health Service standards. H.R. Rep. No. 1153, 93d Cong., 2d Sess. 17 (1974). EPA did so. *See* 40 Fed. Reg. 59566 (Dec. 24, 1975) and 41 Fed. Reg. 28402 (July 9, 1976) (National Interim Primary Drinking Water Regulations).

⁵The SDWA originally called on the National Academy of Sciences (NAS) to provide proposals for health goals to serve as a target for additional regulations. Pub. L. No. 93-523, § 1412, 88 Stat. 1662 (1974) (former SDWA § 1412(B) and (e)). Believing this exercise required consideration of non-health factors that were beyond their purview, NAS declined to provide proposals for health goals. *See* 48 Fed. Reg. 45503 (Oct. 5, 1983).

⁶*See* 45 Fed. Reg. 40222 (June 13, 1980) (the small systems compliance strategy).

⁷*See, e.g.*, H.R. 4509, 97th Cong., 1st Sess., 127 Cong. Rec. H6385 (daily ed. Sept. 17, 1981) (introduced by Rep. Gramm).

ter suppliers, Congress passed the SDWA Amendments of 1996.¹⁵ The 1996 Amendments instituted several critical reforms to the program. Most significantly, the amendments withdrew the provisions mandating 25 new standards every three years and instead provided EPA with the flexibility to decide which contaminants to regulate, based on occurrence data, risk assessment, and cost-benefit considerations.

Following the September 11, 2001 terrorist attacks, the Public Health Security and Bioterrorism Preparedness and Response Act of 2002 introduced a number of security-related amendments. For example, community water systems (CWSs) serving more than 3,300 people were required to conduct vulnerability assessments and prepare emergency response plans.¹⁶

Another important amendment, the Drinking Water Protection Act, addressed the assessment and management of the risks posed by algal toxins in public drinking water supplies.¹⁷ EPA was required to, among other items, assess the health risks from algal toxins, issuing health advisories if needed; provide guidance on the assessment and measurement of these toxins; recommend treatment and protection options for water supplies; and provide technical assistance to public water systems facing this issue.¹⁸

Following the Flint Water Crisis, and in the wake of increasing national security bioterrorism concerns, Congress made a number of amendments to the SDWA with the Water Infrastructure Improvements for the Nation (WIIN) Act.¹⁹ The 2016 amendments redetermined allowable lead levels in drinking water, required disclosure when levels exceeded the maximum amount, increased assistance for disadvantaged communities and schools, and generally provided additional funding opportunities for public water infrastructure projects.²⁰

Several themes in drinking water regulation will be familiar to those who have experience with other federal environmental programs. EPA sets enforceable standards to protect health (National Primary Drinking Water Regulations (NPDWR) or Primary Regulations) that apply to public water systems. These standards are to be set as close as possible to established health goals, considering the “best available technology” (BAT), cost, and feasibility. States, territories, and tribes may adopt standards that are at least as stringent as the federal program and, after EPA approval, may assume primary enforcement authority. The contemporary themes of water security and water conservation are incorporated via EPA’s implementation of the SDWA.²¹

This Chapter discusses the types of water systems subject to regulation, the setting of Primary Regulations, variances and exemptions, public notification, state

²¹Water security provisions can be found at SDWA §§ 1433 to 1435, 42 U.S.C.A. §§ 300i-2 to 300i-4. EPA’s consideration of water conservation played a central role in its 2003 decision that “submetering” by apartment buildings and others was not “selling water” for purposes of classification as a public water system. *Applicability of the Safe Drinking Water Act to Submetered Properties*, 68 Fed. Reg. 74233-34 (Dec. 23, 2003). The decision withstood challenge. *Manufactured Housing Institute v. U.S. Environmental Protection Agency*, 467 F.3d 391, 36 Env’tl. L. Rep. 20216 (4th Cir. 2006) (rejecting petition challenging EPA’s failure to include manufactured housing and mobile home parks under EPA policy).

drinking water programs, enforcement authorities, and groundwater protection.²² It does not address Underground Injection Control regulation under the Safe Drinking Water Act, as that subject is discussed elsewhere in this treatise.

II. WHAT IS A PUBLIC WATER SYSTEM?

§ 18:2 In General

Only water served by “public water systems” is subject to minimum requirements under the SDWA.

§ 18:3 Public Water System Defined

The term public water system means “a system for the provision to the public of water for human consumption through pipes or other constructed conveyances, if such system has at least fifteen service connections or regularly serves at least twenty-five individuals.”¹ Water systems typically take in surface water or groundwater, treat it, and then send it through pipes to consumers. The 1996 SDWA Amendments expanded the definition of public water system to encompass “constructed conveyances” in addition to pipes.² The amendments specify that, under certain circumstances, conveyances other than pipes shall not be considered “connections” for purposes of the “fifteen service connections” requirement.³ The amendments also exempted from public water system status certain irrigation districts in existence prior to May 18, 1994.⁴

Public water systems need not be “public” in the sense they are government-owned,⁵ and there are many public water systems owned and operated by private investors. To be covered by the Act, public water systems need only “regularly”

²²This Chapter does not address the more detailed, general provisions of the SDWA, such as inspection authority, grants, whistleblower protections and judicial review. Those subjects are covered in SDWA §§ 1441 to 1450, 42 U.S.C.A. §§ 300j-1 to 300j-11 and are relatively straightforward.

[Section 18:3]

¹SDWA § 1401(4), 42 U.S.C.A. § 300f(4). Before the 1996 Amendments, which expressly address irrigation canal systems, the U.S. Court of Appeals for the Ninth Circuit held that where untreated water was provided to consumers through an irrigation canal system, the irrigation district was not a public water system, because the canals did not constitute a “piped” system. *Imperial Irr. Dist. v. U.S. E.P.A.*, 4 F.3d 774, 776-77, 37 Env’t. Rep. Cas. (BNA) 1557, 23 Env’tl. L. Rep. 21310 (9th Cir. 1993). “Water for human consumption” also includes water for “such normal uses as bathing and showering, cooking and dishwashing, and maintaining oral hygiene.” *U.S. v. Midway Heights County Water Dist.*, 695 F. Supp. 1072, 1076, 27 Env’t. Rep. Cas. (BNA) 2183, 27 Env’t. Rep. Cas. (BNA) 2185, 19 Env’tl. L. Rep. 20142 (E.D. Cal. 1988). Connections to homes or buildings are service connections. The term “public water system” includes (1) collection, treatment, storage, and distribution facilities under control of the operator and used primarily with such system, and (2) any collection or pretreatment storage facilities not under such control which are used primarily in connection with the system. The outer bounds of “collection or pretreatment storage facilities” have not been defined. However, the Georgia Supreme Court, interpreting a state law that is virtually identical to the SDWA, held that the statute does not regulate private lines running from the service connections of distribution facilities into homes, because private lines are not within the control of the water system operators. *Bass v. Ledbetter*, 257 Ga. 738, 363 S.E.2d 760, 761, 27 Env’t. Rep. Cas. (BNA) 1471 (1988).

²EPA has issued guidance defining “public water system,” as provided in the 1996 SDWA amendments. 63 Fed. Reg. 41940 (Aug. 5, 1998). EPA has also adopted definitions relating to “wholesale systems,” “consecutive systems,” and “combined distribution systems” for purposes of implementing the primary drinking water regulations, although these definitions do not expand the term “public water system.” See 40 C.F.R. § 141.2 (definitions) and Part 141, Subpart U.

³SDWA § 1401(4)(B)(i), 42 U.S.C.A. § 300f(4)(B)(i).

⁴SDWA § 1401(4)(B)(ii), 42 U.S.C.A. § 300f(4)(B)(ii).

serve the requisite number of persons.⁶ EPA has defined regular service to be daily service at least 60 days out of the year.⁷ As explained below, EPA has further subdivided public water systems based on the number of days of service so that not all systems are required to meet the same regulations.

The term “public water systems” encompasses a broad array of facilities and includes systems that are not traditionally considered water utilities. Gasoline stations, factories, schools, private housing developments, campgrounds,⁸ trailer camps, restaurants, motels, and other facilities that have their own wells or surface water supplies must comply with the regulations if they serve the requisite number of service connections or persons.⁹ Thus, even a system on an off-shore drilling platform near Louisiana has been held to be a public water system by EPA.¹⁰

Despite the breadth of the public water system definition, certain systems are unregulated. Obviously, systems that serve fewer than 25 persons or 15 service connections are not covered. Under the Act, a system is also exempt if it:

- (1) consists only of distribution and storage facilities (without any collection and treatment facilities);
- (2) obtains all its water from, but is not owned or operated by, a public water system;
- (3) does not sell water to any person; and
- (4) is not a carrier that conveys passengers in interstate commerce.¹¹

This exemption is in part intended to exclude facilities like hotels and grocery stores, which merely by virtue of having a storage tank and acting as a conduit from public water system to the consumer would otherwise be subject to regulation.¹² Carriers of water in interstate commerce (for example, airplanes and buses) are not exempt, and water they serve must meet SDWA standards.¹³ Bottled drinking water purveyors are not public water systems because they are not providing water through a “pipe or constructed conveyance.”¹⁴ However, the Food and Drug Administration, as authorized by statute, has adopted the drinking water standards for bottled water, so that, by federal law, bottled water distributed interstate is to

⁶Systems serving more than 25 persons have occasionally attempted to disconnect users to avoid regulation, or to establish two “separate” systems, each serving fewer than 25 persons. In the latter case, there is often a factual question whether there will be one system or two after the attempted spin-off.

⁷40 C.F.R. § 141.2. Specifying 60 days rather than two months means that a system may qualify as a public water system even if it is not operational every day during two months or through a continuous 60-day period. 40 Fed. Reg. 59566 (Dec. 24, 1975).

contain no more contaminants than tap water.¹⁵ In § 305 of the 1996 SDWA amendments, Congress amended the Federal Food, Drug, and Cosmetic Act to impose further requirements on bottled water. EPA has allowed systems to provide bottled water to consumers to prevent unreasonable risks during the term of a variance or exemption and has established monitoring, quality, and quantity requirements for such interim measures.¹⁶

§ 18:4 Community and Non-Community Water Systems

Figure 1.¹

When the National Interim Drinking Water Regulations were adopted in 1975, EPA subdivided public water systems into two types—community water systems and non-community water systems.² Community systems are what we normally think of as water utilities—they serve our homes. Community water systems serve the same people year-round: at least 15 service connections or 25 residents.³ According to EPA, eight percent of U.S. community water systems provide water to 82% of the U.S. population.⁴ All of the federal SDWA regulations apply to these systems.

¹⁵Federal Food, Drug and Cosmetic Act § 410, 21 U.S.C.A. § 349. *See* 21 C.F.R. Pt. 129. Although bottled water must meet minimum standards, the Food and Drug Administration has not adopted EPA's monitoring requirements for public water systems.

¹⁶40 C.F.R. §§ 141.101, 142.57(a) to (b), 142.62(f) to (g); 56 Fed. Reg. 26460, 26563 to 26564 (June 7, 1991). Bottled water may not be used by public water systems to achieve compliance with drinking water standards. 40 C.F.R. § 141.101; 52 Fed. Reg. 25701, 25716 (1987).

⁴*Public Water Systems*, *supra* note 1.

Figure 2.⁵

Non-community systems are all other public water systems that serve the requisite number of persons at least 60 days per year.⁶ Unlike community systems, non-community systems do not serve residents.⁷ Non-community systems include hotels, motels, restaurants, schools, factories, and churches that produce their own drinking water. Non-community systems constitute the large majority of public water systems.⁸ As of 2017, roughly 51,350 community water systems provided water to more than 299 million people.⁹

This distinction is not trivial. Traditionally, while community systems were required to meet all drinking water standards, non-community systems were only required to meet drinking water standards for acutely toxic agents like arsenic, total trihalomethanes, and nitrates.¹⁰ EPA based this science/policy decision on the general proposition that brief or intermittent exposures resulting from most non-community systems did not justify a high priority for control of other contaminants that caused adverse health effects only after longer-term exposure (*i.e.*, chronic effects).¹¹ EPA also indicated that it was concerned about the feasibility of immediate implementation of the drinking water program, given the large number of small water systems and limited laboratory capability.¹² These concerns proved real, as EPA later recognized in adopting a strategy to assist the smaller systems that were having trouble complying with even the few maximum contaminant levels (MCLs)

⁵Data retrieved from EPA's ECHO system, available at <https://echo.epa.gov/trends/comparative-maps-dashboards/drinking-water-dashboard?yearview=CY&view=activity&criteria=basic&state=National>.

that existed.¹³

There is another category of public water systems: non-transient non-community water systems (NTNCWS).¹⁴ This class of public water system applies to systems serving at least 25 of the same persons over six months per year.¹⁵ Those persons cannot be residents; otherwise, the system would be considered a “community system.” Thus, NTNCWSs include schools, factories, and hospitals that produce their own water. Most drinking water regulations apply to these systems.

§ 18:5 Protection for Other Water Systems

Over 12% of the nation’s population uses drinking water from private sources rather than public water systems.¹ What standards apply to drinking water that is not provided by public water systems? The short answer is that the SDWA simply does not regulate these sources.² Thus, for example, private wells serving a few homes even year-round are not covered by federal drinking water regulations. A nationwide survey conducted by the United States Geological Survey concluded that a significant percentage of private wells contain at least one contaminant at levels of potential health concern.³

Without the protections provided by the federal SDWA, what other means of regulatory protection are available for users of private water sources? Local ordinances may require initial testing of private wells, although such ordinances rarely provide minimum, mandatory standards for water quality, or require regular monitoring. The remaining “protections” do not apply directly to water systems, but they are generally directed at controlling or preventing contamination of surface

¹³See 45 Fed. Reg. 40222 (June 13, 1980). Maximum contaminant levels, essentially performance standards for public water systems, are discussed in greater detail in § 18:10. MCLs are the highest levels of contaminants that are allowed in drinking water; Maximum Contaminant Level Goals (MCLGs) are the contaminant levels below which there are no known or expected risks to health. MCLGs have a safety margin and are non-enforceable public health goals. MCLs are set as close to MCLGs as possible using the best available treatment technology, and MCLs take cost into consideration. See EPA, *Ground Water and Drinking Water: National Primary Drinking Water Regulations*, <https://www.epa.gov/ground-water-and-drinking-water/national-primary-drinking-water-regulations#one> (last visited July 21, 2020).

¹⁴There is a third broad category of PWS: transient non-community water systems (TNCWS) provide water in places where people do not remain for long periods of time. Locations such as gas stations and campgrounds would be considered TNCWSs. Only SDWA regulations for contaminants that pose immediate risks to health (e.g., bacteria, nitrates) apply to these systems.

¹⁵40 C.F.R. § 141.2; 52 Fed. Reg. 25712 (July 8, 1987). EPA has clarified that those persons must be served at least four days per week for at least 26 weeks per year. Memorandum from Paul Baltay, Director, State Programs Division, U.S. EPA Office of Drinking Water, to Regional Drinking Water Program Branches (Sept. 16, 1987).

¹Andrea Kopaski, *Public vs Private: A National Overview of Water Systems*, The Environmental Finance Blog, UNC School of Government: Environmental Finance Center (Oct. 19, 2016) (citing the data derived from EPA’s Safe Drinking Water Information System), <http://efc.web.unc.edu/2016/10/19/public-vs-private-a-national-overview-of-water-systems/>.

²Note, however, that the Administrator’s emergency powers under SDWA § 1431, 42 U.S.C.A. § 300i, are not limited to protecting public water systems. For example, those powers may be used to protect underground sources of drinking water or to address threatened or potential terrorist attacks. Also, § 101(b)(2) of the SDWA Amendments of 1996 directed the General Accounting Office to undertake a study ascertaining the number and location of water systems that are not “public water systems” by virtue of the “connections” exceptions under SDWA § 1401(4)(B)(i), (ii), 42 U.S.C.A. § 300f(4)(B)(i), (ii).

This survey analyzed water drawn from about 2,100 wells located in 48 different states. Over 200 contaminants were identified during the study; inorganic chemicals were the dominant presence at levels presenting potential health effects.

water or groundwater. They are discussed more specifically elsewhere in this treatise, but several deserve special mention here.

If there is a threat of contamination that may cause an imminent and substantial endangerment to either surface or groundwater drinking supplies, EPA has authority to take any action necessary to address the threat.⁴ Also, if there is a contamination incident, tort law (primarily nuisance and trespass) has traditionally supplied grounds for legal action.⁵ Where the contamination incident is caused by the release of a substance from a facility regulated by the Resource Conservation and Recovery Act (RCRA),⁶ or if contamination comes to the attention of EPA through the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA)⁷ program, EPA may act to require the responsible facility to clean up the site to meet the applicable drinking water standards, if the affected drinking water currently is or potentially could be used by a public water system.⁸ CERCLA also provides remedies allowing private parties (for example, a well owner) to clean up the site and bring actions for cost recovery against parties responsible for hazardous substance contamination,⁹ regardless of whether the water affected is used by a public water system.¹⁰ Various state “drinking water” laws, such as California’s Proposition 65 and groundwater protection laws, also attempt to prevent contamination of drinking water supplies, irrespective of whether the supply is used by a public water system.¹¹

§ 18:6 In General

Federal drinking water regulations are divided between two categories. National Primary Drinking Water Regulations (Primary Regulations or NPDWR) protect health and are enforceable against public water systems. Primary Regulations are the heart of the SDWA. National Secondary Drinking Water Regulations (Secondary Regulations) protect “welfare,” address aesthetic concerns such as odor, and are not federally enforceable under the SDWA.¹ Most of this section is devoted to Primary Regulations and the exemptions and variances from Primary Regulations.

§ 18:7 National Primary Drinking Water regulations—Definition

Primary Regulations specify MCLs or treatment techniques for contaminants that may have any adverse effect on the health of persons.¹ MCLs and treatment techniques are the heart of the Primary Regulations, and they are discussed at length below. In addition to MCLs and treatment techniques, Primary Regulations include “criteria and procedures” for assuring compliance (for example, monitoring) and may include requirements for minimum quality intake waters and siting.² “Contaminants” that may be regulated include anything that may be in water, regardless of whether it is naturally occurring or man-made, intentionally or unintentionally added.³

MCLs are essentially performance standards for public water systems: MCLs are not to be exceeded in water delivered to users.⁴ Public water systems are generally free to meet MCLs using any technology they desire.⁵ However, systems may not use bottled water to comply with MCLs because of concern that these alternatives would not provide the same degree of public health protection as centralized treatment of drinking water;⁶ bottled water is restricted to temporary use to avoid unreasonable risks to health during a variance or exemption.⁷ Typical water treatment practices have traditionally included filtration and disinfection (usually by chlorination), but these practices do not effectively reduce many of the organic and inorganic contaminants that have been discovered in drinking water sources. More recently, advanced treatment technologies, such as granular activated carbon, ion exchange, and microfiltration, are being used routinely to achieve compliance with MCLs.

[Section 18:6]

¹The distinction between primary “health” and secondary “welfare” regulations has its origins in the Clean Air Act of 1970, which contains a similar distinction. *See* Clean Air Act § 109(a) to (b), 42 U.S.C.A. § 7409(a) to (b). This is no coincidence. The SDWA was referred to the same congressional committees that reviewed and passed the Clean Air Act. One major difference between Primary and Secondary Regulations under the two statutes is that the SDWA Secondary Regulations are not federally enforceable, while the Clean Air Act Secondary Regulations are intended to be enforceable.

[Section 18:7]

¹SDWA § 1401(1), 42 U.S.C.A. § 300f(1).

²SDWA § 1401(1)(D), 42 U.S.C.A. § 300f(1)(D).

³“Contaminant” means “any physical, chemical, biological, or radiological substance or matter in water.” SDWA § 1401(6), 42 U.S.C.A. § 300f(6).

⁴SDWA § 1401(3), 42 U.S.C.A. § 300f(3).

⁵EPA is proscribed by the Act from requiring that any particular technology, treatment technique, or other means be used to comply with an MCL. SDWA § 1412(b)(4)(E)(1), 42 U.S.C.A. § 300g-1(b)(4)(E)(1). If the system uses a device to treat water entering houses and buildings (point-of-entry treatment device), the system must show the device is effective and meet other specified criteria. 40 C.F.R. § 141.100. *See* 40 C.F.R. § 141.2 (definition of “point-of-entry treatment device”). Because every building connected to the system must have a point-of-entry treatment device, use of this compliance option may be limited.

⁶*See* 52 Fed. Reg. 25701 (July 8, 1987); 63 Fed. Reg. 31932 (June 11, 1998).

⁷40 C.F.R. § 141.101.

In contrast with MCLs, treatment techniques are engineering or design requirements for public water systems and may be specified in lieu of an MCL. Treatment techniques may be chosen by EPA if it is “not economically or technologically feasible” to ascertain the level of a contaminant.⁸ EPA is required to list the treatment techniques that prevent adverse health effects.⁹

§ 18:8 National Primary Drinking Water Regulations—Pre-1996 SDWA Amendments: Selecting Contaminants for Regulation

The requirements EPA must follow in selecting contaminants for regulation were radically altered by the SDWA Amendments of 1996. Prior to those amendments, EPA was generally directed to establish Primary Regulations for any contaminant “which, in the judgment of the Administrator, may have any adverse effect on the health of persons and which is known or anticipated to occur in public water systems.”¹ That test encompassed both a toxicity component (adverse effect on health) and an occurrence or exposure component (known or anticipated to occur). EPA intended to set standards for as many substances as possible that might be of health concern when present in drinking water.² Specifically, EPA claimed that it would regulate substances where there were: (1) analytical methods to detect a contaminant in drinking water; (2) sufficient health effects information to conclude that there might be a health concern; and (3) occurrences in drinking water or potential for increased occurrences in drinking water.³

The second of these criteria, potential health effects, generally included a wide—but not unlimited—variety of undesirable symptoms, such as the obvious acute and chronic effects of sickness, carcinogenicity, mutagenicity, and teratogenicity.⁴ For example, EPA decided that functional impairment of an organ or bone was an adverse health effect, but that mottling and pitting of teeth from high fluoride levels were not, because mottling and pitting do not functionally impair teeth.⁵ This was upheld in court.⁶ EPA was directed to regulate contaminants that “may” have an adverse effect on health. What probability of a health effect was deemed appropriate to meet the statutory standard? In declining to regulate vinylidene chloride for its “possible” carcinogenic effects, for instance, EPA found the evidence only weakly suggestive of carcinogenicity.⁷ In upholding EPA’s decision, the U.S. Court of Appeals for the District of Columbia Circuit stated, in dictum:

a preponderance-of-the-evidence test would probably be inconsistent with Congress’ directions in the Drinking Water Act. If the evidence established, for example, a 40% probability that a compound was carcinogenic, the agency’s decision not to regulate

⁸SDWA § 1412(b)(7)(A), 42 U.S.C.A. § 300g-1(b)(7)(A).

⁹SDWA § 1412(b)(7)(A), 42 U.S.C.A. § 300g-1(b)(7)(A).

⁵50 Fed. Reg. 47142, 47143-44 (Nov. 14, 1985). In addition, EPA has determined that any impaired self-image or loss of self-esteem that may accompany mottled teeth are not significant enough to be termed adverse health effects under the Act.

⁶Natural Resources Defense Council, Inc. v. E.P.A., 812 F.2d 721, 725, 25 Env’t. Rep. Cas. (BNA) 1681, 17 Env’t. L. Rep. 20418 (D.C. Cir. 1987).

⁷50 Fed. Reg. 46880 (Nov. 13, 1985).

would be difficult to square with the Drinking Water Act's instruction to . . . establish a . . . level for each contaminant which, in its judgment, *may* have any adverse effect on health. Such a decision might well constitute an abuse of . . . discretion.⁸

In the same decision, the court rejected arguments that EPA could regulate contaminants only where the Agency found a “significant risk.” The court pointed out that contaminants may have some adverse effect on health without posing a significant risk.⁹

The third criterion, known or anticipated occurrence, historically played little role in EPA's selection of contaminants to regulate. However, even before the statute was amended in 1986 to specifically include occurrence criteria, EPA asserted authority to regulate contaminants that occur or may occur in “drinking water” (a more expansive universe than “public water systems”).¹⁰ EPA has therefore looked to occurrence in private wells, surface water or groundwater, and liquid or solid waste (as well as production rates of chemicals that may be contaminants, mobility of contaminants in the environment, and dispersive use patterns).¹¹ The 1996 Amendments impose a more demanding burden on EPA to demonstrate occurrence before selecting a contaminant for regulation, and “known or anticipated occurrence” has played a major role since.¹²

Until the 1996 Amendments, EPA's agenda for selecting which contaminants to regulate was dictated by the SDWA Amendments of 1986.¹³ Those amendments required EPA to regulate no fewer than 83 contaminants by June 19, 1989.¹⁴ Those 83 listed contaminants were identified in two EPA Advance Notices of Proposed Rulemaking referred to in the amendments.¹⁵ However, 22 of the 83 contaminants to be regulated were already covered by Primary Regulations (these contaminants were slated for revision by EPA).

The 83 listed contaminants included a variety of organic, inorganic, microbiological, and radiological contaminants. EPA substituted seven contaminants for the listed contaminants, finding that regulating the substitutes was more likely to be protective of public health.¹⁶ EPA was also directed by the statute to develop Primary Regulations requiring two treatment techniques—filtration and disinfection—for public water systems.¹⁷

The 1986 Amendments also required EPA to publish, beginning January 1, 1988, a triennial priority list of contaminants “which are known or anticipated to occur in public water systems and which may require regulation.”¹⁸ Within two years of each

⁸Natural Resources Defense Council, Inc. v. E.P.A., 824 F.2d 1211, 1217, 26 Env't. Rep. Cas. (BNA) 1305, 17 Env'tl. L. Rep. 21100 (D.C. Cir. 1987). However, if adverse effects have been caused by unusual dietary practices whereby persons put themselves at risk, the agency is not bound to set the standard to protect against such effects. *NRDC*, 812 F.2d 721, 724 (D.C. listing, EPA was to propose Primary Regulations for at least 25 contaminants on the list; within three years of listing, regulations were to be promulgated.¹⁹

The standard for listing had two components. First, EPA was required to consider contaminants that are “known or anticipated to occur” in public water systems. This was also the occurrence standard imposed by the Act for contaminants that must be regulated under Primary Regulations.²⁰ Second, EPA was to consider listing those contaminants that “may require regulation.”²¹ Contaminants that may require regulation would logically include those that may have an adverse effect on human health.

EPA was to publish the priority list every three years. The statute did not specify a date after which the priority list need not be published, and there is no legislative history addressing whether Congress intended this requirement to continue indefinitely. It was arguably consistent with the goals of the Act to publish the priority list and regulations so long as EPA identified contaminants that meet the criteria established by the Act.

In preparing the priority lists, EPA looked to (among other sources) hazardous substances under CERCLA and registered pesticides under the Federal Insecticide, Fungicide and Rodenticide Act (FIFRA).²² EPA selected contaminants that appeared most frequently in drinking water and groundwater, and for which there was adequate toxicological information from which to postulate potential adverse health effects.²³ Hazardous substances under CERCLA, including hazardous waste under RCRA, met these requirements and were included on the lists.²⁴

EPA did not publish MCLs for all 83 contaminants by June 19, 1989. By that deadline, it had published MCLs for only eight contaminants and proposed MCLs or treatment techniques for 40 more.²⁵ Citizens groups filed several lawsuits seeking to require EPA to expedite its MCL promulgation schedule.²⁶

§ 18:9 National Primary Drinking Water Regulations—Selecting Contaminants for Regulation after the 1996 SDWA Amendments

The 1996 SDWA Amendments radically altered the direction EPA must follow in selecting contaminants for regulation. The 1996 Amendments, unlike those in 1986, did not prescribe the specific contaminants or the number of contaminants EPA must regulate. Instead, they identified procedures and schedules EPA must use in selecting contaminants to regulate.

To begin with, EPA was required, beginning on February 6, 1998, and every five years thereafter, to publish a list of contaminants that, at the time of publication, were not subject to any proposed or final MCL or treatment technique, and that are

1901 (Jan. 22, 1988) (the first triennial list); 56 Fed. Reg. 1470 (Jan. 14, 1991) (the second triennial list).

¹⁹Former SDWA § 1412(b)(3)(C), (D), 42 U.S.C.A. § 300g-1(b)(3)(C), (D). The first list included 53 contaminants. 53 Fed. Reg. 1892, 1901 (Jan. 22, 1988).

²⁰Former SDWA § 1412(b)(3)(A), 42 U.S.C.A. § 300g-1(b)(3)(A).

²¹Former SDWA § 1412(b)(3)(A), 42 U.S.C.A. § 300g-1(b)(3)(A).

²²7 U.S.C.A. §§ 136 to 136y.

²³53 Fed. Reg. 1892, 1893 (Jan. 22, 1988).

²⁴53 Fed. Reg. at 1898-99.

²⁵Since June 19, 1989, EPA promulgated MCLs or treatment techniques for more of the 83 contaminants. *See* 54 Fed. Reg. 27486 (June 29, 1989); 54 Fed. Reg. 27544 (June 29, 1989); 56 Fed. Reg. 3526 (Jan. 30, 1991); 56 Fed. Reg. 26460 (June 7, 1991); 56 Fed. Reg. 30266 (July 1, 1991); 57 Fed. Reg. 31776 (July 17, 1992); 59 Fed. Reg. 34320 (July 1, 1994); 65 Fed. Reg. 76708 (Dec. 7, 2000); 66 Fed. Reg. 6976 (Jan. 22, 2001); 67 Fed. Reg. 1812 (Jan. 14, 2002).

²⁶*See, e.g.,* Joseph L. Miller v. EPA, No. 89-6328-E (D. Or., filed 6-25-89).

known or anticipated to occur in public drinking water systems.¹ Prior to publication of that list, EPA must consult with its Science Advisory Board, publish the list for notice and comment, and consider the occurrence database established under SDWA § 1445(g).²

By August 6, 2001, and every five years thereafter, EPA was required to publish, for at least five contaminants on its list, a determination as to whether or not it will subject those contaminants to regulation. A regulatory determination is a decision to begin (or decline to begin) the process to develop and promulgate a national primary drinking water regulation (NPDWR) for an unregulated contaminant.³

EPA must first issue a preliminary determination for notice and comment. EPA is required to regulate contaminants if the Administrator determines that: (1) the contaminant may have an adverse effect on the health of persons; (2) the contaminant is known to occur, or there is a substantial likelihood that the contaminant will occur, in public water systems with a frequency and at levels of public health concern; and (3) regulation of such contaminant presents a meaningful opportunity for health risk reduction for persons served by public water systems.⁴ In selecting contaminants according to those three factors, EPA is required to set priorities by considering contaminants that present the “greatest public health concern.”⁵ EPA was also required to include sulfate as one of the first five contaminants to be considered for possible regulation.⁶ In addition, the 1996 Amendments authorized EPA to regulate a contaminant, if necessary to address an urgent threat to public health.⁷

There are some exceptions to this process, however. In contrast to the flexible scheme for selecting most of the contaminants to be regulated, the 1996 Amendments imposed a specific schedule for the regulation of disinfectants and disinfection byproducts.⁸ EPA was required to promulgate an Interim Enhanced Surface

[Section 18:9]

¹SDWA § 1412(b)(1)(B), 42 U.S.C.A. § 300g-1(b)(1)(B).

²In considering contaminants for its list, EPA is required to evaluate, among other contaminants, hazardous substances as defined under CERCLA, and substances registered as pesticides under FIFRA.

³“It should be noted that the analyses associated with a regulatory determination process are distinct from the analyses needed to develop a National Primary Drinking Water Regulation (NPDWR). Thus, a decision to regulate is the beginning of the Agency’s regulatory development process, not the end. For example, EPA may find at a later point in the regulatory development process, and based on additional or new information, that a contaminant does not meet the three statutory criteria for finalizing a NPDWR.” Announcement of Preliminary Regulatory Determinations for Contaminants on the Fourth Drinking Water Contaminant Candidate List, 85 Fed. Reg. 14098, 14100 (Mar. 10, 2020).

⁴SDWA § 1412(b)(1)(A), 42 U.S.C.A. § 300g-1(b)(1)(A).

⁵SDWA § 1412(b)(1)(C), 42 U.S.C.A. §§ 300g-1(b)(1)(C). For purposes of setting those priorities, the 1996 amendments require EPA to take into consideration, “among other factors of public health concern, the effect of such contaminants upon subgroups that comprise a meaningful portion of the general population (such as infants, children, pregnant women, the elderly, individuals with a history of serious illness, or other subpopulations) that are identifiable as being at greater risk of adverse health effects due to exposure to contaminants in drinking water than the general population.”

⁶SDWA § 1412(b)(12), 42 U.S.C.A. § 300g-1(b)(12). EPA has since established a Secondary Regulation for sulfate. 40 C.F.R. § 143.3.

⁷SDWA § 1412(b)(1)(D); 42 U.S.C.A. § 300g-1(b)(1)(D). The urgent threat can only be determined by EPA after consultation with, and written response to, any comments provided by the Secretary of Health and Human Services, acting through the Director of the Centers for Disease Control and Prevention or the Director of the National Institutes of Health.

⁸SDWA § 1412(b)(2)(C), 42 U.S.C.A. § 300g-1(b)(2)(C).

Water Treatment Rule,⁹ a Final Enhanced Surface Water Treatment Rule,¹⁰ a Stage I Disinfectants and Disinfection Byproducts Rule,¹¹ and a Stage II Disinfectants and Disinfection Byproducts Rule,¹² all in accordance with the schedule published in table III.13 of the proposed Information Collection Rule.¹³ The 1996 amendments also required EPA to promulgate an MCL for arsenic by January 1, 2001,¹⁴ and both an Maximum Contaminant Level Goal (MCLG) and either an MCL or treatment technique for radon by August 6, 2000.¹⁵

The final First Candidate Contaminant List (CCL 1) included 60 chemical and microbiological contaminants; that list was published in the Federal Register on March 2, 1998.¹⁶ The final regulatory determinations for nine of the 60 CCL 1 contaminants were published on July 18, 2003.¹⁷ At that time, EPA decided that NPDWRs were not needed for nine contaminants: *Acanthamoeba*, aldrin, dieldrin, hexachlorobutadiene, manganese, metribuzin, naphthalene, sodium, and sulfate. Rather than establish NPDWRs, EPA published information about *Acanthamoeba* on EPA's website and issued health advisories (HAs) for manganese, sodium, and sulfate. However, EPA decided regulating the nine contaminants would not reduce health risks for those served by PWSs.¹⁸

The final Second Candidate Contaminant List (CCL 2) was published on February 24, 2005.¹⁹ That list included the 51 remaining chemical and microbial contaminants from CCL 1.²⁰ The final regulatory determinations for 11 of the 51 CCL 2 contaminants were then published on July 30, 2008.²¹ EPA determined that NPDWRs were not needed for: boron, the dacthal mono- and di-acid degradates, 1,1-dichloro-2,2-bis(p-chlorophenyl)ethylene (DDE), 1,3-dichloropropene (Telone), 2,4-dinitrotoluene, 2,6-dinitrotoluene, s-ethyl dipropylthiocarbamate (EPTC), fonofos, terbacil, and 1,1,2,2-tetrachloroethane.²² EPA then issued new or updated health advisories for boron, dacthal degradates, 2,4-dinitrotoluene, 2,6-dinitrotoluene, and 1,1,2,2-tetrachloroethane.²³

The final Third Candidate Contaminant List (CCL 3) listed 116 contaminants; it

was published in the Federal Register on October 8, 2009.²⁴ During the CCL 3 process, EPA received input from the National Academy of Science's (NAS) National Research Council (NRC) and the National Drinking Water Advisory Council (NDWAC); the public also provided input.²⁵

In selecting candidates for the final CCL 3 list, EPA (1) identified about 7,500 potential drinking water contaminants; (2) selected about 600 contaminants for the preliminary CCL (PCCL) list based on the potential of the various chemicals to occur in PWSs and to cause public health issues; and (3) evaluated the PCCL contaminants after a detailed review of both occurrence and health effects—this led to the identification of a list of 116 CCL 3 contaminants.²⁶

The preliminary determinations for the CCL 3 contaminant list were published in the Federal Register on October 20, 2014.²⁷ EPA made preliminary determinations for five of the 116 contaminants on the CCL 3 list, including a preliminary determination to regulate strontium and a preliminary determination not to regulate dimethoate, 1,3-dinitrobenzene, terbufos, and terbufos sulfone.²⁸ These negative determinations were finalized on January 4, 2016.²⁹ The decision on strontium was delayed; that allowed EPA time to consider additional data.³⁰

EPA published an off-cycle final determination and decided to regulate perchlorate (a CCL 3 contaminant) on February 11, 2011.³¹

The Fourth Contaminant Candidate List (CCL 4) was published on November 17, 2016,³² and included 97 chemicals/chemical groups and 12 microbial contaminants. Then, on February 20, 2020, EPA announced the preliminary regulatory determinations for eight of these chemicals.³³ EPA decided to regulate PFOS and PFOA but not to regulate six other potential contaminants: 1,1-dichloroethane, acetochlor, methyl bromide (bromomethane), metolachlor, nitrobenzene, and RDX.³⁴ EPA then extended the comment period for this preliminary regulatory determination through June 10, 2020.³⁵

§ 18:10 National Primary Drinking Water Regulations—Maximum Contaminant Level Goals

Once EPA decides to regulate a contaminant, the Agency is to set an MCLG, an unenforceable health goal that is the target for the enforceable MCLs. EPA is required to propose the MCLG no later than two years from the time it makes the determination to regulate a contaminant, and must issue the final MCLG within 18 months of the proposal.¹ MCLGs are set at the level at which “no known or anticipated adverse effects on the health of persons occur and which allows an adequate margin of safety.”² MCLs must be set as close to MCLGs as is “feasible,” a term defined in the Act and discussed in the next section.³ MCLGs are goals; they are not required to be set at achievable levels, although they may be achievable in some cases.

EPA has established a three-part scheme for setting MCLGs.⁴ First, contaminants not considered to have carcinogenic potential have MCLGs set at numerical “no effect” levels for chronic or lifetime periods, including a margin of safety. Second, if there is sufficient evidence that a contaminant is a probable animal or human carcinogen, the MCLG is set at zero. As explained by EPA, such an MCLG is based on the inability of scientists to demonstrate experimentally a threshold for carcinogenic effects.⁵ Third, if a contaminant is deemed to be a “possible” human carcinogen, presenting limited or equivocal evidence of carcinogenicity in animals in the absence of human data, a conservative, non-zero MCLG is selected. This MCLG is either based on a projected risk estimate (for example, a 10^{-6} risk) or a non-carcinogenic end point with added uncertainty factors to account for the possibility of carcinogenicity. Carcinogenicity evidence is categorized using EPA’s carcinogen classification scheme.

EPA’s approach has withstood legal challenge. In *NRDC v. EPA*,⁶ the U.S. Court of Appeals for the District of Columbia Circuit deferred to EPA’s judgment that zero was an appropriate level for known or probable human carcinogens to prevent adverse effects with a margin of safety. The court also upheld EPA’s discretion not to regulate vinylidene chloride as a probable animal or human carcinogen, notwithstanding some data suggesting possible carcinogenicity. Finally, the court approved of EPA’s downward adjustment of the MCLG based on chronic effects to account for the possibility of carcinogenicity.

If a contaminant may have an adverse effect (for example, in the case of vinylidene chloride, because of its noncarcinogenic risks), the Administrator is directed to set the recommended level at a level at which “no known or anticipated adverse effects on the health of persons occur *and* which allows an adequate margin of safety.”⁷ The statute thus leaves room for EPA to consider in its actual setting of the recommended level risks other than those that catalyzed the preliminary decision to es-

⁷Prior to the 1986 Amendments, EPA referred to MCLGs as “recommended maximum contaminant levels.”

establish a recommended level.⁸

By contrast, the U.S. Court of Appeals struck down as arbitrary and capricious EPA's MCLG of zero for chloroform when EPA itself had acknowledged that the best available science indicated a non-zero level was justified.⁹

§ 18:11 National Primary Drinking Water Regulations—MCLs and Treatment Techniques

MCLs and treatment techniques are the central requirements public water systems must meet. MCLs are to be set as close to the MCLGs as feasible.¹ Like the MCLGs, MCLs or treatment techniques must be proposed within two years of EPA's determination to regulate a particular contaminant, and the final rule is due 18 months thereafter.² EPA's authority to establish MCLs has withstood constitutional challenges, including suits brought on Commerce Clause grounds.³

How does EPA decide whether to set an MCL or treatment technique? An MCL is the statute's favored approach unless it is technically or economically infeasible to monitor for the contaminant in drinking water, in which case a treatment technique is to be set.⁴ The legislative history explains that EPA is to determine if monitoring is infeasible by analyzing whether (1) effective monitoring techniques are technologically available, and (2) the frequency of monitoring necessary to protect against significantly increased health hazards is economically feasible.⁵

Both MCLs and treatment techniques are to protect to the extent "feasible." Feasibility is defined as "feasible with the use of the best technology, treatment techniques, and other means which the [EPA] finds, after examination for efficacy

⁴SDWA § 1401(1)(C), 42 U.S.C.A. § 300f(1)(C).

⁵H.R. Rep. No. 1153, 93d Cong., 2d Sess. 11–12 (1974). For lead and copper, which occur in drinking water primarily as leachate from pipes and fittings, EPA has promulgated a treatment technique in lieu of MCLs. EPA set a treatment technique because it believed that the lead and copper problem was primarily caused by plumbing in homes, not by facilities under the control of public water systems. 56 Fed. Reg. 26460, 26463 (June 7, 1991). The Lead and Copper Rule has undergone two revisions (and a 2004 revision that was intended to reinstate text that had been inadvertently lost): 65 Fed. Reg. 950 (Jan. 12, 2000) and 72 Fed. Reg. 57782 (Oct. 10, 2007). The 2007 revision strengthened the rule by clarifying minimum sampling requirements and monitoring periods, requiring prior approval of changes in water treatment processes or water sources Oxford common and expanding public notice and public education provisions. On July 29, 2020, EPA issued the final regulation: "Use of Lead Free Pipes, Fittings, Fixtures, Solder, and Flux for Drinking Water." This rule will reduce lead in drinking water by having, among other things, manufacturers or importers certify that their products meet the SDWA requirements using a consistent verification process, which will happen within 3 years of the rule's final publication date. Use of Lead Free Pipes, Fittings, Fixtures, Solder, and Flux for Drinking Water, Pre-publication version (July 29, 2020). The EPA has also proposed additional revisions to the Lead and Copper Rule that are intended to be more protective of human health. National Primary Drinking Water Regulations: Proposed Lead and Copper Rule Revisions, 84 Fed. Reg. 61684 (Nov. 13, 2019).

under field conditions . . . are available (taking cost into consideration).”⁶ This is best available technology (BAT) under the SDWA.⁷ BAT is selected primarily based on an evaluation of: (1) effectiveness of treatment technologies, (2) reasonable affordability by regional and large metropolitan water systems,⁸ (3) analytical methodology to measure to a practical quantitation level,⁹ and (4) health risks.¹⁰

Effectiveness of a technology is usually a relatively straightforward consideration. EPA examines removal efficiency, compatibility with other water treatment processes, service life, and ability to treat all water served by a public water system.¹¹ Field testing data for the technology must be available, but the technology need not be tested for each specific contaminant.¹² The statute specifies that the selected BAT for synthetic organic chemicals must be at least as effective as granular activated carbon.¹³ The 1996 Amendments require EPA, for existing and new MCLs or treatment techniques, to identify technologies or other affordable means for three different classes of small public water systems in order to achieve compliance with those requirements.¹⁴

The statute does not specifically address how costs are to be taken “into consideration.” In setting MCLs, EPA historically looked to the total national cost of compliance for the total number of systems that might have to control organic contaminants.¹⁵ The 1996 Amendments add an entirely new dimension to the cost element. When proposing any MCL, EPA is required to undertake various cost-benefit analyses.¹⁶ EPA is then authorized, based on a determination that the benefits cannot be justified by the costs, to promulgate an MCL that “maximizes health risk reduction benefits at a cost that is justified by the benefits.”¹⁷ The cost-benefit is folded into a risk assessment document available to the public while EPA develops such a regulation. There are restrictions on EPA’s flexibility to use this cost-benefit exception, including a prohibition against its use for disinfectants and

⁶SDWA § 1412(b)(4)(D), 42 U.S.C.A. § 300g-1(b)(4)(D).

⁷Congress modified the former phrase “best generally available technology” by removing the term “generally.” The legislative history explains that Congress wanted to assure that MCLs “reflect the full extent of current technology capability.” S. Rep. No. 56, 99th Cong., 1st Sess. 6 (1985). EPA has concluded that the statutory term “best available technology” is a broader standard than “best technology generally available” and that this standard allows EPA to select a field-tested technology that may not necessarily be in widespread use. 52 Fed. Reg. 25697 (July 8, 1987).

disinfection by-products and against its use as a means to revise existing standards, which prevents backsliding.¹⁸

The other factors EPA evaluates in setting MCL determinations are analytical methodology and health risks.¹⁹ Because drinking water quality is measured analytically to determine MCL compliance, EPA examines the lowest levels that can be reliably measured under routine laboratory operating conditions.²⁰ In addition, EPA looks to the risks presented by the MCLs under consideration to confirm that its MCLs are adequately protective. EPA has a target range for carcinogens of 10^{-4} to 10^{-6} risk using conservative calculation models, and the MCLs EPA has promulgated generally fall in this range.²¹

The 1996 Amendments authorize EPA to establish MCLs at levels other than the “feasible level,” if the technology and other means used to determine the feasible level would result in an increase in the health risk from drinking water by: (1) increasing the concentration of other contaminants in the water; or (2) interfering with the efficacy of drinking water treatment techniques or processes that are used to comply with the SDWA.²²

EPA did not promulgate any treatment techniques in the first 13 years of administering the Act, but the 1986 Amendments directed EPA to promulgate two: one to require filtration (for systems using surface water sources) and the other to require disinfection (for systems using surface waters and groundwater sources).²³ The 1996 Amendments replaced the mandate to disinfect all public groundwater systems with a discretionary program.²⁴ The states were required to determine which public water systems must filter, after notice and opportunity for a hearing, based on criteria established by EPA. The statute specifies deadlines for EPA requirements, state decisions, and public water system compliance.²⁵ The filtration procedure is unusual under the SDWA because it calls on states to make case-by-case decisions as to which public water systems must filter.²⁶

In addition to fulfilling the requirement in the Act to promulgate treatment techniques for filtration and disinfection, EPA also has promulgated treatment techniques for acrylamide and epichlorohydrin,²⁷ and for lead and copper.²⁸ In conjunction with the issuance of either MCLs or treatment techniques, the 1996

¹⁸SDWA § 1412(b)(6)(B) to (C), 42 U.S.C.A. § 300g-1(b)(6)(B) to (C) and SDWA § 1412(b)(9) (the “antibacksliding” provision), 42 U.S.C.A. § 300g-1(b)(9). EPA’s cost-benefit analyses for its drinking water rulemakings under the 1996 amendments have survived several legal challenges. *See City of Portland, Oregon v. E.P.A.*, 507 F.3d 706, 65 Env’t. Rep. Cas. (BNA) 1910 (D.C. Cir. 2007) and *City of Waukesha v. E.P.A.*, 320 F.3d 228, 55 Env’t. Rep. Cas. (BNA) 2025, 33 Env’tl. L. Rep. 20160 (D.C. Cir. 2003).

¹⁹52 Fed. Reg. at 25697, 25699. Analytical methodology is thus a criterion for determining whether regulation is appropriate and in determining whether to set an MCL or a treatment technique, and it is also evaluated in setting MCLs.

²⁰52 Fed. Reg. at 25699, 25700; *see also* 40 C.F.R. § 141.24(g) (setting forth requirements laboratories must meet before they can measure organic chemicals for compliance purposes).

Amendments require EPA to satisfy certain peer review procedures and to provide the public with a detailed presentation of public health information.²⁹

Finally, the 1996 Amendments also required EPA to promulgate a regulation to govern the recycling of filter backwash water within the treatment process of a public water system.³⁰

§ 18:12 National Drinking Water Regulations—Lead

Prior to, and increasingly in the wake of the Flint Water Crisis, the SDWA has had a particular focus on lead in drinking water. The 1986 amendments to the SDWA limited lead concentrations in public water systems by limiting the lead in solder and flux, pipes and pipe fittings, and plumbing fixtures—or what EPA refers to as “endpoint devices.”¹ “Lead free” under these amendments means not greater than 0.2% lead in flux and solder and not greater than 8.0% in pipes and pipe fittings.² Plumbing fixtures are to have no more lead than that of industry standard compliance.³ In addition to the use or installation of such lead-containing materials, these amendments also prohibit selling such materials except where permitted in manufacturing or industrial processes.

Congress added Section 1417(e) to the SDWA in 1996.⁴ Generally, the section directed EPA to assist in the development of standards and testing protocols for analyzing lead leaching in plumbing fittings and fixtures in water systems meant for human ingestion.⁵ The Reduction of Lead in Drinking Water Act subsumed this standard setting process, however.⁶ In 2011, the allowable standard for lead in pipes, plumbing, fittings, and fixtures was lowered from 8.0% to no more than 0.25% by weighted average (where solder and flux are still limited to 0.2% lead). Although it ratcheted down the allowable lead content in plumbing generally, the amendment added an exception for pipes, pipe fittings, plumbing fitting, and fixtures, as well as a variety of other items (toilets, urinals, shower valves, etc.) “used exclusively for nonpotable services . . . where the water is not anticipated to be used for human consumption.”⁷ These new standards became effective on January 4, 2014.

Following the Flint Water Crisis, Congress passed the Water Infrastructure Improvements for the Nation Act (WIIN Act), which added new notification requirements to the SDWA.⁸ Importantly, the WIIN Act requires EPA to notify households when EPA receives drinking water data that indicates the affected household’s lead levels exceed EPA’s lead action levels.⁹

⁹Pub. L. No. 114-322, 130 Stat. 1628 (2016). This modification to Section 1414 of the SDWA

One lead-related focus of the WIIN Act is to provide assistance for low-income communities in reducing lead concentrations in drinking water. The Act accomplished this by instituting a grant program targeting all public water systems, but particularly “water for human consumption at a school, daycare, or other facility that primarily serves children or other vulnerable human subpopulation.”¹⁰ Section 2107 of the WIIN Act further required EPA to establish a testing program for lead in drinking water at schools. Additionally, the WIIN Act amended section 1442 of the SDWA, providing grants to tribes to meet SDWA requirements.¹¹

§ 18:13 Variances and Exemptions

The SDWA gives eligible states, tribes, and EPA the authority to provide variances and exemptions, which can help PWSs achieve MCL compliance.¹ Variances and exemptions provide legal safety valves for systems that cannot comply with the Primary Regulations. Variances and exemptions reach different factual circumstances, but both temporarily excuse noncompliance or delay obligations to comply with Primary Regulations—as long as certain conditions are met.²

Variances allow eligible systems to be noncompliant with a NPDWR if: (1) the system installs a given technology and; (2) the drinking water quality is protective of people’s health.³ Variances may be appropriate if the system’s intake water quality is so poor that it cannot comply with the MCL even after application of BAT.⁴ This BAT may or may not be the same BAT as specified in setting the MCL or treatment technique. EPA is to promulgate this BAT at the same time a Primary Regulation is established, but the Agency’s finding of BAT may vary for purposes of variances depending “on the number of persons served by the system or for other physical conditions related to engineering feasibility and costs of compliance with (MCLs) as . . . appropriate.”⁵ A state may allow a system not to install BAT as a condition of obtaining a variance if it can demonstrate that the BAT would only achieve a *de minimis* reduction of the contaminant of concern.⁶

Any time EPA promulgates an MCL or treatment technique, the 1996 Amendments require the Agency to list “variance technologies” for three classes of small water systems. These technologies, while not necessarily capable of achieving

requires CWS and NTNCWS to provide notice to the public as soon as practical, but no later than 24 hours after the system learns of the lead action level exceedance.

Variances are subject to various conditions; for example, variances and exemptions are not permitted under the Revised Total Coliform Rule.

²See Safe Drinking Water Act Amendments of 1996, Pub. L. No. 104-182, 110 Stat. 1613 (1996).

³*Variances and Exemptions*, *supra* note 1.

⁴SDWA § 1415(a)(1)(A), 42 U.S.C.A. § 300g-4(a)(1)(A). Variances from MCLs provide additional time for systems to investigate and implement alternative measures that lead to compliance. Variances are available from treatment techniques (except the filtration and disinfection requirements) where implementing the techniques is not necessary because raw water sources are clean. See SDWA § 1415(a)(1)(B), 42 U.S.C.A. § 300g-4(a)(1)(B).

⁵SDWA § 1415(a)(1)(A), 42 U.S.C.A. § 300g-4(a)(1)(A). This section of the statute does not contain the provisions of § 1412 restricting technology to field tested techniques or selecting granular activated carbon as a benchmark for synthetic organic chemicals.

⁶See, e.g., 40 C.F.R. § 142.62(a) to (c); 52 Fed. Reg. 25707-08 (July 8, 1987).

compliance with the MCL or treatment technique, must achieve the maximum affordable reductions considering the system size and the quality of the source water.⁷ The 1996 Amendments required EPA, beginning on August 6, 1998, to issue variance technologies for each pre-1996 Amendments drinking water regulation for which § 1415(e) small system variances may be granted.⁸ As a result of the 1996 Amendments, the system would also need to convince the state that alternative water supply sources are not available.⁹

Variances are to be accompanied by compliance schedules and, if appropriate, additional control measures.¹⁰ Before becoming effective, the variance must be the subject of public notice and opportunity for a public hearing. Significantly, the variance must not result in an unreasonable risk to health.¹¹ EPA is to regularly review variances issued by states.¹² If a state abuses its discretion by granting inappropriate variances in a substantial number of instances, EPA may revoke those variances after notice and public hearing.¹³

The 1996 Amendments added a special variance provision specifically for systems serving fewer than 10,000 persons. This provision, unlike the general variance provision, allows states to consider affordability as the basis for letting systems use variance technologies in lieu of complying with an MCL or treatment technique.¹⁴ EPA may, on its own or in response to a petition from a consumer,¹⁵ object to a state variance decision. Importantly, however, EPA determined that small system variances are unavailable for microbial contaminants, as affordable compliance technologies are available, and for any contaminant MCL promulgated prior to January 1, 1986.¹⁶

Exemptions apply under different circumstances. “Exemptions allow eligible systems additional time to achieve and maintain regulatory compliance with new NPDWRs.”¹⁷ Unlike variances, exemptions do not permit the violation of NPDWRs; instead, they permit the system more time to find a solution to achieve compliance.¹⁸

Exemptions are appropriate for systems that cannot comply with MCLs or treat-

⁷SDWA § 1412(b)(15)(A), 42 U.S.C.A. § 300g-1(b)(15)(A).

⁸SDWA § 1412(b)(15)(D), 42 U.S.C.A. § 300g-1(b)(15)(D). By practice to date, EPA has listed variance technologies only where affordable compliance technologies are not identified. “In 2006, EPA published a Federal Register notice to request comment on revisions to EPA’s national affordability methodology for small drinking water systems and a methodology for determining if an affordable variance technology is protective of public health. The proposal described a number of options for revising the affordability methodology for public review and comment.” See EPA, *Small Drinking Water System Variances*, <https://www.epa.gov/sdwa/small-drinking-water-system-variances> (last visited July 21, 2020).

¹⁸*Variances and Exemptions*, available at [https://www.epa.gov/dwreginfo/variances-and-exemption-s#:~:text=The%20Safe%20Drinking%20Water%20Act,maximum%20contaminant%20levels%20\(MCLs\).](https://www.epa.gov/dwreginfo/variances-and-exemption-s#:~:text=The%20Safe%20Drinking%20Water%20Act,maximum%20contaminant%20levels%20(MCLs).)

ment techniques “due to compelling factors (which may include economic factors, including qualification of the public water system as a system serving a disadvantaged community).”¹⁹ The possibility of case-by-case examination of economic factors for other than small systems is one major difference between variances and exemptions.

However, variances and exemptions have several similarities. Exemptions must be accompanied by compliance schedules and, if appropriate, control measures.²⁰ Exemptions are to be the subject of notice and opportunity for a public hearing and may not result in unreasonable risks to health.²¹ In addition, EPA must periodically examine exemptions and may revoke them where appropriate.²²

Exemptions are effective for three years from the original compliance date. A three-year extension is available only if the system establishes that it needs capital or financial assistance or is joining other systems and is taking “all practicable steps” to meet the standard.²³ Systems serving no more than 3,300 persons are eligible for one or more two-year extensions, but not to exceed six years.²⁴ These extensions are available only to systems that require financial assistance for necessary improvements and are taking all practicable steps to meet the standard.²⁵ EPA issued regulations implementing the variance and exemption provisions in the 1996 Amendments.²⁶

§ 18:14 National Secondary Drinking Water Regulations

Secondary regulations address “public welfare” concerns, including taste, appearance, and odor. Contaminants governed by the Secondary regulations are generally the most readily noticed by consumers when they appear and are usually attended to quickly by water system operators when complaints are registered. Certainly, water that smells like rotten eggs due to the presence of hydrogen sulfide is hard to ignore and complaints are to be expected. However, the great public attention paid to these concerns should not overshadow concerns for compliance with the Primary Regulations, given that secondary contaminants are not expected to pose adverse health effects.

Secondary regulations contain MCLs, which EPA believes protect public welfare.¹ Secondary regulations may apply to any drinking water contaminant that may: (1) adversely affect the odor or appearance of water and cause a substantial number of consumers to use other sources; or (2) otherwise adversely affect public welfare.² Aesthetics are therefore, by statute, an aspect of public welfare.

¹⁹SDWA § 1416(a), 42 U.S.C.A. § 300g-5(a). To qualify, the system also must have been in operation on the effective date of the Primary Regulation or not have a reasonable alternative source of drinking water.

²⁰SDWA § 1416(b)(1), 42 U.S.C.A. § 300g-5(b)(1).

²¹SDWA § 1416(a)(3), 42 U.S.C.A. § 300g-5(a)(3).

²²SDWA § 1416(d), 42 U.S.C.A. § 300g-5(d).

²³SDWA § 1416(b)(2), 42 U.S.C.A. § 300g-5(b)(2).

²⁴SDWA § 1416(b)(2)(c), 42 U.S.C.A. § 300g-5(b)(2)(c).

²⁵SDWA § 1416(b)(2)(C), 42 U.S.C.A. § 300g-5(b)(2)(C). The statute provides “taking all practicable steps to meet the requirements of subparagraph (B).” It is unclear whether the system has to reestablish its entitlement to exemption under subparagraph (B) (e.g., showing of need for financial assistance) or merely that it is taking “all practicable steps” to meet the standard. SDWA § 1416(b)(2)(B) to (C), 42 U.S.C.A. § 300g-5(b)(2)(B) to (C).

²⁶63 Fed. Reg. 43833 (Aug. 14, 1998).

[Section 18:14]

¹SDWA § 1401(2), 42 U.S.C.A. § 300f(2).

²SDWA § 1401(2), 42 U.S.C.A. § 300f(2). Such regulations may vary according to geographic and

EPA has established secondary regulations for a variety of public welfare effects, including odor, color, foaming, and corrosivity.³ Without question, the most controversial secondary contaminant is fluoride. Although fluoride at lower levels helps protect against cavities, fluoride is regulated under the secondary regulations for its public welfare effect of mottling and pitting teeth in some children when fluoride is present at high levels.⁴ This decision was controversial in part because, in 1975, EPA regulated fluoride under the primary regulations, believing mottling to be an adverse health effect.⁵ Because fluoride mottling apparently does not impair the function of teeth, EPA set a primary regulation to protect against crippling skeletal fluorosis and reclassified the mottling effect as detrimental to public welfare, a decision that has been upheld by the D.C. Circuit.⁶ Fluoride is also unique because it is the only contaminant that is subject to public notification requirements if the secondary MCL is exceeded.⁷ Because it poses both adverse health effects and adverse public welfare effects, fluoride is thus regulated under both primary and secondary regulations.⁸

Although the secondary MCLs are not federally enforceable, systems may be compelled to meet secondary standards for contaminants as a matter of state law.⁹ In any event, the SDWA requires EPA to notify states whenever EPA finds that systems do not comply with the secondary regulations due to failed state efforts to take “reasonable action” to assure compliance.¹⁰ Obviously, this is no sword of Damocles hanging over states, but the statute does not contemplate one. As both the statute and EPA recognize, enforcement of the primary regulations is a higher priority.¹¹

IV. PUBLIC NOTIFICATION AND MONITORING, REPORTING, AND RECORDKEEPING

other circumstances.

³See 40 C.F.R. § 143.3. These regulations were promulgated in 1979. 44 Fed. Reg. 42195 (July 19, 1979).

⁴40 C.F.R. § 143.3. The secondary MCL is 2.0 milligrams per liter (mg/l). See 51 Fed. Reg. 11396, 11401 (Apr. 2, 1986).

⁵See 40 Fed. Reg. 59566 (Dec. 24, 1975). This decision was upheld in *Environmental Defense Fund, Inc. v. Costle*, 578 F.2d 337, 347 n.35, 11 Env’t. Rep. Cas. (BNA) 1209, 8 Env’tl. L. Rep. 20200 (D.C. Cir. 1978). However, the court also noted that there was a “serious question” whether mottling could be regulated as an adverse health effect.

⁶*Natural Resources Defense Council, Inc. v. E.P.A.*, 812 F.2d 721, 25 Env’t. Rep. Cas. (BNA) 1681, 17 Env’tl. L. Rep. 20418 (D.C. Cir. 1987).

⁷40 C.F.R. § 143.5. The regulation requires water systems serving water with more than 2.0 mg/l fluoride to issue a public notice with specific language explaining the effects of fluoride. EPA has cited SDWA §§ 1445(a) and 1450 as supporting these notification requirements. See 51 Fed. Reg. 11403 (Apr. 2, 1986).

⁸The legislative history expressly endorses this regulatory approach if statutory criteria are met. H.R. Rep. No. 1153, 93d Cong., 2d Sess. 16 (1974).

⁹Some states have treated secondary MCLs as primary MCLs.

¹⁰SDWA § 1414(d), 42 U.S.C.A. § 300g-3(d). “EPA does not propose to use its resources on a routine basis to independently determine compliance. . . . It will however, review data which may be reported by the states on a discretionary basis or which is received incidental to other studies. On the basis of such review, the agency will consult with the States.” 44 Fed. Reg. 42196 (July 19, 1979).

¹¹SDWA § 1414(d), 42 U.S.C.A. § 300g-3(d); 44 Fed. Reg. 42196 (July 19, 1979).

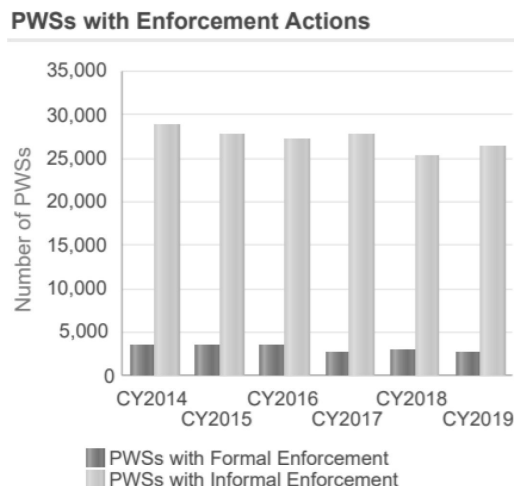

Photo of Pyramid Island taken by A. Driggs on June 9, 2017.

§ 18:15 Public Notification of Violations

The SDWA was the first federal environmental statute to require direct public notification of compliance status. Today, although many statutes require monitoring information to be reported to government officials, only a few require that the general public be educated or alerted.¹ EPA has an information dashboard that “provides an easy-to-use summary of key activities to answer questions like: which PWS are regulated, how many PWSs have been inspected, how many systems have had alleged violations identified and enforcement action taken, and how many systems have returned to compliance.”²

Figure 3.³

The framers of the 1974 Act had lofty goals: “[P]ublic education is deemed essential . . . to develop public awareness of the problems facing public water systems, to encourage a willingness to support greater expenditure . . . to assist in solving these problems, and to advise the public of potential or actual health hazards.”⁴ EPA was given some flexibility to determine the frequency, form, and manner of notification. The statute originally underlined the seriousness of this notice by providing criminal fines for violation of the public notification requirements.⁵

Although the public today is more aware of the importance of safe drinking water and the threats to it, it is hard to ascribe this result to the SDWA public notification requirements. Systems that are likely to ignore monitoring or MCL regulations are less likely to notify the public, and if they have not been monitoring, are less likely to have data to report that indicates an MCL exceedance. Past rules allowed systems

[Section 18:15]

¹As statutes have been amended over the last 15 years, they have been increasingly concerned with opportunities for public education and public involvement. Although some statutes, like the Emergency Planning and Community Right-To-Know Act, 42 U.S.C.A. §§ 11001 to 11050, put more information in the hands of the public, the SDWA public notification provisions are more dramatic, because “violations” of health regulations are being reported directly to consumers.

²Analyze Trends: Drinking Water Dashboard, available at <https://echo.epa.gov/trends/comparative-maps-dashboards/drinking-water-dashboard?yearview=CY&view=activity&criteria=basic&state=National>.

³Data available at <https://echo.epa.gov/trends/comparative-maps-dashboards/drinking-water-dashboard?view=activity&state=National&yearview=CY&criteria=basic>.

⁴H.R. Rep. No. 1153, 93d Cong., 2d Sess 24 (1974).

⁵Original SDWA § 1414(c), 42 U.S.C.A. § 300g-3(c), amended by Pub. L. No. 95-190, § 12(b), 91 Stat. 1398 (1977).

up to three months to report a violation, left it to the system to explain the violation, required notice even for corrected violations, and imposed the same notification requirements for monitoring violations as Primary Regulations violations.⁶ Under these former rules, some systems delayed issuing important notices, and in some cases, notices were confusing and did not explain the violation.

The amended statutory provisions and new rules specify detailed notification requirements applicable to community and noncommunity water systems. Those requirements, which vary depending on the circumstances, include both timing and substantive provisions.⁷

Beginning on January 1, 1998, and annually thereafter, each state was required to prepare and make available to the public a report listing virtually every SDWA violation of which it is aware.⁸ In addition, EPA published regulations, as required by the 1996 Amendments,⁹ requiring each community water supplier to issue an annual “consumer confidence report.”¹⁰ Those reports are intended to provide the public with specific information about the water they are consuming and any associated risks.

Public notice is likely to alert those in the community sensitive to health and environmental issues. Public notification may also achieve the statutory goals of developing an awareness of problems facing public water systems and encouraging expenditures for water system improvements.¹¹

§ 18:16 Monitoring, Reporting, and Recordkeeping

EPA is authorized to require monitoring, reporting, and recordkeeping by public water systems.¹ EPA’s authority may be directed to public water systems and persons (including individuals) who own or operate public water systems. EPA has relied on its monitoring, reporting, and recordkeeping authority to require systems to begin the monitoring required to determine whether treatment will be necessary to comply with MCLs with a future effective date.² Under this authority, EPA may require monitoring, reporting, and recordkeeping as reasonably necessary to determine compliance, assist in establishing regulations, administer financial assistance programs, evaluate health risks of unregulated contaminants, or advise the public of health risks. Although this authority is broad, it may only be invoked by rulemaking.³ Under the 1996 Amendments, the states are authorized to provide relief from EPA’s general monitoring requirements.⁴ The analytical test methods required for all monitoring activities are prescribed in the rules.⁵

Monitoring for unregulated drinking water contaminants is the subject of ad-

ditional provisions in the statute and the regulations. The SDWA directs EPA to promulgate regulations that require public water systems to monitor for “unregulated contaminants.”⁶ The purpose here is preventative: By identifying contaminants early on, water systems and EPA may take appropriate action to protect public health. EPA has promulgated regulations requiring monitoring for numerous contaminants and allowing states discretion to require monitoring for additional ones.⁷ Congress has since amended those requirements: EPA was required, by August 6, 1996,⁸ and every five years thereafter, to issue a list of up to 30 unregulated contaminants to be monitored by public water systems. Consistent with the Act’s emphasis on public notification, systems are required to provide customers with the results of this monitoring.⁹

The Unregulated Contaminant Monitoring Rule (UCMR) is the main tool EPA leverages to collect data on the occurrence of unregulated contaminants in PWSs.¹⁰ EPA published the lists and requirements for the First Unregulated Contaminant Monitoring Rule on September 17, 1999.¹¹ The Second Unregulated Contaminant Monitoring Rule was published on January 4, 2007, under which monitoring was conducted mostly from 2008-10.¹² The Third Unregulated Contaminant Monitoring Rule was published on May 2, 2012, and the monitoring was primarily conducted from 2013-15.¹³ The Fourth Unregulated Contaminant Monitoring Rule was published on December 20, 2016, and the monitoring took place between 2018-2020.¹⁴

§ 18:17 In General

Before the 1970s, few states had adopted standards for drinking water quality. Even fewer states had in place a regulatory program with enforcement capability. A 1971 review of state drinking water standards revealed that only 14 states had adopted the minimal U.S. Public Health Service Drinking Water Standards.¹ A 1970 survey by the Conference of State Sanitary Engineers judged state inspection programs deficient.²

Despite the limited state commitment obvious at the time, Congress remained hopeful that states would “take the lead” in adopting standards and compliance strategies, and in bringing enforcement actions.³ To this end, the SDWA authorizes states to assume “primary enforcement responsibility” (primacy) if they adopt the minimum drinking water program specified by the statute.⁴ At least if measured by the large number of jurisdictions that have assumed primacy, Congress’ desire for state participation has been fulfilled. Currently, 55 of 57 jurisdictions (states, territories, and tribal support programs) have been granted primacy.⁵

To assume primacy, states must establish that their program meets specified criteria.⁶ Under the Act, these criteria include adopting standards at least as stringent as the National Primary Drinking Water Regulations; procedures for the enforcement of these standards; recordkeeping and reporting to EPA; plans for emergency provisions of drinking water; and requiring that variances and exemptions be no less stringent than EPA’s.⁷ Clearly, state regulation may be more stringent. EPA regulations elaborate on these criteria by spelling out in more detail the authorities and administrative programs that states must adopt.⁸ Beyond requirements for injunctive authority, penalties, and reporting to EPA, states are also required to adopt public notification requirements that are at least as stringent as those set by EPA.⁹ Congress expected EPA to exercise “utmost care” in reviewing state primacy applications and to deny such applications only upon a “clear failure” by states to meet primacy requirements.¹⁰

Federal agencies and Indian tribes are also addressed under the Act. Federal facilities are expressly subject to state drinking water authorities, and they are even liable for penalties.¹¹ Under the 1986 Amendments, EPA was to publish regulations specifying whether and when Indian tribes may be treated as states and assume primacy.¹²

[Section 18:17]

¹See H.R. Rep. No. 93-1185, at 6–7 (1974). These standards, adopted in 1962, primarily addressed contaminants posing acute risks.

¹²SDWA § 1451, 42 U.S.C.A. § 300j-11. The Navajo Nation is the only Tribe that has been granted

Once primacy is granted, state drinking water programs are subject to federal oversight. Generally, EPA and the state enter into an agreement specifying the obligations the state must fulfill and EPA provides a sum of money to support the state program. EPA also may review state-issued variances and exemptions,¹³ take enforcement action where states do not,¹⁴ and if necessary, terminate primacy.¹⁵ Indeed, EPA has an obligation to periodically review whether states meet primacy requirements or have issued variances and exemptions that are less stringent.¹⁶ State variances have not always met with EPA's approval.¹⁷

Where states are not able to update their regulations in a timely fashion, the federal regulations still apply. EPA takes the position that the Primary Regulations are federally enforceable in states with primacy.¹⁸ Of course, EPA encourages states to adopt such requirements expeditiously so that there is no "split" primacy.¹⁹ Since the overwhelming majority of eligible jurisdictions have primacy, they conduct most of the enforcement against violations, and maintain active enforcement programs. A 1999 EPA study found that "MCL exceedances are not common" and that volatile organic chemicals and synthetic organic chemicals are the cause of most of those exceedances.²⁰ States have been more vigorously enforcing their laws.²¹

Under the 1986 Amendments, all states were subjected to new duties to minimize lead in drinking water.²² These duties were not tied to primacy; thus, states that do not enforce the requirements do not risk losing primacy. The SDWA's lead provisions, other than those addressing treatment techniques, are not tied to primacy either, but states failing to comply do risk the loss of grant funds. In particular, the

primary regulatory authority. 65 Fed. Reg. 66541 (Nov. 6, 2000).

¹⁷A dispute arose between EPA and several states in the late 1970s over the proper use of variances. Several states had issued variances that did not require use of best generally available technology, and the Agency proposed a rule to clarify that the variance authority did not allow such variances. 45 Fed. Reg. 50833 (1980). Faced with this resolve, the offending states ceased their practices. In 1986, EPA formally revoked variances with these same defects issued by another state when the state did not rescind them. 51 Fed. Reg. 23468 (1986). This process followed the notice-and-comment procedure outlined in SDWA § 1415(a)(1)(G), 42 U.S.C.A. § 300g-4(a)(1)(G), and in 40 C.F.R. § 142.23. More recently, EPA and New York City and New York State jostled for several years on how to protect New York City's water supply, which affected EPA decisions on the state's primacy and spawned an unsuccessful lawsuit by several New York towns. *See Coalition of Watershed Towns v. U.S. E.P.A.*, 552 F.3d 216, 68 Env't. Rep. Cas. (BNA) 1625 (2d Cir. 2008) (towns' injury was not redressable).

²¹As penalties and enforcement have increased, defendants have advanced more fundamental objections with varying degrees of success. *See, e.g., Meadowlake Corp. v. Ohio ex rel. Rogers*, 555 U.S. 1098, 129 S. Ct. 899, 173 L. Ed. 2d 107 (2009) (declining to review 8th Amendment claim of excessive fines and 6th Amendment claim of entitlement to counsel).

²²In later amendments, Congress established a program for: (1) recalling drinking water coolers with lead-lined water reservoir tanks; (2) banning the sale of all drinking water coolers that were not lead-free; and (3) identifying lead problems in schools. The Lead Contamination Control Act of 1988, Pub. L. No. 100-572 (Oct. 31, 1988).

law prohibits the general use and distribution of lead pipe, solder, and flux.²³ States are to enforce this prohibition or risk loss of up to 5% of the annual federal grant that they receive for administering an EPA-approved drinking water program.²⁴ It is safe to say that state drinking water programs have not been generously funded, yet they are called on to adopt a large number of new regulations, more comprehensively regulate the non-transient non-community water systems, adopt new enforcement programs for lead, and step up enforcement efforts.²⁵ Because so many states have primacy, those interested in the implementation of these new drinking water responsibilities will scrutinize state efforts closely.

VI. FEDERAL AND CITIZEN ENFORCEMENT

Photo of Multnomah Falls taken by A. Driggs on August 24, 2019.

§ 18:18 Federal Enforcement—Enforcement of Primary Regulations, Variances, and Exemptions

Anticipating that states might not be willing or able to address all violations of drinking water requirements, the SDWA empowers EPA to enforce Primary Regulations when states do not. Similarly, conditions of variances and exemptions may be enforced by the federal government against non-complying systems when states do not enforce them.¹ Of course, the federal government also has the primary responsibility of enforcing drinking water requirements in Wyoming and in Washington, D.C., as well as on most Indian reservations that do not have primary enforcement authority.² These federal enforcement powers were substantially expanded by the 1986 Amendments, which streamlined enforcement, raised penal-

ties, and established a new administrative order authority. In 1996, Congress required States to adopt administrative order authority as well and mandated States to report on their enforcement activities in an annual report to EPA.³

§ 18:19 Federal Enforcement—Enforcement of Primary Regulations, Variances, and Exemptions—Finding a Violation

Where a state has primacy, EPA retains a backup enforcement role. If, after reviewing a state report, EPA (the Regional Office) finds that a system does not comply with a Primary Regulation or a variance or exemption condition, EPA is to notify the state and the water system and provide “advice and technical assistance” to bring the system into compliance.¹ If, after 30 days following notification, the state has not “commenced appropriate enforcement action,” the statute provides that EPA “shall” issue an order requiring compliance or commence a civil action.² The 1986 amendments adopted the mandatory term “shall” in this provision in place of the permissive term “may.”³

Exercise of this enforcement authority raises several questions. What “finding” of a violation will trigger the process and what violators are likely to attract EPA’s interest? What is “appropriate” state enforcement action that will avoid federal enforcement? Is EPA required to take enforcement action after the statutory procedures have been satisfied?

Under the Act, enforcement provisions are triggered whenever EPA “finds” a violation.⁴ In many cases, EPA will have knowledge of violations. Violations must be reported to the appropriate state, which in turn must report these violations and state enforcement actions (or lack thereof) to the Agency.⁵ However, a question arises whether EPA has the discretion to select the violations of which it is aware for a “finding.” Nothing in the SDWA or legislative history suggests that EPA must make a finding for every violation it discovers. The 1996 Amendments prescribe procedures for EPA enforcement in non-primacy jurisdictions.⁶ What violations are likely to attract EPA attention? EPA generally enters into enforcement agreements with primacy states that detail how and when states are to take enforcement action and when EPA will step in to enforce. EPA specifies in these agreements that a “timely and appropriate enforcement response” is to be taken against “significant

³SDWA § 1413(a)(6), 42 U.S.C.A. § 300g-2(a)(6) (primacy state requirement to have administrative penalty authority); SDWA 1414(c)(3), 42 U.S.C.A. § 300g-3(c)(3) (annual state enforcement reports).

[Section 18:19]

¹Monitoring errors might incorrectly indicate a violation, particularly for contaminants measured at low levels. The legislative history provides that if water systems can provide proof that readings in excess of regulations were due to such error, the system would be excused (at least from the public notification requirement). H.R. Rep. No. 93-1185, at 24 (1974).

²SDWA § 1414(a)(1)(B), 42 U.S.C.A. § 300g-3(a)(1)(B). This process replaced a more extensive procedure that required an additional notice to the state, a state report, a total of 60 days before EPA could take action and, in some cases, a finding that the state had abused its discretion. *See* former SDWA § 1414(a)(1)(B), 42 U.S.C.A. § 300g-3(a)(1)(B), Pub. L. No. 93-523, § 2(a), 88 Stat. 1666. This procedure was generally faulted as cumbersome and one reason why EPA had not taken a significant number of enforcement actions.

³Pub. L. No. 99-339, § 102(b), 100 Stat. 647 (amending SDWA § 1414(a)(1)(B), 42 U.S.C.A. § 300g-3(a)(1)(B)).

⁴SDWA §§ 1414(a)(1)(A) to (B), 1423(a)(1) to (2), 42 U.S.C.A. §§ 300g-3(a)(1)(A) to (B), 300h-2(a)(1) to (2).

⁵40 C.F.R. §§ 141.31, 142.15.

⁶SDWA § 1414(a)(2), 42 U.S.C.A. § 300g-3(a)(2).

non-compliers.”⁷ So far, significant non-compliance has included serious and continuous violations of most MCLs and their respective monitoring and reporting requirements and violations of compliance agreements or compliance schedules (such as the schedules that commonly accompany variances and exemptions).⁸ As a result of the 1996 Amendments, violations are more visible and, thus, more likely to be evaluated for enforcement purposes. For example, no later than August 6, 1997, each state was required to submit to EPA a list of CWSs and NTNCWSs that have a history of significant noncompliance, as defined by EPA.⁹ States must update their lists periodically. By August 6, 2001, each state had to submit to EPA a report on how enforcement mechanisms and other actions have succeeded in improving conditions at water systems on the list.¹⁰ The list and report are part of the capacity development strategy required of each state under penalty of the loss of significant federal loan funds. Each state must develop and implement its strategy to assist public water system to acquire and maintain technical, managerial, and financial capacity.

EPA regards state action as “timely” if it results in formal enforcement action or a compliance agreement within six months of the state’s discovery, depending on the type of violation.¹¹ “Appropriate” state enforcement action, according to EPA, includes issuance of an administrative order, a civil or criminal action, or an enforceable agreement with a compliance schedule signed by both parties.¹²

The question of whether EPA has a mandatory duty to issue an order or commence civil action after these initial hurdles have been cleared is currently unanswered. The change from “may” to “shall” in the enforcement provision and supporting legislative history may provide grounds to argue that the Agency is now subject to mandatory enforcement.¹³ However, given the general preference of the courts to preserve agency enforcement discretion and precedents set under related environmental statutes, a counter-argument can be advanced.

⁷Memorandum from Michael B. Cook, Director of the U.S. EPA Office of Drinking Water, to EPA Water Management Division Directors (May 22, 1990).

⁸Memorandum from Michael B. Cook, Director of the U.S. EPA Office of Drinking Water, to EPA Water Management Division Directors (May 22, 1990).

⁹SDWA § 1420(b), 42 U.S.C.A. § 300g-9(b).

¹⁰SDWA § 1420(b)(2), 42 U.S.C.A. § 300g-9(b)(2).

¹¹Memorandum from Michael B. Cook, Director of the U.S. EPA Office of Drinking Water, to EPA Water Management Division Directors, 4 (May 22, 1990). Of course, actual compliance may take a longer period if compliance requires installation of additional treatment technologies. Compliance may be delayed if the system does not report its violation to the state or if the state does not identify the violation quickly.

¹²Memorandum from Michael B. Cook, Director of the U.S. EPA Office of Drinking Water, to EPA Water Management Division Directors, 4 (May 22, 1990). For relatively minor violators, one could argue that formal enforcement is not appropriate given other, higher priority violations and limited state resources.

¹³See H.R. Rep. No. 575, 99th Cong., 2d Sess. (1986). The prior provision, stating that EPA “may” commence enforcement action, was held to vest absolute prosecutorial discretion on when to seek compliance with primacy drinking water regulations. *Hattie v. Thomas*, 22 Env’t. Rep. Cas. (BNA) 1728 (N.D. Ohio 1985). One could make an argument that under *Heckler v. Chaney*, 470 U.S. 821, 833, 105 S. Ct. 1649, 84 L. Ed. 2d 714, 15 Env’t. L. Rep. 20335 (1985), the presumption against reviewability of enforcement decisions has been rebutted by “circumscribing (the) agency’s power to discriminate among issues or cases it will pursue.” However, in signing the Amendments, the President stated: “The principal [sic] of prosecutorial discretion is an essential ingredient in the execution of the laws. I believe that the Congress cannot bind the Executive in advance and remove all prosecutorial discretion without infringing on the powers of the Executive. It is unrealistic to expect that the EPA will ever have the resources or the need to take formal enforcement action against each and every violation of the Act, without regard to how trivial the violation or unfair an enforcement action would be.” 22 Weekly Comp. Pres. Doc. 832 (June 19, 1986).

§ 18:20 Federal Enforcement—Enforcement of Primary Regulations, Variances, and Exemptions—Commencing a Civil Action or Issuing a Compliance Order

Once EPA decides to bring an enforcement action, it may either commence a civil action or issue a compliance order.¹ If the Agency decides to proceed in U.S. district court, it may call on the court's equitable powers for "such judgment as protection of public health may require," taking into consideration the time necessary to comply and the availability of alternative water supplies.² Injunctive relief is clearly authorized.³ The legislative history states that courts considering remedies in these enforcement actions are not to apply traditional balancing principles used by equity courts. Rather, legislative history directs courts to give utmost weight to the objective of providing maximum feasible protection to public health.⁴

Are courts empowered to close public water systems to protect public health? Although it appears that Congress may have wished courts to have this power, it is equally clear that Congress did not want to deprive consumers of drinking water.⁵ Closing down a water supply system may be a case of killing the patient to effect a cure. In many cases, more limited remedies—such as a temporary requirement that citizens boil water or that the system supply bottled water—provide interim solutions, allowing the water system time to implement a long-term remedy.

EPA may seek civil penalties for violations of Primary Regulations, taking into account the seriousness of the violation, the population at risk, and other appropriate factors.⁶ This maximum penalty amount has been substantially increased since the original Act. Revisions to the penalty authority have also removed a major evidentiary burden for federal prosecutors: prior to the 1986 Amendments, only willful violations were subject to penalties.⁷ Although the government may now seek penalties in a wider variety of cases, enforcement resources and the new opportunity to

⁴H.R. Rep. No. 93-1185, at 23 (1974). This language in the legislative history, specifying maximum "feasible" protection for public health, suggests a balancing of public health concerns and feasibility, contrary to the general desire stated in the legislative history that balancing principles not apply.

⁵"Although requiring prompt compliance by some small outdated systems may in effect force the closing thereof, such a court order would be both permissible and warranted if an expansion of existing regional water service or other state or local assistance would be provided to assure the availability of adequate and safe drinking water supplies to those presently serviced." H.R. Rep. No. 93-1185, at 23-24. And, "[i]t is not the Committee's intent to cause any area to be deprived of existing drinking water supply services." *Id.* at 18.

⁶SDWA § 1414(b), 42 U.S.C.A. § 300g-3(b). *See Alder Creek*, 823 F.2d at 343 (water company found liable for damage resulting from removal of agency-installed monitoring device); *United States v. Neskowin*, 10 Env'tl. L. Rep. (Env'tl. L. Inst.) 20622 (D. Or. 1980) (findings of willfulness in violations and imposing penalties for MCL, monitoring, and public notification violations); *United States v. Tenny*, 14 Env'tl. L. Rep. (Env'tl. L. Inst.) 20094 (M.D. Pa. 1983) (defendants ordered to comply with the Act and to take specific actions). Other actions have sought civil penalties and compliance orders and imposed penalties on water company presidents personally. *See United States v. Paxton Water Corp.*, No. 86-101-C (S.D. consent decree filed 1-15-87); *see also United States v. Merritt Mobile Manors*, No. C86-0207 (D. Wyo. consent decree filed 2-26-87).

⁷*See former section 1414(b)*, 42 U.S.C.A. § 300g-3(b), Pub. L. No. 93-523, § 2(a), 88 Stat. 1666 (1974). EPA has sought penalties. For example, under a 2008 settlement, New York City would build a

issue administrative compliance orders will likely limit civil actions to the more egregious violations.⁸

§ 18:21 Federal Enforcement—Enforcement of Primary Regulations, Variances, and Exemptions—Administrative Compliance Orders and Administrative Penalties

EPA may choose to issue an order to require compliance.¹ These administrative orders may not initially assess penalties for violations. The orders are true “compliance orders,” directing the respondent water system to comply with an applicable requirement.² EPA must provide the system with notice and an opportunity for a public hearing on the order and offer the primacy state the opportunity to confer on the order.³ If an order is violated, EPA may, through a second administrative order, assess administrative penalties.⁴ EPA is also authorized to issue administrative penalty orders against any federal agency that violates the SDWA.⁵ Penalty proceedings are generally formal hearings on the record. Water suppliers may challenge penalty orders in federal circuit court.⁶ The orders will be struck down and remanded back to EPA if the court finds either a lack of substantial evidence in the record to support the finding of violation or that the penalty EPA has assessed is an abuse of discretion.

As an alternative to taking administrative action, EPA may seek civil penalties in U.S. district court for violations of the SDWA or administrative orders.⁷ EPA expects this administrative authority to be a cornerstone of the Agency’s expanded enforcement efforts.⁸ As a result of the 1996 Amendments, states generally must have authority to issue administrative penalty orders as a condition of primacy.⁹

§ 18:22 Federal Enforcement—Public Notification and Monitoring Requirements

In addition to enforcing against violations of the Primary Regulations and condi-

filtration system, pay civil penalties and undertake a supplemental environmental project valued at approximately half a million dollars. *United States v. Middletown*, No. 08-6369 (S.D.N.Y. consent decree approved Sept. 5, 2008).

⁸*See, e.g.*, *U.S. v. Alisal Water Corp.*, 431 F.3d 643, 62 Env’t. Rep. Cas. (BNA) 1009 (9th Cir. 2005). In *Alisal*, EPA brought a civil suit alleging twelve counts of multiple SDWA violations. The counts included allegations of failure to monitor, sample, provide adequate notice, or report as well as counts alleging falsified reports. In all, EPA alleged that the system had over 230 violations.

[Section 18:21]

¹Administrative orders may be issued whenever EPA is authorized to proceed against a violator in court. SDWA § 1414(g)(1), 42 U.S.C.A. § 300g-3(g)(1). EPA has used this tool to enforce a specific standard in states with primacy, where a state may not yet have obtained authority to enforce that standard. For example, EPA used orders to enforce the arsenic standard against 11 systems in California before the state regulations had been revised. *See* BNA Daily Environment Report, Oct. 29, 2008, “EPA Orders California Water Systems to cut Arsenic Levels in Drinking Water.”

²SDWA § 1414(g)(3), 42 U.S.C.A. § 300g-3(g)(3); 63 Fed. Reg. 48076 (Sept. 8, 1998).

³SDWA § 1414(g)(2), 42 U.S.C.A. § 300g-3(g)(2).

⁴40 C.F.R. § 19.4. The Federal Civil Penalties Inflation Adjustment Act of 1990 requires EPA to, every four years, revise the penalty amounts available under federal environmental statutes, including the SDWA. For the current penalty amounts, *see* 40 C.F.R. Pt. 19, Table 1 of Section 19.4.

⁵SDWA § 1447(b), 42 U.S.C.A. § 300j-6(b).

⁷SDWA § 1448(a), 42 U.S.C.A. § 300j-7(a). *See also* SDWA § 1414(g)(3), 42 U.S.C.A. § 300g-3(g)(3); 40 C.F.R. § 19.4.

⁸EPA Journal, Mar. 1987, at 2 (Glenn Unterberger, U.S. EPA Associate Counsel for Water Enforcement).

⁹SDWA § 1413(a), 42 U.S.C.A. § 300g-2(a).

tions of variances and exemptions, the federal government is authorized to enforce all other applicable requirements,¹ such as public notification and monitoring requirements.² Violators of public notification and monitoring requirements are subject to civil penalties and compliance order authority.³ Because civil penalty actions demand more extensive preparation, EPA might use administrative orders to address these violations.

§ 18:23 Federal Enforcement—Emergency Powers and Tampering¹

The SDWA provides EPA with broad powers to protect against threats to public water systems and their water supplies beyond the MCL, variance, and exemption authorities. The Act allows the Administrator to take such actions as deemed necessary to protect health if: (1) the Administrator has information that a contaminant is present in or likely to enter a public water system or an underground source of drinking water; (2) the presence of the contaminant may present an imminent and substantial endangerment to health; and (3) appropriate state and local officials have not acted to protect health.²

EPA may issue orders to protect the health of persons who are or may be water consumers or may commence a civil action for appropriate relief (including a restraining order or permanent or temporary injunction).³ The statute is clear that the Administrator is not limited to these remedies.⁴ Violation of such emergency orders for any reason is subject to civil penalties.⁵

“Imminence” of the danger is to be measured in view of the time it would take to prepare legal papers, complete litigation, and enforce administrative or court orders to protect health.⁶ The legislative history provides examples of “substantial” endangerment. They include a “substantial likelihood” that contaminants “capable of causing adverse health effects” will be ingested by consumers if preventive action is not taken, and “the threat of substantial or serious harm (such as exposure to carcinogenic agents or other hazardous contaminants).”⁷

The fact that it is not used frequently suggests that EPA intends to reserve this

[Section 18:22]

²SDWA §§ 1414(c), 1445(c), 42 U.S.C.A. §§ 300g-3(c), 300j-4(c).

³SDWA §§ 1414(c), 1445(c), 42 U.S.C.A. §§ 300g-3(c), 300j-4(c), 40 C.F.R. § 19.4 (allowing assessment of civil penalties for public notification and monitoring violations, respectively). SDWA § 1414(g)(1), 42 U.S.C.A. § 300g-3(g)(1), authorizes EPA to issue orders in any case in which it is authorized to bring a civil action for public notification and monitoring violations.

[Section 18:23]

¹Under SDWA’s emergency powers, EPA “may take such actions as [the Administrator] may deem necessary” to protect human health when a contaminant in a water system “may present an imminent and substantial endangerment to the health of persons” and state and local authorities have not acted. EPA used this authority under section 1431 to issue its emergency order during the Flint crisis. *See* SDWA § 1431, 42 U.S.C.A. § 300i.

²SDWA § 1431(a), 42 U.S.C.A. § 300i(a). To the extent the Administrator determines it to be practicable in light of the imminent endangerment, the Administrator is to consult state and local authority to confirm the information and ascertain what actions they may be taking. If state or local efforts are not forthcoming in a timely fashion or are not effective, EPA is not barred from taking action. H.R. Rep. No. 1153, 93d Cong., 2d Sess. 35 (1974).

³SDWA § 1431(a), 42 U.S.C.A. § 300i(a).

⁴SDWA § 1431(a), 42 U.S.C.A. § 300i(a).

⁵SDWA § 1431(b), 42 U.S.C.A. § 300i(b); 40 C.F.R. § 19.4 (2009).

⁶H.R. Rep. No. 1153, 93d Cong., 2d Sess. 36 (1974).

⁷H.R. Rep. No. 1153, 93d Cong., 2d Sess. 36 (1974). “[I]t is well established from the legislative history and case law that SDWA confers on the EPA broad authority to address present and future

power to prevent “real” imminent harm (possibly because most threats to health are generally deemed to be under control). Indeed, there is support for the view that this authority should not be used when the system of regulatory controls could be used to protect public health.⁸ Where the jurisdictional requirements are met, emergency orders may be enforced notwithstanding the existence of any exemption, variance, permit, license, regulations, order, or other requirement.⁹ The law does not restrict who may be subject to these emergency orders, but the legislative history states that the orders may be issued to anyone whose “action or inaction requires prompt regulation to protect public health.”¹⁰ The objects of the order may be as broad as the subjects to whom it is issued. The Administrator may “take such actions as he may deem necessary in order to protect the health of such persons.”¹¹ Such orders may therefore be issued to obtain information, to require public notice, to prevent a hazardous condition, to treat or reduce hazardous situations once they have arisen, or to provide alternative water supplies.¹²

The SDWA emergency authority has been invoked frequently in Superfund cases where the government seeks action from potentially responsible parties under CERCLA section 106.¹³ However, in these cases, the SDWA emergency authority has generally played a supporting role rather than a lead role.

“Tampering” with a public water system is singled out as a specific crime under the SDWA.¹⁴ The statute criminalizes actual tampering, attempts to tamper, and threats to tamper where there is the appropriate *mens rea*.

The term “tamper” means to introduce a contaminant into a public water system, or to otherwise interfere with a system’s operations, intending to harm persons.¹⁵ Criminal charges are likely to be restricted to terrorists and other real wrongdoers.

In 2002, Congress passed the Public Health Security and Bioterrorism Preparedness and Response Act to help address concerns that arose in the wake of the September 11, 2001 terrorist attacks.¹⁶ This legislation was, in part, designed to help tighten security at public drinking water systems as well as improve emergency response times in the event of a terrorist attack or other catastrophic event occurs that affects public drinking water. Under the law, community water systems must conduct an assessment of the vulnerability of the system to terrorist attacks as well as prepare and implement an emergency response plan based on the vulner-

harm that may substantially threaten the health of persons who use public water systems.” *W.R. Grace & Co. v. U.S. E.P.A.*, 261 F.3d 330, 339, 52 Env’t. Rep. Cas. (BNA) 1993, 32 Env’t. L. Rep. 20093 (3d Cir. 2001). The absence of evidence demonstrating that water consumers are drinking contaminated water does not necessarily preclude a finding of an “imminent and substantial endangerment.” *Trinity American Corp. v. U.S. E.P.A.*, 150 F.3d 389, 399, 47 Env’t. Rep. Cas. (BNA) 1071, 28 Env’t. L. Rep. 21575 (4th Cir. 1998).

⁸H.R. Rep. No. 1153, 93d Cong., 2d Sess. 35 (1974); *see also* *W.R. Grace*, 261 F.3d at 339-40.

⁹H.R. Rep. No. 1153, 93d Cong., 2d Sess. 35 (1974). In short, compliance with the law is no bar to a SDWA emergency action.

¹⁰H.R. Rep. No. 1153, 93d Cong., 2d Sess. 35 (1974) (Among others, orders may be issued to “owners or operators of public water systems, to State or local government units, to State or local officials, owners or operators of underground injection wells (and) to area or point source polluters.”).

¹¹SDWA § 1431(a), 42 U.S.C.A. § 300i(a).

¹²H.R. Rep. No. 1153, 93d Cong., 2d Sess. 35 (1974).

¹³42 U.S.C.A. § 9606. *See, e.g.,* *W.R. Grace*, 261 F.3d at 339-40; *U.S. v. Stringfellow*, 20 Env’t. Rep. Cas. (BNA) 1905, 14 Env’t. L. Rep. 20385, 1984 WL 3206 (C.D. Cal. 1984).

¹⁴SDWA § 1432, 42 U.S.C.A. § 300i-1. This provision may be redundant with existing state laws (e.g., criminal assault and battery), but the SDWA provision now establishes this activity as a federal offense, subject to Federal Bureau of Investigation jurisdiction and enforcement by local U.S. attorneys.

¹⁵SDWA § 1432(d), 42 U.S.C.A. § 300i-1(d).

¹⁶Pub. L. No. 107-188, 116 Stat. 682 (2002).

ability assessment.¹⁷

§ 18:24 Citizen Suits

The SDWA citizen suit provision itself is unremarkable. Any person may commence a civil action against persons alleged to be in violation of the statute or regulations (including the United States and the various states) and EPA if the Agency is not discharging a non-discretionary duty.¹ The citizen suit must be preceded by proper notice and may not be maintained if the United States or a state is diligently prosecuting a civil action in a court of the United States.² There is another restriction on SDWA citizen suits. No citizen suit can be maintained to require a state to prescribe a schedule for a variance or an exemption unless the plaintiff shows (to the satisfaction of the court) that the state has failed to prescribe schedules in a “substantial number of cases.”³ Although attorneys’ and expert witnesses’ fees are available for the successful plaintiff,⁴ the statute does not authorize the court to assess penalties in such a suit. An exception applies to suits against federal agencies. In those cases, citizens may file suit to collect penalties that an agency has failed to pay within 18 months of the effective date of an administrative penalty order.⁵

Recently, however, other avenues for citizen suits have opened. In response to the Flint Water Crisis, a court upheld a plaintiff’s Federal Torts Claim Act.⁶ Although the court recognized that the SDWA afforded EPA significant discretion in constructing its response to primary regulation violations, the court agreed with the plaintiff that EPA had failed in its mandate.

§ 18:25 Federal Preemption

In the wake of the Flint Water Crisis, a bevy of § 1983 claims were brought against Flint, MI officials responsible for switch between the water sources resulting in elevated lead levels in the city water supply.¹ Two cases, *Boler* and *Mays*, were dismissed in district court when the court ruled that the SDWA preempted the statutory claims of the plaintiffs. The cases were consolidated on appeal. On appeal, the circuit court reversed *Boler*, stating that there was no clear inference of congressional intent from either the text of the SDWA, its legislative history, nor its reme-

Ed. 2d 469 (2018) and cert. denied, 138 S. Ct. 1294, 200 L. Ed. 2d 469 (2018); *McMillian v. Snyder*, 83 Env’t. Rep. Cas. (BNA) 2232, 2017 WL 492077 (E.D. Mich. 2017).

dial scheme that would preempt such claims.²

The *Boler* court reasoned that “the findings enunciated in the SDWA emphasize Congress’s focus on the interstate economic impacts of polluted drinking water, not on any constitutional violation that may accompany the pollution.”³ The court also distinguished violations of the SDWA from a constitutional violation stemming from negligence that results in contaminated drinking water.⁴ The consequence of such a decision is that there may be some leeway between the citizen suit provision and the statutory strictures of the SDWA that some might argue allows individuals private rights of action, even if such actions are contingent on what would amount to a SDWA violation.

§ 18:26 In General

The SDWA contains several provisions intended to identify, improve the quality of, and prevent the deterioration of significant drinking water sources.¹ Section 1424(e) allows EPA on its own, or in response to a petition, to designate as a “sole source aquifer” a groundwater source serving as the sole or principal drinking water source for that area.² EPA must first make a finding, however, that the water source, if contaminated, would create a significant hazard to public health. Once designated, a sole source aquifer enjoys special protection from any federally funded project that might adversely affect the aquifer.

The “critical aquifer protection area” provision, which arose in the 1986 Amendments, authorized various governmental entities to develop comprehensive management plans designed to protect all or part of a designated sole source aquifer.³ The program was a demonstration initiative that could apply only in areas that had been designated, or approved for designation, as of June 19, 1988.

The SDWA also contains a “wellhead protection” provision,⁴ which required the states to submit, by June 19, 1989, a program for protecting areas that, if contaminated, could adversely affect the quality of groundwater sources used for drinking water. Several states have not complied with this provision, and the SDWA does not require EPA to act in their stead.

The 1996 Amendments introduced two new source protection programs. The “Source Water Assessment” provision invited, but did not require, states to develop a program to delineate the boundaries of public water systems and to determine the susceptibility of those delineated areas to exposure from contaminants regulated under the SDWA.⁵ Implementation of this program was a prerequisite for the monitoring relief that states are authorized to provide under SDWA § 1418(a).

The second program allowed any state to establish a program inviting a community water supply system or a locality to submit a “source water quality protection partnership petition.”⁶ That petition would request state assistance in developing a voluntary, incentive-based partnership whose role would be to make recommendations for identifying and controlling sources of contaminants with the potential to enter the water supply source. The partnership would consist of all persons likely to be affected by those recommendations.

VIII. CONCLUSION

§ 18:27 Generally

Obtaining safe drinking water is a perennial problem for civilizations; in a nation where the Safe Drinking Water Act is almost 50 years old and provides a backdrop for potable water consumption, it is easy to take its provisions for granted. Recent events like the Flint Water Crisis have focused renewed attention on this statute,

[Section 18:26]

¹While direct potable reuse (DPR) and indirect potable reuse (IPR) are permissible under the SDWA (and, indeed, can produce water quality that is well above that required by the SDWA), such treated wastewater may need to be identified as a source water. See EPA, *Ground Water and Drinking Water: Potable Water Reuse and Drinking Water*, <https://www.epa.gov/ground-water-and-drinking-water/potable-water-reuse-and-drinking-water> (last visited July 21, 2020).

and emerging issues like PFAS and microplastics continue to be the focus of study and debate. The SDWA continues to evolve: One of the key changes being considered as of the date of this chapter is a suite of regulatory revisions to the NPDWR for lead and copper, which are intended to reduce the levels of those substances in drinking water.¹ Other challenges remain, requiring scientific expertise, significant financial resources, and commitment by our society and people at all levels of government.

Case Studies

Case Studies: Flint, Michigan

Starting in the late 1960s, Flint, Michigan (the “City”) sourced its drinking water from Lake Huron.¹ In 2013, the City decided to switch to another water supplier: the Karegnondi Water Authority (KWA).² The KWA would take several years to build; in the interim, City officials decided to use water from the Flint River.³ This change occurred in April 2014; however, the City made no effort to upgrade its treatment plants or provide for other measures to ensure the safety of the water.⁴

Immediately after City officials changed the source of the water, residents began to complain about the smell, appearance, and taste of the water.⁵ Serious issues with the water included the following:

- Coliform and *E. coli* bacteria were detected after testing in August and September of 2014;
- Shortly after that, in October of 2014, the water was linked to an outbreak of Legionnaire’s disease; and
- General Motors stopped its water service because the pollution in the Flint River was corroding its parts.⁶

Despite numerous warning signals, the City issued a notice in January of 2015 that, while the water violated applicable standards, it was still safe to drink.⁷ Shortly after this, in February 2015, additional testing indicated that the water contained high levels of other chemicals, like lead and trihalomethane.⁸

When “Flint began using the Flint River water in April of 2014, it did not treat the water with orthophosphate to control lead levels in the drinking water, and

instead added chemicals, such as ferric chloride, which, studies have shown, exacerbate” lead levels, resulting in increased lead exposures in a vulnerable, predominantly minority population.⁹

Scientists estimate that 140,000 people in this community were exposed to lead and other drinking water contaminants.¹⁰ The effects of lead exposure include: damage to children’s brains and nervous systems; slowed growth and development; and learning, behavior, hearing, and speech problems.¹¹ Because the community had been dealing with any number of preexisting socioeconomic factors, the consequences of these exposures were particularly pronounced.¹²

In Flint, “assurances of the water’s potability hid the risks, turning residents’ voluntary consumption of a substance vital to subsistence into an involuntary and unknowing act of self contamination.”¹³

In a later action, defendants claimed that they conducted “two required rounds of sampling to determine lead levels, from July to December 2014 and January to June 2015, but the results did not exceed the SDWA [Safe Drinking Water Act] Lead and Copper Rule’s ‘action level.’”¹⁴ However, it became clear that the City did not comply with all of the Lead and Copper Rule monitoring requirements and that testing regimes were inadequate.¹⁵

The City initially advised residents to “pre-flush” taps before using them or, alternatively, stop drinking the water.¹⁶ After EPA warned, in June of 2015, that the lead levels in the water were high, officials provided filters, but they were of questionable quality.¹⁷

Genesee County then declared a public health emergency in October of 2015; at this point, the City decided to reconnect to its previous water supply.¹⁸ However, the protective coating in Flint’s pipes had been damaged by the corrosive water from the river, and studies indicated that the water would continue to have high lead levels until the coating could build up again.¹⁹ In February of 2016, EPA warned residents that the unfiltered water was not safe and instructed them to drink bottled water.²⁰

The Michigan Civil Rights Commission studied the events in Flint. The Commission’s report concluded that the events in Flint were a result of systematic racism, “based on a plethora of events and policies that so racialized the structure of public policy that it systemically produced racially disparate outcomes adversely affecting a community that is primarily made up of people of color.”²¹

Flint will continue to suffer the consequences of this tragedy for decades; in the

meantime, litigation by those affected by these events continues. Although over six years since the crisis began have passed as of the time of this publication, corroded pipes still affect the waters and people of Flint, Michigan.²²

Case Studies: PFAS

Per- and polyfluoroalkyl substances (PFAS) are man-made chemicals that include PFOA (perfluorooctanoic acid), PFOS (perfluorooctane sulfonic acid), and GenX chemicals.²³ These chemicals have been manufactured and used since the 1940s; a variety of facilities have been associated with PFAS releases into the environment, including PFAS manufacturing and processing facilities, facilities using PFAS to produce other products, airports, and military sites.²⁴

PFOA and PFOS are the two chemical PFAS compounds that have been the most widely studied and used; they are virtually ubiquitous, having been detected in up to 98% of samples during biomonitoring studies of the U.S. population.²⁵ However, since 2006, they have been voluntarily phased out in the U.S., and serum concentrations in the population have since been decreasing.²⁶

PFOA and PFOS “can cause reproductive and developmental, liver and kidney, and immunological effects in laboratory animals. Both chemicals have caused tumors in animals. The most consistent findings . . . are increased cholesterol levels among exposed populations, with more limited findings related to: infant birth weights, effects on the immune system, cancer (for PFOA), and thyroid hormone disruption (for PFOS).”²⁷

PFAS have been found in, among other places, drinking water, although they are “typically localized and associated with a specific facility (e.g., manufacturer, landfill, wastewater treatment plant, firefighter training facility).”²⁸

EPA has established health advisories for both PFOA and PFOS.²⁹ The current health advisory level set by EPA is 70 parts per trillion.³⁰ While EPA has indicated

Systemic Racism Through the Lens of Flint at 6 (Feb. 17, 2017)).

²²In re Flint Water Cases, 960 F.3d 303, 310 (6th Cir. 2020).

²³“GenX is a trade name for a technology that is used to make high performance fluoropolymers (e.g., some nonstick coatings) without the use of perfluorooctanoic acid (PFOA). HFPO dimer acid and its ammonium salt are the major chemicals associated with the GenX technology. GenX chemicals have been found in surface water, groundwater, finished drinking water, rainwater, and air emissions in some areas.” EPA, *Basic Information on PFAS*, <https://www.epa.gov/pfas/basic-information-pfas> (last visited July 20, 2020). See *Hardwick v. 3M Company*, 2019 WL 4757134, at *1 (S.D. Ohio 2019) (citing <https://www.epa.gov/pfas/basic-information-pfas>).

³⁰EPA, *Drinking Water Health Advisories for PFOA and PFOS*, <https://www.epa.gov/ground-water-and-drinking-water/drinking-water-health-advisories-pfoa-and-pfos>

that it may eventually regulate PFAS and PFOA under the SDWA,³¹ EPA does not yet regulate these chemicals.³²

Various groups have criticized EPA for an inadequate response to the risks posed by these chemicals.³³ California is leading the nation in establishing PFAS regulations, recently setting response levels to 10 parts per trillion (PPT) for PFOA and 40 PPT for PFOS.³⁴ The State can require that water systems, in addition to notifying the public, be taken out of service and treated if the State Water Board finds that levels of these chemicals exceed the newly established standards.³⁵

EPA seems to be moving toward a positive regulatory determination for both PFOA and PFOS; should it do so, EPA will then undergo the SDWA rulemaking process to establish a National Primary Drinking Water Regulation (NPDWR) for both PFOA and PFOS.³⁶ During that process, EPA will request recommendations from the EPA Science Advisory Board and will also request public comments.³⁷ EPA additionally is conducting hazard assessments for the following PFAS: GenX chemicals; PFBS; PFNA; perfluorobutanoic acid (PFBA); perfluorodecanoic acid (PFDA); perfluorohexanoic acid (PFHxA); and perfluorohexanesulfonic acid (PFHxS).³⁸

Meanwhile, as EPA moves toward establishing maximum contaminant levels (MCLs) under the SDWA, numerous lawsuits have been filed over PFAS contamination.³⁹ In those suits, the plaintiffs have alleged injuries ranging from cancer to increased risks of a variety of diseases to diminished property values.⁴⁰

Case Studies: Tribes and Treatment as a State (TAS) and Primacy

When Congress passed the SDWA, tribes were not eligible to be treated as states.⁴¹ However, this changed with the 1986 SDWA Amendments; for the first time, tribes were authorized to assume primacy.⁴² Decades later, only one tribe, the Navajo Nation, has done so for the Public Water System Supervision (PWSS) Program and two

[and-drinking-water/drinking-water-health-advisories-pfoa-and-pfos](#) (last visited July 20, 2020).

³¹EPA included PFOA and PFOS in the Final CCL 4 because they are “known to occur in drinking water, are persistent in the environment and in the human body, have shown to be toxic in animal studies and may require regulation.” See Drinking Water Contaminant Candidate List 4-Final, 81 Fed. Reg. 81099, 81107 (Nov. 17, 2016).

³²They may also be regulated under other laws, e.g., CERCLA, in the future.

³³See, e.g., Stephanie Ebbs, *EPA working aggressively to address ‘forever chemicals,’ Wheeler says*, ABC News (Nov. 25, 2019, 2:00 PM), <https://abcnews.go.com/Politics/epa-working-aggressively-address-forever-chemicals-wheeler/story?id=67295754>.

³⁴“In addition to notification levels and pursuant to Health and Safety Code section 116455, DDW [Division of Drinking Water] has lowered the response levels for PFOA and PFOS from 70 PPT combined to 10 PPT for PFOA and 40 PPT for PFOS based on a running four quarter average.” Cal. Water Boards, *Drinking Water: Perfluorooctanoic acid (PFOA) and Perfluorooctanesulfonic acid (PFOS)*, https://www.waterboards.ca.gov/drinking_water/certlic/drinkingwater/PFOA_PFOS.html (last visited July 21, 2020).

⁴¹EPA, *Tribal Primacy: An Overview for the Safe Drinking Water Act’s Public Water System Supervision Program* (Aug. 2002), <https://nepis.epa.gov/Exe/ZyPURL.cgi?Dockey=P1007BCH.TXT>.

⁴²EPA, *Tribal Primacy: An Overview for the Safe Drinking Water Act’s Public Water System Supervision Program* (Aug. 2002), <https://nepis.epa.gov/Exe/ZyPURL.cgi?Dockey=P1007BCH.TXT>.

(the Navajo Nation and the Assiniboine and Sioux Tribes of the Fort Peck Indian Reservation) have become authorized under the Underground Injection Control (UIC) Program for Class II wells.⁴³

The chart below shows the number of tribes authorized under various EPA programs;⁴⁴ while a large number of tribes participate in the Water Quality Standards Program, very few are authorized under other environmental regulatory regimes, including the SDWA.

Regulatory Program	Number of Authorized Tribes
CAA § 110—Tribal Implementation Plan (TIP)	7
CAA § 111—New Source Performance Standards (NSPS)	2
CAA § 112—National Emissions Standards for Hazardous Air Pollutants (NESHAP)	2
CAA Title V—Operating Permit Program	4
CWA §§ 303(c) / 401—Water Quality Standards (WQS) Program	69
SDWA § 1413—Public Water System Supervision (PWSS) Program	1
SDWA § 1425—Underground Injection Control (UIC) Program, Class II Wells	2
TSCA §§ 402, 404, 406—Lead Abatement and/or Renovating, Repair, and Painting (RRP) Program	4

The requirements for tribes to be treated as states under the SDWA are as follows:

(1) the Tribe is “recognized by the Secretary of the Interior and has a governing body carrying out substantial governmental duties and powers”;

(2) the “functions to be exercised” by the Tribe in question “are within the area of the Tribal Government’s jurisdiction”; and

(3) the Tribe “is reasonably expected to be capable, in the Administrator’s judgment, of carrying out the functions to be exercised in a manner consistent with the terms and purposes of this subchapter and of all applicable regulations.”⁴⁵

Why have so few tribes assumed permitting authority under the SDWA? One reason is that jurisdictional determinations are complex, heavily litigated, and can take decades, with the concomitant expense and uncertainty for all parties involved.

The divisive and difficult jurisdictional gymnastics involved in Safe Drinking Water Act permitting decisions on or near tribal lands was illustrated in the *Hydro Resources, Inc.* case, where Justice Gorsuch authored the majority opinion for a divided en banc panel.⁴⁶ The case arose because Hydro Resources, Inc. (HRI) needed a SDWA permit to mine its property and had two possible options: the New Mexico Environment Department, which had been delegated permitting authority by EPA for lands other than “Indian lands,” or EPA.⁴⁷ Since HRI owned the property in fee and it was not part of any reservation, HRI applied for, and was granted, a permit

⁴³It was not until October 23, 2000, that EPA determined that the Navajo Nation was eligible to obtain primacy for the PWSS Program. See also EPA, *Tribes Approved for Treatment as a State (TAS)* (June 2020), <https://www.epa.gov/tribal/tribes-approved-treatment-state-tas>.

⁴⁴EPA, *Tribal Primacy: An Overview for the Safe Drinking Water Act’s Public Water System Supervision Program* (Aug. 2002), <https://nepis.epa.gov/Exe/ZyPURL.cgi?Dockey=P1007BCH.TXT>.

⁴⁵See 40 C.F.R. § 131.8(a)(2); 42 U.S.C. § 300j-11(b)(1)(B); 40 C.F.R. § 145.56(b).

by the NMED.⁴⁸

EPA, however, asserted jurisdiction over the land in question since EPA viewed it as “Indian country,” as that term is defined by 18 U.S.C. § 1151.⁴⁹ Section 1151 provides primary federal criminal jurisdiction over “Indian reservation[s],” “dependent Indian communities,” and “Indian allotments.”⁵⁰ Here, EPA argued that HRI’s land should be considered Indian country because it was part of a “dependent Indian communit[y]” under Section 1151.⁵¹ The majority held that “because the individual tract at issue was neither (a) set aside by Congress (or the Executive, acting under delegated authority) for the use of the Indians as Indian land[;] nor (b) dependent in the sense that it is under federal superintendence, it is not part of a dependent Indian community under 18 U.S.C. § 1151(b).”⁵²

In the dissent’s view, “under the rule announced by the majority, a uranium mine located on non-Indian land but surrounded by land that constitutes a dependent Indian community would not be subject to federal regulation.”⁵³ The dissent was concerned that such a position would not be in accord with “the applicable statute, the case law, or the federal government’s ‘distinctive obligation of trust . . . in its dealings with these dependent and sometimes exploited people.’”⁵⁴

I. INTRODUCTION

§ 19:1 In General

This chapter will survey the major federal environmental statutes currently being utilized to regulate industrial and agricultural applications of biotechnology.

Biotechnology grew out of scientific breakthroughs in the early 1970s that made possible, to an unprecedented degree, the purposeful manipulation of the genetic structure of living organisms. In little more than a decade, the discoveries spawned a whole new industry. The diverse products of this industry have touched society at

many points and will continue to have an impact on our social mores, economy, and law.

This chapter is concerned with the impact of one of the most important biotechnologies—genetic engineering—on environmental law. While there is no legislation that specifically addresses the regulatory issues raised by genetic engineering, as this chapter will show, genetic engineering is generating new products, processes, wastes (including new opportunities for waste clean-up, in terms of bioremediation products), and by-products that are subject to existing environmental laws. Accommodation to this new technology has produced an extension and fine-tuning in the implementation of major environmental statutes. But, because many of those statutes are process neutral, regulating products and pollutants without regard to the manner in which they are generated, biotechnology has not impacted those laws in any fundamental sense. As a result, and as evident from the following discussion, products that successfully complete the applicable regulatory review process have been shown to be as safe to produce and use as their conventional counterparts.¹

§ 19:2 What is biotechnology?

Biotechnology is not a precisely defined term but refers generally to the exploitation of biological organisms for practical purposes. Such exploitation is nothing new. The advent of agriculture—a prime example of biotechnology—marked the dawn of civilization. For millennia farmers have been controlling the breeding, and thereby modifying the forms and functions, of plants and animals for agricultural purposes.¹ Similarly, wine, cheese, beer, and other food making processes have taken advantage of the fermentative capabilities of microorganisms.² The central, although not the only, biotechnology—genetic engineering—has dramatically extended the reach of these familiar technologies, largely by reducing the role of chance in the breeding of organisms with desired properties.³ Advances in genetic engineering promise increases in both the variety of new organisms and the rate at which they will be produced.⁴ And, while not covered in-depth in this chapter, we note that advances in technology have also opened the door to commercial-scale production of cell-cultured meat products.⁵

One of the most important and controversial of the new genetic engineering breeding techniques permits scientists to produce new varieties of organisms by directly transferring precise pieces of genetic information from one organism to

another.⁶ This technique, referred to as recombinant deoxyribonucleic acid (DNA)⁷ or gene-splicing, bypasses natural reproductive mechanisms and makes possible the combining of genes from taxonomically unrelated sources.⁸ Genes from higher organisms may now be spliced into microbes and vice versa.⁹ The resulting modified organisms are often referred to as “transgenic.”

Another and more recent advance in breeding techniques provides an even greater degree of precision in genetic engineering by allowing specific changes or “edits” to be made in a living organism’s genome without, in many cases, the need to transfer pieces of genetic information from another organism.¹⁰ Think of the genome as all of the genetic material in a plant, animal, or microbe including DNA, ribonucleic acid (RNA), genes and other elements that control the activity of those genes. Genome editing, also called gene editing, is a group of technologies that give scientists the ability to change an organism’s DNA by adding, removing, or altering discrete pieces of genetic material at particular locations in the genome.¹¹ The resulting modifications enhance the ability of the organism to grow and function in a desirable manner.¹²

With recombinant DNA and other advanced genetic techniques, we are many steps closer to being able to tailor organisms specifically to meet our needs. But the mixing of genetic material made possible by certain techniques can result in organisms that contain combinations of genetic material unlikely to be found in nature.¹³ The key scientific question is whether these acknowledged novelties in genetic constitution will significantly affect the nature and ecology of the constructed organisms. This is not an easy question to answer because both novelty and environmental effects are primarily matters of degree.

Genetically engineered organisms not found in nature are not unfamiliar. Especially during the last century, a progression of increasingly sophisticated controlled-breeding techniques produced a host of engineered organisms for use in agriculture and animal husbandry.¹⁴ Among these, hybrid corn, American Beauty roses, and beef cattle all attest to the success and relative benevolence of genetic engineering,

at least by traditional methods.¹⁵ The traditional methods for genetically modifying organisms have now been joined by a spectrum of new techniques that include, in addition to gene editing, recombinant DNA techniques, somaclonal variation, and protoplast fusion.¹⁶ Not all of these techniques share with gene splicing the potential for producing highly novel organisms with genes from dissimilar parents.¹⁷ Sorting out the degree of novelty and risk associated with various organisms constructed by genetic techniques—both traditional and advanced—is a major challenge scientists and regulators face.

§ 19:3 Applications of genetic engineering

For regulatory purposes, it is useful to consider engineered organisms as having two general kinds of applications: products and processes. In product applications—represented by insect-resistant crops,¹ mineral-leaching microbes,² or biopesticides³—the organisms themselves serve as products. Such applications are most likely to involve the deliberate introduction of organisms to the general environment, and are the primary concern of this chapter.

By contrast, process applications, best represented by fermentation systems, involve genetically engineered organisms not as end products, but as production tools.⁴ The fermentation systems of interest here usually involve bacteria whose normal complement of genetic material has had foreign genes spliced into it.⁵ Grown in large numbers under carefully controlled conditions,⁶ the engineered bacteria can be regarded as mini-chemical manufacturing plants capable of synthesizing the substances coded for by the introduced genetic elements. Often such substances are present in only minute amounts in living tissues and cannot be obtained in the quantities needed for testing and therapy by any method other than genetic engineering.⁷ Fermentation applications will not receive further attention in this chapter because, as discussed later, use of genetically engineered organisms in

fermentation systems poses relatively low levels of environmental risk.⁸

The products of both kinds of applications have proven to be diverse and ingenious.⁹ Most of these have concentrated in areas that have been heavily dependent upon biotechnology in the past—agriculture, pharmaceuticals, and chemical manufacturing.¹⁰ But the technology has also spilled over into other fields such as pollution control and mineral ore extraction.¹¹ Like computer technology, future applications—many beyond imagination today—will emerge as biotechnology is applied and refined.¹²

§ 19:4 Benefits of genetic engineering

Along with any potential risks, the benefits of genetic engineering will continue to figure prominently in the regulatory picture. Promoters of the technology, and those who make use of its products both now and in the future, hope the varied applications discussed above will continue to lead to a new array of social, technical, and economic benefits.

Of the many uses of biotechnology, agricultural applications are among the most diverse and exciting, providing food, feed, fiber, and fuel including for the world's 800 million people who suffer from hunger and poverty.¹ New strains and varieties of crops have increased the availability of food, opened up new geographic ranges for crop growth, and led to plants that protect themselves from harmful insect pests and disease.² Socio-economic benefits of biotechnology crops have been extensively documented showing that they have contributed to: increasing productivity that contributes to global food, feed, and fiber security; supporting self-sufficiency on a nation's arable land; conserving biodiversity, precluding deforestation and protecting biodiversity sanctuaries; and mitigating the challenges associated with climate change.³

microorganisms capable of degrading toxins like aldrin, DDT, and kepone have been isolated with a view toward cleaning up hazardous waste.⁴ Genetic engineering offers the means of improving the efficiency of naturally occurring organisms and making microbial waste cleanup effective on a large scale and under a wide variety of cleanup situations.⁵ New methods of treating hazardous chemicals are needed to replace the environmentally unsatisfactory methods of burying or burning waste currently employed.

Finally, there are the purely economic benefits and resulting societal benefits associated with the new industry, particularly as related to agricultural applications. Nations around the world view biotechnology as one of the keys to future economic prosperity and thus have invested substantial public and private funds into its development.⁶ In 2019, the 24th year of biotechnology crop commercialization (cultivation and import for food, feed, and processing), the 470.5 million acres planted globally continued to contribute to the alleviation of socio-economic problems.⁷ The accumulated biotechnology crop area from 1996 to 2019 of 6.7 billion acres continues to provide food, feed, and shelter to a global population now at 7.7 billion, with estimated economic benefits of over \$225 billion.⁸ Global acreage of biotechnology crops increased 112-fold from 1996 to 2019, making these crops the most rapidly adopted crop technology in recent times.⁹ Stacked traits with insect resistance and herbicide tolerance increased by 6% to cover 45% of the global area planted in biotechnology crops, proof of farmers' preference for smart, sustainable agriculture with no-till and reduced use of insecticide sprays for crops with the

insect resistance trait.¹⁰

An estimated 17 million farmers planted biotechnology crops in 2019 in 29 countries, including two European Union nations, and on every continent except Antarctica.¹¹ Of the 29 countries, 24 were developing and 5 were industrial countries.¹² Developing countries grew 56% of the global biotechnology crop area.¹³ In addition to the major commodity crops, so-called “minor” crops such as eggplant, papaya, potato, and squash are also being planted, and valuable new crops are being field tested specifically for use in developing countries.¹⁴

In the United States, biotechnology crops were grown commercially on over 176 million acres in 2019.¹⁵ Three crops—soybeans, corn, and cotton—made up the bulk of the total acres of biotechnology crops planted, followed by canola, sugar beets,

¹⁰*Global Status of Commercialized Biotech/GM Crops in 2019*, INTERNATIONAL SERVICE FOR THE ACQUISITION OF AGRI-BIOTECH BRIEF 55-2019 (2020), available at <https://www.isaaa.org/resources/publications/briefs/55/; Executive Summary, Biotech Crops Drive Socio-Economic Development and Sustainable Environment in the New Frontier>, INTERNATIONAL SERVICE FOR THE ACQUISITION OF AGRI-BIOTECH BRIEF 55-2019 (2020), available at <https://www.isaaa.org/resources/publications/briefs/55/executivesummary/default.asp>.

¹⁴*Global Status of Commercialized Biotech/GM Crops in 2019*, INTERNATIONAL SERVICE FOR THE ACQUISITION OF AGRI-BIOTECH BRIEF 55-2019 (2020), available at <https://www.isaaa.org/resources/publications/briefs/55/; Executive Summary, Biotech Crops Drive Socio-Economic Development and Sustainable Environment in the New Frontier>, INTERNATIONAL SERVICE FOR THE ACQUISITION OF AGRI-BIOTECH BRIEF 55-2019 (2020), available at <https://www.isaaa.org/resources/publications/briefs/55/executivesummary/default.asp>. A total of 29 countries have issued regulatory approvals for commercial cultivation of biotechnology crops. Since 1992, there have been 4,485 approvals granted by regulatory authorities to 403 biotechnology events in 28 biotechnology crops (from alfalfa to wheat), excluding carnation, rose, petunia, and tobacco. Of these approvals, 2,115 were for food, either for direct use or for processing, 1,514 were for feed use, for direct use or processing, while 856 were for environmental release or cultivation. The U.S. had the highest number of events approved (single traits only) followed by Japan (not including intermediate events from approved stacked and pyramided events), Canada, Brazil, and South Korea in the top five. “An event is the insertion of a particular transgene into a specific location on a chromosome. The term ‘event’ is often used to differentiate genetically engineered crop varieties.” U. Nebraska, *Ag Biosafety, Glossary*, <https://agbiosafety.unl.edu/glossary.htm> (last visited Jan. 12, 2022).

alfalfa, potatoes, papaya, squash, and apples.¹⁶ Ninety-five percent of the soybeans, corn, and cotton grown in the United States contain at least one trait as a result of the application of modern biotechnology, with the predominant traits being tolerance to herbicide sprays, resistance to insect pests, or both, but also including such traits as drought tolerance and disease resistance.¹⁷ Newer crops with consumer and health benefits will further diversify this mix, including apples with reduced bruising and browning and potatoes with late blight protection, reduced potential for black spot bruising, improved taste and texture, and decreased potential formation of acrylamide during high-temperature cooking.¹⁸

Looking back on the first 25 years of commercial planting of biotechnology crops leads to the conclusion that these crops have delivered a variety of valuable agronomic, economic, environmental, health, and social benefits.¹⁹ While the results may vary based on the crop and country in question, farmers have realized such benefits as higher yields (growing more food on less land), a significant reduction in pesticide application with a corresponding reduction in farmer exposure, and the ability to use safer herbicides to fight weeds well into the growing season.²⁰ As a result, biotechnology crops support sustainable development in numerous ways,

including contributing to food security and more affordable food in general, reducing agriculture's environmental footprint, contributing to the alleviation of poverty and hunger, mitigating climate change and reducing greenhouse gases, and contributing to sustainable economic benefits.²¹

Public acceptance and supportive government policies are key for agricultural, socio-economic, and environmental benefits of biotechnology crops to reach the poor and the hungry. Ensuring that the benefits of agricultural biotechnology will continue now and in the future depends also on the diligence and forward-looking regulatory steps based on science, critically looking at the benefits in addition to risks, agricultural productivity with a sense of environmental conservation, sustainability and product stewardship, and most importantly taking into consideration the millions of hungry and impoverished people in need of resources.²²

Moreover, what constitutes a benefit is often controversial, as demonstrated by differing views of the engineering of crops.²³ Finally, any evaluation of benefits must take into account both a range of secondary impacts and the distribution of these benefits.

§ 19:5 Why regulate genetic engineering?

Before turning to the framework of environmental legislation available to regulate genetic engineering, it is appropriate to ask, why do so? There are at least two factors that contributed to the early momentum behind regulation.

The first factor was the concern that genetic engineering would produce, along with promised benefits, unwanted health and environmental consequences. While this concern was scientifically grounded, it should be emphasized that it arose largely out of uncertainty. Unlike the well-recognized risks that gave rise to all of our health and environmental regulatory programs, the risks associated with biotechnology were speculative and hypothetical and remain so to this day. Notwithstanding intensive regulatory, commercial, and academic oversight over the past 35 years and the widespread adoption of the technology in agriculture and healthcare, the postulated adverse health and environmental consequences have not been demonstrated and are not at all certain to occur.

The second factor is a widespread nervousness about genetic engineering, particularly as related to the food supply. The nervousness is of sufficient magnitude

(genetically engineering herbicide-tolerant soybeans and herbicide-tolerant corn have not increased yields, and insect-resistant corn has improved yields only marginally; the increase in yields for both crops over the last 13 years was largely due to traditional breeding or improvements in agricultural practices); MATIN QAIM, PALGRAVE STUDIES IN AGRICULTURAL ECONOMICS AND FOOD POLICY, GENETICALLY MODIFIED CROPS AND AGRICULTURAL DEVELOPMENT (2016) (biotechnology can contribute substantially to sustainable agricultural development and food security, but continued opposition to technologies shown to be beneficial and safe entails unnecessary human suffering and environmental degradation).

that it has affected the acceptance of the technology, regardless of the scientific judgment on its potential adverse consequences. A case in point is the science-based reviews of numerous biotechnology crops conducted by the European Commission (EC). The European Union (EU) Register of Authorized GMOs currently lists five crops, corn, cotton, soybeans, oilseed rape (canola) and sugar beets, comprising a total of 58 traits (including combinations of traits), that have been authorized by the EC for food, feed, and nonfood uses.¹ Notwithstanding these safety findings and authorizations, only one crop-trait combination, an insect-resistant corn plant, is commercially cultivated in the EU,² and the majority of EU countries continue to question the safety of biotechnology crops, at least for purposes of human consumption, and have elected not to authorize their cultivation.³

Much of the scientific uncertainty and public uneasiness about genetic engineering resulted from our lack of long-term experience with the technology, and the fact that society's evaluation of this technology began in advance of its implementation and in the absence of any significant educational effort regarding the underlying science. To the extent that the regulatory processes put in place have been able to identify and avoid the potential hazards associated with the technology, the pre-implementation vantage point has been an advantage. But the vantage point has simultaneously been a burden because it required decisionmaking in the early years in the face of a significant degree of uncertainty about both risks and benefits. Fortunately, that uncertainty has motivated the scientific community and agency regulators to develop and utilize risk assessment techniques for assessing the safety of biotechnology products and risk management methods to address any concerns that are identified, all of this prior to commercialization.⁴

Perhaps the most persuasive remaining justification for continued regulation is the need to increase public acceptance particularly with regard to the safety of biotechnology foods.⁵

A recent major step taken in that direction was passage by Congress of legislation requiring the U.S. Department of Agriculture (USDA) to establish the National Bioengineered Food Disclosure Standard (NBFDS).⁶ The statute, which had bipartisan support on Capitol Hill,⁷ was signed into law by President Obama on July 29, 2016.⁸ USDA promulgated regulations establishing the NBFDS in 2018 and disclosure of bioengineered content in covered food products became mandatory

through labeling or other approved means on January 1, 2022.⁹ While consumers acquaint themselves with disclosure under the NBFDS, one can certainly argue that it is time for the Environmental Protection Agency (EPA), USDA, and the Food and Drug Administration (FDA) to revisit their current premarket review programs with an eye toward using the experience gained over the past 35 years and the enviable safety record of biotechnology products cleared for market entry during that time to identify appropriate, science-based opportunities for product exemptions and reduced oversight. As discussed in Section 19:15, it is arguable that USDA did just that in May 2020 when it issued extensive amendments to its Plant Protection Act (PPA) regulations.

§ 19:6 The concerns about genetic engineering

The storm of interest in genetic engineering dates from the discovery of recombinant DNA techniques capable of transferring genes among organisms from widely divergent taxonomic classifications.¹ As mentioned above, at least some of these genetic exchanges are unlikely to occur in nature;² thus such organisms are likely to be considered genuinely novel among the earth's organisms. It is the novelty of these organisms and our relative lack of experience with them that are the root of the concerns about genetic engineering. The concerns resolve themselves into two categories.

The first category derives from the properties of the new organisms themselves. There are concerns that the technology will generate organisms with undesirable properties; in most instances, these encompass pests or pathogens similar to those already in existence.

A second set of concerns revolves around the impact of the introduction of new organisms into the complex network of organisms that constitute the global ecosystem. Scientists wonder whether engineered organisms, because of their novel genetic constitutions, might proliferate in the environment, thereby displacing existing species or in some other way disrupting the balance of nature.³ The best analogy of the kind of ecological effect that might result from the release of new organisms is the introduction of a nonindigenous species into a new environment.⁴ In most cases such introductions fail, but occasionally the new organism not only survives but is so successful that it becomes a pest with serious economic consequences.⁵ Examples of naturally-occurring, nonindigenous species that come to mind are

gypsy moths, kudzu, and chestnut blight in the United States, and myxoma virus in Australia.⁶

§ 19:7 Lack of unique risks

Related to being able to assess the nature and magnitude of any potential risk is another aspect of the environmental introduction issue that poses special difficulties for regulators: whether there are any risks uniquely associated with organisms engineered by recombinant DNA, gene editing, or other advanced genetic engineering techniques. As mentioned above, the spread of naturally occurring organisms like gypsy moths and kudzu depends upon an organism being novel to the environment, but not upon how it acquired its novelty.¹ Genetically engineered organisms produced by advanced genetic techniques are expected to pose these kinds of risks because of their novelty, but so do other nonindigenous organisms now existing in nature or produced by conventional technologies.² To date, notwithstanding intensive oversight, scientists have not identified any new adverse ecological consequences which flow directly from the method by which the organisms were engineered or from the fact that organisms exhibit hybrid sets of traits from distantly related organisms.³ Some ecologists have even refused to distinguish among traditional and advanced methods of genetic engineering in discussing environmental risk.⁴

Reserving the possibility that all the potential ecological hazards associated with gene-spliced organisms may not yet be known, at present environmental hazards posed by organisms produced by advanced genetic techniques appear to be similar to those produced by conventional methods. Until the controversy over biotechnology surfaced, introduction of novel organisms into the environment was considered a genuine but manageable environmental threat. Thus, while agricultural laws bar the import and distribution of novel plant pests and weeds,⁵ they do not bar the introduction of novel organisms *per se*. In fact, deliberate introductions of nonindigenous organisms are routine integrated pest management techniques.⁶

The approach chosen by the federal government for the premarket regulation of

organisms intended for use in the open environment is largely process-based, with the result that it restricts regulation to organisms produced by the advanced genetic techniques, in effect grandfathering conventionally modified organisms. While directly responsive to the source of concerns about genetic engineering and easier to implement than a pure risk-based approach, such a regulatory regime has produced certain inconsistencies. Not surprisingly, the scheme has drawn fire because organisms produced by advanced techniques are subjected to premarket regulation from which their similar, conventionally produced cousins are exempt.⁷ This concern has been heightened by gene editing techniques, which often do not introduce “foreign” DNA and contain modifications indistinguishable from those that could occur in nature or through conventional breeding. Furthermore, recombinant DNA, and now gene editing, technologies have labored under a competitive disadvantage, since they have a substantially greater regulatory overhead.⁸ It has been said that the road from a good idea to commercial success is a long and perilous one and, if our experience in bringing new products to market for the past three decades is any example, a very expensive one as well.⁹

II. THE FEDERAL REGULATORY FRAMEWORK

§ 19:8 In General

The biotechnology industry has brought to the marketplace an array of products, the majority of which fall into categories that are regulated under existing legislation. In the early 1980’s, the question naturally arose whether new legislation was needed or whether, perhaps with some tinkering, the existing statutes would adequately regulate the products expected of biotechnology.

Under the lead of the Office of Science and Technology Policy (OSTP) and the Cabinet Council on Biotechnology, the White House made this question the focal point of its biotechnology policy. It took the position that, at least for the time being,

no new legislation was needed.¹ To support this position, the OSTP coordinated the publication in the *Federal Register* of a matrix listing all the provisions of statutes, regulations, and other guidance that would apply to biotechnology.² Along with the matrix, the USDA, FDA, and EPA published proposed statements of their biotechnology policies.³ The issuance of this proposed Coordinated Framework elevated the biotechnology issue on agency agendas and stimulated the development of biotechnology policies and procedures.

A revised regulatory matrix was published in 1985.⁴ At the same time, the OSTP announced the formation of a Biotechnology Science Coordinating Committee (BSCC) consisting of senior executive-branch policy officials involved in oversight of biotechnology research and products.⁵ The final version of the Coordinated Framework, containing the policy statements of five federal agencies—FDA, EPA, USDA, Occupational Safety and Health Administration (OSHA), and the National Institutes of Health (NIH), was published in 1986.⁶

The policy statements made by the agencies reflect three categories of statutes in terms of readiness to take on biotechnology products. The statutes in one category—including the Federal Food, Drug, and Cosmetic Act (FFDCA) and the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA)—regulate clearly defined categories of products under protective federal licensing schemes backed with extensive test requirements.⁷ These statutes provided ample statutory authority to regulate the specified products, and their implementing programs were already in place.⁸ Over time, as regulators gained a better understanding of the product mix, they made new policies and additions to existing regulations.⁹

In the second category are statutes which provide authority to handle expected products, but which would require further interpretation, rulemaking, or similar agency action in order to be in a position to regulate products of biotechnology. The Toxic Substances Control Act (TSCA) and most of the agriculture statutes fell into this category.¹⁰ The third category includes pollution control statutes such as the Clean Air Act (CAA) and the Federal Water Pollution Control Act Amendments of 1972 (FWPCA) which have well-established regulatory programs to address pollutants from a variety of sources.¹¹ Although EPA asserted authority under these statutes, it has not mentioned them further and has expressed no plans to use these two statutes to regulate genetically engineered organisms. The result is not surprising in light of the fact that no unique risks have been identified with respect to current commercial processes.

OSHA declined to regulate workplace exposures to engineered organisms because,

¹¹*See* 49 Fed. Reg. 50,856, 50,875 (Dec. 31, 1984); 50 Fed. Reg. 47,173, 47,193 (Nov. 14, 1985).

in its view, no unique risks to workers had been identified.¹² In its brief statement in the final Coordinated Framework, OSHA reiterated its position that no additional regulation of biotechnology workplaces was currently needed because no hazards from biotechnology *per se* had been identified.¹³ OSHA, however, indicated its readiness to regulate if any of the new biotechnology processes were shown to cause hazardous workplace conditions. In that regard, OSHA noted that the Occupational Safety and Health Act imposes a general duty on each employer to furnish its employees a place of employment free from recognized hazards likely to cause death or serious physical harm.¹⁴

The NIH expressed its intention to continue to rely on its funding authority for biotechnology research to prescribe guidelines for the conduct of that work, including requiring independent review in advance of designated research projects.¹⁵ The NIH Guidelines for Research Involving Recombinant DNA molecules (NIH Guidelines), first issued in 1976, have been updated repeatedly to keep pace with developments in ongoing research.¹⁶

Since its first publication in 1986, the Coordinated Framework has undergone two updates.¹⁷ The first update, in 1992, was issued to provide a “basis for the oversight of biotechnology products introduced into the environment or used for human or animal food.”¹⁸ The second update, in 2017, was intended to clarify the roles and responsibilities of the primary agencies that regulate biotechnology products, develop a long-term strategy for federal regulatory oversight of such products, and commission an independent, expert analysis of the future landscape of such products.¹⁹ In June 2019, President Donald Trump issued an executive order for the purpose of further modernizing the regulatory scheme applicable to biotechnology products.²⁰ Among other directives, the order requires agencies to review certain regulations and guidance to determine if updates are needed to remove barriers to bringing innovative and safe genome-edited-specialty-crop plant products to market, as well as requiring the development of an international strategy to remove trade barriers and expand markets for agricultural biotechnology products.

§ 19:9 Introduction to regulatory framework

Below is a review of the major federal statutes, regulations, and guidelines that

govern oversight of biological organisms and the premarket review requirements that apply to those organisms. The review focuses on the three major individual statutes applicable to the regulation of organisms intentionally introduced into the environment—FIFRA, TSCA, and the PPA. It also includes brief discussions of the Animal Health Protection Act (AHPA), the CAA, the FWPCA, the FFDCA, the OSTP definitions of classes of organisms, and the NIH Guidelines.

The approach chosen by the federal government for the premarket regulation of genetically engineered organisms intended for use in the open environment is largely modeled on the requirements that apply to a subset of their conventional counterparts. To the extent some of those requirements have been more restrictive for biotechnology products without a clear basis in risk, they have resulted in a process-based approach to regulation that has produced certain inconsistencies. This approach has not been without its critics, and gene editing techniques have raised these concerns anew given that they often do not introduce “foreign” DNA and contain modifications indistinguishable from those that could occur in nature or through conventional breeding.¹ The inconsistencies are further exacerbated by the advantage given to those entities that can afford to commit the time, effort, and funding necessary to navigate the regulatory process at one, two, and sometimes three different federal agencies.²

The review of statutes, regulations and guidelines that follows highlights three parameters important for the regulation of genetically engineered organisms: (1) scope of organisms covered; (2) scope of activities covered; and (3) authority for pre-release testing and review. For purposes of this discussion, it is assumed that at the time these provisions were established, the concerns about the introduction of genetically engineered organisms were potentially serious enough to justify the imposition of a significant regulatory burden on the regulated community, as well as a delay in the introduction of new products that have been shown to be of value to agriculture.

§ 19:10 Initial federal policies

The OSTP portion of the Framework established definitions of two classes of organisms considered to be appropriate for regulation: pathogens and so-called intergeneric organisms.¹ The OSTP definitions included certain important exemptions to the pathogen and intergeneric organism categories. In the OSTP’s view,

[Section 19:10]

¹51 Fed. Reg. 23,302, 23,306 (June 26, 1986).

exempted organisms, generally speaking, were of less concern than the pathogens and intergeneric organisms and in need of less, if any, regulatory scrutiny.²

The OSTP defined regulable pathogens as: (a) viruses or microorganisms that belong to species whose members have the ability to cause disease in other living organisms; or (b) organisms that are derived from pathogens or have been genetically engineered to contain genetic material from pathogens.³ Exempt from the pathogen category were organisms belonging to generally recognized non-pathogenic strains of species commonly used for laboratory research or commercial purposes.⁴ Also exempted were genetically engineered organisms that are created by the transfer from pathogenic source organisms of only well characterized, non-coding regulatory sequences such as origins of replication,⁵ ribosome binding sites,⁶ promoters, operators,⁷ and terminators.⁸

According to the OSTP definitions, intergeneric organisms are those deliberately formed to contain genetic material from source organisms in different genera.⁹ As with pathogens, exemptions were provided where the transferred genetic material consists of only non-coding regulatory regions from the donor organisms.¹⁰ The OSTP based the exclusion of such intergeneric transfers of non-coding sequences on the fact that such transfers do not result in the expression of new proteins in the genetically engineered organisms.¹¹ Left unaddressed by this rationale was the question whether, even in the absence of new proteins, exempted organisms might not possess novel traits of ecological significance. Other organisms exempt under the definitions included those formed by deletion or rearrangement of an organism's own genetic material, or by transfer to recipient organisms of genetic material from sources from within the same genera.

Concern about the definitions and their exemptions prompted the Foundation for Economic Trends (FET) to challenge their validity in court. In its suit, the FET asserted that the definitions issued by the OSTP were procedurally deficient because they appeared for the first time in the final framework and thus lacked notice and comment.¹² In any case, FET asserted that the definitions were irrational because, among other things, they exempted many genetically engineered organisms of

potential concern. In a memorandum opinion, the District Court for the District of Columbia dismissed the complaint for lack of a case or controversy.¹³ The court found that the definitions issued by the OSTP were not part of a legislative rulemaking.¹⁴ Because the definitions were without legal effect, notice and comment were not required and the plaintiff had no standing to object to the definitions.¹⁵ The court noted, however, that the plaintiff would have the opportunity to object to the definitions should they be incorporated by regulating agencies into legally binding rules.¹⁶ No such challenge was ever brought.

The OSTP also proposed principles for the scope of federal oversight for the planned introduction into the environment of organisms with modified hereditary traits. The principles are risk based rather than process based. The precise oversight mechanism for specific types of activities are to be established by the individual federal agencies.¹⁷ Subsequently, the OSTP proposed actions to update field test requirements for biotechnology plants developed for food or feed use, and to establish early food safety assessments for new (or “unfamiliar”) proteins produced by such plants.¹⁸

§ 19:11 NIH Guidelines

A brief discussion of the NIH Guidelines is important background for the review of the major regulatory statutes. The Guidelines serve to provide “biosafety practices and containment principles” for recombinant or synthetic nucleic acid research within the United States, and compliance is required to receive NIH funding.¹

The Guidelines identify the roles and responsibilities of the NIH, the research institution, the Institutional Biosafety Committee (IBC), and various experts such as the Biological Safety Officer (BSO) and Principal Investigator (PI). Human etiologic agents such as bacteria, parasites, and viruses are classified on the basis of hazard. Physical and biological containment measures are set out in considerable detail and linked to the degree of hazard associated with the research. Among other measures, the Guidelines address: training requirements; standards for ventilation systems and protective clothing; procedures for decontamination, inactivation, and movement of research materials; and requirements for recordkeeping and reporting.

In 1976, the NIH became the first federal agency to respond to the advent of recombinant DNA, the seminal technique of the new biotechnology,² and for nearly 10 years NIH acted as the *de facto* lead agency on the biotechnology issue. NIH’s presence in the regulatory arena is unusual because it is not a regulatory agency. Its official role is that of a funding agency, disbursing to the scientific community monies Congress appropriates for biological research.³

³42 U.S.C. § 241.

NIH's quasi-regulatory status is attributable to its development of guidelines for the conduct of research with organisms produced by recombinant DNA techniques and its establishment of a Recombinant DNA Advisory Committee (RAC) to formulate scientific policy and administer the Guidelines. Both the Guidelines and the RAC are the outgrowth of the now-famous meeting at Asilomar, California, at which eminent scientists agreed, in effect, to regulate themselves by placing restrictions on basic research carried out with recombinant DNA techniques.⁴

Early versions of the NIH Guidelines were directed almost solely toward the prevention of human health hazards posed by laboratory research with recombinant DNA. They described categories of recombinant DNA experiments ranked according to the likelihood that they would yield organisms that threatened human health, and either forbade the experiments or required that they be reviewed and approved by the RAC and NIH and carried out under a set of progressively stringent containment conditions.⁵ For example, laboratories at the P1 Level (Minimal) were deemed to possess no special engineering design features, and special containment equipment was neither required nor generally available.⁶ At the P2 Level (Low), the laboratory needed access to an autoclave within the building and a "Biological Safety Cabinet."⁷ Among other requirements, the P3 Level (Moderate) required laboratories to have special engineering design features and physical containment equipment, while the P4 Level (High) required experiments to be confined to work areas in facilities "designed to contain microorganisms that are extremely hazardous to man or [could] cause serious epidemic disease."⁸

Over the years, the NIH Guidelines were substantially relaxed as laboratory experience with the recombinant DNA technology failed to demonstrate any hazard to laboratory personnel or others.⁹ Most categories of experiments with recombinant DNA continue to require the approval of local IBCs, composed of in-house scientists and public representatives, although the RAC retains jurisdiction over the review of specific categories of experiments.¹⁰

The Guidelines are not restricted to particular organisms. Various provisions apply, as appropriate, to experiments with plants, animals, and microbes.¹¹ Additional guidance has been added over time to address such issues as physical containment for large-scale uses of organisms, including Good Large Scale Practice, physical and biological containment for research involving plants, physical and biological contain-

Amendments to the Guidelines are issued separately upon their approval and published in the Federal Register. See, e.g., 81 Fed. Reg. 15,315 (Mar. 22, 2016).

¹⁰U.S. Department of Health and Human Services, National Institutes of Health, *NIH Guidelines for Research Involving Recombinant or Synthetic Nucleic Acid Molecules* (Apr. 2019), https://osp.od.nih.gov/wp-content/uploads/NIH_Guidelines.pdf (last visited Jan. 12, 2022).

¹¹*Id.*

ment for research involving animals, and human gene transfer experiments.¹² Until recently the Guidelines were focused on research involving recombinant DNA and were known as the NIH Guidelines for Research Involving Recombinant DNA Molecules.¹³ NIH amended the scope of the Guidelines in 2012 to include certain research with nucleic acid molecules created solely by synthetic means and renamed them as NIH Guidelines for Research Involving Recombinant or Synthetic Nucleic Acid Molecules.¹⁴ NIH amended the Guidelines again in 2019, with the goal of both simplifying oversight for research protocols pertaining to human gene transfer research and reducing duplicative reporting requirements.¹⁵

Early versions of the NIH Guidelines also applied to deliberate release experiments,¹⁶ which are defined as experiments involving the planned introduction of recombinant DNA-containing microorganisms, plants, or animals into the environment.¹⁷ NIH involvement in reviewing this category of experiments was limited, however. Indeed, the first approval granted by NIH for an experiment involving the deliberate release of a recombinant microorganism was enjoined by a federal court which found that NIH's environmental assessment (EA) and its discharge of its statutory responsibility to consider the propriety of an environmental impact statement (EIS) under the National Environmental Policy Act (NEPA) were "wholly inadequate."¹⁸ Subsequent deliberate release experiments were submitted to EPA and USDA for review under statutes administered by those agencies, thereby eliminating the need for NIH review.¹⁹ In recognition of the breadth of coverage provided by EPA and USDA for environmental release experiments, the Guidelines were amended in 1994 to delete the requirement for NIH review of this category of experiments in its entirety.²⁰

Although the Guidelines have been and remain enormously influential, they are quite limited in scope. In terms of the parameters outlined above, the only activity they regulate is biotechnology research conducted at institutions that receive financial support from the NIH.²¹ Furthermore, while industry follows the NIH guidelines on a voluntary basis and other government agencies have adopted them

¹²*Id.*

¹³*See, e.g.*, 66 Fed. Reg. 1,146 (Jan. 5, 2001).

¹⁴77 Fed. Reg. 54,584 (Sept. 5, 2012).

¹⁵84 Fed. Reg. 17,858 (Apr. 26, 2019). NIH explained that, at the time, there were duplicative requirements for submitting protocols, annual reports, amendments, and serious adverse events for human gene transfer clinical research to both NIH and FDA, which did not exist for other areas of clinical research. 84 Fed. Reg. 17,858 (Apr. 26, 2019). Accordingly, NIH proffered the amended Guidelines in an effort to align oversight of human gene transfer clinical research with the oversight required for other types of research. *Id.*

Cir. 1985) (affirming an injunction prohibiting the release by University of California scientists of ice-minus bacteria engineered by recombinant DNA techniques pending completion of an EA by NIH). EPA subsequently reviewed and approved a virtually identical experiment under the federal pesticide program. *See* 51 Fed. Reg. 22,858 (June 23, 1986); § 19:19.

¹⁹The Guidelines were amended in 1987 to eliminate the requirement for NIH review of experiments approved by another federal agency. 52 Fed. Reg. 31,848, 31,848–50 (Aug. 24, 1987). Under an earlier revision to the Guidelines, NIH was authorized to defer to other federal agencies in its review of certain experiments. *See* 50 Fed. Reg. 48,344 (Nov. 22, 1985).

²⁰59 Fed. Reg. 34,472, 34,472–73, 34,475 (July 5, 1994). The Guidelines were amended again on August 5, 1994, to delete conditions for approving environmental release experiments involving certain plants. 59 Fed. Reg. 40,170, 40,170–73 (Aug. 5, 1994).

²¹51 Fed. Reg. 16,952, 16,959 (May 7, 1986).

as research guidelines,²² they do not impose any requirements on industrial or privately funded research. Even in terms of biotechnology research, they are restricted in coverage in that the Guidelines extend only to work with recombinant DNA and synthetic nucleic acid molecules. They do not include work with other technologies, such as nuclear transplantation.²³ Finally, the Guidelines are backed up by a relatively weak enforcement capability. The only legal sanction for violation of the Guidelines is a withdrawal of research funds.²⁴ While this sanction is an effective one within the scientific community, it has no other force. Even within the scientific community, NIH has limited authority to inspect research facilities and must rely on other federal agencies or either the good faith of researchers or the professional compulsion to publish to learn whether a researcher followed the Guidelines in carrying out an experiment. Notwithstanding these limitations, the NIH Guidelines quickly became the *de facto* standard followed by industry for liability and public accountability reasons.

As the need to regulate commercial products of biotechnology came to the fore, the main arena for regulatory action shifted away from NIH, although it remains responsible for NIH-funded research that is not otherwise federally regulated and experiments submitted voluntarily by the private sector. But the legacy of NIH for the future regulation of genetic engineering is an important one. While the RAC has not been without its critics, particularly from the ranks of environmentalists,²⁵ the RAC has maintained a good measure of credibility and prestige on potentially divisive scientific issues. Moreover, the RAC demonstrated the advantage of a procedure flexible enough to set rigorous standards that could be relaxed in a timely fashion to reflect a decreasing estimate of risk.

§ 19:12 Agricultural statutes

Agriculture is a major component of biotechnology policy because the current and future agricultural uses of genetically engineered organisms are so numerous,¹ and because those uses involve the open-air, large-quantity releases of organisms that provoke the greatest environmental concern. In contrast to product-oriented statutes like FIFRA, the agricultural statutes do not, in every case, narrow the issues to particular categories of products. From the regulatory perspective, application of most agricultural statutes to genetically engineered organisms has been more challenging than application of FIFRA in that it requires the development of a more-or-less comprehensive regulatory policy for all applications of the technology.

The USDA portion of the Coordinated Framework identified the regulatory programs that would be utilized for genetically engineered organisms.² Subsequently, USDA issued voluntary guidelines for research involving the planned introduction into the environment of organisms with deliberately modified hereditary traits.³

Following are discussions of the major statutes that USDA has at its disposal to

accomplish the regulation of products of biotechnology.

§ 19:13 Agricultural statutes—Virus-Serum-Toxin Act

The VSTA is a licensing statute which provides strict premarket testing and review of organisms classified as or involved in the production of veterinary biologics.¹ The VSTA provides USDA with the authority to regulate the import, export, and intrastate and interstate transport of veterinary biological products.² Such products are defined as “all viruses, serums, toxins, and analogous products of natural or synthetic origin, such as diagnostics, antitoxins, vaccines, live microorganisms, [and] killed microorganisms . . . *intended for use in the diagnosis, treatment, or prevention of diseases of animals.*”³ USDA and FDA have issued a memorandum of understanding resolving the overlap of jurisdiction between the VSTA and the FFDCA.⁴

Veterinary biologics must be prepared in USDA-licensed establishments and each product must be individually licensed for production.⁵ Product license applications require the submission of test reports and data establishing the purity, safety, potency, and efficacy of the product.⁶ “Safety” in these regulations generally refers to adverse effects on the recipient of the biologic or treatment, rather than to broad environmental effects.⁷

The VSTA regulations do, however, address environmental effects under certain circumstances. For example, they specifically require USDA’s approval prior to shipment of any experimental biological product.⁸ To obtain this approval, an applicant must furnish any information USDA requires in order to assess the product’s impact on the environment.⁹ These requirements are not tied to a commercial purpose, and thus appear to govern academic as well as commercial research.¹⁰ While the regulations could be read to govern only experiments involving *shipment* of experimental products, they are also subject to a broader interpretation.¹¹ In particular, the regulations require USDA to assure that the conditions under which experiments are to be conducted are adequate to prevent the spread of disease, and authorize USDA to impose special restrictions or tests, especially in the case of live organisms, whenever deemed necessary or advisable.¹² Permits are also required in order to import veterinary biological products for various purposes and a letter of authori-

¹²9 C.F.R. § 103.3.

zation is needed to produce experimental biological products at licensed facilities.¹³

In terms of organisms and activities covered, the VSTA is limited to organisms intended for a particular commercial use—that is, veterinary treatments. The VSTA, however, was the first agricultural statute with established procedures under which pre-release reviews of organisms were conducted.¹⁴ When assessing the potential impact on the environment under the VSTA, USDA routinely asks for data on virus shed, spread, and backpassage studies to determine the likelihood of reversion to virulence.

§ 19:14 Agricultural statutes—Animal Health Protection Act

The AHPA¹ provides additional authority under which USDA may regulate biotechnology products. Passed as part of the 2002 Farm Bill, this legislation consolidates, clarifies, and expands upon various prior statutes designed to protect animal health (*i.e.*, the animal quarantine statutes).

The AHPA's application to biotechnology products results not from any express provisions, but rather from its broad definitions and scope, which parallel that of the PPA that preceded it.² The AHPA defines “pest” very broadly, as any of several objects that “can directly or indirectly injure, cause damage to, or cause disease in livestock,” including, *inter alia*, an arthropod, bacteria, fungus, plant, parasite, virus, vector, or prion.³ “Livestock” is also defined more broadly than under previous animal quarantine statutes, to include “all farm-raised animals,” presumably including fish.⁴ And, the term “animal” itself is defined as “any member of the animal kingdom (except a human).”⁵ The term “article” is defined as “any pest or disease or any material or tangible object that could harbor a pest or disease.”⁶ The statute then authorizes USDA to “prohibit or restrict” the importation, exportation, or interstate movement of any article “if the Secretary determines that the prohibition or restriction is necessary to prevent the introduction or dissemination of any pest or disease of livestock.”⁷ The definition of the term “disease” is left to the discretion of USDA,⁸ indicating a potential broadening of the term's traditional definition, which could include specific references to changes brought about through the use of new technologies.

The AHPA defines the term “move” as, *inter alia*, “to release into the environment.”⁹ Transgenic plants and animals can be regulated under the AHPA based on their potential to be pests or to act as articles that could harbor pests or disease.

In December 2020, USDA, operating through its Animal and Plant Health Protection Service (APHIS) and Food Safety Inspection Service (FSIS), issued an advance notice of proposed rulemaking concerning the regulation of movement of certain

animals modified or developed by genetic engineering.¹⁰ Under the proposed regulatory framework, USDA would provide regulatory oversight from premarket review through post-market food safety monitoring for animals subject to the Federal Meat Inspection Act and Poultry Products Inspection Act that have been modified or developed by genetic engineering and are intended for use as human food.¹¹ USDA would additionally provide this level of regulatory oversight for certain genetically engineered animals intended for agricultural purposes.¹² As of April 2022, a proposed rule has not been issued.

§ 19:15 Agricultural statutes—Plant Protection Act

USDA has responsibility for safeguarding American agriculture and regulating organisms that pose a threat to plants. APHIS is typically the first stop for any researcher interested in developing a biotechnology plant. The PPA,¹ enacted in 2000, and its predecessor statutes, such as the Plant Pest Act and Noxious Weed Act,² provide USDA with the authority to regulate the movement into or within the United States of organisms that may endanger plant life and to prevent the introduction, dissemination, or establishment of such organisms.³

Based on authority Congress granted in the Plant Pest Act and other statutes then in existence in 1987, USDA established a regulatory process designed to ensure that certain genetically engineered plants and other “genetically engineered organisms” potentially posing a plant pest risk receive a thorough premarket review and, where appropriate, a permit before they are ever placed in an open field or otherwise introduced into the environment.⁴ USDA’s legal analysis,⁵ prepared in support of the biotechnology permit regulations, carefully reviewed the relevant legislative history in which Congress expressed its clear intent to fill a gap in previously existing law in order to “protect American agriculture against invasion by foreign plant pests and diseases,” such as the imported fire ant and witchweed, and to permit USDA to regulate the movement of “new” pests as well as those “that might later be found to be injurious.”⁶ The statutory authority available to APHIS to control the movement and introduction of such genetically engineered organisms, no matter how localized, was confirmed when Congress enacted the PPA and expressly provided that all plant pests, noxious weeds, plants, plant products, and articles capable of harboring plant pests or noxious weeds are “in or affect interstate commerce or foreign commerce.”⁷

Apart from genetically engineered organisms, however, all other organisms that

⁷PPA § 402(9), 7 U.S.C. § 7701(9); *see also* 54 Fed. Reg. 22,892, 22,895 (May 30, 1987).

meet the definition of a plant pest, real or potential, continue to be regulated under the permit system that predated the biotechnology rules.⁸ Thus, under USDA's broad reading of its legislative mandate, all novel and nonindigenous organisms are subject to APHIS review as potential plant pests without regard to their sources—that is, whether they are naturally occurring or produced through genetic engineering or classical genetics.⁹

In May 2020, USDA issued the Sustainable, Ecological, Consistent, Uniform, Responsible, Efficient (SECURE) Rule, which amended the Agency's biotechnology regulations at 7 C.F.R. Part 340.¹⁰ APHIS defines “genetic engineering” as “[t]echniques that use recombinant, synthesized, or amplified nucleic acids to modify or create a genome.”¹¹

“Organism,” in turn, is defined as “[a]ny active, infective, or dormant stage of life form of an entity characterized as living, including vertebrate and invertebrate animals, plants, bacteria, fungi, mycoplasmas, mycoplasma-like organisms, as well as entities such as viroids, viruses, or any entity characterized as living, related to the foregoing.”¹² Finally, “plant pest” is defined as “[a]ny living stage of a protozoan, nonhuman animal, parasitic plant, bacterium, fungus, virus or viroid, infectious agent or other pathogen, or any article similar to or allied with any of the foregoing, that can directly or indirectly injure, cause damage to, or cause disease in any plant or plant product.”¹³

With certain exceptions,¹⁴ revised Part 340 requires a permit to move any genetically engineered organism that: “(a) Is a plant that has a plant-trait-mechanism of action combination that has not been evaluated by APHIS in accordance with § 340.4 or that, as a result of such evaluation, is subject to the regulations; (b) Meets the definition of a plant pest in § 340.3; (c) Is not a plant but has received DNA from a plant pest, as defined in § 340.3, and the DNA from the donor organism either is capable of producing an infectious agent that causes plant disease or encodes a compound that is capable of causing plant disease; (d) Is a microorganism used to control plant pests, or an invertebrate predator or parasite (parasitoid) used to control invertebrate plant pests, and could pose a plant pest risk; or (e) Is a plant that encodes a product intended for pharmaceutical or industrial use.”¹⁵

Prior to the issuance of revised Part 340, APHIS provided a process for developers to petition for a determination that a particular genetically engineered organism should not be regulated as a plant pest or potential plant pest under the Part 340 regulations, referred to as a “determination of nonregulated status” or “deregulation.”¹⁶

Generally speaking, the regulations required USDA approval before a genetically engineered crop variety could be commercialized. Revised Part 340 eliminated that process in favor of a number of other options for determining whether a genetically engineered plant was regulated or not under Part 340 based on defined, science-

¹⁶*See* USDA APHIS, *Petitions for Determination of Nonregulated Status*, <https://www.aphis.usda.gov/aphis/ourfocus/biotechnology/permits-notifications-petitions/petitions/petition-status> (last visited Jan. 12, 2022).

based criteria.¹⁷ For example, certain genetically engineered plants are not subject to Part 340 because they contain modifications that can be obtained using conventional breeding, where there is a history of safe use related to plant pest risk, or where APHIS has previously evaluated a plant-trait-mechanism of action combination and determined that it is not to be regulated under Part 340.¹⁸

Under revised Part 340, developers of genetically engineered plants must first determine whether their plant meets the criteria for an exemption.¹⁹ USDA has provided a voluntary mechanism by which developers may seek confirmation from USDA as to whether a genetically engineered plant qualifies for an exemption.²⁰ APHIS “will provide a written response (confirmation letter) within 120 days of receiving a sufficiently detailed confirmation request,” except in unanticipated circumstances.²¹ Plant developers may also submit a request that USDA exempt a plant because it was “developed with additional modifications” not enumerated in the regulations but “that could be achieved through conventional breeding.”²²

For genetically engineered organisms that are not exempt, the developer may apply for a permit and/or, in the case of a genetically engineered plant, request that APHIS conduct a “regulatory status review” (RSR) to “determine whether there is a plausible pathway by which the genetically engineered plant, or any sexually compatible relatives that can acquire the engineered trait from the genetically engineered plant, would pose an increased plant pest risk relative to the plant pest risk posed by the respective non- genetically engineered or other appropriate comparator(s).”²³ Unlike the system that existed prior to the Sustainable, Ecological, Consistent, Uniform, Responsible, Efficient (SECURE) Rule, the RSR process requires much less information to be provided to APHIS and includes no requirement for laboratory or field-test data.²⁴

If, during the RSR process, APHIS determines that the genetically engineered plant is unlikely to pose an increased plant pest risk relative to its comparator(s), the plant will be deemed not subject to Part 340.²⁵ If APHIS identifies a plausible pathway by which the genetically engineered plant would pose an increased plant pest risk relative to its comparator(s), the developer may apply for a permit and/or request that APHIS conduct a second-level review by evaluating “the factor(s) of concern identified in the initial review to determine the likelihood and consequence of the plausible increased plant pest risk.”²⁶ Absent exigent circumstances, APHIS will complete its initial review of a request for an RSR within 180 days and the second level review within 15 months.²⁷

All permit applications must include detailed information such as the origin and destination of the genetically engineered organism, the quantity of the genetically engineered organism, “the country (or countries) and locality (or localities) where the organism was collected, developed, manufactured, reared, cultivated, and cultured (as applicable); the organism’s genus, species and any relevant subspecies

and common name information; the intended activity (i.e., importation, interstate movement, or release into the environment of the genetically engineered organism); and information on the intended trait and the genotype of the intended trait.”²⁸ Depending on the type of permit sought (e.g., a permit for release into the environment), additional information must be furnished to APHIS.²⁹

Permit conditions will govern the release and/or movement of the relevant genetically engineered organism, including procedures for maintenance and disposal, reports of volunteer monitoring activities, and remedial measures to prevent the spread of plant pests.³⁰ Absent exigent circumstances, an application for a permit will be approved or denied within (1) 45 days for an application for a permit for interstate movement or for importation, and (2) 120 days for an application for a permit for release into the environment.³¹

Prior to issuing a permit for the movement of a genetically engineered organism into the environment or making an RSR determination, APHIS must follow the requirements of NEPA,³² assess any potential impacts on threatened or endangered species under the Endangered Species Act (ESA),³³ and, depending on the agency’s initial review, prepare a publicly available EA as well as an environmental impact statement, when necessary.³⁴ Prior to issuing a permit for an environmental release, APHIS must also coordinate with the state where the release is planned, including submitting a copy of the application to the appropriate state or tribal regulatory official for review.³⁵

§ 19:16 Agricultural statutes—Litigation

For the first 20 years that APHIS actively regulated genetically engineered organisms, approving thousands of field tests and granting dozens of determinations of nonregulated status, there were no judicial challenges to the agency’s decisions. That changed in 2006, when environmental groups successfully challenged APHIS’s permitting of field trials of certain genetically engineered plants based on APHIS’s failure to properly document its environmental analysis of the field trials under NEPA and the ESA.¹ The following year, APHIS lost another lawsuit challenging its NEPA documentation of permitted field trials of genetically engineered glyphosate-

²⁸*Id.* § 340.5. Since 1987 and under the previous regulatory scheme, APHIS reviewed and acted on tens of thousands of proposals for the importation, interstate movement or field testing of regulated articles, with field tests conducted in virtually every state. *See* USDA APHIS, *Check Status*, https://www.aphis.usda.gov/aphis/ourfocus/biotechnology/permits-notifications-petitions/sa_permits/ct_status (last visited Jan. 12, 2022). In the vast majority of cases, APHIS either approved the permit application or acknowledged the notification, allowing the proposed activity to proceed. *Id.* While most of these actions related to corn, cotton, soy and other food or feed crops that were engineered for insect resistance, herbicide tolerance or a combination of both traits, many permits covered plants with pharmaceutical or industrial applications. *Id.* Still, hundreds of permits and notifications were denied, and hundreds more were withdrawn by the submitter or found to be incomplete by APHIS with no further action taken. *Id.*

tolerant grasses.² APHIS has since revised its procedures to provide for appropriate documentation of environmental review for field trials.³ In a more recent challenge to permitted field trials of genetically engineered eucalyptus trees under both NEPA and the ESA, APHIS prevailed on all counts.⁴

In 2007, environmental groups saw the first of two successful challenges to deregulation decisions authorizing commercialization of herbicide-tolerant crops based on NEPA procedural violations.⁵ In each of these cases, the first involving genetically engineered glyphosate-tolerant alfalfa, and the second genetically engineered glyphosate-tolerant sugarbeet, APHIS had prepared an EA under NEPA. However, in both cases, the courts found that the EAs did not adequately address evidence of environmental, social and economic impacts of the GE crops, vacated APHIS's determinations of nonregulated status, and ordered APHIS to prepare EISs.⁶

In the alfalfa case, the district court initially enjoined APHIS from allowing any planting of the crop pending completion of an EIS,⁷ and this injunction was upheld by the Ninth Circuit.⁸ The Supreme Court overruled the injunction, however, recognizing that it is, in the first instance, the role of APHIS, not the courts, to determine what level of planting may be appropriate during the pendency of an EIS.⁹ In another similar case, plaintiffs unsuccessfully challenged APHIS's approvals of limited sugarbeet plantings pending completion of the sugarbeet EIS.¹⁰

APHIS completed EISs for both glyphosate-tolerant alfalfa and glyphosate-tolerant sugarbeet in December 2010 and June 2012, respectively.¹¹ Environmental groups unsuccessfully challenged the alfalfa EIS under both NEPA and ESA,¹² and appealed that decision to the Ninth Circuit. On appeal, the court held that genetically engineered alfalfa was not a "plant pest" under the meaning of the term in the PPA and its implementing regulations, and that the deregulation of the alfalfa by APHIS did not violate the ESA or NEPA.¹³ According to the Ninth Circuit, APHIS's deregulation of the alfalfa was a nondiscretionary act resulting from its determination that the plant was not a plant pest under the PPA. Thus, APHIS had no duty

to consult under the ESA and no obligation to consider alternatives to unconditional deregulation under NEPA.¹⁴ Moreover, the court stated that the Coordinated Framework tasks EPA, not APHIS, with regulating herbicide use pursuant to FIFRA. The PPA does not address alleged harms caused by the increased use of herbicides, and APHIS has no authority to regulate that use.¹⁵

Plaintiffs have also used NEPA to successfully challenge decisions by the U.S. Department of the Interior and the Fish and Wildlife Service (FWS) for the government's failure to document potential environmental impacts of planting biotechnology crops at wildlife refuges.¹⁶ However, these cases have not been universally successful.¹⁷ In 2014, FWS issued a memorandum stating that it would phase out the use of genetically engineered crops on refuge lands to feed wildlife, but would nonetheless consider temporary use of genetically engineered crops for habitat restoration on a case-by-case basis.¹⁸ In August 2018, however, FWS issued a memorandum withdrawing the 2014 memorandum.¹⁹ FWS's subsequent withdrawal of the memorandum was also challenged by environmental groups on NEPA and ESA grounds, but was ultimately dismissed.²⁰

Recently, plaintiffs brought suit under NEPA and the ESA to challenge FDA's approval of a New Animal Drug Application (NADA) that allowed for the development, marketing, and sale for human consumption of a genetically engineered salmon.²¹ In March 2016, plaintiffs filed suit alleging that FDA had not adequately assessed the environmental and ecological effects of the approval of the NADA. Among other allegations, the plaintiffs claimed that FDA failed to prepare an EIS as required by NEPA and further failed to consult with the federal fish and wildlife agencies as required by the ESA. On November 12, 2020, the court entered judgment in favor of plaintiffs based on violations of NEPA and the ESA, but left the approval in place while the Agency updated its analysis.²²

Perhaps motivated by the growing global scientific consensus that biotechnology crops themselves are safe, plaintiffs have more recently brought challenges based on alleged adverse effects of the pesticides used in conjunction with those crops. Initially these challenges took the form of anti-biotech ordinances passed by local jurisdictions in Hawaii. A summary of these legislative actions and the inevitable

judicial challenges follows.

In November 2013, the Kauai County Council passed Bill 2491, which principally restricted pesticide use but also required disclosure of genetically engineered crop cultivation locations and imposed buffer zone requirements that restricted the cultivation of genetically engineered crops. Biotech seed companies filed suit in federal court to challenge the ordinance on several grounds, including on the basis the ordinance was preempted by state and federal law.²³ In August 2014, Magistrate Judge Barry Kurren issued a final decision in the case, finding that Bill 2491 was preempted by state law and issuing an injunction against implementation of the measure.²⁴ Kauai County and the intervenors appealed to the Ninth Circuit and, in November 2016, the Court of Appeals affirmed the decision of the lower court.²⁵

In December 2013, Hawaii County passed Bill 113, which severely restricted the cultivation, propagation, development, and testing of genetically engineered crops. Papaya farmers, including named Plaintiff Ross Sibucan, filed a narrow lawsuit in Hawaii state court to seek relief from implementation of the registration and disclosure provisions of Hawaii Bill 113. Plaintiffs first obtained a temporary restraining order and then a preliminary injunction, indicating that all genetically engineered papaya growers in the County would be protected from disclosure of their identities and the location of their genetically engineered papaya crops.²⁶

In June 2014, farmers, ranchers, flower growers, and organizations representing them, along with the Biotechnology Industry Organization, filed a second, broader lawsuit in federal district court, comprehensively challenging Bill 113.²⁷ The case was assigned to Magistrate Judge Barry Kurren. The plaintiffs filed a motion for partial summary judgment in July, which was heard in October 2014. In December 2014, the court held that Bill 113 was wholly preempted by state law and partially preempted by federal law.²⁸ The County's appeal to the Ninth Circuit was unsuccessful.²⁹

In November 2014, voters in Maui County narrowly approved a restrictive "moratorium" on genetically engineered crops that for all intents and purposes operated as a ban. Opponents of the moratorium brought suit in federal court against the County.³⁰ On June 30, 2015, Chief Judge Susan Mollway issued a 56-page opinion in which she concluded on the merits that the ordinance "is preempted by federal and state law and exceeds the County's authority to impose fines."³¹ The County and the intervenors appealed to the Ninth Circuit and, in November 2016, the Court of Appeals affirmed the decision of the lower court.³²

Also notable is the recent challenge to USDA's amendment to 7 C.F.R. Part 340,

as described in Section 19:15.³³ In July 2021, plaintiffs brought suit challenging the final rule, alleging violations of NEPA, the ESA, and the PPA, among other statutes. Plaintiffs specifically allege that USDA failed to undertake a required consultation process in violation of the ESA, failed to explore reasonable alternatives that would be more protective of the environment in violation of NEPA, and failed to comply with the PPA because it does not implement USDA's noxious weed authority. The case is still pending as of this writing.³⁴

§ 19:17 Agricultural statutes—Summary of the agricultural statutes

The jurisdiction of the agricultural statutes covers organisms used for certain purposes (*e.g.*, veterinary biologics) or having certain properties (*e.g.*, plant pests), resulting in a diverse pattern of coverage without a direct relationship to the broad range of potential ecological effects that may be associated with products of biotechnology. The statutes on their faces do not appear to cover, for example, either organisms that are beneficial to plants or crop plants, although in theory both may be as likely to disturb the environment as are organisms fitting the definitions of plant pests or noxious weeds. However, APHIS takes a very broad view of its authority under these statutes. In one example, USDA regulated honeybees, not because they were harmful to plants, but because of an infestation by mites that were harmful to the honeybees.¹

Notwithstanding any perceived statutory limitations, USDA has moved aggressively to bring genetically engineered plants and other organisms within the purview of its regulatory review programs, which have traditionally been utilized to limit the movement and introduction of organisms considered to be agricultural pests, noxious weeds, or agents of contagious disease. Although the principal purpose of these programs has been protection of agriculture rather than the environment, USDA has made a concerted effort to address the full range of potential ecological effects by consulting with EPA and other government agencies and by preparing EAs prior to acting on proposals for release, movement, or licensure of genetically engineered products.² APHIS promulgated revised procedures for conducting EAs in 1995,³ and adopted a policy for responding to the low-level presence of regulated genetically engineered plant materials in 2007.⁴

Although USDA has been successfully challenged in court on several occasions since 2006, all of the deficiencies noted were procedural in nature. No court has ever found that a genetically engineered organism posed a threat to health, safety, or the environment.

§ 19:18 Federal Insecticide, Fungicide, and Rodenticide Act—Regulation of pesticides¹

FIFRA played an early and key role in the regulation of genetically engineered

products—specifically, pesticides. FIFRA is a licensing statute that regulates chemicals and microorganisms intended for use as pesticides and prohibits the sale or distribution of pesticides not registered with EPA.² Congress amended the statute in 1988 to make it clear that, to the extent necessary to prevent any unreasonable risk to humans or the environment, EPA is authorized to limit the distribution, sale, or use in any state of any pesticide that is not registered and not otherwise the subject of an experimental use permit or emergency exemption.³

FIFRA's jurisdiction extends to substances “intended for preventing, destroying, repelling, or mitigating any pest, . . . [or] for use as a plant regulator, defoliant or desiccant.”⁴ The term “pest” is defined broadly to include “any insect, rodent, nematode, fungus, weed, or . . . any other form of terrestrial or aquatic plant or animal life or virus, bacteria, or other micro-organism (except viruses, bacteria, or other micro-organisms on or in living man or other living animals) which the Administrator declares to be a pest” under FIFRA.⁵ By far, the greatest number of pesticides are conventional chemical substances, although a number of microbial pesticides and biochemical pesticides have been registered under FIFRA.⁶ The federal government registered the first microbial pesticide in 1948 to control Japanese beetle larvae, although it was not until the late 1960s and early 1970s that interest in microbial pesticides, and genetically engineered versions, began to increase.⁷

Registration does not require that pesticides be proven absolutely safe to humans or to the environment. Such a requirement would effectively bar the use of pesticides, because chemicals that are intended to kill pest organisms are often also dangerous to other living beings. Under FIFRA, EPA balances the adverse effects of pesticides against their benefits to the economy, society, and the environment.⁸ The statute conditions EPA's approval of a pesticide on its conclusion that the pesticide's use “will not generally cause unreasonable adverse effects on the environment.”⁹ As part of the registration process, EPA sets the terms and conditions for use of a pesticide in order to meet that statutory standard. These terms and conditions are reflected in the label approved for each pesticide product.¹⁰ It is a violation of FIFRA to use a registered pesticide in a manner inconsistent with its label.¹¹ Where EPA determines that a pesticide applied in accordance with the directions for use may cause unreasonable adverse effects to the environment, including injury to applica-

tors, pesticide registrations may be restricted to particular uses and specific conditions that avoid those effects.¹² Pesticides classified for restricted use may be applied only by or under the direct supervision of a certified applicator.¹³

FIFRA and implementing EPA regulations require applicants to perform a variety of different studies and tests and to submit extensive health and environmental data on which the Agency can base its registration decision.¹⁴ For pesticides intended for use on food or feed crops, EPA requires applicants to provide additional data to address potential dietary risks.¹⁵ The Agency then takes appropriate action under the FFDCA with respect to anticipated residues of the pesticide in the food supply.¹⁶ In order to register a food or feed use for a pesticide, EPA must determine that any residue of the pesticide that may be present in or on food or feed will be “safe,”¹⁷ defined to mean that there is “a reasonable certainty that no harm will result from aggregate exposure to the pesticide chemical residue, including all anticipated dietary exposures and all other exposures for which there is reliable information.”¹⁸

§ 19:19 Federal Insecticide, Fungicide, and Rodenticide Act—Microbial pesticides

EPA’s policy for regulating genetically engineered microorganisms under FIFRA, first announced in 1984,¹ and confirmed in the 1986 OSTP Framework document, built on the existing microbial pesticide regulations. The policy asserted jurisdiction over genetically engineered microorganisms, declining to regulate vertebrates, insects, and macroscopic parasites.² For purposes of FIFRA’s policy, “genetically engineered” includes not only organisms prepared by recombinant DNA techniques, but also by other advanced techniques, such as recombinant RNA, cell fusion, and plasmid transfer.³

In its most important action in this matter, EPA announced that it would not apply the small acreage exemption from the requirements to obtain experimental use permits (EUPs) to field tests of genetically engineered or nonindigenous microbes.⁴ The development of pesticide products routinely requires field tests to determine whether pesticides are effective under field conditions and to generate the data needed to support the registration application. FIFRA permits applicants to obtain

EUPs so they can conduct such tests prior to registration.⁵ Normally, however, small tests involving 10 acres of land or less are exempt from this requirement.⁶ Under the 1984 policy, the exemption no longer applied to nonindigenous or genetically engineered microorganisms, in effect extending EPA's jurisdiction to all field releases of genetically engineered microorganisms intended for pesticidal use.⁷ Applicants intending to test nonindigenous or genetically engineered microbes were required to notify EPA of their intent to test and submit with that notice information enabling EPA to decide whether an EUP was necessary.⁸

EPA's original microbial pesticide policy embodied a case-by-case approach. Rather than publish generic guidelines prior to processing applications for EUPs, EPA proceeded to evaluate each application as it arrived.

In accordance with its EUP procedures, EPA required and subsequently received applications for EUPs for small acreage tests of so-called ice-minus bacteria.⁹ After thorough review, including several requests to the company for additional data, EPA issued its first approval of a release of a living organism engineered by recombinant DNA techniques.¹⁰ EPA's approval of the EUPs was immediately challenged in court.¹¹ Following a temporary suspension of the EUPs by the Agency,¹² Judge Thomas F. Hogan denied plaintiffs' request for a preliminary injunction.¹³ The suspension was subsequently lifted and, following unsuccessful attempts at the state and local levels to block the release of the bacteria, the experiment was conducted uneventfully in April 1987 in Contra Costa County, California. EPA has since processed dozens of submissions and approved a number of additional experiments with genetically engineered microbial pesticides.¹⁴

After 10 years of experience in reviewing notifications and approving EUPs for field tests of genetically modified microbial pesticides, in 1994, EPA promulgated separate regulations governing the notification process for these experiments.¹⁵ The regulations codified the preexisting Agency procedure in effect since 1984. That procedure involved EPA screening planned small-scale tests to evaluate the potential for adverse effects on human health or the environment. EPA would then determine whether to require an EUP for carrying out the test.¹⁶

The 1994 rule applies to small-scale testing of microbial pesticides whose

pesticidal properties have been imparted or enhanced by the introduction of genetic material that has been deliberately modified.¹⁷ Small-scale tests include the experimental use of a microbial pesticide in a facility such as a laboratory or greenhouse, or in limited replicated field trials or other tests conducted on a cumulative total of no more than 10 acres of land or one surface acre of water per pest.¹⁸ The phrase “introduction of genetic material” is defined broadly to include the movement of nucleotide sequences into a microorganism regardless of the technique used, and the phrase “deliberately modified” is defined as the directed addition, rearrangement, or removal of nucleotide sequences to or from genetic material.¹⁹ The term “microorganism” includes a bacterium, fungus, alga, virus, or protozoan.²⁰

In promulgating the regulations, EPA significantly reduced the number of notifications that applicants must submit, relative to prior EPA policy.²¹ The regulations carve out a specific exemption for an entire category of low-risk experiments involving microbial pesticides resulting from deletions or rearrangements within a single genome that are brought about by the introduction of genetic material that has been deliberately modified.²² In addition, testing conducted in a facility with adequate containment and inactivation controls, as specified in the rule, does not require notification.²³ Finally, the rule exempts from review certain nonindigenous microbial pesticides, with the exception of those that have not been acted on by, or are not pending before, USDA.²⁴

Applicants must submit notification to EPA at least 90 days prior to the initiation of the proposed test. Notification must include data on the microorganism involved and its potential effects, including such information as host range, survival and ability to increase in numbers in the environment, relative environmental competitiveness compared to the parental strain, potential for genetic transfer and exchange with other organisms, genetic stability of any inserted sequences, and means of evaluating potential adverse effects and methods of controlling the microorganism if detected beyond the test area.²⁵

EPA then reviews and evaluates the data submitted and makes a determination no later than 90 days after receipt of a complete notification.²⁶ However, the proposed test may not proceed until the submitter has received notice from EPA that the Agency has approved the test.²⁷ EPA may respond to a notification by (1) requiring additional data, (2) approving the test as proposed, (3) approving the test with modifications, (4) requiring an EUP for the test, or (5) disapproving the test because of the potential for unreasonable adverse effects.²⁸

The rule includes a petition process by which additional pesticides may be proposed for exemption, and an explicit reminder of the obligation for those conduct-

ing tests on microbial pesticides to submit information of adverse health and environmental effects to EPA regardless of whether the pesticide is subject to notification or is exempt.²⁹ Finally, the regulations warn that EPA may seek civil or criminal penalties or otherwise invoke the sanctions provided for under FIFRA for violations of the regulations or the terms or conditions of the approval given by EPA, or for use of a microbial pesticide in a manner that creates an imminent threat of substantial harm to health or the environment.³⁰

§ 19:20 Federal Insecticide, Fungicide, and Rodenticide Act—Plant-incorporated protectants

Through modern genetic techniques, it is possible to develop plants whose genetic structure has been altered or manipulated to exhibit pesticidal traits. In particular, these techniques permit the development of plants that produce their own pesticides or are otherwise resistant to insects, viruses, and other plant pests. This capability is an extension of traditional plant breeding techniques that attempt to select the heartiest and most disease-resistant strains for use in producing hybrid seeds and plants. In many cases the active pesticidal entity or “active ingredient” would be a protein produced by the plant. Following a lengthy review of regulatory options for addressing pesticidal substances that are produced in living plants, but not extracted from the plants, EPA announced its intention to regulate these substances—but not the plants themselves—as “plant-pesticides” under FIFRA.² In addition, for crop plants, residues of the pesticide anticipated in the food or feed would require a separate safety determination by EPA pursuant to a rulemaking conducted under the FFDCA.³

After a protracted rulemaking proceeding,⁴ which included a delay while key issues were reviewed by a committee convened by the National Research Council,⁵ EPA promulgated final rules in 2001 for regulating what the Agency now refers to as “plant-incorporated protectants” (PIPs).⁶ As a practical matter, the Agency had been implementing the essential elements of the 1994 proposal in registration and tolerance decisions made since 1995.⁷

Keeping abreast of scientific developments, EPA issued an advance notice of

[Section 19:20]

¹FIFRA § 2(a), 7 U.S.C. § 136(a).

²59 Fed. Reg. 60,496 (Nov. 23, 1994).

³*Id.*; See FFDCA § 408, 21 U.S.C. § 346a.

⁴The process was complicated due to the need to address EPA’s pesticide responsibilities under both FIFRA and the FFDCA, both of which were amended during the rulemaking by the Food Quality Protection Act. Pub. L. No. 104-107, 110 Stat. 1489 (1996). In deciding how best to address genetic engineering techniques for pesticides, EPA convened three conferences of regulators and scientists between 1987 and 1990 and sought advice from the Agency’s Scientific Advisory Panel and Biotechnology Advisory Committee in public meetings held between 1992 and 1994. See 66 Fed. Reg. 37,771, 37,775 (July 19, 2001) (discussing conferences). A package of five policy statements and rulemaking proposals was published for public comment in 1994, followed by requests for public comment on three supplemental proposals that addressed specific elements of the original notice. See *id.*

⁵National Research Council, GENETICALLY MODIFIED PEST-PROTECTED PLANTS: SCIENCE AND REGULATION (2000).

⁶66 Fed. Reg. 37,771 (July 19, 2001) (establishing a new Part 174 of Title 40 C.F.R.). Interestingly, one of the most controversial issues focused on the appropriate nomenclature for the substances being regulated by EPA. See, e.g., 66 Fed. Reg. 37,771, 37,781 (July 19, 2001).

⁷See U.S. EPA, *Current and Previously Registered Section 3 Plant-Incorporated Protectant (PIP) Registrations*, <https://www.epa.gov/ingredients-used-pesticide-products/current-and-previously-registered-section-3-plant-incorporated> (last visited Jan. 12, 2022) (listing current and previously registered

proposed rulemaking in 2020 regarding possible exemptions for certain PIPs derived from newer technologies.⁸ Under EPA regulations, the term “plant-incorporated protectant” is formally defined as “a pesticidal substance that is intended to be produced and used in a living plant, or in the produce thereof, and the genetic material necessary for production of such a pesticidal substance.”⁹ It also includes any inert ingredient “contained in the plant, or produce thereof.”¹⁰ In turn, “pesticidal substance” is defined as “a substance that is intended to be produced and used in a living plant, or in the produce thereof, for a pesticidal purpose, during any part of a plant’s life cycle (e.g., in the embryo, seed, seedling, mature plant).”¹¹ The term “produce thereof,” when used with respect to plants containing PIPs, means “a product of a living plant containing a plant-incorporated protectant, where the pesticidal substance is intended to serve a pesticidal purpose after the product has been separated from the living plant.”¹² Examples of such products might include agricultural produce, grains, and lumber. Importantly, EPA noted that products, such as raw agricultural commodities bearing pesticide chemical residues, are not “produce thereof” when the residues are not intended to serve a pesticidal purpose in the produce.¹³

EPA has approved several dozen of these PIPs for commercial sale and use in corn, cotton, soybean, potato, plum, and papaya.¹⁴ The EPA regulatory process governing approval of PIPs typically proceeds in two or three distinct stages, depending on the product involved. First, researchers interested in conducting field tests, typically on over 10 acres of land, apply for an EUP under § 5 of FIFRA.¹⁵ Generally at this point small-scale field tests have already been conducted pursuant to a permit or notification under USDA’s permit program.¹⁶ If granted, an EUP allows research to proceed, subject to monitoring requirements and under carefully controlled conditions that address such factors as the size and location of test plots, duration of plantings, and the use of cultivated crops, which generally are prohibited from entering the food supply.¹⁷ The next stage, which applies to some but not all products, involves an application to EPA for a registration that is limited to the production of propagative plant products such as seeds, tubers, corns, and cuttings.¹⁸ The production of these plant reproductive materials is an integral step in the development of certain commercial plant varieties. The final stage involves submission to EPA of an application for a registration under § 3 of FIFRA that will autho-

rize full commercialization of the PIP.¹⁹ Assuming the plant will be used for food or feed, the applicant must also petition for establishment of a food safety tolerance for the pesticidal substance, typically a protein, or an exemption from tolerance requirements under § 408 of the FFDCA.²⁰

EPA granted the first registration for a PIP to Monsanto Company in 1995 for a potato, under the trade name NewLeaf, that contained the genetic material needed to produce an insecticide within the plant.²¹ The plant-incorporated protectant was produced when genetic material necessary to make an insecticidal protein was taken from a naturally occurring bacterium, *Bacillus thuringiensis* or “B.t.,” and transferred to the potatoes. The insecticidal protein was produced in very small quantities by the potato plant and was specifically designed to control the Colorado potato beetle, a serious plant pest. EPA found that the protein is nontoxic to mammals, birds, and most other insects, and would eliminate the use of traditional chemical pesticides sprayed on the crop to control the Colorado potato beetle.²² In addition to the registration granted under FIFRA, EPA also issued an exemption from the requirement for a tolerance under the FFDCA for residues of the insecticidal protein and the genetic material necessary for its production in the potatoes.²³ The technology has advanced considerably since the early approvals. In 2011, EPA registered the first combination product to include a “stack” of multiple insect-resistant traits referred to as SmartStax.²⁴ EPA has additionally registered B.t. PIPs deployed as “pyramids,” where two or more proteins are used to address a single pest.²⁵

EPA used the new rules issued in 2001 as an opportunity to address the relationship between plants and PIPs and clarify that plants used as biological control agents remain exempt from FIFRA requirements.²⁶ In particular, EPA confirmed that it was not regulating plants or varieties of plants per se, but rather the pesticidal substances produced in the plants.²⁷

In general, macroorganisms intended to function as biological control agents have been exempted by EPA from regulation under FIFRA.²⁸ EPA defines a “biological control agent” as “any living organism applied to or introduced into the environment that is intended to function as a pesticide against another organism declared

²⁸40 C.F.R. § 152.20(a).

to be a pest” under FIFRA.²⁹ This exemption applies to all biological control agents other than eucaryotic microorganisms, including protozoa, algae and fungi; procaryotic microorganisms, including bacteria; and parasitically-replicating microscopic elements, including viruses.³⁰ Coverage under the exemption extends to both invertebrate and vertebrate macroorganisms and is based on a finding that, in general, such organisms are adequately regulated by USDA and the U.S. Department of the Interior, respectively.³¹ While all living plants intended for use as biological control agents are exempt from FIFRA requirements, the regulatory status of PIPs is addressed separately under 40 C.F.R. Part 174.³² In the event that EPA determines that an individual biological control agent or class of biological control agents is no longer adequately regulated by another federal agency, and should not otherwise be exempted from the requirements of FIFRA, EPA has stated its intention to amend the regulation to revoke the exemption.³³

Pursuant to this exemption, macroorganisms such as ladybugs, mantises, chrysanthemums, and marigolds were formally exempted from regulation as pesticides. In particular, with respect to plants that met the definition of a biological control agent, EPA determined that USDA had mechanisms in place to adequately regulate those organisms.³⁴ The fact that most plants found in nature contain chemicals that may possess certain pesticidal properties did not lead EPA to conclude that regulation of plants as pesticides under FIFRA was warranted. This conclusion was in keeping with the Agency’s previously established policy of not imposing FIFRA requirements on macroscopic biological control agents.³⁵

The exemption for macroorganisms explicitly states that PIPs are not exempt, but, rather, are addressed in their own set of regulations.³⁶ An analysis of EPA’s proposed rules issued in 1994 and final rules issued in 2001 confirms that the Agency examined this issue at length and concluded that the existing exemption does not cover PIPs. It does, however, cover the plants in which the protectants are produced.³⁷

The only practical difference between an EUP or a registration for a conventional chemical pesticide and an EUP or a registration for a pesticide expressed in a genetically engineered plant is that, in the case of the conventional product, the pesticide is applied to the plant or the soil as opposed to being present in the plant itself. Regulation of pesticides produced in plants through genetic engineering has been a prudent course to follow as the technology proved its safety and its value to growers and the environment.³⁸ Now that those objectives have been met, the Agency has presumably gained sufficient experience to make informed decisions with respect to possible new science-based exemptions in line with those provided for

certain other pesticide products.³⁹

Where the pesticide itself is regulated under FIFRA, there should be no need to regulate the plant as a pesticide, and EPA has repeatedly confirmed its decision to proceed in that manner.⁴⁰ The plant would be subject to regulation by EPA only indirectly and only to the extent necessary to assure adequate regulation of the pesticide in the plant. A variety of terms and conditions are routinely imposed on the sale and use of pesticides under registrations and EUPs. The plants themselves are subject to regulation directly by USDA.⁴¹

Current genetic manipulation techniques also permit development of plants designed to exhibit tolerance to herbicides and other agricultural chemicals.⁴² The pesticides to which the plants in question would be tolerant would have to be registered by EPA under FIFRA. Even if already registered, an amendment would be required to the registration in order to permit use of the pesticide on the plants in question or at the higher application rate permitted as a result of the engineered tolerance of the plants.⁴³ Where food or feed crops are involved, the possibility of pesticide residues would have to be addressed under the FFDCA. The widespread adoption of herbicide tolerant crops has generated considerable controversy due to the concern that this might increase the use of traditional chemical pesticides particularly if instructions for use are not followed.⁴⁴ As to the widespread commercial adoption of PIPs, the only meaningful concern identified has been the potential development of resistance by the lepidopteran pests, such as corn rootworm, that the proteins expressed by the modified crops are designed to target. EPA has moved aggressively to address this concern through consultations with independent experts and a variety of insect resistance management (IRM) conditions imposed on the PIP registrants.⁴⁵

§ 19:21 Federal Insecticide, Fungicide, and Rodenticide Act—Summary of FIFRA

There is little controversy about the application of FIFRA to genetically engineered microorganisms. FIFRA provides EPA ample authority to conduct pre-release reviews of an important category of microbial pesticides and to register those that meet FIFRA's exacting standards. EPA first announced a policy interpreting that authority in 1984 and immediately put in place a program implementing that policy. With respect to plants whose genetic structure is modified to exhibit pesticidal traits, the Agency has successfully asserted jurisdiction over the pesticidal substance in those plants, has reviewed and approved numerous applications for field testing and has registered numerous PIPs expressed in corn, cotton, soybeans,

and a variety of other crops.¹

Although considered generally a satisfactory vehicle for premarket review, some may question the adequacy of the statute's enforcement mechanisms for controlling the use of engineered pesticides. As noted above, FIFRA often restricts pesticide registration to particular uses and conditions of use specified on the product label. For conventional chemical pesticides, much of the enforcement is directed toward ensuring that pesticides are applied in accordance with those restrictions. The enforcement effort relies heavily on inspections conducted at the state level where products are sold and used.

For PIPs, enforcement practices must follow a somewhat different path. Typically, the commercial product purchased by farmers is a bag of pest-protected seed. While the seed contains the genetic material needed for the plant to express the pesticidal substance, neither the seed nor the plant are regulated as a pesticide, nor are they labeled as such. Accordingly, it is the registrant that bears the burden of compliance with the terms and conditions of registration, and it is in those terms and conditions that the various restrictions specified by EPA are found. Farmers and other end users of seeds and plants that contain plant-incorporated protectants are bound by contractual or other commercial arrangements entered into with the registrant. As a practical matter, those arrangements take the place of a pesticide label and require compliance with the appropriate conditions of registration, such as insect resistance management.² For many pest-protected crops, such as insect-resistant corn and cotton, the registrants must provide their customers with a variety of educational materials and report to EPA at regular intervals on adherence by those customers to the specified registration conditions.³

EPA's current approach to enforcement of the terms and conditions of registration for PIPs appears to be working and FIFRA's enforcement authority appears to be adequate.⁴

§ 19:22 Toxic Substances Control Act¹

One of the most interesting statutes available to regulate the products of biotechnology is TSCA.² In contrast to FIFRA, which regulates a narrowly defined product category, TSCA is a comprehensive statute addressed to the full range of

problems associated with the manufacture of “chemical substances.”³ This term is defined to include tens of thousands of industrial and consumer chemicals that are not subject to regulation as pesticides, foods, drugs, or certain other specific product categories.⁴ The statute provides broad authority to regulate chemicals from cradle to grave, both prior to, during, and after manufacture, and includes the ability to gather information about the covered substances. TSCA provides EPA with an assortment of regulatory tools that can be used to oversee the commercial development, production, and use of biotechnology products.

Enacted in late 1976, TSCA was the product of six years of intense congressional debate.⁵ The central issue of the debate, the premanufacture review of chemicals, was finally resolved with a compromise between the burden the review program imposes on industry and the increment of safety it is expected to achieve.⁶ Just as at TSCA’s inception, following several years of deliberation, the statute underwent significant amendment in 2016 when Congress passed, with bipartisan support, and President Obama signed the Frank R. Lautenberg Chemical Safety for the 21st Century Act.⁷ Among other enhancements, the amendments require new chemicals to receive a more extensive, risk-based review and an affirmative safety evaluation from EPA prior to market entry.⁸ In addition, TSCA now sets out a mechanism for the collection of user fees, providing a new source of funding for the agency’s work.⁹ EPA uses TSCA to review the proposed manufacture and use of covered genetically engineered microorganisms on a case-by-case basis.¹⁰ Below is a discussion of some of the features of TSCA which are important to that end.

§ 19:23 Toxic Substances Control Act—Premanufacture notice program

TSCA administers a premanufacture review program for chemical substances that is midway in its burden on industry between the classical licensing scheme seen in FIFRA and the permitting scheme seen in the agricultural statutes. The premanufacture notice (PMN) program requires that manufacturers and importers give EPA 90 days’ notice of intent to manufacture or import¹ a “new” chemical substance,² defined as a chemical substance not currently listed on an inventory maintained by EPA.³ The TSCA Inventory is a list of chemical substances currently manufactured or processed, including imports, in the United States for uses under

[Section 19:23]

¹The term “manufacture” is defined under TSCA to include importation into the customs territory of the United States. TSCA § 3(7), 15 U.S.C. § 2602(7).

²TSCA § 5(a), 15 U.S.C. § 2604(a).

³Initially compiled in 1979, the TSCA Inventory is regularly updated with information on chemicals that pass PMN review. TSCA § 8(b), 15 U.S.C. § 2607(b).

TSCA.⁴ The notice must contain certain descriptive information, test data that are in the manufacturer's possession, and any other data on health or environmental effects known to or reasonably ascertainable by the manufacturer.⁵ During the 90-day period (which may be extended by EPA for good cause),⁶ EPA has an opportunity to request additional test data on the chemicals and, where the Agency has a concern about a chemical, it can request extensive testing and data submission.⁷ These requests for data are usually satisfied voluntarily by the manufacturers, although the high degree of cooperation is undoubtedly influenced by the several administrative and judicial actions available to EPA to coerce submissions.⁸ Like FIFRA, TSCA does not require that chemical substances meet a "zero risk" standard.⁹ TSCA's standard was, however, strengthened by the 2016 amendment and now requires an affirmative finding that the chemical substance in question "is not likely to present an unreasonable risk of injury to health or the environment, without consideration of costs or other nonrisk factors, including an unreasonable risk to a potentially exposed or susceptible subpopulation identified as relevant by the Administrator under the conditions of use."¹⁰

If EPA finds that a chemical may pose such an unreasonable risk to health or the environment, it must take action to the extent necessary to protect against such risk by rule or administrative order.¹¹ Such action may include establishing controls on the chemical's manufacture, processing, distribution, or disposal.¹²

If EPA makes a finding that a chemical is not likely to present an unreasonable risk of injury to health or the environment, or if the review period expires without any regulatory action being taken by the agency, the chemical may be manufactured or imported as intended by the PMN submitter.¹³ The same process applies with respect to commencement, manufacture, or processing for a significant new use of an existing chemical.¹⁴

For a new chemical substance, the final step for placement on the Inventory comes after the requisite filing of a Notice of Commencement (NOC) by the PMN submitter who has commenced manufacture or import of the substance for a non-exempt commercial purpose.¹⁵ The NOC must be submitted on, or no later than, the 30th calendar day after the first day of such manufacture or import.¹⁶ Once EPA receives a complete NOC, the reported substance is considered to be on the Inventory and becomes an "existing chemical." Chemicals on the Inventory can still be regulated by EPA but, in general, only through the relatively burdensome procedures of notice and comment rulemaking,¹⁷ or through the Agency obtaining a

⁴TSCA § 8(b), 15 U.S.C. § 2607(b). As of August 2021, the Inventory contained 86,607 chemicals of which 41,953 are commercially active. U.S. EPA, *How to Access the TSCA Inventory*, <https://www.epa.gov/tsca-inventory/how-access-tsca-inventory> (last visited Jan. 12, 2022).

court order.¹⁸

Over 40,000 PMNs were submitted to EPA since the new chemical review program began in fiscal year 1980 and up through June 22, 2016.¹⁹ Although it does not assure that all such new chemicals are free of risk, the program does submit each to a preliminary screening, requires additional data where needed, and regulates those that fail to meet the statute's unreasonable risk standard.²⁰ EPA estimates that approximately 10% of the total PMN submissions have resulted in various restrictions, additional testing requirements, and notices withdrawn in the face of regulation.²¹ For example, during this same 36-year period, 1,729 "Section 5(e) consent orders"²² were signed, controlling exposure to new chemical substances that raise health or environmental concerns pending development, receipt, and review of additional information.²³ Following passage of the 2016 amendments, another 658 Section 5(e) consent orders were signed through December 1, 2021,²⁴ and an almost equal number of chemicals (668) subject to either a PMN or Significant New Use Rule were cleared during this period based on an affirmative finding of "not likely to present an unreasonable risk" under Section 5(g).²⁵

TSCA's role providing for oversight of new chemical substances before they reach the workplace makes the statutory scheme a first line of defense with respect to chemicals that may pose a threat to the health and safety of American workers.

In March 2021, EPA announced its intent "to ensure necessary protections for workers identified in its review of new chemicals through regulatory means."²⁶ Specifically, EPA explained that, when the Agency "identifies a potential unreasonable risk to workers that could be addressed with appropriate personal protective equipment (PPE) and hazard communication, EPA will no longer assume that work-

¹⁸TSCA § 6, 15 U.S.C. § 2607.

²¹See U.S. EPA, *Statistics for the New Chemicals Review Program under TSCA*, <https://www.epa.gov/reviewing-new-chemicals-under-toxic-substances-control-act-tsca/statistics-new-chemicals-review> (last visited Jan. 12, 2022).

²²TSCA § 5(e), 15 U.S.C. § 2604(e); see U.S. EPA, *Statistics for the New Chemicals Review Program under TSCA*, <https://www.epa.gov/reviewing-new-chemicals-under-toxic-substances-control-act-tsca/statistics-new-chemicals-review> (last visited Jan. 12, 2022). Over 2,000 PMNs were withdrawn by their submitter during this same period.

²³Section 5(e) orders impose conditions on the commercial manufacture and use of the new chemical substance such as use of worker personal protective equipment, exposure limits for workers, hazard communication requirements, restrictions on distribution and use, limits on environmental releases, recordkeeping, and testing requirements that apply once a specified production volume or time period is reached. Although EPA is authorized to issue such orders unilaterally, the vast majority are consent orders negotiated with the PMN submitter. See U.S. EPA, *Actions under TSCA Section 5*, <https://www.epa.gov/reviewing-new-chemicals-under-toxic-substances-control-act-tsca/actions-under-tsca-section-5> (last visited Jan. 12, 2022); U.S. EPA, *TSCA Section 5(e) Exposure-Based Policy: Testing*, <https://www.epa.gov/reviewing-new-chemicals-under-toxic-substances-control-act-tsca/tsca-section-5e-exposure-based> (last visited Jan. 12, 2022). Consent orders are often accompanied by a significant new use rule (SNUR) issued under TSCA § 5(a)(2), 15 U.S.C. § 2604(a)(2), discussed in § 19:25.

²⁴TSCA § 5(e), 15 U.S.C. § 2604(e); see U.S. EPA, *Statistics for the New Chemicals Review Program under TSCA*, <https://www.epa.gov/reviewing-new-chemicals-under-toxic-substances-control-act-tsca/statistics-new-chemicals-review> (last visited Jan. 12, 2022).

ers are adequately protected under OSHA's worker protection standards and updated Safety Data Sheets (SDS)."²⁷ EPA will instead "identify the absence of worker safeguards as 'reasonably foreseen' conditions of use, and mandate necessary protections through a TSCA section 5(e) order, as appropriate."²⁸ There so far have been very few legal challenges to regulation under the PMN program. The smooth functioning of the PMN program for chemicals depends in part on the economic incentives at work in the regulated community in the early stages of a chemical's development. The investment in chemicals is apparently substantial enough to incentivize manufacturers to perform the necessary tests to move a chemical through PMN review, but not large enough to justify litigation in case of disagreements with EPA. Industry prefers to avoid developing harmful products, and thus, in the early stages of a chemical's development, EPA and industry generally find it in their mutual interest to identify those that are potentially harmful.

This mutual interest was also evident in the passage of the 2016 amendments.

§ 19:24 Toxic Substances Control Act—Significant new use rules

The scope of the safety reviews conducted under the PMN program, including for microorganisms,¹ is limited in an important way. Generally, chemical risks are determined to be reasonable or unreasonable only on the basis of those exposures and health effects connected with the particular uses envisioned for the chemical at the time of the PMN review. Different uses could easily result in increased exposures sufficient to convert a reasonable risk into an unreasonable one. Yet, there is no provision in TSCA restricting uses to those specified in the PMN. In general, once they cease to be new and are entered into the Inventory, chemical substances may be produced by any manufacturer and used for any TSCA purpose absent regulatory action by EPA.

One important tool EPA possesses to address concerns over risks presented by new uses of existing chemicals is the ability to promulgate a significant new use rule (SNUR).² Using SNUR authority, EPA can promulgate a rule requiring notice of a new use of an existing chemical, which it can then subject to PMN review.³ Controls may be imposed on SNUR chemicals under the same § 2604 procedures that apply to new chemicals.⁴ In March 2021, EPA announced the Agency would stop issuing "not likely to present an unreasonable risk" determinations based on the existence of a proposed SNUR.⁵ Instead, EPA will issue an order addressing potential risks when it either: (1) concludes that one or more uses may present an unreasonable risk; or (2) lacks the necessary information to make a safety finding.⁶

SNUR authority is important to the regulation of engineered organisms because

²⁷*Id.*

²⁸*Id.*

[Section 19:24]

¹See discussion at § 19:26.

²TSCA § 5(a)(1)(A)(ii), (a)(2), 15 U.S.C. § 2604(a)(1)(A)(ii), (a)(2). EPA has issued over 2,000 SNURs as of this writing. See 40 C.F.R. Pt. 721, Subpt. E.

³A SNUR requires manufacturers, importers and processors of the chemical substance to notify EPA prior to beginning any activity that EPA designates as a "significant new use." See TSCA § 5(a)(1)(B), 15 U.S.C. § 2604(a)(1)(B); 40 C.F.R. Pt. 721, Subpt. A; EPA, *Actions under TSCA Section 5*, <https://www.epa.gov/reviewing-new-chemicals-under-toxic-substances-control-act-tsca/actions-under-t-sca-section-5> (last visited Jan. 12, 2022).

⁶*Id.*

all naturally occurring microbes are automatically included on the Inventory and have the status of existing chemicals.⁷ SNUR authority represents a mechanism by which defined classes of microbes or uses of microbes might be subject to PMN review despite the fact that they are similar or identical to organisms already on the Inventory.

Another major mechanism available to EPA for oversight of existing chemicals is the Chemical Data Reporting (CDR) rule. The rule requires certain manufacturers and importers of chemical substances to submit to EPA information on the production and use of many chemicals in commerce.⁸ Under the CDR rule, EPA collects basic exposure-related information including information on the types, quantities, and uses of chemical substances produced domestically and imported into the United States.⁹ The CDR database provides EPA with a comprehensive source of basic screening-level, exposure-related information, and the Agency uses it to protect the public from potential chemical risks.¹⁰ EPA collects the information every four years from manufacturers (including importers) of certain chemicals in commerce, generally when production volumes for the chemical are 25,000 pounds or greater for a specific reporting year.¹¹

§ 19:25 Toxic Substances Control Act—Information-gathering authority

In addition to the CDR rule discussed above, TSCA authorizes EPA to require the testing of chemicals and to take timely action on the basis of test results that provide a reasonable basis to conclude that a chemical or mixture presents a significant risk of serious or widespread harm to humans.¹ The 2016 amendments require EPA to establish a risk-based process to determine which existing chemicals will be prioritized for assessment, identifying them as either “high” or “low” priority substances.² A high priority designation would be based on a finding that, “without consideration of costs or other nonrisk factors, the chemical may present an unreasonable risk of injury to health or the environment because of a potential hazard and a potential route of exposure under the conditions of use, including an unreasonable risk to a potentially exposed or susceptible subpopulation” identified as relevant by the Agency.³ A high priority designation triggers a requirement and deadline for EPA to complete a risk assessment on that substance and, if an unreasonable risk is identified, the agency must take final risk management action within two years—or up to four years if an extension is needed.⁴

TSCA also authorizes EPA to impose on manufacturers (including importers), processors, and distributors requirements regarding the retention of reports of allegations of significant adverse reactions to health or the environment,⁵ the report-

ing of available health and safety studies on chemicals,⁶ and the reporting of information which supports the conclusion that chemicals present substantial risks of injury to health or the environment.⁷ EPA is additionally empowered to promulgate rules requiring manufacturers to maintain records and report various production, health, and exposure information.⁸ These authorities need not be confined to the support of regulations under TSCA; they could be the basis of a broader effort to collect the information needed to assess and regulate products under other federal statutes.⁹ Small manufacturers or importers are exempt from some of the information retention and gathering provisions,¹⁰ which could be a factor in view of the small size of many newly established biotechnology firms.

§ 19:26 Post-Market Regulation—Hazardous waste statutes¹

For more information, see Chapter 14 Soil and Groundwater.

§ 19:27 Toxic Substances Control Act—Using TSCA to regulate genetically engineered organisms—Jurisdiction

TSCA's broad sweep of authorities makes it an attractive basis for the regulation of genetically engineered organisms. But EPA had to confront a significant threshold problem in its use of the statute: TSCA does not expressly cover living organisms. Its jurisdictional provisions refer to "chemical substances," not living organisms.¹ Moreover, the legislative history of the statute does not mention living organisms.²

EPA nevertheless has asserted jurisdiction over both whole living organisms and the DNA they contain.³ According to EPA's interpretation, the definition of a chemical substance as "any organic or inorganic substance of a particular molecular identity, including any combination of such substances . . . occurring in nature"⁴ covers whole living organisms and their DNA. The interpretation is a potentially controversial one and, as a matter of policy, EPA has limited its TSCA activities concerning living organisms to microbes, intentionally excluding plants and animals.⁵ While there is no doubt that living organisms are composed of chemical molecules, some commentators disagree with EPA that whole organisms can be considered as chemical substances under TSCA.⁶ As a fallback, however, these commentators believe that recombinant DNA molecules within engineered organisms

⁴TSCA § 3(2)(A)(i), 15 U.S.C. § 2602(2)(A)(i).

⁵51 Fed. Reg. 23,302, 23,324 (June 26, 1986); 59 Fed. Reg. 45,526–27 (Sept. 1, 1994). Legal support for coverage of microorganisms under TSCA was based, at least in part, on *Diamond v. Chakrabarty*, a 1980 Supreme Court decision which upheld the patentability of a genetically engineered microorganism under the Patent Act originally drafted by Thomas Jefferson. 447 U.S. 303 (1980).

⁶See Thomas O. McGarity & Karl O. Bayer, *Federal Regulation of Emerging Genetic Technologies*,

could serve as the basis for TSCA jurisdiction.⁷ To date, EPA's interpretation has not been subject to legal challenge.

§ 19:28 Toxic Substances Control Act—Using TSCA to regulate genetically engineered organisms—Small quantities and research activities

In an effort to reduce the burden on small businesses and research and development activities, TSCA specifically exempts from the notice and data provisions of § 2604 chemicals that are manufactured in small quantities solely for the purpose of scientific experimentation or research for product development.¹ Small quantities are to be defined by rule.² In accordance with this provision, EPA has specified the conditions under which a microorganism is considered not to qualify for the research and development exemption.³

As recognized by EPA in the Coordinated Framework, the application of the small quantity exemption to genetically engineered microorganisms would permit deliberate releases into the environment during the stage in product development before the organisms were ready for PMN review.⁴ EPA is concerned with potential consequences of applying this exemption to living microorganisms, which can multiply: although their amounts may be small, unlike chemicals, the effects may be much greater.⁵

To eliminate this loophole, in 1997, EPA promulgated a rule defining “small quantities” as limited to contained uses of microorganisms for research and development purposes.⁶ Under EPA's rule, there is no small quantities exemption for microorganisms introduced into the environment during commercial research and development.⁷ The rule establishes the rough functional equivalent of the EUP system for small acreage testing of pesticides under FIFRA.⁸

The PMN program would not apply to the release of genetically engineered microorganisms developed for purely academic or other noncommercial purposes.⁹ For purposes of § 2604, “manufacture” and “process” are specifically defined as “manufacturing or processing for commercial purposes.”¹⁰

§ 19:29 Toxic Substances Control Act—Using TSCA to regulate genetically engineered organisms—Levels of review

Like the FIFRA program, the TSCA program established different levels of review based on the definitions in the Coordinated Framework and EPA's 1997 rule.¹ The highest level of review is conducted through the mechanism of PMNs, which are required for microorganisms that are either (1) considered to be “new” chemical substances under TSCA, or (2) subject to SNURs.² EPA refers to either type of notification as a Microbial Commercial Activity Notice, or MCAN.³

Microorganisms resulting from deliberate, intergeneric combinations of genetic material are considered “new” for purposes of TSCA.⁴ For such new microorganisms, EPA requires MCAN submissions that contain information on the microorganism's identity, byproducts, intended categories of use, production volumes, workplace exposure, and environmental release.⁵ In accordance with the OSTP framework document, certain new microorganisms constructed by the transfer of well-characterized, noncoding regulatory sequences may qualify for an exemption from high-level PMN review.⁶

EPA's rule provides a tiered exemption from the requirement to submit a MCAN for microorganisms intended for “general commercial use,” defined by EPA as use for commercial purposes other than research and development.⁷ Commercial activities that meet specified criteria would qualify for either a Tier I exemption on the basis of a limited certification to EPA, making the activity completely exempt from further EPA review, or a Tier II exemption, allowing for an abbreviated submission and expedited EPA review.⁸ Three requirements must be met in order to qualify for either tier: (1) the recipient organism must be specifically listed by EPA; (2) the introduced genetic material must meet designated criteria—well characterized, limited in size to the material required to perform the intended function, poorly mobilizable, and free of certain sequences; and (3) the activity must utilize performance-based criteria for physical containment and control of the new microorganisms.⁹

Although researchers are free to submit a complete MCAN as required for commercial use, EPA offers several exemptions from MCAN reporting that reduce the researcher's reporting obligations under § 2604. The first exemption is based on the “small quantities” definition and applies to research carried out in contained structures.¹⁰ The remaining exemptions cover research subject to the jurisdiction of other federal authorities, field experiments with microorganisms that EPA has specifically exempted from review, certain test marketing activities, and small-scale tests for which a TSCA Experimental Release Application (TERA) is approved by EPA.¹¹ All of the exemptions are conditional, in that they involve reduced reporting and/or recordkeeping and must meet stringent eligibility criteria established by the

Agency.¹²

The TERA is intended to provide an abbreviated notification process for the environmental testing of new microorganisms by providing EPA with sufficient information to permit a reasoned evaluation of the potential health and environmental effects of the planned test.¹³ Information to be provided to EPA includes all available data concerning actual or potential human health and environmental effects of the new microorganism; a detailed description of the proposed research and development activity; and information on monitoring, confinement, mitigation, and emergency termination procedures.¹⁴

With the cooperation of the regulated industry, EPA has successfully implemented the TSCA program originally set forth in the Coordinated Framework. In particular, EPA reviewed 101 MCANs from 1998 through February of 2016, the vast majority of which were “dropped from review” after EPA was unable to identify any unreasonable risk to health or the environment or any substantial or significant exposure, allowing the submitter to begin commercialization.¹⁵ One of the MCANs was withdrawn by the submitter.¹⁶ Since February 2016, over 170 MCANs have been filed with EPA.¹⁷ Of these, EPA determined that over 130 were not likely to present an unreasonable risk, pursuant to TSCA § 5(a)(3)(C).¹⁸ Also during the 1998 to 2016 period, EPA reviewed and approved 30 TERAs, while review of three others was suspended or found to be invalid for various reasons.¹⁹ Post-2016, EPA has received 11 additional TERAs, 7 of which have been approved.²⁰ The promulgation of the 1997 rule for microbial products of biotechnology clarified the review requirements that apply to all activities involving genetically engineered microorganisms subject to TSCA jurisdiction.

§ 19:30 Toxic Substances Control Act—Using TSCA to regulate genetically engineered organisms—Activities covered

TSCA applies primarily to chemical substances produced for commercial purposes. Of the three activities mentioned at the outset of this section as being likely to involve intentional releases of genetically engineered organisms, TSCA provides ample authority for the regulation of commercial manufacture and commercial research and development activities, but only scant authority over pure scientific research. Different authorities under TSCA apply to different activities. The premanufacture review provisions of § 2604 specifically cover commercial

manufacture and all commercial research and development except for that covered under the small quantity exemption, but exclude chemical substances used in research conducted for other than commercial purposes.¹ Many of the existing chemical provisions of § 2605 are also restricted by use and are not available to reach every chemical that poses an unreasonable risk.² In contrast, the emergency authority provided to EPA under § 2606 to address imminent hazards is not limited to commercial activities.³ Section 2607 information-gathering authorities regarding adverse health reactions, health and safety studies, and information on substantial risk are restricted to commercial manufacturers and distributors of chemicals,⁴ but the general reporting authority of § 2607(a) authorizes EPA to collect information on both commercial chemicals and chemicals used for the purposes of scientific experimentation from all who manufacture or process chemicals except small manufacturers or processors.⁵

§ 19:31 Toxic Substances Control Act—Using TSCA to regulate genetically engineered organisms—Pre-release review

The PMN program is not a permit program; the stringency of reviews conducted under it may vary enormously. No standard set of tests is required, but TSCA gives EPA full discretion to request any data it believes it needs. As noted above, EPA's requests for test data on chemicals have usually elicited voluntary submissions from industry. The question is whether the balance of incentives that make the PMN system function smoothly in the case of chemicals will continue to work smoothly for engineered microorganisms as it has since 1998. There are two factors to be considered in this regard.

The first relates to the enormous degree to which the success of any program will depend upon EPA's willingness to exercise its discretion and obtain the data necessary for review. As written, the MCAN rule requires submission of substantial amounts of data as a routine matter for new microorganisms, including information on microorganism identity, byproducts, production volume, use, worker exposure, environmental release, and available data on health and environmental effects.¹

The second factor is the effectiveness of the backup enforcement authority available to EPA. The effectiveness of the enforcement provisions of § 2604 has heretofore not been tested because the incentives are such that most manufacturers would rather drop the development of the chemical than litigate an adverse decision from EPA. If a biotechnology manufacturer chose not to cooperate with requests for data, EPA would likely respond by issuing a § 2604(e) administrative order to obtain the data. If the manufacturer failed to comply with the order, EPA would be forced to seek an injunction. TSCA requires that, in order to prevail in such a proceeding, EPA would have to demonstrate, among other things, either (1) that the microorganism may present an unreasonable risk of injury to health or the environment or (2) that it would be produced in substantial quantities and either enter or reasonably be anticipated to enter into the environment in substantial quantities or there is or

may be significant human exposure to the substance.² Unless EPA possessed or could generate data of its own on the behavior of the organism in the environment or on the health or environmental risks posed by the organism, there is always a chance that it would not succeed in enforcing its order. Such a result would provide an incentive to manufacturers to fail to supply health data to EPA. It is likely, however, that a reviewing court would accord substantial deference to EPA, particularly on a matter related to a novel microorganism.

§ 19:32 Toxic Substances Control Act—Using TSCA to regulate genetically engineered organisms—Imminent hazards

TSCA provides emergency authority that EPA might use if a genetically engineered organism turns out to cause unanticipated adverse health or environmental effects. Section 2606 of TSCA authorizes EPA to bring a civil action for seizure of imminently hazardous chemical substances or to pursue other relief measures against the manufacturer, processors, distributors, or users of such substances.¹ Authorized relief measures include issuance of public notice of such a risk, and recall, replacement, or repurchase of the substance.² Chemical substances are considered imminently hazardous if they are likely to result in serious or widespread injury to health or the environment before a final rule under § 2605 can protect against the risk.³

§ 19:33 Toxic Substances Control Act—Summary of TSCA

TSCA is a central element of the claim that existing legislation is adequate to regulate products of biotechnology. Without TSCA, important applications of engineered organisms in areas such as pollution control, production of biofuels, and mining might be essentially unregulated. Moreover, because TSCA's jurisdiction is open-ended with respect to product categories other than the specifically exempted ones, it can act as a regulatory catchall, important in view of the innovative applications expected from the technology in the future.

Judging from the 1997 rule for microbial products of biotechnology, the Agency's public outreach activities,¹ and implementation efforts to date, EPA is making a serious attempt to adapt TSCA to the regulation of genetically engineered microorganisms. Admittedly, the application of the unique regulatory scheme embodied in TSCA to microorganisms is not a straightforward matter. In that regard, three aspects of TSCA are worthy of comment:

- 1) TSCA's jurisdiction does not expressly extend to living organisms. While, in theory, EPA's ongoing regulation of microorganisms under TSCA may still be open to the threat of challenge on this basic jurisdictional issue, the passage of time has largely eroded the likelihood that such a challenge would succeed.
- 2) The PMN Program is not a permit system; it merely affords EPA notice and opportunity for review. As long as EPA vigorously pursues its PMN op-

¹See, e.g., 81 Fed. Reg. 70,419 (Oct. 12, 2016). In addition, in its early efforts to develop a biotechnology rule under TSCA, EPA requested comments from the public on several occasions. See, e.g., 54 Fed. Reg. 7,027 (Feb. 15, 1989); 59 Fed. Reg. 45,526 (Sept. 1, 1994).

portunities, particularly under the enhancements provided by the 2016 TSCA amendments, and the requirements of the MCAN rule, products under TSCA jurisdiction will not enter the marketplace until EPA reviews the relevant data.

- 3) The PMN program does not cover noncommercial research. Although a major portion of research is covered by the NIH Guidelines, it is likely that there will always be some relatively small amount of noncommercial, nongovernment supported research that is virtually exempt from federal government regulation.

§ 19:34 Federal Food, Drug, and Cosmetic Act—Pharmaceutical products

The FFDCA is used extensively to regulate the production of drugs and related pharmaceutical products by genetically engineered organisms and new genetic techniques. This activity will not be discussed at length in this chapter because environmental impacts do not typically play a significant role in FDA's regulatory decisions. We note, however, our discussion of FDA's approval of a NADA for a genetically engineered salmon and the ensuing court challenge in Sections 19:16 and 19:35.¹

FDA currently regulates pharmaceuticals based on process, not end-product, uses of biotechnology.² In contrast to end-product uses, these process uses do not entail deliberate releases of organisms into the environment. Under ordinary conditions, the microorganisms used to produce pharmaceuticals are confined to growth chambers; only their byproducts are removed. These uses may pose small risks of occasional accidental releases, but even if released, the engineered organisms are unlikely to proliferate. Microorganisms adapted to the luxuriant conditions of growth chambers have very poor survival prospects in the harsher general environment.³ As a result, at least for the present, FDA regulation of genetically engineered pharmaceutical products focuses almost exclusively on a set of human health and quality control issues that are quite distinct from the environmental issues that dominate the use of the traditional environmental statutes.⁴

FDA's final policy statement in the Coordinated Framework identifies several new safety and efficacy concerns associated with the use of engineered organisms for drug production, but finds that these concerns can be addressed on a case-by-case basis within the existing regime.⁵ FDA takes a similar case-by-case approach to the regulation of biological organisms involved with the production of animal drugs, animal food additives, and medical devices.⁶

The FDA policy does not propose any special measures to address the possibility of environmental releases of organisms used in drug production. However, FDA notes its responsibility under NEPA to prepare environmental impact statements or EA for premarketing approvals of FDA regulated products or other major federal ac-

tions anticipated to cause significant environmental impacts.⁷

An excellent example of FDA's commitment under NEPA can be found in the Agency's approval of the first genetically engineered new animal drug on November 5, 1993.⁸ The product is a recombinant version of the naturally occurring protein hormone, bovine somatotropin (bST),⁹ produced by cows. Marketed by Monsanto Company under the trade name POSILAC®, recombinant bST¹⁰ increased the production of milk when injected into dairy cows to supplement the cows' natural bST. FDA's review of the new animal drug application for POSILAC® extended to six years and included an evaluation of a nine-volume EA prepared by the drug's sponsor. FDA required the assessment to address potential impacts of the approval of POSILAC®, both direct and indirect, including the potential for environmental release from production facilities; the fate and environmental effects of emitted substances; and resource and other secondary and tertiary effects, such as potential impacts on land use, small dairy producers, feed production, pesticide usage, manure production, and emissions of the greenhouse gases carbon dioxide and methane. Based on its review of the EA, FDA concluded that approval of the product was not expected to have a significant effect on the quality of the human environment.¹¹

§ 19:35 Federal Food, Drug, and Cosmetic Act—Food products

FDA formally approved the first food ingredient produced through recombinant DNA technology in 1990.¹ The product is a chymosin enzyme preparation used in the production of cheese and other dairy products. FDA's action affirmed that the use of a chymosin preparation derived by fermentation of a genetically modified bacterium is "generally recognized as safe" (GRAS) under the FFDCA.² In announcing its determination, FDA indicated that it had carefully considered the potential environmental effects of its action under NEPA and concluded that the action would not have a significant impact.³

Two years later, FDA unveiled a long-awaited policy on foods derived from new plant varieties, including plants developed by recombinant DNA techniques.⁴ The 1992 policy provides that foods developed through biotechnology are not inherently dangerous and, except in rare cases, should not require extraordinary testing and regulation before being able to be lawfully marketed. Foods such as fruits, vegetables, grains, and their byproducts derived from plant varieties developed by the new methods of genetic modification, will be evaluated and regulated within FDA's existing framework, utilizing an approach that is essentially identical to that

⁷*Id.* at 23,313.

⁸58 Fed. Reg. 59,946 (Nov. 12, 1993).

⁹Bovine somatotropin is referred to as bST and alternatively as bovine growth hormone or bGH.

¹⁰The product is referred to alternatively as recombinant bST, recombinant bGH, and sometribove.

¹¹58 Fed. Reg. 59,946, 59,947 (Nov. 12, 1993). FDA's decision to approve POSILAC® was the subject of considerable controversy and was challenged in a suit in federal court alleging that the Agency's decision failed to comply with both NEPA and the FFDCA. Judge Barbara B. Crabb decided the case was decided in favor of FDA. *Stauber v. Shalala*, 895 F. Supp. 1178 (W.D. Wis. 1995).

[Section 19:35]

⁴57 Fed. Reg. 22,984 (May 29, 1992). Although labeling of food products produced through genetic engineering is discussed in FDA's policy statement, a separate notice was issued by FDA to address the labeling issue. 58 Fed. Reg. 25,837 (Apr. 28, 1993).

applied to foods developed by traditional plant breeding.⁵ Since its inception, over 170 crops have satisfactorily completed FDA's review process, with FDA concluding that these products are just as safe as their conventional counterparts.⁶ Note, however, that—just as with FDA's premarket review of most conventional food ingredients—the consultation process for biotechnology foods is technically voluntary. In reality, the process is mandated by the needs of the marketplace, both domestically and globally.

The policy holds that genetically engineered foods should be regulated just like ordinary foods unless they contain ingredients or demonstrate attributes not usual for the product. Safety questions may arise if: (1) genetic modifications produce a substance that is not substantially similar to a common attribute of food (for example, levels of fats, proteins, and carbohydrates typically found in specific foods and food products); or (2) the new substance has no history of safe use in food. In the event that questions regarding the safety or nutritional value of the food are raised, premarket approval would be necessary before commercialization of a genetically modified plant.⁷

In general, FDA takes the approach that the environmental impacts of most genetically modified plants will be assessed in-depth by one or more other federal agencies, such as EPA and USDA, and that this assessment will often occur prior to commercialization.⁸ In all cases, FDA indicates that it will coordinate with these other agencies to share information and minimize duplication of environmental reviews.⁹ In terms of its own actions, FDA does not consider that the informal activities it may undertake, such as consultations with producers on safety issues and providing advice on the regulatory status of foods from new plant varieties, will constitute agency action for purposes of NEPA.¹⁰ However, to the extent a food additive regulation is needed for a biotechnology food ingredient, the promulgation of that regulation under § 409 of the FFDCA would be assessed under FDA's existing NEPA process.¹¹

An examination of the review process for the FLAVR SAVR tomato, the first genetically engineered whole food product to be marketed in the United States, illustrates the cautious approach FDA followed with respect to its evaluation of novel food products under the 1992 policy statement. The FLAVR SAVR tomato, as the first product of its kind to be reviewed by FDA, provided the Agency with an opportunity to develop a blueprint for processing future submissions.

The FLAVR SAVR is a tomato modified to permit the ripe fruit to remain firm for an extended period, thereby allowing fresh market tomatoes to be vine-ripened for enhanced flavor. As early as 1991, the product's developer, Calgene, Inc., requested an advisory opinion from FDA concerning whether FLAVR SAVR tomatoes are "food" under the FFDCA and, therefore, subject to the same regulation as other tomato varieties.¹² FDA announced Calgene's request and sought public comment in

⁵57 Fed. Reg. 22,984 (May 29, 1992). The policy applies to animal feeds as well as food produced for human consumption.

⁸*Id.* at 23,004.

⁹*Id.*

¹⁰*Id.* at 23,005.

¹¹*Id.*

¹²See *id.* at 22,984. The advisory opinion was sought pursuant to 21 C.F.R. § 10.85 and prior to is-

a notice published simultaneously with the agency's 1992 policy.¹³ FDA proceeded to address the status of the FLAVR SAVR tomato through a relatively informal consultation process consistent with the principles outlined in the 1992 policy.

A closely related element of the FDA review process concerned the marker gene inserted in FLAVR SAVR tomatoes as an aid to product selection and development. Recombinant DNA techniques involve the isolation and subsequent introduction into a host plant of discrete DNA segments containing genes with one or more desirable traits, such as disease resistance or delayed ripening. The successful introduction of a new trait into a plant is referred to as "transformation" and the transformed plants that contain genetic material from other sources are called "transgenic." Developers of these transgenic plants need a means to distinguish cells that are successfully transformed from those that are not. Selectable marker genes which confer antibiotic resistance are typically used to perform this function.¹⁴

Calgene originally requested a separate advisory opinion from FDA regarding whether the selectable marker utilized in the FLAVR SAVR tomato, known as the *kan^r* gene, may be used in the production of genetically engineered tomato, cotton, and oilseed rape plants. FDA published a notice announcing receipt of the request and soliciting comments from interested persons.¹⁵ Subsequent to submission of the request for an advisory opinion, FDA published its 1992 policy on foods derived from new plant varieties, which specifically discussed selectable markers.¹⁶ Pursuant to the FDA policy statement, Calgene requested FDA to convert Calgene's request for an advisory opinion to a food additive petition, seeking FDA approval under § 409 of the FFDCa for the safe use of the *kan^r* gene product as a processing aid.¹⁷ Calgene's food additive petition was the subject of a separate notice that again sought comment from the public.¹⁸

Calgene prepared an EA in support of its original *kan^r* submission and updated that assessment as part of its food additive submission. The EA discussed such potential impacts as emissions from production facilities, weediness of the tomato plants, gene transfer to soil microbes or other plants, and changes in agronomic practices. Both of the notices published by FDA for the tomato marker gene sought public comment on the EAs.¹⁹ The consultation process that followed with respect to the tomato itself was not the subject of a separate EA. The conclusion reached in the EA, and independently ratified by FDA in a separate NEPA finding, was that the commercial use of modified plants containing the *kan^r* gene would not have a significant impact on the environment.²⁰

Ultimately, FDA subjected the results of its review of both the tomato and the marker gene to public scrutiny at a meeting of the Agency's Food Advisory

suance of FDA's policy on foods derived from new plant varieties.

Committee.²¹ The committee was actually asked to undertake a scientific discussion of FDA's overall approach to evaluating the safety of whole foods produced by new biotechnologies.²² The FLAVR SAVR tomato served as an example and focus of the discussion, however.²³ Committee members generally expressed the view that the approach used by FDA to assess the safety of the tomato was appropriate and that all relevant scientific questions had been adequately addressed.²⁴

On May 17, 1994, FDA concluded the consultation process with Calgene and cleared the way for the marketing of the FLAVR SAVR tomato.²⁵ Specifically, FDA found that FLAVR SAVR tomatoes have not been significantly altered when compared to varieties of tomatoes with a history of safe use.²⁶ The tomatoes had already been cleared by USDA under the Plant Pest Act.²⁷ With regard to the marker gene, FDA approved the use of the *kan^r* gene product as a processing aid in the development of new, genetically modified varieties of tomatoes, oilseed rape, and cotton intended for food use.²⁸ The *Federal Register* notice announcing FDA's decision on the marker gene responded to the comments that had been received from the public on the EA and discussed at length the fate of the *kan^r* gene in the environment.²⁹

Later, on November 19, 2015, after an exhaustive, rigorous and unprecedented scientific review of nearly 20 years duration, FDA determined that a genetically engineered Atlantic salmon is as safe to eat as any nongenetically engineered Atlantic salmon, and also as nutritious.³⁰ The modification was made using a gene from a related salmon species that allows the modified salmon, the AquaAdvantage® salmon, to reach market size more rapidly, thereby increasing productivity while reducing costs and environmental impacts that may be associated with current salmon farming locations.³¹ FDA's regulatory process included a comprehensive EA under NEPA, and the Agency's decision required a number of measures designed to

²⁵See 59 Fed. Reg. 26,647 (May 23, 1994).

²⁶See *id.* In authorizing the marketing of the Calgene tomato, FDA referred to its 1992 consultation policy and its regulations for general recognition of safety, 21 C.F.R. § 170.30, as a basis for evaluating the regulatory status of the tomato and for concluding that the tomato had not been significantly altered compared to conventionally-bred tomatoes with a history of safe use. Reliance on this longstanding regulation provides additional regulatory credence to FDA's underlying policy on foods derived from new plant varieties.

²⁷See 57 Fed. Reg. 47,608 (Oct. 19, 1992) (issuing interpretative ruling that previously field-tested lines of FLAVR SAVR tomatoes do not present a plant pest risk and are not regulated articles under Plant Pest Act regulations). See also § 19:15. In response to a Calgene petition, additional genetically engineered tomato lines were subsequently added by USDA to those covered by the initial determination of nonregulated status. See, e.g., 59 Fed. Reg. 50,220 (Oct. 3, 1994).

²⁸See 59 Fed. Reg. 26,700 (May 23, 1994). The approval for use of the *kan^r* gene product took the form of an amendment to the food additive regulations that was effective on publication in the *Federal Register* on May 23, 1994. *Id.*

provide for containment of the modified salmon.³² FDA reviewed the genetic construct used to develop the modified salmon under its new animal drug authority.³³ FDA's approval was challenged in court in March 2016, as discussed in Section 19:16, but ultimately has remained in place since issued.³⁴

§ 19:36 Post-Market Regulation—Products

Earlier, this chapter explained EPA's oversight of chemical products in commerce under TSCA.¹ With that exception, the preceding discussions focused largely on the premarket regulation of genetically engineered organisms under the major, product-specific federal statutes and that is, in fact, where most of the attention has traditionally been focused. Once a product is on the market, however, each of those statutes authorizes a number of different means to address potential risks that may be identified with the manufacture, processing, use, or disposal of the product. Importantly, the technique used to develop the product, regardless of whether it is conventional or genetically engineered, is irrelevant when it comes to the authority of the agencies to address any emerging risks to health, safety, or the environment. A summary of the key post-market authorities follows.

FDA has extensive authority to regulate food and drug products in commerce. FDA is authorized to conduct examinations and investigations for the purposes of carrying out its FFDCA responsibilities through officers and employees of the agency or through any designated health, food, or drug officer or employee of any State, Territory, or political subdivision thereof.² The litany of prohibited acts under the FFDCA includes the introduction or receipt in interstate commerce of any food or drug that is adulterated or misbranded or the act of adulterating or misbranding any food or drug,³ the refusal to permit access to or copying of any required record,⁴ the refusal to permit entry or inspection as authorized by the FFDCA,⁵ and the manufacture of any food or drug that is adulterated or misbranded.⁶ As early as 1890, Congress authorized the President to suspend importation of any article used for human food or drink that is adulterated to an extent dangerous to the health or

welfare of the people of the United States.⁷

If FDA determines, based on information gathered through the agency's reportable food registry,⁸ or through any other means, that there is a reasonable probability that an article of food is adulterated or misbranded and the use of or exposure to such article will cause serious adverse health consequences or death to humans or animals, the Agency is to provide the responsible party with an opportunity to cease distribution and recall the article.⁹ Should the responsible party refuse to comply, FDA is authorized to issue a mandatory recall order directed to all persons manufacturing, processing, packing, transporting, distributing, receiving, holding, or importing and selling such article, and to which such article has been distributed, transported, or sold.¹⁰ When an adulterated or misbranded food or drug product is introduced into interstate commerce or while it is held for sale, FDA is also authorized to go to federal court to obtain an order to have the product seized.¹¹

Congress has, since 2007, enacted a number of measures to bolster FDA's ability to police the food supply. One such measure authorizes enhanced aquaculture and seafood inspection.¹² Another directs FDA to consult with the National Marine Fisheries Service of the National Oceanic and Atmospheric Administration to produce a report on any environmental risks associated with genetically engineered seafood products, including the impact on wild fish stocks.¹³ Additional amendments improved FDA's capacity to prevent, detect, and respond to food safety problems.¹⁴

Turning to the USDA, in enacting the PPA in 2000, Congress recognized that the frictionless movement of plants, plant products, biological control organisms, or other articles into, out of, or within the United States is vital to the nation's economy and should be facilitated to the extent possible.¹⁵ At the same time, Congress made clear that the detection, control, eradication, suppression, prevention, or retardation of the spread of plant pests or noxious weeds is necessary for the protection of the agriculture, environment, and economy of the United States.¹⁶

The PPA contains two additional directives that have helped USDA fine-tune its regulatory programs. First, decisions affecting imports, exports, and interstate movement of products regulated under the PPA must be based on sound science.¹⁷ Second, Congress made a key finding that all plant pests, noxious weeds, plants, plant products, articles capable of harboring plant pests or noxious weeds regulated under the PPA are "in or affect interstate commerce or foreign commerce."¹⁸ The many measures available to USDA to monitor and address issues associated with products in commerce include the prohibition or restriction of unauthorized movement of plant pests or noxious weeds,¹⁹ authorizations for inspections and enforce-

ment,²⁰ and establishment of eradication programs.²¹

As a full-blown licensing statute, FIFRA establishes an ongoing relationship between pesticide registrants and EPA, including a rolling registration review requirement.²² Each registration must be reviewed by the Agency within 15 years of the date on which the first pesticide containing a new active ingredient is registered and every 15 years thereafter.²³ EPA can require registrants to submit any additional data deemed necessary to maintain the registration of a pesticide in effect.²⁴ Registrants have an independent obligation to promptly submit additional factual information to EPA regarding unreasonable adverse effects on the environment of the pesticide.²⁵

Inspections of any location where pesticides are being held for sale or distribution can be conducted by EPA officials or duly-designated State officials to enforce the provisions of FIFRA,²⁶ including to review and copy any records required to be maintained by FIFRA.²⁷ Information that supports a finding that a product no longer meets the applicable, risk-based statutory criteria can lead to EPA's initiation of a cancellation proceeding.²⁸ If an EPA or State official finds a pesticide that is adulterated,²⁹ misbranded, or otherwise in violation of any provision of FIFRA, an order may be issued to stop the sale, use, or removal of the product except as may be specified in the order.³⁰

§ 19:37 Post-Market Regulation—Media-specific pollution control statutes

The Clean Air and Federal Water Pollution Control Acts, although listed by the OSTP in the framework of legal authority applicable to genetically engineered organisms, are not included among the statutes discussed in the policy statements. They remain on a reserve tier of authorities available as may be needed to regulate environmental releases of genetically engineered organisms. These media-specific statutes are intended to protect the nation's air and water resources by reducing their levels of pollutant contamination. They achieve these purposes by prohibiting or limiting the discharges or emissions of pollutants into air or water, including from facilities that manufacture pharmaceuticals, pesticides, and other regulated products.

Although there was no discussion of the rationale supporting the decision not to

²⁶FIFRA § 9, 7 U.S.C. § 136g. Authority and responsibility for implementing and enforcing FIFRA on Native American lands lies with EPA. U.S. EPA, *Tribal Pesticide Programs*, <https://www.epa.gov/pesticide-advisory-committees-and-regulatory-partners/tribal-pesticide-programs> (last visited Jan. 12, 2022). Nonetheless, the Agency “also establishes cooperative agreements and provides funding to some tribes to offer pesticide education, training, technical assistance, compliance and enforcement, and to develop and implement pesticide programs under tribal law.” *Id.*

²⁷FIFRA § 8, 7 U.S.C. § 136f.

²⁸FIFRA § 6(b), 7 U.S.C. § 136d(b). EPA may issue an order to suspend the pesticide registration immediately, if the Agency determines that action is necessary to prevent an imminent hazard during the time required for cancellation. FIFRA § 6(c), 7 U.S.C. § 136d(c).

²⁹Adulteration of a pesticide can result if its strength or purity falls below the approved standard, any substance has been substituted for an approved ingredient, or any valuable constituent has been abstracted. FIFRA § 2(c), 7 U.S.C. § 136(c).

³⁰FIFRA § 13, 7 U.S.C. § 136k.

expressly regulate under these two statutes, some combination of the following seems reasonable. First, there might have been a belief that EPA should focus its resources on testing and market entry of products under TSCA and FIFRA. Second, the media-based statutes limit emissions and discharges of pollutants but do little to generate data on their effects. Therefore, implementation of these statutes would not do much to resolve any remaining uncertainty about the nature of any potential hazards presented by engineered organisms. Third, the uncertainty about potential hazards of release might make it difficult to set legally defensible emissions and discharge limitations for biological pollutants. Fourth and finally, there was, and is not today, any evidence to suggest that emissions from facilities that utilize engineered organisms are inadequately addressed under existing federal and state pollution control programs.

Even granting the general validity of the reasons for not using the statutes, EPA may not be able to keep them on the back burner indefinitely and there is certainly nothing in the statutes to prevent their use in that regard. As the production levels of organisms rise, routine emissions into air and water could begin to constitute significant pathways by which organisms are released into the environment. If so, such situations might prompt calls to use media-based statutes to control such releases, for consistency's sake, if for no other reason.

§ 19:38 Hazardous waste statutes—Introduction

Hazardous wastes are regulated primarily under the Resource Conservation and Recovery Act (RCRA).¹ The Comprehensive Environmental Response, Compensation and Liability Act (CERCLA or “Superfund”)² authorizes EPA to clean up abandoned waste dumps and to respond to emergencies caused by releases or threats of releases of toxic and hazardous substances.³ Both statutes may give EPA some authority to address releases of engineered organisms into the environment, assuming the applicable criteria are met. EPA, however, has so far not seen any reason to exercise it.

§ 19:39 Hazardous waste statutes—RCRA

RCRA authorizes EPA to regulate “hazardous wastes,” defined to include wastes which, because of “quantity, concentration, or physical, chemical or infectious characteristics,” are toxic, or which otherwise cause a substantial hazard to health or the environment when improperly managed.¹ The terms of the definition show that hazards to the environment, as well as to health, may lead to regulation of wastes, and the inclusion of “infectious” characteristics plainly evidences an intent to include living organisms, although neither the statute nor the legislative history is clear whether living organisms are to be included for characteristics other than infection.

In any case, EPA has not included living organisms among the wastes presently regulated under RCRA, and does not require waste generators to determine whether

[Section 19:38]

¹42 U.S.C. §§ 6901 to 6987. This is technically the Solid Waste Disposal Act, but since extensive amendment in 1976 it is commonly referred to as “RCRA.”

²42 U.S.C. §§ 9601 to 9657.

³CERCLA §§ 104, 106, 42 U.S.C. §§ 9604, 9606.

[Section 19:39]

¹RCRA § 1004(5), 42 U.S.C. § 6903(5).

their wastes are “infectious.”² Unless EPA takes further regulatory action, therefore, living organisms are not regulated under RCRA.

The statute prohibits disposal of hazardous wastes without a permit, however, and so could be used to prohibit unintentional release or purposeful disposal of engineered organisms, including accidental releases from production facilities that were not promptly recovered.³ TSCA may be a more useful statute for regulating production facilities, however, as it gives EPA direct authority over the production process, while RCRA applies only to the management of wastes.

§ 19:40 Hazardous waste statutes—CERCLA

EPA’s emergency response authority may be triggered by either a release (or substantial threat of a release) of a “hazardous substance,”¹ or by an imminent hazard posed by a “pollutant or contaminant.”² The definition of both terms is complex,³ but there are several routes by which they may apply to engineered organisms.

First, the statute provides that when EPA takes emergency action concerning any chemical substance under TSCA § 7, the chemical becomes a “hazardous substance” to which EPA may also respond under CERCLA.⁴ The additional authority is important, since CERCLA provides both funds and authority for EPA itself to contain and clean up releases, while TSCA only confers authority to compel action by others.⁵

Second, if EPA designates an infectious waste under RCRA, that too will be a “hazardous substance” to which the Agency may respond under CERCLA (although, as noted in the preceding subsection, EPA has not designated any infectious wastes, and shows no inclination to do so).⁶

Third, EPA may be authorized to designate living organisms as “hazardous substances” under CERCLA alone.⁷ Agency authority to make such designations is limited to “substances,” but because CERCLA authorizes the Agency to also respond to “disease agents” and “infectious” waste regulated under RCRA, there is no reason to think living things are excluded.

As to any of these three types of designated substances, EPA may respond whenever there is a release or threat of release—even if the release has been permitted by EPA itself; CERCLA provides added authority for EPA to respond if permitted releases of pesticides, for example, cause unforeseen problems.⁸ Private parties responsible for the release will not be liable under CERCLA for the costs of response

²See 40 C.F.R. Pt. 261. EPA initially proposed regulating such wastes, but withdrew the proposal. See 45 Fed. Reg. 33,119 (May 19, 1980). See also U.S. EPA, EPA GUIDE FOR INFECTIOUS WASTE MANAGEMENT (1986), available at <http://nepis.epa.gov/> (last visited Jan. 12, 2022). See Donald W. Stever, LAW OF CHEMICAL REGULATION AND HAZARDOUS WASTE (2018).

[Section 19:40]

¹See CERCLA § 104(a)(1)(A), 42 U.S.C. § 9604(a)(1)(A).

²See CERCLA § 104(a)(1)(B), 42 U.S.C. § 9604(a)(1)(B).

³See CERCLA § 101(14), 42 U.S.C. § 9601(14) (“hazardous substance”); CERCLA § 104(a)(2), 42 U.S.C. § 9604(a)(2) (“pollutant or contaminant”).

⁴See CERCLA §§ 101(14), 104(a)(1)(A), 42 U.S.C. §§ 9601(14), 9604(a)(1)(A).

⁵See generally § 14:100.

⁶See CERCLA § 101(14), 42 U.S.C. § 9601(14).

⁷CERCLA § 102(a), 42 U.S.C. § 9602(a).

⁸An exemption of “federally permitted releases” only limits financial liability for certain releases expressly authorized by permit, but does not affect EPA response authority. CERCLA § 107(a), (j), 42 U.S.C. § 9607(a), (j).

to federally permitted releases as they would be for other responses to hazardous substances.⁹ However, liability for response costs associated with a federally permitted release may attach under other statutes or common law.

Fourth, and finally, EPA may respond in any situation where a release or substantial threat of release of a “pollutant or contaminant” poses an imminent and substantial danger to public health or welfare.¹⁰ “Disease agents” are expressly included in the definition of “pollutant or contaminant” for this purpose;¹¹ the language of the statute and its history do not make clear whether other organisms are included.

This last authority is available without further regulatory action; EPA may respond to any imminent hazard posed by the release of disease organisms, and perhaps other engineered organisms. When responding to “pollutants or contaminants,” EPA may take any response measures necessary, but private parties responsible for the release have no liability for the costs of response, or damages to natural resources, as they would if the Agency were responding to unpermitted releases of “hazardous substances.”¹²

It is plain, therefore, that EPA has ample authority to respond after the fact to releases of engineered organisms, and may take protective measures where a release is threatened. The Agency may also secure injunctive relief to prevent or remedy a release if the organism has been designated a hazardous substance.¹³ While the Agency has no advance regulatory authority under CERCLA, as such, plainly it could promulgate rules, or establish policies, concerning the circumstances under which it would respond to releases of engineered organisms.

III. COORDINATION OF BIOTECHNOLOGY POLICY

§ 19:41 In General

In its early stages, the development of the federal government’s policy on biotechnology was coordinated by the BSCC, a spinoff of the Domestic Policy Council Working Group on Biotechnology that spearheaded the development of the Coordinated Framework.¹ More recently, the coordinating functions of the BSCC have been assumed by the OSTP.² On July 2, 2015, the Executive Office of the President issued a memorandum directing the primary agencies that regulate the products of biotechnology—USDA, EPA, and FDA—to review and update the Coordinated Framework. Following a request for comment and public meetings, the consolidated response from EPA, FDA, and USDA was issued in 2017.³

IV. CONCLUSION

§ 19:42 In General

⁹See CERCLA § 107(a), (j), 42 U.S.C. § 9607(a), (j).

²See, e.g., 67 Fed. Reg. 50,578 (Aug. 2, 2002).

³See U.S. EPA, *Modernizing the Regulatory System for Biotechnology Products: Final Version of the 2017 Update to the Coordinated Framework for the Regulation of Biotechnology*, https://www.epa.gov/sites/default/files/2017-01/documents/2017_coordinated_framework_update.pdf (last visited Jan. 12, 2022).

The United States has become a leader in utilizing the potential of modern biotechnology to enhance the properties of living organisms for the benefit of society. New techniques for manipulating the genetic constitutions of biological organisms are at the heart of that technology, and newer more precise techniques continue to become available. While organisms developed using these new techniques might still, in theory, pose uncertain risks to health and the environment, no such risks have yet been realized.

The Reagan Administration took the initiative on the policy front by coordinating a multiagency policy statement in support of its conclusion that existing legislation is adequate for regulating the new technology. The final version of the statement, which was issued June 26, 1986, is a milestone in biotechnology policy evolution. The issuance facilitated the establishment of new regulatory programs implementing TSCA and the agricultural statutes, and the refinement of programs under FIFRA and the FFDCA, and the responsible agencies have made adjustments to those programs as experience and science dictate.

The effectiveness of the existing statutes depends both on their legal adequacy and the vigor with which they are implemented by the responsible agencies. Of the three major statutes or sets of statutes being applied to regulate environmental applications of the products of biotechnology, FIFRA provides the strongest legal foundation for the prior review of the environmental introduction of engineered organisms. TSCA provides authority that EPA has implemented as a federal premarket review and approval program. The agricultural statutes offer an established regulatory review mechanism. Although traditionally these statutes have not been implemented in a manner that addressed the full range of environmental effects, USDA has significantly enhanced its process for assessing the potential environmental impacts of products of biotechnology under NEPA and the ESA. FDA has also paid particular attention to its responsibilities under NEPA and the ESA when approving new animal drug products, including animals produced using genetic engineering, under the FFDCA. The agencies' performance under existing legislation will remain subject to scrutiny by Congress and the courts.

Products of genetic engineering remain subject to regulation, both premarket and post market, because of a lingering concern by some that environmental introductions might have unwanted environmental and health effects. According to our current scientific understanding, such effects are theoretically possible but otherwise unseen and poorly defined and without confirmation. At this stage in the development of the technology, the United States has chosen to continue to regulate largely based on the long-standing precedents established for regulation of conventionally-developed products and the slow pace of public acceptance for their biotechnology counterparts. But any remaining uncertainty about the nature of the risk imposes a special burden on the regulators. They must continue to exercise an appropriate degree of oversight with respect to the potential impacts of the introduction of engineered organisms on the environment and public health, but also to understand the extent, if any, of those impacts based on valid scientific data and information and adjust the nature and degree of regulation to reflect the presence or absence of risk. Moving forward, just as conventionally-developed products qualify for exemption or reduced oversight when warranted by science and experience, so too must their genetically engineered counterparts.

§ 20:1 In General

As originally conceived, this treatise addressed environmental protection in the form of regulation of pollutants and waste. It expressly did not include natural resources law, which many consider a field separate from environmental law that addresses land, minerals, oil and other resources. The law of environmental protection, however, goes beyond regulation of wastes and products to protect human health and the environment and includes protection and regulation of the environment itself. Thus, in lieu of addressing regulation of natural resources, this treatise addresses the protection of the environment itself in this Part F, Protection of the Ecosystem.

In order to address protection of the ecosystem, chapters are devoted to endangered species, alien species, ocean, and climate. Of course air, water, and land as well as soil and groundwater could be included in this section as well, but the way in which our federal laws address environmental issues lends itself to this arrangement. Arguably, we could include a chapter on land use regulation within Part F, and we may include that at a later date. For the moment, we address air,

I. INTRODUCTION; HISTORICAL BACKGROUND OF ESA

§ 21:1 Generally

In 1973, the U.S. Congress enacted the Endangered Species Act (ESA).¹ The ESA, which is one of the most potent pieces of environmental legislation enacted by Congress, represents a determination that species of fish, wildlife, and plants facing extinction as a result of economic growth and development require a comprehensive scheme of federal protection. The ESA also stands as a congressional mandate that requires all federal departments and agencies to conserve endangered and threatened species by utilizing their authorities in furtherance of the Act’s purposes. Because the ESA represents a broad approach to species protection and conservation that is implemented by absolute prohibitions driven by biological factors, it is a source for land use laws, agency regulations, and judicial decisions that can lead to significant impacts on private property rights and economic development. In short, the ESA has been and will continue to be of profound importance to the species, agencies, landowners, developers, and citizens who fall within the ambit of this broadly worded statute.

As first enacted, the ESA represented the balancing of species protection and conservation with sustained economic development, with the balance tipped heavily to-

[Section 21:1]

¹Endangered Species Act of 1973, 16 U.S.C.A. §§ 1531 et seq.

ward species protection and conservation. Subsequent congressional amendments, agency regulations, and judicial opinions have sought to reduce the heavy tilt of the ESA's original balance toward species protection and conservation, while still striving to maintain the Act's overriding conservationist scheme. The result is an often mystifying labyrinth of regulations and court decisions construing the ESA's statutory language. This body of law leaves many landowners, agency regulators, developers, and citizens confused as to what is required, what is prohibited, and what is allowed under the ESA. This primer analyzes the ESA, its history, agency regulations, and court decisions in order to: (1) shed light on the meaning of the ESA as drafted by Congress and interpreted by agencies and the courts; (2) provide a guide for interpreting the Act; and (3) outline the information and steps that might be needed for compliance with the ESA and applicable regulations.

With these overarching goals in mind, subchapters I and II briefly outline the historical background of the ESA and provide an overview of the Act. Subchapter III covers the listed endangered or threatened species. Subchapter IV addresses designation of critical habitat for listed species, while subchapter V addresses recovery plans for protection and conservation of listed species. Subchapter VI covers the consultation process implemented under § 7 of the ESA to coordinate planning and consider whether actions proposed by other federal agencies would comply with the ESA. Subchapter VII addresses the actions that are prohibited under the ESA and the scope of a key ESA term, the "take" definition, under § 9. Subchapter VIII discusses habitat conservation plans and incidental take permitting under § 10. Subchapter IX covers enforcement and citizen suits under § 11. Subchapter X addresses federal-state interaction issues. Subchapter XI addresses the interface between the ESA, the Natural Environmental Policy Act, and the Freedom of Information Act. Subchapter XII examines the emerging issues regarding the ESA and climate change. Subchapter XIII covers the international aspects of the ESA. Subchapter XIV addresses the issue of whether and to what extent the ESA is applicable to Indian lands. Subchapter XV covers the topic of experimental populations under the Act. Finally, Subchapter XVI addresses the ESA and the taking of property under the Fifth Amendment of the U.S. Constitution.

§ 21:2 Historical background—Generally

The ESA has important roots based on the historical antecedents of wildlife regulation, an emerging awareness of the importance of biodiversity and American natural resources, the failure of prior legislative efforts to preserve those resources, and the increasingly environmentally sensitive political climate of the late 1960s and early 1970s.

§ 21:3 Historical background—Historical antecedents of wildlife regulation

Historically, wild animals occupied a unique status within Western legal tradition.¹ The law considered wild animals in their natural state to be the property of no one until captured or killed.² Ancient Romans placed only a single restriction on acquiring wildlife as property by capture or kill, which was that a private landowner had an exclusive right to capture or kill any wildlife located upon his

[Section 21:3]

²Michael J. Bean & Melanie J. Rowland, *The Evolution of National Wildlife Law* 8 (1997).

property.³ This single restriction was perhaps more “a recognition of the right of ownership in land than an exercise by the state of its undoubted authority to control the taking and use of that which belonged to no one in particular, but was common to all.”⁴

Government regulation of wildlife, however, became more apparent in feudal Europe.⁵ Sir William Blackstone attributed the origins of wildlife regulation to the desire of barons and kings to retain the fruits of their conquest by keeping weapons out of the hands of the people they conquered.⁶ Blackstone observed that “[n]othing could do this more effectively than a prohibition of hunting and sporting.” Accordingly, feudal rulers withheld the right to hunt and the right to bear arms from the general populace and those upon whom they had not granted a specific right.⁷

Early wildlife protection via restrictions on hunting and land use detrimental to wildlife soon spread from specific lands reserved to feudal kings, known as “royal forests,” to a more general and exclusive royal authority to hunt applicable to all lands within a kingdom.⁸ Feudal rulers could and often did grant franchises to hunt and fish to favored individuals; and by the 13th century, so many franchises had been granted in England that the Magna Carta of 1215 contained provisions limiting the king’s ability to grant further franchises.⁹ This reduction in royal authority paved the way for parliamentary control over wildlife regulation as the political system within England evolved.¹⁰

Although parliamentary control over wildlife regulation did not signal any great democratization of the rights to manage wildlife, it did set the stage for the development of the primary features of English wildlife law that were transplanted to the New World upon the establishment of colonies in the early 1600s.¹¹ The principal mechanism for parliamentary control over wildlife was the enactment of “qualification statutes.”¹² Those statutes prohibited the taking of game by anyone not “qualified” by the ownership of a certain amount of wealth or lands as prescribed by the statutes.¹³ Generally, the English system of wildlife regulation was focused on hunting restrictions, which some scholars believe to have perpetuated class discrimination by keeping weapons out of the hands of those who were “considered unfriendly, or potentially so, to those in power.”¹⁴

English wildlife law was imported to the new world via colonization. Though some of the particular enactments, such as the royal forest restrictions, had fallen into disuse, many of the qualification statutes remained in force until several decades after American independence.¹⁵ Thus, the essential core of English wildlife law, that Parliament—and to a lesser extent, the king—had complete authority to determine

what rights others might have with respect to the taking of wildlife, became the foundation of American wildlife regulation.¹⁶

In *Martin v. Waddell*,¹⁷ the U.S. Supreme Court first considered the relationship of government and citizen with respect to wildlife. The facts of *Martin* are illustrative of the extent to which parts of the English system of wildlife regulation remained within the United States after ties with England were severed following the Revolutionary War.¹⁸ In *Martin*, the issue was whether a riparian landowner had the right to exclude all others from taking oysters located in certain mudflats in New Jersey's Raritan River.¹⁹ The landowner claimed to own both the riparian and submerged lands and traced the right of ownership to a 1664 grant from King Charles, which purported to convey "all lands, islands, soils, rivers, harbours, mines, minerals, quarries, woods, marshes, waters, lakes, fishings, hawkings, huntings, and fowlings" within the boundaries of the grant.²⁰

Chief Justice Roger Taney determined that the issue at stake in *Martin* was more than an interpretation of a deed of title; it was a question of where the authority to grant that title came from and whether that authority survived the Revolutionary War.²¹ Accordingly, Chief Justice Taney first considered the character of the right claimed by the British Crown²² and then considered whether the character of that right changed when title to the lands passed from the Crown to the plaintiff.²³ After considering these fundamental issues, Chief Justice Taney determined that "dominion and property in navigable waters, and in the lands under them [were] held by the King as a public trust" and by virtue of the limitations imposed by the Magna Carta and his public trust responsibilities, the King had no power to abridge "the public common of piscary."²⁴ Furthermore, Justice Taney determined that this public trust nature of navigable waters and the land submerged therein survived the American Revolution,²⁵ and he thus placed the states in the roles of successors to Parliament and the Crown with respect to the authority to manage wildlife and laid the foundations for the doctrine of state ownership of wildlife.²⁶ The state ownership doctrine, although technically only the law of the original 13 colonies,²⁷ was potentially a limitation upon congressional ability to enact comprehensive wildlife protection legislation until a broader interpretation of Congress' authority to legislate in previously state-governed matters via the Commerce Clause and Treaty Power began to take hold in the early 1900s.²⁸

§ 21:4 Historical background—Emerging awareness of the importance of biodiversity and early legislative attempts at species protection and conservation

The explosion of industry and capitalism following the Industrial Revolution,

²⁸See generally Bean & Rowland, *supra* note 1, at 11–27.

which spawned immense wealth, did not come without costs. Throughout the New World, buildings were being erected in places where only nature and wildlife existed.¹ Not surprisingly, by the dawn of the 20th century, wildlife populations in the United States were at historic lows.² Even the most abundant species, such as the white-tailed deer and the seemingly infinite bison herds, were nearly gone.³ This astonishingly rapid and widely publicized decline aroused public sentiment in favor of wildlife protection.⁴ State and local governments began to respond, enforcing existing hunting regulations more stringently and imposing new ones.⁵ For the first time, native animals were transplanted from their remaining strongholds to reinforce dwindling populations elsewhere.⁶

Although Congress showed interest in protecting individual species in certain locations, such as plains bison as early as the 1870s,⁷ protection for any species on a national scale did not commence until 1900 with the passage of the Lacey Act.⁸ The Lacey Act prohibited interstate commerce in animals killed in violation of state law and directed the Secretary of Agriculture to ensure the continued abundance of game animals and birds.⁹ By enacting the Lacey Act, Congress recognized that the individual states had inadequate resources to prevent species extinction and that federal help was necessary.¹⁰ Sixteen years later, Congress and the executive branch recognized the international scope of problems faced by species extinction and

⁹See Lacey Act of 1900, 18 U.S.C.A. § 42 (2001).

¹⁰See 33 Cong. Rec. H4871 (daily ed. Apr. 30, 1900) (statement of Rep. Lacey). Act of May 25, 1900 ch. 553, §§ 1 to 5, 31 Stat. 187 (current version at 16 U.S.C.A. § 667(e) (2001), 18 U.S.C.A. §§ 42 to 44 (2001)). The Lacey Act was intended to prohibit partially the transportation of birds or game animals that were captured or killed in violation of state law. See George Cameron Coggins, *Federal Wildlife Law Achieves Adolescence: Development in the 1970s*, 1978 Duke L.J. 753 (1978) (discussing origins of federal wildlife law and tracing development of several specific acts including the Migratory Bird Treaty Act and the ESA); James R. Dickens, *The Law and Endangered Species of Wildlife*, 9 Gonz. L. Rev. 57 (1973) (discussing development of international treaties, early federal laws, and state laws concerning endangered wildlife).

entered into an international treaty protecting migratory birds.¹¹

Congress' efforts, however, were piecemeal, focusing on either specific species or issues rather than on a comprehensive preservation program.¹² Moreover, Congress made little effort to estimate the economic value of preserving a species or to recognize that allowing a species to become extinct created an economic loss to society.¹³ It was not until the 1960s that the "the environmental costs of unchecked economic development" were recognized. Even then, Congress had yet to enact any major legislation.¹⁴

§ 21:5 Historical background—Environmental sensitivity of the 1960s and 1970s

Congress began to recognize in the early 1960s that more comprehensive legislation was needed to address species protection and conservation.¹ With plant and animal species facing extinction at an ever-increasing rate, Congress realized that the rapidly escalating economic development of the first half of the 20th century was increasingly devastating to plant and wildlife ecology.² In response to this growing awareness, Congress passed the Endangered Species Protection Act of 1966 (the 1966 Act).³

The 1966 Act was the first federal action to confront species extinction generally.⁴ This law, however, provided only nominal protection.⁵ The Secretary of the Interior was required merely to implement conservation programs when "practicable"⁶ and "consistent with the primary purposes"⁷ of either his own agency or another agency requiring his assistance in implementing the requirements of the Act.⁸

Congress soon realized the limitations of the 1966 Act and passed the Endangered

¹¹See Convention for the Protection of Migratory Birds, Aug. 16, 1916, U.S.-Gr. Brit. (on behalf of Can.), 39 Stat. 1702 [hereinafter Canada Convention]; see also Migratory Bird Treaty Act of 1918, ch. 128, 40 Stat. 755 (1918) (codified as amended at 16 U.S.C.A. §§ 703 to 711 (2001)). State of Missouri v. Holland, 252 U.S. 416, 40 S. Ct. 382, 64 L. Ed. 641, 11 A.L.R. 984 (1920), the Court explored and established the scope of federal treaty power through the lens of this treaty and the Migratory Bird Treaty Act of 1918.

⁷1966 Act § 1(b) (repealed 1973).

⁸1966 Act § 2(d) (repealed 1973).

Species Conservation Act of 1969 (the 1969 Act).⁹ More comprehensive than the 1966 Act, the 1969 Act barred the importation of any endangered species,¹⁰ expanded the definition of “wildlife” to include both vertebrates and invertebrates,¹¹ authorized the Secretary of the Interior to develop a list of species or subspecies threatened with worldwide extinction,¹² and authorized the state purchase of private lands that would aid in the preservation of endangered species.¹³ The 1969 Act, however, still had significant limitations. Perhaps most notably, it failed to eliminate the “practicability” qualifier¹⁴ from the obligations imposed on the Secretary of the Interior.¹⁵

In the early 1970s, Congress passed more major pieces of ecological and environmental legislation than ever before in American history. The environmental revolution began with Earth Day in 1970. That event raised the environmental conscience of the nation and led to a series of landmark environmental statutes. The National Environmental Policy Act (NEPA)¹⁶ was considered the linchpin of these laws by directing every federal agency to consider the environmental impacts of their actions.¹⁷ Other environmental statutes enacted were the Clean Air Act,¹⁸ the Resource Conservation and Recovery Act,¹⁹ the Federal Water Pollution Control Act of 1972,²⁰ and the most significant piece of wildlife protection legislation—the ESA.²¹

The environmental statutes enacted in the 1970s represented a major shift in

¹⁹Pub. L. No. 94-580, 90 Stat. 2795 (codified as amended at 42 U.S.C.A. §§ 6901 to 6992k, ELR Stat. RCRA §§ 1001 to 11011).

²⁰The Federal Water Pollution Control Act Amendments, Pub. L. No. 92-500, 86 Stat. 816 (1972), substantially expanded and reorganized the Federal Water Pollution Control Act of 1948, ch. 758, 62 Stat. 1155. During its first five years, the Act was commonly known as the Federal Water Pollution Control Act. Since 1977, when Congress amended the Act and officially approved the term “Clean Water Act,” it has usually been called by that name. See Michael Blumm, *The Clean Water Act’s Section 404 Program Enters Its Adolescence: An Institutional and Programmatic Perspective*, 8 Ecology L.Q. 410, 410 (1980).

²¹Endangered Species Act, Pub. L. No. 93-205, 87 Stat. 884 (codified as amended at 16 U.S.C.A. §§ 1531 to 1544, ELR Stat. ESA §§ 2 to 18). The Act was considered so significant because it provided comprehensive protection for threatened and endangered species and their habitats, without any limitations or bypass provisions. See §§ 21:6 to 21:7 note 1 and accompanying text (detailing specific provisions of Act).

priorities for Congress. Before then, particularly in the early part of the 20th century, Congress seemed reluctant to formulate a national environmental policy, and few pieces of legislation were passed.²² Scholars have offered two theories to explain this. One theory holds that Congress was demonstrating a simple lack of interest in, or social awareness of, species preservation and other environmental issues.²³ Another, more probative theory concludes that Congress' reluctance to pass environmental and ecological legislation was a reaction to the Court's decision in *Geer v. Connecticut*.²⁴

The *Geer* Court ruled that a state "owns" its wild animals and "has an absolute right to control and regulate the killing of game as its judgment deems best in the interest of its people."²⁵ Thus, the Court concluded that the right to control and regulate was a proper exercise of the state's police power.²⁶ Given the holding in *Geer*, Congress might have been understandably reluctant to interfere with a judicially sanctioned state police action, even though its interstate commerce power may have granted Congress authority to override this state police power.²⁷ Either way, Congress passed little legislation on species preservation nationwide until the 1960s.

While the 1966 Act²⁸ and the 1969 Act²⁹ evidenced Congress' growing concern that both plant and animal species were becoming extinct at an alarming rate and that federal legislation was needed,³⁰ the passage of the ESA in 1973 manifested these concerns as paramount.³¹ Chief Justice Warren Burger observed that, in enacting the ESA, Congress intended to "halt and reverse [the] trend towards species extinction, whatever the cost."³²

Second, on a more philosophical plane, the gradual elimination of different forms

²²See § 21:4, notes 6–11 and accompanying text (discussing early legislative efforts).

³⁰S. Rep. No. 526, 91st Cong., 1st Sess. 3 (1969), *reprinted in* 1969 U.S.C.C.A.N. 1413, 1415. The U.S. Senate report on the 1969 Act embodied two rationales. One rationale was that the extinction of a species removes its unique genetic contribution from the ecology and eliminates the possible benefits of "controlled exploitation" of the species for the public good.

³¹See des Rosiers, *supra* note 1, at 835–37 nn.64–74 (providing supplemental reference citations concerning 1966 and 1969 Acts and underlying congressional intent and purpose); see also Steven P. Quarles & Thomas R. Lundquist, *The Pronounced Presence and Insistent Issues of the ESA*, Nat. Res. & Env't, Fall 2001, at 59 (noting that the Court likely found that the ESA manifests overbearing statutory authority because it is devoid of "weasel words" such as "to the extent feasible," "insofar as practicable," "best available technology," and "in the public interest").

³²*Tennessee Valley Authority v. Hill*, 437 U.S. 153, 185, 98 S. Ct. 2279, 57 L. Ed. 2d 117 (1978) (enjoining completion and operation of Tellico Dam because it would place the snail darter, an endangered species of fish, in danger of extinction). Chief Justice Burger went on to say that the disregard of cost in species preservation "[was] reflected not only in the stated policies of the Act, but in literally every section of the statute." See George Cameron Coggins, *Conserving Wildlife Resources: An Overview of the Endangered Species Act of 1973*, 51 Notre Dame L. Rev. 315 (1974) (providing background of rationale underlying the ESA).

of life reduces the richness and variety of our environment and may restrict our understanding and appreciation of natural processes. Moreover, in hastening the destruction of different forms of life merely because they cannot compete in our common environment upon man's terms, mankind, which has inadvertently arrogated to itself the determination of which species shall live and which shall die, is assuming an immense ethical burden.

S. Rep. No. 526, 91st Cong., 1st Sess. 3 (1969).

II. OVERVIEW AND STRUCTURE OF THE ESA

§ 21:6 Generally

Congress enacted the ESA in 1973 and, in so doing, substantially increased the government's management authority over endangered and threatened species on public and private land.¹ Finding that "species of fish, wildlife, and plants are of esthetic, ecological, educational, historical, recreational, and scientific value to the Nation and its people,"² Congress established in the ESA a comprehensive set of affirmative mandates, stringent prohibitions, and limited exceptions.³

§ 21:7 Basic purposes of the ESA

Congress stated that the ESA had three purposes: first, to provide a means to conserve the ecosystems of endangered and threatened species;¹ second, to provide a conservation program for the endangered and threatened species;² and third, to take appropriate steps to achieve the purposes of specific treaties and conventions identified in the Act.³

Congress granted two federal agencies the authority to implement and carry out the provisions of the ESA. Specifically, the U.S. Department of the Interior (DOI) is responsible for all terrestrial species, while the U.S. Department of Commerce is responsible for marine species and anadromous fish such as salmon.⁴ Congress also directed that all federal departments are to "seek to conserve endangered species and threatened species" and use their authorities in furtherance of the purposes of the Act.⁵

In 1978, the Supreme Court summarized the breadth and reach of the ESA by stating that the Act was "the most comprehensive legislation for the preservation of

endangered species ever enacted by any nation.”⁶ Although Congress has substantially amended the ESA since the Court’s landmark *Tennessee Valley Authority v. Hill*⁷ decision, the ESA remains a powerful tool for species protection and conservation.⁸

§ 21:8 Structure of the ESA

The ESA describes in detail: how to determine and designate an endangered or threatened species;¹ how the state may purchase land to protect a species’ habitat;² how states and federal agencies must cooperate with the ESA’s objectives and regulations;³ how the ESA prohibits certain acts⁴ how to obtain exemptions from its provisions;⁵ and how the ESA enforces its provisions and penalizes violators.⁶

In enacting the ESA, Congress intended “to halt and reverse the trend toward species extinction.”⁷ Accordingly, § 4 of the ESA directs the Secretary of Commerce to determine which species are “in danger of extinction throughout all or a significant portion of [their] range”⁸ and to create a list of such “endangered” species. The ESA also directs the Secretary to list as “threatened” any species that is “likely to become an endangered species within the foreseeable future through all or a portion of its range.”⁹ Section 4 of the ESA describes the criteria and process for listing a species¹⁰ and imposes certain duties on the Secretary of the Interior and the Secretary of Commerce to develop and maintain these lists.¹¹ With the exception of certain monitoring, conferencing, and conservation activities associated with a candidate species, the ESA only provides substantive protection to species that are listed as endangered or threatened in accordance with § 4 of the Act.¹² Thus, the scope of these listings is key to obtaining the protections provided by the Act.

Section 4 also addresses two other key elements of the ESA: critical habitat designations; and recovery plans for listed species. Concurrent with a listing determination, the Secretary is also required to determine “to the maximum extent

⁷*Tennessee Valley Authority v. Hill*, 437 U.S. 153, 184, 98 S. Ct. 2279, 57 L. Ed. 2d 117 (1978).

⁸16 U.S.C.A. § 1532(6), ELR Stat. ESA § 3(6). An important distinction is that plant life is only protected on federal land. See 16 U.S.C.A. § 1538, ELR Stat. ESA § 8 (making it unlawful to “remove and reduce to possession any such species from areas under Federal jurisdiction”).

⁹16 U.S.C.A. § 1532(20), ELR Stat. ESA § 3(20).

¹⁰The present or threatened destruction of a species’ range, the inadequacy of existing regulatory mechanisms, or other natural or man-made factors affecting its continued existence justifies the Secretary’s listing of an endangered species. See 16 U.S.C.A. § 1533, ELR Stat. ESA § 4.

¹¹The present or threatened destruction of a species’ range, the inadequacy of existing regulatory mechanisms, or other natural or man-made factors affecting its continued existence justifies the Secretary’s listing of an endangered species. See 16 U.S.C.A. § 1533, ELR Stat. ESA § 4.

¹²See 16 U.S.C.A. §§ 1534 to 1537, ELR Stat. ESA §§ 5 to 8.

prudent and determinable” whether any area should be designated as “critical habitat” for that listed species under the Act.¹³ Section 4(f) requires the adoption and implementation of “recovery plans” for each listed species unless a finding is made that such plans will not benefit the species.¹⁴

Section 7 of the ESA requires federal agencies, in consultation with the Secretary, to “ensure that any action authorized, funded, or carried out by such agency . . . is not likely to jeopardize the continued existence of any endangered or threatened species” or “result in the destruction or adverse modification of [critical] habitat.”¹⁵ Section 7 establishes procedures governing “consultation” by federal agencies with the Secretary regarding such agency actions. The consultation process is often considered the heart of the ESA in that it is the primary procedural mechanism for the U.S. Fish and Wildlife Service (FWS) and National Marine Fisheries Service (NMFS) to review federal agency actions that affect listed species. Other provisions require coordination between federal and state officials, as well as cooperation with foreign countries, to protect endangered or threatened species.¹⁶ The ESA also authorizes specific federal agencies to acquire land in order to support conservation programs¹⁷ and directs these agencies to consult with affected states before acquiring land for this purpose.¹⁸

Section 9 of the ESA restricts private conduct on privately owned land.¹⁹ The provisions that make it illegal to “take” endangered species within the United States, in the territorial seas of the United States, or upon the high seas have been highly controversial.²⁰ “Take” is broadly defined as “to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect.”²¹ The DOI interprets this definition as forbidding “significant habitat modification or degradation where it actually kills or injures wildlife.”²² This interpretation of the term “take” hinders private as well as public building and commercial activities, and thus has been a frequent source of litigation.²³ Arguably, the “take” interpretation that results in restrictions regarding habitat modification is equivalent to a land use or zoning regulation of private lands. Traditionally, regulation of land use and zoning were the province of state and local governments.²⁴ Furthermore, the DOI’s broad interpretation of the “take” definition affects recreational uses of land, such as driving off-road vehicles and

walking in the sand.²⁵ Perhaps not surprisingly, critics of the ESA argue that this broad interpretation, particularly the habitat modification restrictions that have an impact on the traditional powers of state and local government, cannot be justified under either the Treaty Power or the Commerce Clause.²⁶

The ESA also has a strong enforcement provision that includes a citizen suit authority under § 11, as well as important provisions to conserve and protect endangered and threatened species internationally. Most recently, climate change has emerged as a major factor in the effort to conserve listed species and their habitats.

III. CRITERIA AND PROCEDURES FOR SPECIES LISTINGS

§ 21:9 Generally

Congress granted two federal agencies, the DOI and the U.S. Department of Commerce (DOC), the authority to implement and carry out the provisions of the ESA. The DOI has delegated this authority under the ESA to the FWS, and the DOC has delegated its authority to the NMFS.¹ The ESA requires these agencies to publish lists of species determined to be “endangered” or “threatened.”² Those species in danger of becoming extinct “throughout all or a significant portion of their range” are to be listed as “endangered,”³ while those likely to become endangered in the foreseeable future are to be listed as “threatened.”⁴ A number of factors, including the present or threatened endangerment of the species’ habitat,⁵ overutilization of the species,⁶ disease or predation,⁷ inadequacy of existing regulations,⁸ and all other natural and man-made factors affecting the species’ continued existence⁹ are assessed in making these determinations.

²⁵See Endangered and Threatened Wildlife and Plants: Determination of Endangered Species for the Delhi Sands Flower-Loving Fly, 58 Fed. Reg. 49881, 49884 (Sept. 23, 1993) (to be codified at 50 C.F.R. pt. 17).

²⁶See, e.g., Gibbs v. Babbitt, 214 F.3d 483 (4th Cir. 2000); Omar N. White, *The Endangered Species Act’s Precarious Perch: A Constitutional Analysis Under the Commerce Clause and the Treaty Power*, 27 Ecology L.Q. 215 (2000); Linehan, *supra* note 24; Gavin R. Villareal, *One Leg to Stand On: The Treaty Power and Congressional Authority for the Endangered Species Act After United States v. Lopez*, 76 Tex. L. Rev. 1125 (1998); J. Blanding Holman, *After United States v. Lopez: Can the Clean Water Act and the Endangered Species Act Survive Commerce Clause Attack?*, 15 Va. Env’tl. L.J. 139 (1995) (arguing that the ESA’s take provision may be constitutionally vulnerable).

[Section 21:9]

¹See 50 C.F.R. § 424.01 (1997) (stating that the two agencies have jointly promulgated regulations implementing the statutory provisions of the listing process).

²16 U.S.C.A. § 1533(c), ELR Stat. ESA § 4(c). One such classification that spawned intense controversy involved a small fish called the snail darter. Because the snail darter was classified as an endangered species, the Supreme Court upheld the issuance of an injunction that prohibited the completion of the Tellico Dam project, a multimillion dollar dam on the Little Tennessee River. See *Tennessee Valley Authority v. Hill*, 437 U.S. 153, 193-94, 98 S. Ct. 2279, 57 L. Ed. 2d 117 (1978) (holding that the ESA prohibited continuation of a dam project because impounding a river would destroy snail darter’s habitat). Congress overruled the Court’s decision by amending the appropriations law to exempt the Tellico Dam project from the provisions of the ESA. See *Energy and Water Development Appropriation Act of 1979*, Pub. L. No. 96-69, 93 Stat. 437 (1979) (authorizing the completion of the Tellico Dam project notwithstanding “any other law”); see also *Sequoyah v. Tennessee Valley Authority*, 480 F. Supp. 608, 611 (E.D. Tenn. 1979), judgment aff’d, 620 F.2d 1159 (6th Cir. 1980) (holding that Congress expressly exempted the Tellico Dam project from any law that could affect its completion, including the ESA).

³16 U.S.C.A. § 1532(6), ELR Stat. ESA § 3(6).

⁴16 U.S.C.A. § 1532(20), ELR Stat. ESA § 3(20).

⁵16 U.S.C.A. § 1533(a)(1)(A), ELR Stat. ESA § 4(a)(1)(A).

⁶16 U.S.C.A. § 1533(a)(1)(B), ELR Stat. ESA § 4(a)(1)(B).

⁷16 U.S.C.A. § 1533(a)(1)(C), ELR Stat. ESA § 4(a)(1)(C).

In determining whether to list a species, the responsible agency is required to consider the above factors “solely on the basis of the best scientific and commercial data available.”¹⁰ Thus, such determinations take into account primarily biological risks without considering other factors such as economic impact.¹¹ All listings are subject to review at least once every five years by the Secretary of the Interior, who must determine whether the species should be removed from the list or whether its status should be upgraded from endangered to threatened or downgraded from threatened to endangered.¹² In addition, as discussed in subchapter IV, in conjunction with the listing of a species, the agencies must designate any known habitat of any listed species that meets the definition of “critical habitat.”¹³

Because the Secretary of the Interior is authorized to promulgate any regulations “necessary and advisable” for the conservation of each listed species, and the ESA prohibits specific acts regarding endangered species¹⁴ and authorizes similar prohibitions for threatened species,¹⁵ the scope of what is a “species” is important for purposes of the ESA. The following discussion focuses on the definition of “species,” the specifics of the species listing process, relevant rulemaking procedures, the exceptions available, and potential compliance issues that may arise under NEPA as the result of a listing decision.

§ 21:10 What is a “species”?

Under the ESA, an “endangered species” is “any species [of plant or animal] in danger of extinction throughout all or a significant portion of its range,” as determined by the Secretary of the Interior.¹ “Threatened species” means “any species which is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range.”² The legislative history of the ESA states that, “the protective measures to counter species extinction take effect when a species is listed.”³ Thus, with the exception of certain monitoring, conferencing, and conservation activities, the ESA offers real protection to only those species listed as threatened or endangered.

Although the ESA vests a nondiscretionary duty to list such endangered and

threatened species,⁴ it does not define the term “species” with any scientific precision. Instead, the ESA takes a broad view of what types of “species” should be protected,⁵ by defining the term “species” to include “any subspecies of fish or wildlife or plants, and any distinct population segment of any species of vertebrate fish or wildlife that interbreeds when mature.”⁶ The only specific exclusion from the definition of “species” is of any “species of the Class Insecta determined by the Secretary to constitute a pest whose protection . . . would present an overriding risk to man.”⁷

Though the term “species” is not defined in a biologically⁸ or taxonomically accurate manner,⁹ the ESA is viewed as implicitly recognizing scientific nomenclature as a threshold criterion for listing. Both the FWS and the NMFS have concluded that the term “species” may be applied, “according to the best biological knowledge and understanding of evolution, specialization, and genetics.”¹⁰ Therefore, in determining whether a species will be listed as endangered or threatened, agencies may use sources such as the International Code of Zoological Nomenclature to the extent practicable.¹¹

The ESA seems to rest on a mix of “evolutionary and essentialist assumptions and, like the 1969 Act, demonstrates a concern for both morphological and reproductive distinctions.”¹² In 1973, the House Committee on Merchant Marine and Fisher-

⁴H.R. Rep. No. 97-835, at 20 (1982).

⁵In contrast, the 1966 and 1969 precursors to the ESA covered a very limited number of species. The 1966 Act covered only vertebrate species, and most of the species it designated as endangered were mammals, birds, fish, or certain types of reptiles and amphibians. See Pub. L. No. 89-669, 80 Stat. 926 (repealed 1973). The 1969 Act added two invertebrate species, mollusks and crustaceans, to the types of organisms covered. See Pub. L. No. 91-135, 83 Stat. 275 (repealed 1973).

⁶16 U.S.C.A. § 1532(16), ELR Stat. ESA § 3(16).

⁷16 U.S.C.A. § 1532(6), ELR Stat. ESA § 3(6); 50 C.F.R. § 424.02(e).

⁸Originally, species classification was a straightforward identification of morphological characteristics as developed by Carl Linnaeus. See Ernst Mayr, *The Growth of Biological Thought* 171–80 (1982). However, Charles Darwin’s publication of *On the Origin of Species* in 1859, with its rejection of the static view of nature in favor of a changing evolutionary view, forever altered the nature of species classification, as well as the rest of biology. See Kevin D. Hill, *The Endangered Species Act: What Do We Mean by Species?*, 20 B.C. Env’tl. Aff. L. Rev. 239, 249 (1993). Modern biology has a number of competing definitions for the term “species.” See, e.g., Joel Cracraft, *Species Concepts and Speciation Analysis*, 1 *Current Ornithology* 159 (1983) (explaining the phylogenetic species concept); Alan R. Templeton, *The Meaning of Species and Speciation: A Genetic Perspective*, in *Speciation and Its Consequences* 12 (Otte & Endler eds., 1989) (describing the cohesion concept). The biological species concept, which is based on the isolation species concept proposed in the early 1940s by Harvard evolutionary biologist Ernst Mayr, is perhaps the most widely accepted. See Hill, *supra*, at 249. Notwithstanding the biological species concept’s wide acceptance, it is also subject to criticism. See Guy L. Bush, *Modes of Animal Speciation*, 6 *Ann. Rev. Ecol. & Systematics* 339, 364 (1975) (arguing that the biological species concept is only widely accepted in ornithology and is rejected by botany). The confusion surrounding the exact definition of species may in part be due to the different uses the species category has in the varying branches of biology. See Mayr, *supra*, at 552 (concluding that a biochemist’s definition of species would not necessarily be useful to an evolutionary biologist). Perhaps this is why Congress, in enacting the ESA, chose a very broad definition for the term “species,” as a broad definition would maximize the legislation’s conservation purpose.

⁹Merriam-Webster’s dictionary defines species as:

(1): a category of biological classification ranking immediately below the genus or subgenus, comprising related organisms or populations potentially capable of interbreeding, and being designated by a binomial that consists of the name of a genus followed by a Latin or latinized uncapitalized noun or adjective agreeing grammatically with the genus name.

ies appealed to both genetic and morphological¹³ values when it explained the need to revise the 1969 Act.¹⁴ The Committee also described the “genetic heritage” represented by the species of the world as having incalculable value.¹⁵

As first enacted in 1973, the ESA included a definition of “species” that indicated Congressional intent to protect more than just evolutionary potential. The ESA of 1973 defined “species” as including not only subspecies of animals and plants but also “any other group of fish or wildlife of the same species or smaller taxa in common spatial arrangement that interbreed when mature.”¹⁶ A “taxon” is a “group of organisms of any taxonomic rank that is sufficiently distinct to be worthy of being named and assigned to a definite category.”¹⁷ While closely tracking Harvard evolutionary biologist Ernst Mayr’s biological species concept¹⁸ based primarily on evolutionary relationships, the origin of the clause can be traced to the Marine Mammals Protection Act, which protected both species and “population stocks.”¹⁹

The concept of “population stocks” was developed by the drafter of the Marine Mammal Protection Act to ensure the protection of Alaskan polar bears in the face of disagreement in the scientific community over whether Alaskan bears belonged to a separate subspecies than other arctic bears.²⁰ By using the population stock concept, Congress evinced a desire to protect the Alaskan polar bear population without regard to the evolutionary relationships among polar bears generally. Therefore, by borrowing the population stock concept within the ESA, Congress has enabled the protection of groups considered valuable for reasons other than their evolutionary heritage.

This expansive view of species protection was reinforced in 1978, when Congress expressly rejected the narrowest definition of the biological species concept. In 1978, Congress rejected an amendment that would have limited the ESA’s protections to sexually reproducing groups incapable of breeding with others. The House passed a bill that would have redefined “species” as “a group of fish, wildlife, or plants, consisting of physically similar organisms capable of interbreeding but generally

Isn't Always Better Policy, 75 Wash. U. L.Q. 1029, 1092 (1997). The 1969 Act had extended coverage to animal subspecies, but like the 1966 Act did so without any specific expansion of the definition. 1969 Act § 3(a) (repealed 1973). The 1969 Senate report did, however, emphasize the evolutionary element of the term species, noting the value of species as genetic resources for future exploitation. *See* S. Rep. No. 91-526, at 3 (1969) (noting that “with each species we eliminate, we reduce the pool of germplasm available for use by man in future years. Since each living species and subspecies has developed in a unique way to adapt itself to the difficulty of living in the world’s environment, as a species is lost, its distinctive gene material, which may subsequently prove invaluable to mankind in improving domestic animals or increasing resistance to disease or environmental contaminants, is also irretrievably lost.”). The morphological meaning of species was also implicitly invoked in the Senate report as well. *See* S. Rep. No. 91-526, at 3 (1969) (noting that the “gradual elimination of different forms of life reduces the richness and variety of our environment.”).

¹³Morphology is defined as: “a.) a branch of biology that deals with the form and structure of animals and plants; b.) the form and structure of an organism or any of its parts.” *See* Merriam Webster’s Collegiate Dictionary (20th ed. 2001).

¹⁹Pub. L. No. 92-522, 3(11), 86 Stat. 1027 (1972) (defining “population stocks” as groups “of the same species or smaller taxa in a common spatial arrangement, that interbreed when mature”).

²⁰*See* H.R. Rep. No. 92-707, at 22 (1972).

incapable of producing fertile offspring through breeding with organisms outside this group.”²¹ This definition would have withdrawn recognition from groups that had become reproductively isolated in nature but had not yet diverged sufficiently to become sexually incompatible. Furthermore, it would have precluded protection of asexually-reproducing organisms. However, the Senate rejected a similar proposal,²² leaving the definition of species untouched. The Conference Committee resolved the conflict by drafting the current, inclusive definition.²³

The 1978 Amendments to the ESA thus altered the earlier definition in two respects. First, Congress substituted the words “distinct population segment” for “any other group of fish or wildlife of the same species or smaller taxa in common spatial arrangement.” Second, it limited protection of population segments to vertebrates. This second change eliminated the possibility of protecting groups of invertebrates below the subspecies level. Whether the first change was intended to have any effect on the meaning of the term “species” is unclear.²⁴

Congress considered the definition of “species” again in 1979, in light of a General Accounting Office (GAO) report harshly criticizing the listing process.²⁵ The GAO report expressed concern that the existing definition was so broadly drafted that the FWS would be able to list the squirrels in any given city park as a distinct population segment, even if the squirrels existed in abundance in other parks within the same city or elsewhere in the country.²⁶ Congress ultimately reauthorized the ESA in 1979 without altering the definition of “species”; however, it admonished the listing agencies to list populations “sparingly and only when the biological evidence indicates that such action is warranted.”²⁷ At the same time, Congress observed that the ESA authorized protection of domestic populations of species found in abundance outside the United States.²⁸ This inconsistency of endorsing distinctions based on political boundaries while at the same time calling for listings based only on “biological evidence” was either unnoticed or ignored.

Based on the legislative history and amendments, it seems clear that Congress intended to protect at least distinct forms, genetic resources, and domestic populations.²⁹ Congress also recognized that none of the many species definitions employed by scientists captured all these elements. Yet, Congress did not intend to provide legal protection to the entire diversity of life.³⁰ Perhaps, attempting to find a middle ground, it adopted a definition that would largely leave to the listing agen-

²¹H.R. 14104, 95th Cong., 2d Sess. 5(2). This revision was suggested in order to limit the scope of the ESA’s protection, “to the detriment of man, to every individual creature on the face of the Earth that might differ in one degree or another from one of its brothers.” 124 Cong. Rec. 38154 (1978), *reprinted in* ESA Legislative History, *supra* note 14, at 881.

cies the task of identifying protectable groups.³¹

Overall, the agencies have provided little public information as to how they address the term “species” in the context of listing decisions. The regulatory definition of “species” is identical to the expansive statutory definition.³² In practice, however, the protection of taxonomic species has generated little controversy.³³ This is perhaps due to the fact that the term “species” has a generally understood biological significance notwithstanding the lack of a singularly accepted definition.³⁴ Conversely, the concepts of “subspecies” and “distinct population segment” components of the “species” definition have been highly controversial.³⁵

§ 21:11 “Subspecies” and “distinct population segments”

Even if a group is not recognized as a distinct taxonomic species, it may still qualify for protection under the ESA as a “subspecies” or “distinct population segment.”¹ The term “subspecies” is common in biological literature and generally reflects differences in behavior, genetics, geographic location, and morphology.² However, there is no single generally accepted definition.³ The term “distinct population segment” (DPS) is not used within biological literature at all,⁴ and some suggest it has little objective significance.⁵ As a result, the boundaries between “subspecies” and “distinct population segment” groups, which can be crucial in determining whether a group is entitled to the protections of the ESA, can turn on distinctions that might appear to be trivial.⁶ The scope of DPS determinations, in particular, has

³¹16 U.S.C.A. § 1533(a)(1), ELR Stat. ESA § 4(a)(1); Michael J. Bean & Melanie J. Rowland, *The Evolution of National Wildlife Law* 7–8 (1997).

³²50 C.F.R. § 424.02(k).

³³See National Research Council, *Science and the Endangered Species Act* 47 (1995). The only court to deal with full taxonomic species status did so only in passing. The U.S. District Court for the Southern District of Florida refused to block a white-tailed deer hunt by holding that white-tailed deer are not protected by the ESA simply because they are physically capable of breeding with the listed Key deer. *See Fund for Animals, Inc. v. Florida Game and Fresh Water Fish Com’n*, 550 F. Supp. 1206, 1208 (S.D. Fla. 1982) (declining to hold the two types of deer to be the same species without any showing that they interbreed in nature).

⁴Policy Regarding the Recognition of Distinct Population Segments Under the Endangered Species Act, 61 Fed. Reg. 4722 (Feb. 7, 1996).

⁵See Holly Doremus, *Listing Decisions Under the Endangered Species Act: Why Better Science Isn’t Always Better Policy*, 75 Wash. U. L.Q. 1029, 1101 (1997).

⁶See § 21:10, note 30 and accompanying text. For example, one subspecies listing dispute turned on the taxonomic status of a small songbird called the California gnatcatcher. *See* Holly Doremus, *Listing Decisions Under the Endangered Species Act: Why Better Science Isn’t Always Better Policy*, 75 Wash. U. L.Q. 1029, 1104 (1997). The California gnatcatcher is found in the southwestern United States and northwestern Mexico. The FWS determined that the species included two distinct subspecies, with slight differences in bill length. One subspecies was found north of about 30 degrees latitude in Baja, California. The other was found south of that line. The location of the boundary drawn between the subspecies led to a listing of the northern subspecies, which was reduced to a very small population. If the species had been considered as a whole, it would not have qualified for a listing.

been the subject of significant litigation.⁷

Historically, the ESA permitted listing of populations as threatened or endangered without evidence of genetic variation or geographic isolation.⁸ For example, the American alligator in Louisiana was listed as both endangered and threatened by the FWS; separate populations were defined by parish boundaries⁹ even though the populations were “taxonomically and morphologically identical.”¹⁰ Although the Louisiana alligator decision was prior to the 1978 amendment to the ESA, which added the distinct population segment language, both the FWS and the NMFS have used a flexible approach to justify differential treatment of populations in listing decisions.¹¹

The language and the legislative history of the ESA indicate that Congress intended for groups of vertebrates to be listed at levels below species and subspecies.¹² Since 1978, both the FWS and the NMFS have struggled to identify the appropriate criteria on which to make DPS listing decisions,¹³ and over time, have increased the rate of DPS listings.¹⁴

The increasing number of DPS listing petitions spurred the FWS and the NMFS to develop formal policies to guide DPS listing decisions. Although the criteria used in determining a population’s eligibility for being listed as a DPS have changed over time,¹⁵ the agencies generally rely on two key policy documents: (1) the 1991 NMFS policy applying the species definition to Pacific salmon¹⁶ and (2) the 1996 joint policy

⁷See *Marincovich v. Lautenbacher*, 553 F. Supp. 2d 1237 (D. Or. 2008) (Pacific salmon); *Northwest Ecosystem Alliance v. ¹⁶56 Fed. Reg. 58612, 58618 (Nov. 20, 1991).

on the recognition of distinct vertebrate population segments.¹⁷

Although the 1991 NMFS policy is specific to Pacific salmon, the 1991 policy has become a benchmark for both agencies for other population listing decisions.¹⁸ The 1991 policy provides that a particular salmon stock will qualify as a DPS only if that stock “represents an evolutionarily significant unit (ESU) of the biological species.”¹⁹ An ESU must satisfy two criteria: (1) substantial reproductive isolation from other nonspecific population units and (2) representation as an important component in the evolutionary legacy of the species.²⁰ Thus, the crux of the 1991 policy is genetic distinction.²¹ Populations that are not genetically distinct—that is, they are neither reproductively isolated nor representative as an important component of a species’ evolutionary history—are ineligible for listing.²²

The 1996 joint DPS Policy outlines the interpretation of the term “DPS” for any species of vertebrate fish or wildlife for the purpose of listing, delisting, and reclassifying species under the ESA.²³ The 1996 joint policy references the 1991 policy as a “detailed extension” of the joint policy and notes the 1991 policy’s specific application to Pacific salmon.²⁴ Although the criteria for listing a DPS are different under the 1996 joint policy, the FWS and the NMFS consider both policies to be consistent.²⁵ The 1996 policy lists three guiding principles for recognition of a DPS: (1) discreteness of the population segment in relation to the remainder of the species to which it belongs, (2) the significance of the population segment to the species to which it belongs, and (3) the conservation status of the population segment (whether the DPS is endangered or threatened).²⁶

The first two guiding principles²⁷ focus on whether the population qualifies as a DPS and, like the 1991 policy, center on reproductive isolation and significance as critical factors.²⁸ Not surprisingly, the 1996 joint policy provides further guidance with respect to these principles. Under the 1996 joint policy, a population meets the discreteness principle if it satisfies either of the two following conditions:

¹⁷61 Fed. Reg. 4722 (Feb. 7, 1996).

¹⁸See Kate Geoffroy & Thomas Doyle, Listing Distinct Population Segments of Endangered Species: Has It Gone Too Far?, Nat. Resources & Env’t, Fall 2001, at 85. The NMFS applied the criteria used in the 1991 policy to list different season runs of Chinook salmon in the Columbia River Basin as separate evolutionarily significant units. See also 57 Fed. Reg. 14653 (Apr. 22, 1992) (determining that spring/summer Chinook salmon and the fall Chinook salmon in the Snake River were two separate species for listing purposes); Daniel J. Rohlf, *Pacific Salmon: There’s Something Fishy Going on Here: A Critique of the National Marine Fisheries Service’s Definition of a Species Under the ESA*, 24 Env’tl. L. 617, 621–22 (1994).

²⁵61 Fed. Reg. 4721 (Feb. 7, 1996).

²⁶61 Fed. Reg. 4721 (Feb. 7, 1996). The joint policy does not on its face appear to require a positive determination on all three criteria for a species to be listed as a DPS, but it appears clear that at least the first two principles must be met for a DPS determination. See *id.* at 4724–25. See also Tony A. Sullins, Endangered Species Act 2 (2001); see Kate Geoffroy & Thomas Doyle, Listing Distinct Population Segments of Endangered Species: Has It Gone Too Far?, Nat. Resources & Env’t, Fall 2001, at 85.

²⁷See 61 Fed. Reg. at 4725 (describing discreteness and significance respectively).

²⁸See Kate Geoffroy & Thomas Doyle, Listing Distinct Population Segments of Endangered Species: Has It Gone Too Far?, Nat. Resources & Env’t, Fall 2001, at 85.

- (1) It is markedly separated from other populations of the same taxon as a consequence of physical, physiological, ecological, or behavioral factors. Quantitative measures of genetic or morphological discontinuity may provide evidence of this separation.
- (2) It is delimited by international governmental boundaries within which differences in control of exploitation, management of habitat, conservation status, or regulatory mechanisms exist that are significant in light of section 4(A)(1)(D) of the Act.²⁹

The policy does not seem to require complete reproductive isolation, so long as the population is substantially reproductively isolated or defined with a reference to an international boundary.³⁰

After a population is found to meet the discreteness principle, the FWS and the NMFS must consider available scientific evidence used to determine the “significance” of the population to its species, which may include, but is not limited to, the following:

- (1) Persistence of the discrete population segment in an ecological setting unusual or unique for the taxon.
- (2) Evidence that loss of the discrete population segment would result in a significant gap in the range of a taxon.
- (3) Evidence that the discrete population segment represents the only surviving natural occurrence of a taxon that may be more abundant elsewhere as an introduced population outside its historical range.
- (4) Evidence that the discrete population segment differs markedly from other populations of the species in its genetic characteristics.³¹

The 1996 joint policy explicitly admits that there is inherent imprecision in applying these criteria and declines to formulate a blanket policy or describe all of the types of information that might justify a DPS decision.³²

The third principle adopted within the 1996 joint policy evaluates the conservation status of the population³³ and requires consideration of the statutory listing criteria set out in the ESA.³⁴

Several courts have heard challenges to the lawfulness of the DPS policy. A case in the Ninth Circuit determined whether the DPS policy had the force of law and whether the requirement that a population be significant to its taxon was unlawfully restrictive. In *Northwest Ecosystem Alliance v. U.S. Fish and Wildlife Service*,³⁵ the court reviewed the determination of the FWS to deny a petition classifying the Western Gray Squirrel as an endangered distinct population segment. The court first determined that the DPS policy is granted Chevron deference because Congress “expressly delegated authority to the Service to develop criteria for evaluating peti-

³⁵*Northwest Ecosystem Alliance v. U.S. Fish and Wildlife Service*, 475 F.3d 1136 (9th Cir. 2007).

tions to list endangered species.”³⁶ Additionally, the creation or modification of the policy required a notice and comment period, and the court therefore held the policy carried the force of law.³⁷ Granting the FWS such deference, the court held that the FWS’ denial of the petition for listing based on the determination that the western gray squirrel in Washington was a discrete population, but not significant to the taxon, was not arbitrary and capricious.³⁸

The courts have generally deferred to determinations by the FWS that a specific population of a species represents a DPS irrespective of its worldwide status. As the court in *Defenders of Wildlife v. Norton* held, the FWS is required to address whether a species is in danger of extinction in a significant portion of its historical range, regardless of whether the species as a whole is in danger of extinction.³⁹ As a court determined in upholding the listing of the Arizona population of pygmy owls despite evidence that the species is plentiful in Mexico, “a population segment can be considered ‘discrete’ if it is delineated by international boundaries across which exist differences in management control of the species.” A species population can also be considered “significant if its loss would result in a significant gap in the range of the taxon.”⁴⁰ Thus, the listing of population segments of certain species, such as the gray wolf, has been upheld, even though the populations in Canada are plentiful.⁴¹

However, in 2001, in *Alsea Valley Alliance v. Evans*,⁴² a court overturned the FWS’ decision to list the Oregon Coast Coho Salmon as an evolutionarily significant unit (ESU), which combined hatchery and naturally spawned Coho but excluded listing the hatchery population as threatened because it was not “deemed essential” to the species’ recovery. The court held that the FWS arbitrarily distinguished members of the same DPS/ESU. The court held that “Congress expressly limited the Secretary’s ability to make listing distinctions among species below that of subspecies or a DPS of a species” and that “once NMFS determined that hatchery spawned Coho and naturally spawned Coho were part of the same DPS/ESU, the listing decision should have been made without further distinctions between members of the same DPS/ESU.”⁴³

After the Alsea decision, the NMFS developed a Hatchery Listing Policy (HLP) that required that hatchery fish be a consideration in ESU listing decisions as well as any listing of the ESU of which they are a part.⁴⁴

In delineating an ESU to be considered for listing, NMFS will identify all components of

⁴⁰*Nat’l Association of Home Builders v. Norton* (No. CIV-00-0903-PHX-SRB) (Sept. 21, 2001) (slip. op. at 8).

⁴¹*U.S. v. McKittrick*, 142 F.3d 1170 (9th Cir. 1998). Recently, a court vacated the FWS’ delisting of the distinct population segment (DPS) of the Northern Rocky Mountain population of wolves as not meeting the recovery standard. *Defenders of Wildlife v. Hall*, 565 F. Supp. 2d 1160 (D. Mont. 2008). Subsequently, the FWS reopened the comment period and delisted the wolf DPS only in Idaho and Montana, not Wyoming. 74 Fed. Reg. 15070 (Apr. 2, 2009). That action was again challenged, and the court issued a Preliminary Injunction enjoining wolf hunts in those states and holding that the FWS could not delist part of a species below the level of a DPS based on political lines. *Defenders of Wildlife v. Salazar*, No. CV 09-77-MM-DVM (D. Mont. Sept. 8, 2009).

⁴³*Alsea Valley Alliance v. Evans*, 161 F. Supp. 2d 1154, 1162–63 (D. Or. 2001).

⁴⁴70 Fed. Reg. 37204 (June 28, 2005).

the ESU, including populations of natural fish (natural populations) and hatchery stocks that are part of the ESU. Hatchery stocks with a level of genetic divergence relative to the local natural population(s) that is no more than what occurs within the ESU: (a) are considered part of the ESU; (b) will be considered in determining whether an ESU should be listed under the ESA; and (c) will be included in any listing of the ESU.⁴⁵

However, in 2007, in *Trout Unlimited v. Lohn*, a district court found the HLP to be “internally contradictory”⁴⁶ and acknowledged that many biologists have protested the HLP because its application to hatchery fish “would not be scientifically valid.”⁴⁷ As a result, that court concluded that the HLP was contradictory to the ESA and held that hatchery-bred fish could no longer be counted toward ESA goals and listing decisions.⁴⁸

In 2008, in *Marincovich v. Lautenbacher*,⁴⁹ the District Court of Oregon once again looked at listing decisions involving the Lower Columbia River Coho Salmon. While hatchery Coho was present in abundance, the NMFS had determined that “low abundance of extant population, diminished diversity, and fragmentation and isolation of the remaining naturally produced fish confer considerable risks to the ESU.”⁵⁰ The court looked to the record and gave deference to the scientific expertise necessary to make the listing determination.⁵¹ The court held that the “NMFS’s decision to consider only naturally spawning populations in making its listing determination was not arbitrary and capricious.”⁵²

§ 21:12 Listing criteria and procedures

Section 4 of the ESA prescribes five criteria to be considered in the listing, delisting,¹ and reclassifying² of a species as either “endangered” or “threatened.” Those criteria are:

- (1) The present or threatened destruction, modification, or curtailment of the species’ habitat or range.
- (2) Overutilization for commercial, recreational, scientific, or educational purposes.

⁴⁵70 Fed. Reg. at 37215; *see also* *Alsea Valley Alliance v. Lautenbacher*, 66 Env’t. Rep. Cas. (BNA) 1108, 2007 WL 2344927 (D. Or. 2007), *aff’d*, 319 Fed. Appx. 588 (9th Cir. 2009) (holding that the NMFS did not violate the ESA and the APA by distinguishing between hatchery stock and “natural” salmon populations in its listing process).

⁵²*Marincovich v. Lautenbacher*, 553 F. Supp. 2d 1237 (D. Or. 2008). On September 29, 2008, the U.S. District Court for the District of Columbia vacated the U.S. Fish & Wildlife Service’s (FWS) 2007 Final Rule removing ESA protection for the Western Great Lakes distinct population segment (DPS) of the gray wolf, and remanded it back to FWS.

[Section 21:12]

¹*See* 50 C.F.R. § 424.11(d) (2001) (providing that a species may only be delisted when it meets one of the following conditions: (1) the species is extinct; (2) the species has recovered; to a point where protection is no longer required, or (3) the scientific and commercial data on which the original listing decision was made is found to be erroneous).

²A species’ status under the ESA may be changed from “threatened” to “endangered” or vice versa. *See* 16 U.S.C.A. § 1533(c)(2)(B)(ii) to (iii), ELR Stat. ESA § 4(c)(2)(B)(ii) to (iii).

- (3) Disease or predation.
- (4) The inadequacy of existing regulatory mechanisms.
- (5) Other natural or man-made factors affecting the species' continued existence.³

A positive determination upon any single criteria may support a listing decision, and courts have examined listing decisions closely with regard to these listing criteria.⁴ In fact, the U.S. Court of Appeals for the District of Columbia Circuit has made it clear that any deviation from the five criteria listed in the ESA is improper.⁵

1. The Meaning of "In Danger of Extinction Throughout All or a Significant Portion of Its Range"

Under the ESA, a species may be listed as "endangered" based on these criteria if "it is in danger of extinction throughout all or a significant portion of its range."⁶ However, the ESA is silent on what constitutes "a significant portion" of a species' range. This language was added to the ESA to "allow the Secretary more flexibility in [his] approach to wildlife management."⁷ Many cases have grappled with what constitutes "a significant portion" of a species' range for purposes of listing decisions. The central controversy in most of these cases is whether the Secretary must make a listing decision based only upon a species' current and future range or must also consider the species' lost historical range. In 2001, the Ninth Circuit created the most relied upon definition in *Defenders of Wildlife v. Norton*, in which it concluded that "a species may be extinct 'throughout . . . a significant portion of its range' if there are major geographical areas in which it is no longer viable but once was."⁸

In 2005 a district court vacated the gray wolf rulemaking based on the definition of "a significant portion of its range" created in *Norton*.⁹ The gray wolf decisions are of particular significance because the FWS had held a meeting at Marymount University in 2000 in order to define the "significant portion" of the wolf's range. At that meeting, the FWS defined the significant portion of the gray wolf's range as "that area that is important or necessary for maintaining a viable, self-sustaining, and evolving representative population or populations in order for the taxon to persist into the foreseeable future."¹⁰ The Secretary relied on the Marymount meeting definition to reclassify certain populations of the gray wolf from "endangered" to "threatened." The court in *Defenders of Wildlife v. Secretary, U.S. Dep't of the Interior* held that the Marymount meeting definition of a "significant portion" of the gray wolf's range was not reasonable because it failed to consider or explain the sig-

³16 U.S.C.A. § 1533(l)(A) to (E), ELR Stat. ESA § 4(1)(A) to (E); 50 C.F.R. § 424.11(c)(1) to (5) (2001).

⁴*See, e.g., Oregon Natural Resources Council v. Daley*, 6 F. Supp. 2d 1139 (D. Or. 1998) (holding that current regulatory structure is the only appropriate basis for a listing decision); *Friends of Wild Swan, Inc. v. U.S. Fish and Wildlife Service*, 945 F. Supp. 1388 (D. Or. 1996) (holding an agency's own speculations as to future effects of another agency's species management plans insufficient basis to delay a listing decision); *Northern Spotted Owl (Strix Occidentalis Caurina) v. Hodel*, 716 F. Supp. 479 (W.D. Wash. 1988) (holding that the FWS disregarded its own biologists' expert opinions and failed to provide any expert analysis in support of its decision to not list the spotted owl).

⁵*See Biodiversity Legal Foundation v. Babbitt*, 943 F. Supp. 23 (D.D.C. 1996); *Southwest Center for Biological Diversity v. Babbitt*, 939 F. Supp. 49 (D.D.C. 1996).

⁶16 U.S.C.A. § 1532(6), ELR Stat. ESA § (3)(6). Similarly, a species may be listed as "threatened" if it "is likely to become an endangered species in the foreseeable future throughout all or a significant portion of its range." 16 U.S.C.A. § 1532(20), ELR Stat. ESA § (3)(20).

⁷*Defenders of Wildlife v. Norton*, 258 F.3d 1136, 1144 (9th Cir. 2001).

⁸*Defenders of Wildlife v. Norton*, 258 F.3d 1136, 1145 (9th Cir. 2001).

⁹*Defenders of Wildlife v. Secretary, U.S. Department of the Interior*, 354 F. Supp. 2d 1156, 1167-69 (D. Or. 2005).

nificance of the wolf's lost historical range in accordance with the Norton definition.¹¹ Later that year, the court in *National Wildlife Federation v. Norton*, vacated another gray wolf listing decision on similar grounds.¹²

In 2007 another district court applied the Norton definition in analyzing a listing decision involving the flat-tailed horned lizard.¹³ In 1993, the Secretary of the Interior had proposed listing the lizard for protection¹⁴ but later moved to withdraw the proposal upon concluding that “the lost habitat is ‘not a significant portion’ of the lizard’s range and ‘does not result in the species likely becoming endangered in the foreseeable future throughout all or a significant portion of its range.’”¹⁵ The issue before the court was whether the Secretary’s determination was consistent with the Ninth Circuit Norton decision. In his findings in support of withdrawal, the Secretary first chose a point in time in which to determine the lizard’s range to establish a temporal baseline and define the subject area.¹⁶ Next, the Secretary evaluated the significance of the lizard’s lost historical habitat.¹⁷ The court held that this two-step analysis was sufficient to satisfy both the ESA and the Norton decision, especially because the Secretary had explained why the lizard’s lost historical range was not significant to the species.¹⁸

A 2007 Solicitor’s opinion further clarified the meaning of “In Danger of Extinction throughout All or a Significant Portion of its Range.”¹⁹ That opinion noted that:

Since approximately 2000, the Department . . . has interpreted the SPR [significant portion of its range] phrase to mean that a species is an endangered species only when it is in danger of extinction throughout a portion of its current range that is “so important to the continued existence of the species that threats to the species in that area can have the effect of threatening the viability of the species as a whole.” *Ctr. for Biological Diversity v. Norton* (citation omitted).²⁰

The opinion provides four reasons for this conclusion:

- (1) The SPR phrase is a substantive standard for determining whether a species is an endangered species—whenever the Secretary concludes because of the

²⁰Solicitor’s Opinion M-37013 (Mar. 16, 2007), available at <http://www.doi.gov/solicitor/opinions.html>. (citing *Center for Biological Diversity v. Norton*, 411 F. Supp. 2d 1271, 1278 (D.N.M. 2005)).

statutory five-factor analysis that a species is “in danger of extinction throughout . . . a significant portion of its range,” it is to be listed and the protections of the ESA applied to the species in that portion of its range where it is specified as an “endangered species.”

- (2) The word “range” in the SPR phrase refers to the range in which a species currently exists, not to the historical range of the species where it once existed.
- (3) The Secretary has broad discretion in defining what portion of a range is “significant” and may consider factors other than simply the size of the range portion in defining what is “significant.”
- (4) The Secretary’s discretion in defining “significant” is not unlimited; he may not, for example, define “significant” to require that a species is endangered only if the threats faced by a species in a portion of its range are so severe as to threaten the viability of the species as a whole.²¹

2. Required Use of “Best Scientific and Commercial Data Available”

As discussed above, § 4 of the ESA identifies five factors, such as habitat loss and modification, overharvesting, disease, predation, inadequate regulatory control, and other natural and manmade factors²² as the criteria to be considered for listing decisions under the ESA. In addition, § 4 requires the FWS and NMFS to make determinations “solely on the basis of the best scientific and commercial data available”²³ as to whether a species will become endangered or extinct in the foreseeable future.²⁴ Furthermore, Congress included “trade data”²⁵ as clarification for the term “commercial information” as used in the ESA. If the FWS or the NMFS finds that a species is likely to become endangered or extinct in the foreseeable future without protection, then by definition that species is presently threatened or endangered.²⁶

The FWS and the NMFS have issued joint listing regulations that specifically exclude the use of economic impact data from the definition²⁷ of best scientific and commercial data.²⁸ These regulations were issued in response to 1982 amendments to the ESA overturning Executive Order 12291, which had previously required economic impact analysis data to be included in listing decisions.²⁹ At that time, Congress also noted that “emotional reasons” and “improper biological data” were

inappropriate bases for listing decisions³⁰ under the ESA.

The phrase “best scientific and commercial data available” appears to reflect a “fervent Congressional preference for scientific decision making.”³¹ However, Congress did not precisely indicate what it meant by “best scientific and commercial data available.” Although the FWS and the NMFS have enacted regulatory provisions to fill the definitional void and the courts have enthusiastically reviewed sources of data for lawfulness under the ESA using an “arbitrary and capricious standard,”³² a specific meaning for what meets the “best” hurdle remains elusive.

The FWS has determined that scientific or commercial publications, administrative reports, maps or other graphic materials, expert analyses or testimony, and interested party comments may be reviewed in listing decisions.³³ In 1994, the FWS and the NMFS issued a policy statement in order to clarify the inherent variability in the quality and reliability of information contained in the wide variety of sources available for consideration in listing decisions.³⁴

The agencies also provided guidelines to ensure that listing decisions under the ESA are made using the “best scientific and commercial data available.” These guidelines direct the listing decisionmaker to:

- (1) Require the evaluation of all scientific information and other information used in making a listing decision.
- (2) Gather and impartially evaluate the biological, ecological, and any other information that is contrary to the official position taken by the FWS and the NMFS.
- (3) Ensure that the evaluation of all information supporting or contrary to any position proposed by the listing agency is documented.
- (4) Use primary and original sources of information as the basis for listing decisions or recommendations.
- (5) Adhere to the timeframes established in the ESA for listing decisions.
- (6) Conduct management-level review of any documentation developed by the listing agency to verify and ensure the quality of the science used in the establishment of official agency positions.³⁵

Furthermore, the FWS and NMFS policy requires peer review of any pertinent data used in listing decisions by, “three appropriate and independent specialists.”³⁶ The opinions of the peer reviewers must be included in summary form in any final listing rule or proposed rule.³⁷

The courts have also considered what constitutes “best scientific and commercial data” in their review of the data used in listing decisions. Judicial review of administrative decisions involving the ESA is governed by § 706 of the Administrative Procedure Act (APA).³⁸ A reviewing court uses § 706 to determine whether agency decisions are “arbitrary, capricious, an abuse of discretion, or otherwise not

in accordance with law.”³⁹ The arbitrary and capricious test gives reviewing courts a very narrow scope of review regarding agency fact-finding.⁴⁰

In order to determine whether an agency violated the arbitrary and capricious standard, a court must determine whether the agency articulated a rational connection between the facts found and the choice made.⁴¹ Therefore, reviewing courts are not empowered to substitute their judgment for that of the agency.⁴² As long as the agency decision was based on a consideration of relevant factors and there is no clear error of judgment, the reviewing court may not overturn the agency’s action as arbitrary and capricious.⁴³ The basis for the decision, however, must come from the agency. The reviewing court may not substitute reasons for agency action that are not in the record.⁴⁴

Generally, courts defer to the agency’s expertise in situations such as listing decisions where “resolution of this dispute involves primarily issues of fact.”⁴⁵ Therefore, reviewing courts will set aside only those conclusions that do not have a basis in fact, not those with which they merely disagree.⁴⁶ However, judicial review would be meaningless unless courts carefully reviewed the record to “ensure that agency decisions are founded on a reasoned evaluation of the relevant factors.”⁴⁷ Accordingly, the courts have refused to “rubber-stamp . . . administrative decisions that they deem inconsistent with a statutory mandate or that frustrate the congressional

⁴⁴See *Camp v. Pitts*, 411 U.S. 138, 142, 93 S. Ct. 1241, 36 L. Ed. 2d 106 (1973) (holding that “[t]he focal point for judicial review is the administrative record in existence . . .”).

⁴⁵See *Marsh v. Oregon Natural Resources Council*, 490 U.S. 360, 377, 109 S. Ct. 1851, 104 L. Ed. 2d 377 (1989) (holding that “[b]ecause analysis of the relevant documents ‘requires a high level of technical expertise,’ we must defer to the informed discretion of the responsible federal agencies.”) (internal citations omitted). The courts also view deference as being particularly important when the agency is “making predictions, within its area of special expertise, at the frontiers of science.” See *Baltimore Gas and Elec. Co. v. Natural Resources Defense Council, Inc.*, 462 U.S. 87, 103, 103 S. Ct. 2246, 76 L. Ed. 2d 437 (1983).

⁴⁶See, e.g., *Marsh v. Oregon Natural Resources Council*, 490 U.S. 360, 378, 109 S. Ct. 1851, 104 L. Ed. 2d 377 (1989) (holding that “when specialists express conflicting views, an agency must have discretion to rely upon reasonable opinions of its own qualified experts even if, as an original matter, a court might find contrary views more persuasive.”); *U.S. Dept. of Interior, Bureau of Indian Affairs v. Federal Labor Relations Authority*, 887 F.2d 172, 176 (9th Cir. 1989); *Love v. Thomas*, 858 F.2d 1347 (9th Cir. 1988); *Loggerhead Turtle v. County Council of Volusia County, Fla.*, 120 F. Supp. 2d 1005, 1023 (M.D. Fla. 2000) (holding that “[p]laintiffs’ disagreement with the Service’s ultimate findings or the studies underlying them does not render its decisions arbitrary and capricious [and thus] Plaintiffs fail[ed] to demonstrate that the Secretary’s decisions were not informed by the required data.”); *New Mexico Cattle Growers Ass’n v. U.S. Fish and Wildlife Service*, 81 F. Supp. 2d 1141, 1160 (D.N.M. 1999), rev’d on other grounds, 248 F.3d 1277 (10th Cir. 2001) (rejected by, *Arizona Cattle Growers’ Ass’n v. Salazar*, 606 F.3d 1160 (9th Cir. 2010)).

⁴⁷*Marsh v. Oregon Natural Resources Council*, 490 U.S. 360, 378, 109 S. Ct. 1851, 104 L. Ed. 2d 377 (1989).

policy underlying a statute.”⁴⁸

Thus, federal courts have been willing to overturn agency decisions based on improper data. In *Friends of the Wild Swan v. U.S. Fish and Wildlife Service*, the court held that the FWS could not rely upon its own speculations as to the future effects of another agency’s management plans in order to delay a listing.⁴⁹ Similarly, in *Northern Spotted Owl v. Hodel*, the court determined that the FWS had improperly disregarded the opinion of its own expert and failed to provide any other expert analysis in support of its decision not to list the spotted owl.⁵⁰

While an agency generally has wide latitude to determine what is “the best scientific and commercial data available,” the Ninth Circuit Court of Appeals interpreted this provision to mean an agency cannot ignore available biological information, reasoning that “[i]n light of the ESA requirement that the agencies use the best scientific and commercial data available to ensure that protected species are not jeopardized, the FWS cannot ignore available biological information.”⁵¹ On the other hand, it is presumed that agencies have used the best data available unless those who are challenging agency action can identify relevant data not considered by the agency.⁵²

In fact, the courts have not even required that the data considered in listing decisions be conclusive.⁵³ Finding that Congress intended for listing actions to occur “sooner rather than later,” the Ninth Circuit concluded that data presently available would suffice to meet the best scientific and commercial data threshold.⁵⁴ There is no legal requirement for the listing agency to pursue better data than what is presently available even if such data are merely an estimate.⁵⁵

3. Listing Priority Guidelines

In 1979 Congress amended the ESA to require the listing agencies to establish “a ranking system” to identify species that would receive priority review in listing decisions.⁵⁶ In the relevant legislative history for the 1982 amendments to the ESA, Congress stated that the ranking system should be scientifically based without

⁴⁸*N.L.R.B. v. Brown*, 380 U.S. 278, 291–92, 85 S. Ct. 980, 13 L. Ed. 2d 839 (1965).

Cal. 2000); *Pacific Coast Federation of Fishermen’s Ass’n v. National Marine Fisheries Service*, 71 F. Supp. 2d 1063, 1073 (W.D. Wash. 1999), aff’d in part, vacated in part on other grounds, 253 F.3d 1137 (9th Cir. 2001), opinion amended and superseded on denial of reh’g, 265 F.3d 1028 (9th Cir. 2001).

⁵²See, e.g., *Friends of Endangered Species, Inc. v. Jantzen*, 760 F.2d 976 (9th Cir. 1985).

⁵³See *Defenders of Wildlife v. Babbitt*, 958 F. Supp. 670 (D.D.C. 1997) (holding the FWS requirement for conclusive evidence in support of a listing decision to be “arbitrary and capricious”).

⁵⁴See *Conner v. Burford*, 848 F.2d 1441, 1454 (9th Cir. 1988).

⁵⁵See *Southwest Center for Biological Diversity v. Babbitt*, 215 F.3d 58, 61 (D.C. Cir. 2000) (holding that the Secretary of the Interior was not legally obliged to conduct actual counts of a species in making a listing determination and that population estimates would support the decision). See also *Southwest Center For Biological Diversity v. Norton*, 2002 WL 1733618 (D.D.C. 2002) (detailed analysis of adequacy of data in the decision not to list the Goshawk).

⁵⁶Act of Dec. 28, 1979, Pub. L. No. 96-159, § 3(6), 93 Stat. 1225 to 1226 (1979). This amendment is now codified at 16 U.S.C.A. § 1533(h)(3), ELR Stat. § 4(h)(3).

regard to whether a species was a “higher or lower life form.”⁵⁷ Accordingly, in 1983, the FWS published its Listing Priority Guidelines establishing three criteria for prioritizing listing actions:

- (1) The magnitude of the threat faced by a species.
- (2) The immediacy of the threat faced by a species.
- (3) The taxonomic distinctiveness of the species.⁵⁸

The 1983 Guidelines are still used to set priorities among species. The FWS subsequently established four additional criteria to assign priorities to different types of listing actions.⁵⁹ These are, in order from highest to lowest priority:

- (1) Emergency listing rules.
- (2) Final determinations on proposed listings.
- (3) Determinations regarding current candidate species, either listing or delisting a species.
- (4) Processing of administrative findings on petitions to list or reclassify species.⁶⁰

The guidance on priority setting is identified as only a “guide.”⁶¹ Furthermore, the Listing Priority Guidelines withstood a legal challenge questioning their validity under the listing criteria under § 4 of the ESA.⁶² Perhaps in the spirit of judicial deference to agency decisions based on the facts in *Marsh*,⁶³ most courts have at least implicitly recognized the listing agencies’ applications of these guidelines as valid in particular cases.⁶⁴

4. The Listing Petition Process

The ESA listing process may be commenced by either a formal agency rulemaking or via a written petition submitted to an agency urging it to list, delist, or reclassify a species.⁶⁵ However, the citizen petition process remains the most important source of species listings. Such petitions are considered petitions for formal rulemaking under the Administrative Procedure Act and must be processed in accordance with those rulemaking procedures and applicable regulations issued by the FWS and the NMFS.⁶⁶

The FWS and the NMFS regulations specify certain minimum requirements for a valid petition. A valid petition must (1) be clearly identified as a petition; (2) be dated; (3) include the name, address, telephone number, and business or other affili-

⁵⁷H.R. Conf. Rep. No. 835, at 21, *reprinted in* 1982 U.S.C.C.A.N. 2860, 2862.

⁵⁸48 Fed. Reg. 43098, 43103 (1983).

⁵⁹64 Fed. Reg. 57114 (1999).

⁶⁰64 Fed. Reg. 57114, 57118 to 19 (1999). One commentator has noticed that this guidance has eliminated critical habitat designation from priority guidance altogether. *See* Tony A. Sullins, *Endangered Species Act 2* (2001).

⁶¹*See* 48 Fed. Reg. 43098 (1983) (noting that the priority systems presented are not to be “looked upon as inflexible frameworks for determining resource allocation”).

⁶²*See* *Biodiversity Legal Foundation v. Babbitt*, 146 F.3d 1249 (10th Cir. 1998).

⁶³*Marsh v. Oregon Natural Resources Council*, 490 U.S. 360, 377, 109 S. Ct. 1851, 104 L. Ed. 2d 377 (1989).

⁶⁴*See, e.g.,* *Carlton v. Babbitt*, 900 F. Supp. 526 (D.D.C. 1995). However, one circuit has ruled that “when faced with a nondiscretionary duty to designate critical habitat” the deciding agency must do so without regard to preferred priorities. *See* *Forest Guardians v. Babbitt*, 174 F.3d 1178 (10th Cir. 1999).

⁶⁵16 U.S.C.A. § 1533(B)(3)(A), ELR Stat. ESA § 4(B)(3)(A); 50 C.F.R. § 424.14(a). Additionally, an interested person may request the designation or revision of a critical habitat. *See* 50 C.F.R. § 424.10.

⁶⁶5 U.S.C.A. § 553(e); *see* 50 C.F.R. § 424.14(a) (requiring the agency to acknowledge receipt of petitions in writing within 30 days).

ation of the petitioner; and (4) be signed by the petitioner.⁶⁷ Furthermore, the joint regulation specifies what type of substantive information a valid petition contains. In order to justify the petitioned action, a valid petition should:

- (1) Clearly indicate the measure sought.
- (2) Give the scientific and common names of the species involved.
- (3) Contain a detailed narrative that justifies the recommended measure based upon available information, past and present numbers and distribution of the species, and any threats to the species.
- (4) Provide information regarding the status of the species in its range or significant portion thereof.
- (5) Provide supporting documentation in the form of scientific publications, letters, reports, and the like.⁶⁸

In designating the species involved, the petitioner may limit the scope of the petition by either requesting that a species or subspecies be listed throughout its entire range or requesting that a “distinct population segment” be listed. Some courts have required the listing agency to specifically address and even adhere to the scope of petitions.⁶⁹

a. The 90-Day Finding

Once an agency receives a valid petition, “to the maximum extent practicable”⁷⁰ the ESA requires it to make a finding within 90 days of receipt as to whether the petition presents “substantial scientific or commercial information” indicating that the petitioned action may be warranted.⁷¹ The joint FWS and NMFS regulations define “substantial information” as “that amount of information that would lead a reasonable person to believe that the measure proposed in the petition may be warranted.”⁷²

The 90-day finding may be waived in the rare instance where “devotion of staff resources to petition responses would interfere with actions needed to list other species in greater need of protection.”⁷³ Absent waiver, the agency making a 90-day finding must consider whether the petitioned action may be warranted.⁷⁴ Its decision must be published in the *Federal Register*;⁷⁵ a decision that the action is not

⁶⁷See 50 C.F.R. § 424.14(a).

⁶⁸See 50 C.F.R. § 424.14(b)(2)(i) to (iv).

⁶⁹See, e.g., *Friends of Wild Swan, Inc. v. U.S. Fish & Wildlife Service*, 12 F. Supp. 2d 1121, 1133 (D. Or. 1997) (finding the FWS’ designation of five distinct population segments of bull trout arbitrary and capricious when the petitioner had specifically requested the bull trout be listed in its entire range); *Southwest Center for Biological Diversity v. Babbitt*, 926 F. Supp. 920, 922 (D. Ariz. 1996) (noting that the agency had properly considered the narrow listing petitioned for and expanded its consideration following a decision that the narrow listing was not warranted); *Defenders of Wildlife v. Babbitt*, 958 F. Supp. 670 (D.D.C. 1997) (same).

⁷⁰The phrase “maximum extent practicable” is not defined within the ESA or by regulation. The Tenth Circuit has characterized the phrase as “facially ambiguous.” See *Biodiversity Legal Foundation v. Babbitt*, 146 F.3d 1249 (10th Cir. 1998). See also *Building Industry Ass’n of Superior California v. Norton*, 247 F.3d 1241 (D.C. Cir. 2001).

⁷¹16 U.S.C.A. § 1533(b)(3)(A), ELR Stat. ESA § 4(b)(3)(A); 50 C.F.R. § 424(b)(1).

⁷²See 50 C.F.R. § 424.14(b)(1).

⁷³See 49 Fed. Reg. 38900 (1984); H.R. Conf. Rep. No. 97-835, at 21 (1982), *reprinted in* 1982 U.S.C.A.N. 2807, 2862. Such an instance would be when a “scientifically based priority system” is in place that does not consider whether a species is a “higher or lower life form.”

⁷⁴16 U.S.C.A. § 1533(b)(3)(A), ELR Stat. ESA § 4(b)(3)(A); 50 C.F.R. § 424.14(b)(1).

⁷⁵16 U.S.C.A. § 1533(b)(3)(A), ELR Stat. ESA § 4(b)(3)(A); 50 C.F.R. § 424.14(b)(1).

warranted is subject to judicial review.⁷⁶ A finding that the petitioned action may be warranted triggers the “12-month finding” process.

b. The 12-Month Finding

Once the 90-day finding is made, the agency must make the next decision in the listing process within 12 months of the date the original petition was received.⁷⁷ While “review[ing] . . . the status of the species concerned,”⁷⁸ the agency must also determine whether (1) the petitioned action is warranted, (2) the petitioned action is not warranted, or (3) the petitioned action is warranted but precluded.⁷⁹ A “warranted but precluded action” is one that would be taken but for the existence of other pending proposals affecting that decision.⁸⁰

Like the 90-day finding, the determination that a proposed action is not warranted may be judicially reviewed⁸¹ and must be communicated to the petitioner and published in the *Federal Register*.⁸² If the agency determines that an action is warranted, the decision must be published in the *Federal Register* as a general notice with the complete text of any proposed regulation implementing the action.⁸³

The “warranted but precluded” determination has proven controversial in both scholarly literature⁸⁴ and the courts.⁸⁵ In fact, a “warranted but precluded” finding may be supported only if three conditions are met. First, the agency must determine that the information available regarding the petitioned action indicates that the action is warranted.⁸⁶ Second, timely promulgation of the petitioned action must be found actually to be precluded by other higher priority pending decisions.⁸⁷ Finally, a determination must be made that “expeditious progress” is being made to list, delist, or reclassify other species.⁸⁸ When making a “warranted but precluded” finding, the FWS is required to “publish such finding in the *Federal Register*, together with a description and evaluation of the reasons and data on which the finding is based.”⁸⁹ Furthermore, a petition that is found to be “warranted but precluded” is automati-

⁸⁹16 U.S.C.A. § 1533(b)(3)(B); See also *Center for Biological Diversity v. Kempthorne*, 466 F.3d 1098 (9th Cir. 2006) (remanding the case to the FWS upon failure to publish its description and evaluation of its reasons and data together with its finding that the listing of the Sierra Nevada Mountain yellow-legged frog was warranted but precluded).

cally resubmitted on the anniversary date of the original petition,⁹⁰ and the agency must make a new determination as to the status of the renewed petition within 12 months of the original “warranted but precluded” finding.⁹¹

5. Rulemaking Procedures Required to List a Species

The ESA prescribes the rulemaking process for the listing, delisting, or reclassifying of species whether the rulemaking is in response to a petition or based upon an agency’s own initiative.⁹² The rulemaking process is a formal process that is governed by specific provisions of the ESA as well as the general rulemaking provisions of the Administrative Procedure Act.⁹³

a. Publication of Proposed Listing

The rulemaking process begins with the publication of a “general notice” and the complete text of any proposed rule in the *Federal Register*.⁹⁴ Regulations require the following information to be published along with the general notice: (1) a summary of data upon which any proposed rulemaking is based; (2) a summary of the relationship between the proposed rule and its supporting data; and (3) a summary of the factors affecting the species.⁹⁵

b. Further Notice and Public Comment

In addition to the *Federal Register* notice, the agency must also provide notice of the proposed rule directly to each state agency and local governmental authority in areas in which the species is believed to be found.⁹⁶ The agency is also required to provide direct notice to any other federal agencies, foreign governments, private organizations, and individuals who are “known to be affected” by the proposed rule.⁹⁷

The agency must accept public comment for at least 60 days following publication of the proposed rule in the *Federal Register* and may decide to extend or reopen the public comment period for “good cause.”⁹⁸ The agency must hold at least one public hearing upon request if such a request is made within 45 days of publication of the rulemaking notice in the *Federal Register*.⁹⁹ These rulemaking procedures and requirements are designed to promote “meaningful” participation in the rulemaking process under the APA.¹⁰⁰

c. The Final Rule

The final rule generally must be published within 12 months after the *Federal*

⁹⁰16 U.S.C.A. § 1533(b)(3)(C)(i), ELR Stat. ESA § 4(b)(3)(C)(i); 50 C.F.R. § 424.14(b)(4).

⁹¹50 C.F.R. § 424.14(b)(4).

⁹⁴16 U.S.C.A. § 1533(b)(5)(A)(i), ELR Stat. ESA § 4(b)(5)(A)(i); 50 C.F.R. § 424.16(b).

⁹⁵50 C.F.R. § 424.16(b).

⁹⁶16 U.S.C.A. § 1533(b)(5)(A)(ii), ELR Stat. ESA § 4(b)(5)(A)(ii); 50 C.F.R. § 424.16(c)(1)(ii).

⁹⁷16 U.S.C.A. § 1533(b)(5)(B), ELR Stat. ESA § 4(b)(5)(B); 50 C.F.R. § 424.16(c)(1)(iii); 50 C.F.R. § 424.16(c)(1)(iv).

⁹⁸50 C.F.R. § 424.16(c)(2); *see also* Kern County Farm Bureau v. Allen, 450 F.3d 1072 (9th Cir. 2006) (holding that the FWS did not violate the ESA when it refused to reopen the comment period for the listing of the Buena Vista Lake shrew after relying on three new studies in the final rule).

⁹⁹50 C.F.R. § 424.16(c)(3). The agency must also publish a notice of the hearing and its location in the *Federal Register* at least 15 days in advance of the hearing.

¹⁰⁰*See* Idaho Farm Bureau Federation v. Babbitt, 58 F.3d 1392, 32 Fed. R. Serv. 3d 774 (9th Cir. 1995) (finding agency’s failure to provide meaningful opportunity to comment invalidated the decision).

Register publication of the proposed rule.¹⁰¹ Alternatively, the agency may publish a notice withdrawing the proposed rule or extending the decision deadline by no more than six months.¹⁰² Extending the deadline is permissible only upon a finding that “there is substantial disagreement regarding the sufficiency or accuracy of the available data relevant to the determination.”¹⁰³

A final rule is to take effect no sooner than 30 days following its publication in the *Federal Register* as a final rule, unless the agency has made a finding of “good cause,”¹⁰⁴ and not later than 90 days after both its publication and provision of the required notice to affected state and local agencies.¹⁰⁵ The publication of a final rule is required to contain the complete text of the rule, a summary of the comments and recommendations made to the proposed rule, a summary of any data relied upon by the agency in support of the rule, and a summary of the factors found to be affecting the species.¹⁰⁶ Further, the FWS and the NMFS have adopted a policy of identifying activities that because of the final rule will or will not be likely to result in a violation of the prohibited acts provisions of § 9 of the ESA.¹⁰⁷

§ 21:13 Emergency listings

Section 4 of the ESA also contains an emergency listing procedure that allows the FWS and the NMFS to bypass the normal listing procedures where there is a significant risk to the well-being of any species.¹ Emergency listings may be made effective immediately upon publication in the *Federal Register*;² and once an emergency rule is adopted, the species receives the full protection of the ESA. Publication of emergency listing notices must be accompanied by detailed explanations for the regulation, and actual notice of the listing must also be given to state authorities affected by the listing.³ Emergency rules expire 240 days after their effective dates unless the agency complies with the normal listing process in the interim.⁴ The agencies generally have utilized the emergency listing process sparingly.⁵

IV. CRITICAL HABITAT DESIGNATION

§ 21:14 Critical habitat criteria

Section 4 of the ESA specifies that the FWS and the NMFS shall “to the maximum extent prudent and determinable” designate specific geographical areas as “critical

³50 C.F.R. § 424.20 (1992). See *City of Las Vegas v. Lujan*, 891 F.2d 927 (D.C. Cir. 1989). *City of Las Vegas* was the first and remains the only major case addressing the use of emergency rulemaking authority. The case involved a challenge to the emergency listing of the Mojave population of the desert tortoise as an endangered species. The D.C. Circuit held that the ESA contemplated a somewhat less rigorous process of investigation and explanation for emergency regulations than for normal rulemaking.

⁴16 U.S.C.A. § 1533(b)(7), ELR Stat. ESA § 4(b)(7).

⁵See Ivan J. Lieben, *Political Influences on FWS Listing Decisions Under the ESA: A Time to Rethink Priorities*, 27 *Envtl. L.* 1323, 1351 & nn.219–20 (1997).

habitat,” concurrently with the listing of a species.¹ Such action is to be taken through proposal and promulgation of regulations in accordance with the procedures set out in § 4 of the ESA.² “Critical habitat” is defined as the “specific areas within the geographical areas occupied by the species, at the time it is listed . . . on which are found those physical or biological features (I) essential to the conservation of the species and (II) which may require special management considerations or protection”³ In addition, the agencies may designate “specific areas outside of the geographical area occupied by the species at the time it is listed . . . upon a determination by the Secretary that such areas are essential for the conservation of the species.”⁴

However, unlike the decision to list a species, the agencies are required to consider economic impact and a number of other factors in the critical habitat designation process. Pursuant to § 4 of the ESA, the agencies have a statutory obligation to designate critical habitat on the basis of the “best scientific data available . . . after taking into consideration the economic impact, the impact on national security, and any other relevant impact, of specifying any particular area as critical habitat.”⁵ However, the Secretary may exclude any area from critical habitat “if he determines that the benefits of such exclusion outweigh the benefits of specifying such area as critical habitat, unless he determines, based on the best scientific and commercial data available, that the failure to designate such area as critical habitat will result in the extinction of the species concerned.”⁶

In making a critical habitat designation, the listing agency shall consider the following: (1) space; (2) food, water, air, light, minerals, or other nutritional or physiological requirements; (3) cover or shelter; (4) breeding and nesting sites; and (5) habitats protected due to their historical geographic or ecological distribution of the species.⁷ Furthermore, in making critical habitat determinations, the agencies are “to focus on the principal biological or physical constituent elements within the defined area that are essential to the conservation of the species,” and known primary constituent elements are to be listed with the critical habitat designation.⁸ Once critical habitat is determined, the designated area must be delineated on a map as part of the final rule.⁹

§ 21:15 Meaning of “prudent and determinable”

The ESA requires critical habitat designation only to the extent that it is “prudent

[Section 21:14]

and determinable.” While this phrase is not defined in the statute, the FWS and NMFS have issued joint regulations defining these terms. Under these regulations, a critical habitat designation is not “prudent” when: (1) the species is threatened by taking or other human activities and designation would increase the degree of the threat; or (2) the designation would not benefit the species.¹ A critical habitat is not “determinable” when: (1) there is not sufficient information available to analyze the designation in accordance with the statute; or (2) the biological needs of the species are sufficiently unknown as to prevent identification of a critical habitat.² Courts have taken a “hard look” at the listing agencies’ decisions on critical habitat and have overturned decisions based on conclusory statements.³

§ 21:16 Procedures for critical habitat designation and revision

Ideally, critical habitat designation decisions are made contemporaneously with the listing decision. However, in the event the critical habitat decision is not made contemporaneously with the listing decision and there is a finding that the critical habitat is “not then determinable,” the listing agency has 12 months from the date of the listing decision to designate critical habitat.¹ It is often the case that critical habitat is not designated at the time of listing or within the statutory time limit.² However, the inability to designate critical habitat at the time of a listing decision cannot be used to delay the listing itself.³

Furthermore, any party may petition the listing agency for critical habitat designation.⁴ A petition from an interested party may also initiate proposed revisions to critical habitat designations. The agency must make a finding within 90 days of the receipt of the petition as to whether the petitioned critical habitat designation or revision may be warranted,⁵ and must publish notice of how it intends to proceed within 12 months of that 90-day finding.⁶

A party may also file a complaint against the agency for failing to designate a

Ed. 2d 725 (2008). “Congress meant for species to be protected by listing decisions even if determination of their critical habitat were delayed . . . delay in habitat designation should never be used to delay the listing.”

⁴50 C.F.R. § 424.14(d) provides:

Upon receiving a petition to designate critical habitat or to adopt a special rule to provide for the conservation of a species, the Secretary shall promptly conduct a review in accordance with the Administrative Procedure Act (5 U.S.C.A. § 553) and applicable Departmental regulations, and take appropriate action.

⁵16 U.S.C.A. § 1533(b)(3)(D), ELR Stat. ESA § 4(b)(3)(D); 50 C.F.R. § 424.14(c)(1).

⁶16 U.S.C.A. § 1533(b)(3)(D)(ii), ELR Stat. ESA § 4(b)(3)(D)(ii); 50 C.F.R. § 424.14(c)(1). The agency may elect to propose a rule revising the designated critical habitat or determine that the revision is neither prudent nor determinable.

critical habitat within the mandatory time period.⁷ However, the court in *Center for Biological Diversity v. Hamilton*⁸ held that such a petition must be filed within six years of the listing determination. In *Hamilton*, the Secretary of the Interior listed two species of minnows as threatened species but failed to designate a critical habitat.⁹ Twelve years later, the plaintiffs filed a complaint against the Secretary, alleging that the continuing violation doctrine should apply that allows a “plaintiff to sue on an otherwise time-barred claim when additional violations of the law occur within the statutory period.”¹⁰ Despite a district court’s prior holding that the continuing effects doctrine applied to § 4 of the ESA thereby tolling the statute of limitations,¹¹ the *Hamilton* court held that the continuing effects of the failure to designate a critical habitat did not constitute a continuing violation under the meaning of the doctrine, and that the plaintiffs’ statute of limitations had expired after six years.¹² In its decision, the court clarified that the plaintiffs could still petition the Secretary to designate a critical habitat, as no statute of limitations applies to that action.¹³

§ 21:17 Economic impact and FWS “incremental baseline” theory

Under § 4(b)(2) of the ESA, consideration of the potential economic impacts of a critical habitat designation is mandatory, not discretionary.¹ That section provides that the FWS or the NMFS “shall designate critical habitat . . . on the basis of the best scientific data available and after taking into consideration the economic impact, the impact on national security, and any other relevant impact, of specifying any particular area as critical habitat.”² For years, the FWS employed an “incremental baseline”³ theory, whereby the FWS would only examine “those economic impacts that were solely attributable to the critical habitat designation for the species; any economic impacts that were attributable to different causes, such as listing of the species, were not considered.”⁴ The FWS reasoned that because the impacts of listing a species were coextensive with the impacts of critical habitat (both triggered § 7 consultation for federal actions), no real impact resulted from the critical habitat designation.⁵

However, the FWS’ reliance on this theory in order to avoid detailed economic analysis has been soundly rejected by several courts. In *Middle Rio Grande Conser-*

vancy District v. Babbitt (MRGCD),⁶ the court reviewed the designation of critical habitat for the Rio Grande silvery minnow. The FWS had been given a total of 120 days to designate critical habitat for the species by the Tenth Circuit following a challenge to its failure to make a designation.⁷ The Middle Rio Grande Conservancy District (MRGCD) challenged the proposed designation of a 163-mile stretch of the Rio Grande due to the fact that it would cause a substantial curtailment of irrigated agriculture in the Middle Rio Grande Valley and would result in significant negative ecological, economic, aesthetic, cultural, and social changes. Specifically, the plaintiffs alleged that in designating the entirety of the silvery minnow's present habitat, the FWS failed to quantify adequately the impact of the designation.

In MRGCD, the FWS alleged that the designation of critical habitat provides little or no additional benefit beyond the listing of the species. Rejecting the FWS' position, the court reached the common-sense conclusion that designation has significant consequences apart from the listing.⁸ The MRGCD court's critique of the FWS' economic analysis of the impact of designation on the Middle Rio Grande Valley is especially telling. The court held that the FWS could not summarily dismiss legitimate concerns of the economic consequences of designation simply because they conflicted with the FWS' misapprehension "that the identified activities would have no impact which would not also jeopardize the continued existence of the species; and therefore, no impact of legitimate concern."⁹ Further, the court relied on *Catron County Bd. of Comm'rs v. U.S. Fish and Wildlife Service*¹⁰ in rejecting the FWS' argument that NEPA does not apply as a matter of law. The court directed the FWS to issue an environmental impact statement for the designation.

Since MRGCD, a number of other courts have held that the FWS' assumption that the designation of critical habitat does not lead to impacts above those of the listing is faulty. In *Sierra Club v. U.S. Fish and Wildlife Service*,¹¹ the court rejected the FWS' conclusion that designation of critical habitat would provide no additional benefit to a species beyond the protections currently available through the consultation and jeopardy provisions of § 7. The court held that the "adverse modification" standard of 50 C.F.R. § 402.02¹² was inconsistent with the ESA and that this led the Service to erroneous conclusions regarding the benefit of designation for threatened species. The FWS has not revised the "adverse modification" definitions following the decisions.

The Tenth Circuit subsequently expanded upon the holdings of *Sierra Club* and *MRGCD*. In *New Mexico Cattle Growers Association v. U.S. Fish and Wildlife Service*,¹³ the Tenth Circuit set aside a critical habitat designation that was based on the same faulty theory that designation causes little to no economic impact be-

yond what is caused by listing species because the “jeopardy standard” (applied in the context of listing) and the “adverse modification standard” (applied in the context of designated critical habitat) are essentially the same.¹⁴ Citing both Sierra Club and MRGCD, the court noted that “Congress intended that the FWS conduct a full analysis of all of the economic impacts of a critical habitat designation, regardless of whether those impacts are attributable co-extensively to other causes.”¹⁵ Realizing that the required economic analysis might lead to exclusion of certain areas, the court stated that this would not undermine protection of the species, as the significant protections afforded by the listing would remain in place.¹⁶

The critical habitat designation for the cactus ferruginous pygmy-owl was overturned by a federal court in *Nat’l Association of Home Builders v. Norton*.¹⁷ The court held that “broader reconsideration” of the designation was necessary in order to fully consider economic impacts, after finding that the plaintiffs “presented evidence which suggests that [the FWS] did not fully evaluate the ‘economic and other impacts’ ” of the 731,000-acre designation in four counties in Arizona.¹⁸ Moreover, the FWS had “not presented . . . any evidence suggesting that significant harm to the species is likely to occur if the [critical habitat] designation is vacated pending remand.”¹⁹ The FWS had requested the court to stay the litigation in order to allow it to complete a new economic analysis, while keeping the designation in effect. Rejecting this request, the court held that the “FWS’s failure to comply with the statutory requirements regarding critical habitat designation is more than a minor procedural error. Its failure to follow the mandates of the statute calls the very substance of the critical habitat designation into question.”²⁰

In light of these decisions, the FWS has since recognized that its prior policy was not correct and that critical habitat designation can have an “incremental” effect above that of the “baseline” of listing. In several cases, the FWS has taken voluntary remands of designations in order to conduct new economic analyses that look at the cumulative and incremental impacts of the critical habitat designation. These decisions to vacate the designation during the remand process have largely been upheld against challenges by intervenor environmental groups. In one case, the court

¹⁴The FWS regulations define “jeopardy” as the continued existence of means to engage in an action that reasonably would be expected, directly or indirectly, to reduce appreciably the likelihood of both the survival and recovery of a listed species in the wild by reducing the reproduction, numbers, or distribution of that species and “adverse modification” as a direct or indirect alteration that appreciably diminishes the value of critical habitat for both the survival and recovery of a listed species. Such alterations include, but are not limited to, alternations adversely modifying any of those physical or biological features that were the basis for determining the habitat to be critical.

¹⁵The FWS regulations define “jeopardy” as the continued existence of means to engage in an action that reasonably would be expected, directly or indirectly, to reduce appreciably the likelihood of both the survival and recovery of a listed species in the wild by reducing the reproduction, numbers, or distribution of that species and “adverse modification” as a direct or indirect alteration that appreciably diminishes the value of critical habitat for both the survival and recovery of a listed species. Such alterations include, but are not limited to, alternations adversely modifying any of those physical or biological features that were the basis for determining the habitat to be critical.

¹⁶The FWS regulations define “jeopardy” as the continued existence of means to engage in an action that reasonably would be expected, directly or indirectly, to reduce appreciably the likelihood of both the survival and recovery of a listed species in the wild by reducing the reproduction, numbers, or distribution of that species and “adverse modification” as a direct or indirect alteration that appreciably diminishes the value of critical habitat for both the survival and recovery of a listed species. Such alterations include, but are not limited to, alternations adversely modifying any of those physical or biological features that were the basis for determining the habitat to be critical.

upheld a decision to vacate the designation of critical habitat for the Riverside Fairy shrimp in Southern California due to the absence of any “specific threat to the species or the designated critical habitat units (either in the occupied or unoccupied areas) over the short time frame during which new rules would be adopted.”²¹

In *Cape Hatteras Access Preservation Alliance (CHAPA) v. U.S. Department of Interior*,²² the court discussed whether the FWS’ method of economic analysis was appropriate in determining that the critical habitat designation did not create any incremental economic impact related to future § 7 consultations. The court looked to several relevant circuit court decisions assessing the FWS’ employment of functional equivalence and baseline analysis in its economic analysis. The court noted that the Fifth and Ninth Circuits took issue with the functional equivalence doctrine, i.e., “the theory that the designation of critical habitat serves a minimal additional function separate from the listing a species.”²³ The court looked at an FWS regulation that defined “[j]eopardize” and “destruction and adverse modification” essentially identically. The court indicated that the regulation allowing the FWS to “assert that actions meeting the adverse modification standard almost always meet the jeopardy standard,” undercuts the importance of critical habitat designation and underestimates the economic impact.²⁴ While the court agreed with the Fifth and Ninth Circuits’ rejection of the functional equivalence doctrine, the court did not support the Tenth Circuit’s rejection of the FWS’ baseline economic analysis.²⁵

The *CHAPA* court found that the “baseline approach is a reasonable method for assessing the actual costs of a particular critical habitat designation.”²⁶ The FWS described its methodology as “distinguish[ing] between economic impacts caused by the ESA listing of the piping plover and those additional effects that would be caused by the proposed critical habitat designation.”²⁷ While the court accepted the methodology as “sound and in accordance with law,” the court concluded that the FWS’ “no effect” conclusion had “no connection to the facts found and [was] therefore arbitrary and capricious and must be revisited.”²⁸

²¹Other cases where voluntary remands were approved and designations vacated while the FWS reconsidered its designation include: *Building Industry Legal Defense Foundation v. Norton*, 231 F. Supp. 2d 100 (D.D.C. 2002) (Riverside Fairy shrimp and Arroyo Southwestern toad); *Home Builders Associations of Northern California v. Norton*, 293 F. Supp. 2d 1 (D.D.C. 2002) (California red-legged frog); *National Ass’n of Home Builders v. § 21:18 Special management plan exclusions

The issue of whether the FWS and the NMFS may decide not to designate critical habitat due to the existence of special management plans already in place for the same geographic area has been litigated with differing results. In *Center for Biological Diversity v. Norton* (CBD),¹ the FWS stated in both the proposed and final rules designating critical habitat for the Mexican spotted owl that it “may exclude areas from critical habitat designation if [it] determines that the benefits of exclusion outweigh the benefits of including the areas as critical habitat, provided the exclusion will not result in the extinction of the species.”² The FWS had excluded over 9 million acres of owl habitat because the land was already governed by the Forest Service’s “Forest Plan.”³ The FWS reasoned that “[a]dditional special management is not required if adequate management or protection is already in place.”⁴ The court, however, disagreed with the FWS’ interpretation of “critical habitat,”⁵ concluding that “the fact that a particular habitat does, in fact, require special management is demonstrative evidence that the habitat is ‘critical,’ ”⁶ rather than excludable.

However, in *Home Builders Ass’n of Northern California v. U.S. Fish and Wildlife Service*,⁷ the court dismissed the reliance by plaintiff environmental groups on CBD for the proposition that exclusion was not permitted for lands with existing management plans pursuant to § 3(5)(A).⁸ Rather, the court noted:

The relevant provision of the ESA here is § 4(b)(2), which permits the FWS to conduct a discretionary analysis of its exclusions. Thus, the Environmental Groups have not cited any authority that would preclude the FWS from considering the existence of other management schemes in deciding whether to exclude land from its critical habitat designation.⁹

The court found that the FWS’ determination to exclude lands with comprehensive resource management plans and habitat conservation plans was reasonable because the FWS had explained that the benefits of exclusion outweighed the benefits of inclusion and the exclusion would not result in the extinction of the species.¹⁰ In fact, the court noted that based on a draft plan, designation of critical habitat

“would provide little gain by way of increasing recognition for special habitat values on lands” because the land is already “expressly managed to protect and enhance those values.”¹¹

A 2008 Solicitor’s opinion addressed the Secretary’s authority to exclude areas from a critical habitat designation under § 4(b)(2) of the ESA.¹² The opinion noted that “[t]he Secretary has broad discretion to exclude areas under section 4(b)(2) [but that] [t]here are some limitations on that discretion, and the Secretary must comply with the relevant procedural and substantive requirements of the ESA and its implementing regulations.”¹³

In 2005, six senators approached the Keystone Center—a neutral, nonprofit, public policy and education organization—about convening and facilitating a cross-sector working group on the habitat provisions of the ESA. Keystone brought together a diverse group of individuals from the environmental and regulated communities to discuss the adequacy of the ESA in protecting and conserving habitat. This group published a list of recommendations focused on three areas: (1) incentives (with specific recommendations for the Farm Bill, voluntary cooperative agreements, tax incentives, and streamlining); (2) recovery planning (that is, producing recovery plans that are scientifically sound, financially reasonable, and adaptive); and (3) regulatory issues (so that any conservation program is more effective and less burdensome).¹⁴ The recommendations in the Keystone Report can serve as an effective starting point for discussions on future changes to habitat provisions of the ESA.

V. RECOVERY PLANS FOR LISTED SPECIES

§ 21:19 Background

Section 4(f) of the ESA requires the adoption and implementation of “recovery plans” for each listed species unless a finding is made that such a plan will not benefit the species.¹ The agency is required to give priority to species facing immediate threat from construction projects or other economic activities.² Section 4(f) forbids the prioritizing of recovery plans based upon taxonomic classification of the species.³ The section further requires the agency to report back to Congress biannually on the progress of recovery plan development but does not impose any specific timeta-

reconsideration, 2007 WL 201248 (E.D. Cal. 2007).

ble for plan development and implementation.⁴

Recovery plans are designed and implemented with public input,⁵ and are generally drafted by a team of individual citizens and governmental representatives as well as members of the scientific and academic community.⁶ Ideally, recovery plans are created for the benefit of multiple species, and social and economic impacts of recovery activities are to be considered in drafting the plans.⁷ The FWS and the NMFS have issued joint regulations defining recovery as “meaning improvement in the status of listed species to the point at which listing is no longer appropriate under the criteria set out in section 4(a)(1) of the Act.”⁸ The preamble to that rule linked recovery to the concept of conservation and removal of the threat to the species that led to the original listing.⁹

§ 21:20 Recovery plan preparation and content

The ESA requires, to the maximum extent practicable, that recovery plans: (1) describe any site-specific management actions necessary to conserve and ensure survival of the species; (2) identify objective and measurable criteria that should result in the delisting of the species; and (3) set time and cost estimates for the carrying out of plan measures and to achieve intermediate steps toward the goal of recovery.¹

These three criteria for recovery plans, as set forth in the ESA, have been interpreted by the courts to act as guidance, and not specific requirements for recovery plan contents. Courts have given agencies significant leeway in determining when and if recovery plans are created, and how those plans are implemented.² Section 4(f) of the ESA does require the agencies to “provide public notice and an opportunity for public review and comment” on each “new or revised” recovery plan and to “consider” all information presented during the public comment period.³

Because the ESA does not establish a timetable for plan development, courts have not ordered recovery plan development unless the agency has “unreasonably delayed” the development of the plan.⁴ Courts have similarly determined that although the contents are to be guided by the ESA’s three criteria, the agencies retain the discretion to determine the specifics of any recovery plan.⁵ Thus, it appears that as long as an agency makes a reasonable effort to prepare a recovery plan under

⁴16 U.S.C.A. § 1533(f)(3) ELR Stat. ESA § 4(f)(3).

²See, e.g., *Oregon Natural Resource Council v. Turner*, 863 F. Supp. 1277, 1282 (D. Or. 1994) (finding delay in development of recovery plan due to prioritization efforts was reasonable); *Morrill v. Lujan*, 802 F. Supp. 424, 433 (S.D. Ala. 1992) (finding the contents of recovery plans are discretionary).

³16 U.S.C.A. § 1533 (f)(1)(B), ELR Stat. ESA § 4(f)(1)(B).

⁴See *Oregon Natural Resource Council v. Turner*, 863 F. Supp. 1277, 1282 (D. Or. 1994).

⁵See, e.g., *Oregon Natural Resource Council v. Turner*, 863 F. Supp. 1277, 1282 (D. Or. 1994); *Morrill v. Lujan*, 802 F. Supp. 424, 433 (S.D. Ala. 1992) (finding the contents of recovery plans are discretionary); *Fund for Animals, Inc. v. Rice*, 85 F.3d 535, 35 Fed. R. Serv. 3d 547 (11th Cir. 1996) (finding that the recovery plan requirements “breathes discretion at every pore” and quoting *Strickland v. Morton*, 519 F.2d 467 (9th Cir. 1975)). *But see* *Fund for Animals v. Babbitt*, 903 F. Supp. 96 (D.D.C. 1995), opinion amended, 967 F. Supp. 6 (D.D.C. 1997) (determining that § 4(f) imposes a clear

§ 4(f), the plan is unlikely to be set aside by the courts.

However, while the courts have refused to force preparation of recovery plans, they have held that the contents of plans are reviewable once they are prepared. In *Fund for Animals v. Babbitt*,⁶ the court faulted the grizzly bear recovery plan for failing to adequately describe “site specific management actions” as required under § 4(f), observing that the ESA suggests certain “methods and procedures may be necessary to conserve a species” but “none of these methods or procedures is mandated by the Act.”⁷ However, the court also held that “a recovery plan that recognizes specific threats to the conservation and survival of a threatened or endangered species but fails to recommend corrective action or explain why it is impracticable or unnecessary to recommend such action, would not meet the ESA’s standard.”⁸

In *Defenders of Wildlife v. Babbitt*,⁹ the court ruled that the FWS’ recovery plan for the Sonoran pronghorn violated the ESA by failing to identify objective measurable criteria because the criteria in the plan failed to address identified threats to the species survival. The court stated that:

[t]hese criteria plainly do not address the five delisting factors. Defendants argue that the factors are otherwise addressed in the Plan in that certain recovery actions recognize, study, and attempt to address these five categories of potential threats. The fact that these factors are discussed elsewhere in the plan as areas for further research fails to satisfy the requirement that the criteria proposed for downlisting address these factors and whether these factors pose a continuing threat to the species.¹⁰

Thus, the courts have increasingly recognized the importance of recovery plans as a vital tool in achieving the ultimate goal of the ESA to permanently bring a species back from the brink of extinction. They will scrutinize the contents of plans under the statutory criteria; yet, they seem reluctant to force the FWS and the NMFS to prepare plans.

The *Oregon Natural Resource Council v. Turner* court’s observation is especially telling:

Congress recognized that development of recovery plans for listed species would take significant time and resources. It therefore provided in the ESA that the Secretary could establish a priority system for developing and implementing such plans. This priority system allows the Secretary broad discretion to allocate scarce resources to those species that he or she determines would most likely benefit from development of a recovery plan.¹¹

In another case, the court in *Strahan v. Linnon*¹² rejected Strahan’s argument that the NMFS had violated the ESA by failing to do a recovery plan for the blue, sei, fin, or minke whales. The court held that the ESA “places no time constraints on the development of recovery plans” and that “there are not stringent time requirements for revising a recovery plan even when the recovery plan itself provides for

duty to meet the statutory demands to the maximum extent feasible or practicable).

⁶*Fund for Animals v. Babbitt*, 903 F. Supp. 96 (D.D.C. 1995), opinion amended, 967 F. Supp. 6 (D.D.C. 1997).

periodic revision.”¹³

§ 21:21 Implementation of recovery plans

Courts have also determined that because of the significant agency discretion in the development of recovery plans, recovery plans are not documents with the “force of law.”¹ In fact, a 1996 report to Congress on recovery planning stated that implementation of recovery tasks in any given plan are not assured by publication.² However, notwithstanding the substantial discretion agencies have over recovery plans and the minimal legal impact of those plans, recovery plans are still considered an essential tool in species conservation.³

In September 2007, in its Endangered Species Bulletin, the FWS responded to criticism that the ESA was not succeeding because of little recovery-related delistings.⁴ In the preceding five years, only five species had had recovery-related delisting.⁵ The FWS indicated that it does not think that recovery-related delistings are the best measure of success. The Bulletin noted that by the end of fiscal year 2006, the FWS was responsible for conserving 1,269 listed species throughout all 50 states and other lands.⁶ According to the 2007 Bulletin, 522 listed species were stable or improving in status; and “[f]orty-one percent of the species are doing better since they have gained protection under the Act.”⁷ The Bulletin stated that 90% of listed species have a recovery plan in place or do not require one. As of 2007, the Bulletin reported that 1,084 species listed for more than 2.5 years had final recovery plans, and three species had been delisted in the prior year.⁸

§ 21:22 The enforceability of recovery plans

Despite Congress’ provision for recovery plans, the courts have uniformly refused to make such plans enforceable. In one case, the court rejected an argument that the U.S. National Park Service was required to close a campground under the terms of the grizzly bear recovery plan because the location of the campground increased the risk of bear mortality.¹ In another case, a court of appeals refused to enforce the recovery plan for the endangered California condor, rejecting the argument that the FWS captive-breeding program was inconsistent with its 1979 recovery plan.²

Several cases have more clearly articulated the unenforceability of such plans. In

²*National Audubon Soc. v. Hester*, 801 F.2d 405 (D.C. Cir. 1986).

Defenders of Wildlife v. Lujan,³ the court rejected an action to enforce the 1987 recovery plan for the northern Rocky Mountain wolf that required reintroduction of the wolf in Yellowstone National Park. The court explained that “the Recovery Plan itself has never been an action document . . . It left open different approaches and contemplated that when an agency or group made specific proposals for achieving a particular objective of the plan, there would be a need for further study.”⁴ In *Fund for Animals, Inc. v. Rice*,⁵ plaintiffs sued to stop construction of a municipal landfill in wetlands that arguably violated the 1987 Florida Panther Recovery Plan. The Eleventh Circuit rejected the argument, holding that recovery plans “are for guidance only,”⁶ and a number of cases subsequently have supported the holding in *Rice*.⁷

However, in *Biodiversity Legal Foundation v. Norton*,⁸ the court refused to extend the holding of *Rice* to a Multi-Species Recovery Plan (MSRP) created by the FWS. In that case, the Foundation had challenged the FWS’ delay in revising the Cape Sable seaside sparrow’s critical habitat designation. The FWS cited *Rice* to support its argument that the content of the Recovery Plan was not binding upon it and did not create a legal duty.⁹ While the court was generally persuaded by the argument that the original Recovery Plan was merely guidance, the court would not extend the *Rice* discretion to the MSRP. The MSRP was created 16 years after the original Recovery Plan and was based on new research and data. The MSRP “committed FWS to [r]eview and revise current critical habitat designation” because the current critical habitat was not sufficient for the recovery of the species.¹⁰ The court saw the MSRP as the FWS’ manifestation of intent to revise the critical habitat designation and held that the FWS had a duty to do so.¹¹

VI. FEDERAL AGENCY CONSERVATION OBLIGATIONS AND CONSULTATION UNDER § 7 OF THE ESA

§ 21:23 Generally

The ESA mandates protection of endangered and threatened species on an individual species and project basis, and § 7 of the ESA addresses the obligations of federal agencies with respect to conservation and protection of species listed as either endangered or threatened under the ESA.¹ Section 7(a)(1) sets out the primary

[Section 21:23]

¹16 U.S.C.A. § 1536, ELR Stat. ESA § 7. See §§ 21:9 to 21:13, *supra*, for a discussion of the

provisions on the species conservation obligations of federal agencies,² and § 7(a)(2) addresses the basic obligation of other federal agencies to “consult” with the NMFS and the FWS before taking any “action” that might have direct or indirect impacts on listed species or designated critical habitat.³ Section 7(a)(3) provides that a private applicant for a federal action, e.g., permit or license, that may affect areas with listed species can request a consultation and evaluation of those impacts.⁴ The consultation procedures under § 7 are quite detailed and are intended to assure that federal agency action “is not likely to jeopardize the continued existence of any endangered species or threatened species or result in the destruction or adverse modification of [critical] habitat of such species,” unless a specific exemption is granted for such action under § 7.⁵

§ 21:24 Section 7(a)(1) conservation obligations

Section 7(a)(1) directs all federal agencies, “in consultation with and with the assistance of the Secretary, [to] utilize their authorities in furtherance of the purposes of [the ESA] by carrying out programs for the conservation of [species listed as endangered or threatened].”¹ Agencies are required to affirmatively act within the scope of their authority for the conservation of listed species. However, the ESA does afford agencies some discretion in determining how conservation programs are to be implemented.²

Currently, there are no regulations directly interpreting or implementing § 7(a)(1). Joint regulations adopted by the NMFS and the FWS only address § 7(a)(1) in the limited context of adverse impact on listed species resulting from federal action.³ Thus, the boundaries of § 7(a)(1) have been set by litigation⁴ and, as such, provide case-specific guidance.⁵

Courts have determined that, at a minimum, § 7(a)(1) imposes some mandatory duties upon federal agencies.⁶ Historically, § 7(a)(1) had been interpreted to require substantially more from federal agencies with respect to the restoration of

criteria and procedures for listing species as “endangered” or “threatened” under the ESA.

⁶*See* Tony A. Sullins, *Endangered Species Act*, Basic Practice Series (2001).

endangered or threatened species.⁷ Subsequently, the Ninth Circuit in the Pyramid Lake case found that, while § 7(a)(1) imposes affirmative conservation duties, “some discretion should be allowed” to federal agencies in fulfilling these responsibilities.⁸ It has been said that § 7(a)(1) emerges from the Pyramid Lake Paiute Tribe of Indians v. Dep’t of the Navy decision as “a little something extra” and “in the absence of firm guidance by the biological agencies, there is considerable leeway as to what that something will be.”⁹

Initially, § 7(a)(1) was construed by the courts to impose duties on federal agencies when those agencies were carrying out their primary agency missions.¹⁰ Section 7(a)(1) has been interpreted to authorize an agency to refuse to execute a contract,¹¹ to require implementation of alternative courses of action that had significant conservation benefits,¹² to require an agency to show it minimized harm to endangered species in a manner consistent with its primary obligations,¹³ and to require an agency to consider § 7(a)(1) when carrying out nonconservation activities.¹⁴ The Fifth Circuit may have significantly expanded the reach of § 7(a)(1) in *Sierra Club v. Glickman*.¹⁵

In *Glickman*, the Fifth Circuit found that § 7(a)(1) imposed an “affirmative duty on each federal agency to conserve each of the species listed.”¹⁶ Additionally, the court found that the U.S. Department of Agriculture (USDA) was required to create or implement conservation programs consistent with § 7(a)(1).¹⁷ The USDA had not taken any measures to fulfill its conservation obligations imposed by § 7(a)(1) at the time of the litigation.¹⁸ Two district court cases contemporaneous with the *Glickman* decision defined agency obligations in less mandatory terms;¹⁹ however, the agencies in those cases had taken some steps to conserve species. Thus, the courts were reluctant to reverse agency decisions without a showing that the same alternative method of conservation that would have provided greater conservation benefits should have been adopted.²⁰

⁷See, e.g., *Sierra Club v. Clark*, 755 F.2d 608 (8th Cir. 1985); *National Wildlife Federation v. Hodel*, 839 F.2d 694 (D.C. Cir. 1988); *Carson-Truckee Water Conservancy Dist. v. Secretary of the Interior*, 748 F.2d 523 (9th Cir. 1984); *Connor v. Andrus*, 453 F. Supp. 1037, 1041 (W.D. Tex. 1978) (disapproved of by, *State of La., ex rel. Guste v. ²⁰*Strahan v. Linnon*, 967 F. Supp. 581, 596 (D. Mass. 1997); *Hawksbill Sea Turtle v. Federal Emergency Management Agency*, 11 F. Supp. 2d 529, 543 (D.V.I. 1998).

However, in 2008, the court in *Florida Key Deer v. Paulison*²¹ held that FEMA had failed to comply with § 7(a)(1). The Eleventh Circuit held that FEMA's program of incentives to communities to conserve species "amounted to [] total inaction" because there was "no evidence that even a single community [had] developed or adopted" a conservation plan.²²

§ 21:25 Section 7 consultation process

Section 7 has often been described as the "heart" of the ESA. Before engaging in any type of activity that may have direct or indirect effects on endangered or threatened species or critical habitat, federal agencies must "consult" with the NMFS or the FWS¹ in order to evaluate the impact of the proposed agency action.² This consultation may be "formal" or "informal" in nature. After reviewing the biological assessment prepared by the agency, the NMFS or the FWS prepares a "biological opinion" that ultimately determines whether the proposed agency action is likely to have an adverse impact on a listed species. If such an impact will occur, the NMFS or the FWS will provide written requirements for minimizing the impact on the listed species in the form of an "incidental take" statement. Section 7 requires consulting agencies "to use the best scientific and commercial data available,"³ and failure to consult properly may result in the proposed activity being enjoined.⁴

The critical and often difficult questions regarding the § 7 requirements include: (1) what kinds of "agency actions" trigger the consultation requirements; (2) what are the procedures for interagency consultation; and (3) how are indirect and cumulative effects to be evaluated? These questions are answered by reference to both the detailed regulations adopted by the FWS and the NMFS to implement § 7⁵ and the various court decisions addressing the scope and application of § 7.

§ 21:26 Agency "action" triggering consultation

a. The Scope of Agency Action

Consultation under § 7(a)(2) is triggered through proposed "agency action." Section 7(a)(2) refers to "each Federal agency," which is defined by the ESA to mean "any department, agency, or instrumentality of the United States."¹ The ESA does not apply to state or local agency actions, even though these actions could trigger federal agency action. This is because agency action under § 7 of the ESA is limited to "activities or programs of any kind *authorized, funded, or carried out, in whole or in part, by Federal agencies* in the United States or upon the high seas."²

Under the implementing regulations, the term agency "action" has been further

²¹*Florida Key Deer v. Paulison*, 522 F.3d 1133 (11th Cir. 2008) (slip op. at 28).

²²*Florida Key Deer v. Paulison*, 522 F.3d 1133, 1147 (11th Cir. 2008) (slip op. at 28).

[Section 21:25]

¹Whether the agency must consult with the NMFS or the FWS depends on the particular species affected. See 50 C.F.R. §§ 223.102, 224.101 for species listed by the NMFS and 50 C.F.R. §§ 17.11, 17.12 for species listed by the FWS.

²16 U.S.C.A. § 1536(a)(2), ELR Stat. ESA § 7(a)(2).

³16 U.S.C.A. § 1536(a)(2), ELR Stat. ESA § 7(a)(2).

⁴See, e.g., *Pacific Rivers Council v. Robertson*, 854 F. Supp. 713, 724 (D. Or. 1993), judgment aff'd in part, rev'd in part on other grounds, 30 F.3d 1050 (9th Cir. 1994) (enjoining the underlying proposed action for agency's failure to initiate required consultation).

⁵50 C.F.R. Part 402.

[Section 21:26]

¹16 U.S.C.A. § 1532(7), ELR Stat. ESA § 3(7).

²50 C.F.R. § 402.02 (1990) (emphasis added).

defined to include but not be limited to:

- (1) actions intended to conserve listed species or their habitat;
- (2) the promulgation of regulations;
- (3) the granting of licenses, contracts, leases, easements, rights-of-way, permits, or grants-in-aid; or
- (4) actions directly or indirectly causing modifications to the land, water, or air.³

The courts have generally interpreted the term “agency action” broadly.⁴ Examples of activities found to constitute “agency action” include the annual delivery of water under existing service contracts,⁵ the creation of interim management strategies,⁶ and even ongoing activities and projects.⁷

The preamble to the regulations issued to implement the consultation provisions of the ESA indicates that it is the federal action agency that has the discretion, authority, and ultimate responsibility to describe the action and to comply with the ESA:

The determination of possible effects is the Federal agency’s responsibility. The Federal agency has the ultimate duty to ensure that its actions are not likely to jeopardize listed species or adversely modify critical habitat. The Federal agency makes the final decision on whether consultation is required, and it likewise bears the risk of an erroneous decision.⁸

The regulations require a federal action agency to “review its actions . . . to determine whether any action may affect listed species or critical habitat.”⁹ Thus, it is the action agency’s responsibility to define the action, assess its potential impacts, and determine whether consultation with the NMFS or the FWS is necessary. The action agency’s formal consultation request is required to include a “description of the action to be considered,” i.e., a project description, and the preamble makes clear that other activities “that are interrelated or interdependent would be discussed along with the effects of the action.”¹⁰

The preamble to the § 7 consultation regulations also establishes as a basic principle that the NMFS and the FWS “perform strictly an advisory function under Section 7 by consulting with other federal agencies to identify and help resolve conflicts between listed species and their critical habitat and proposed actions.”¹¹

¹⁰51 Fed. Reg. at 19950.

¹¹51 Fed. Reg. at 19928.

Their role for the purposes of § 7, as delineated in the regulations, is to “assist the Federal agencies in conforming their proposed actions to the requirements of section 7,” recognizing that “the Federal agency makes the ultimate decision as to whether its proposed action will satisfy the requirements of section 7(a)(2)” and that “the Federal agency has the primary responsibility for implementing section 7’s substantive command.”¹² The ESA “does not give the [NMFS or the FWS] the power to order other agencies to comply with its requests or to veto their decisions.”¹³

b. Agency Discretion and Agency Action

Courts have grappled with cases involving the intersection between an action agency’s discretion and the § 7 consultation requirement. The concept of ongoing activities, for example, has been a source of conflict among circuit courts with regard to the requirement for § 7 consultation. The National Forest Management Act directs the Forest Service to develop a Land and Resource Management Plan (LRMP) for each unit of the National Forest System.¹⁴ The Ninth Circuit has held that because every project planned in national forests is implemented according to those LRMPs, the LRMPs constitute ongoing agency action since they “have an ongoing and long-lasting effect even after adoption.”¹⁵ However, the Tenth Circuit held that “[an] LRMP simply does not fit within [the agency action] definition.”¹⁶ In its holding, the Tenth Circuit clarified that “the very definition of ‘action’ in [50 C.F.R.] § 402.02 tells us that the ‘promulgation of regulations,’ not the regulations themselves, constitutes ‘action’ ” for the purposes of § 7(a)(2).¹⁷ Despite this broad interpretation of “agency action,” the FWS’ regulations do limit the definition to “actions in which there is *discretionary* Federal involvement or control.”¹⁸

A significant case involved EPA’s authority under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA). In *Washington Toxics Coalition v. EPA*,¹⁹ the Ninth Circuit held that EPA had a duty to consult with the FWS regarding the effects of registering 54 active ingredients on 25 species of salmon and steelheads. The district court found that there was scientific evidence to establish a causal link between the 54 active ingredients and both direct and indirect effects on the salmonid population that triggered a duty to consult under § 7(a)(2). In affirming the district court, the Ninth Circuit held that the registration provisions of FIFRA did not exempt the agency from its duty to consult under the ESA.²⁰

In 2004, EPA issued joint “counterpart regulations” that had been agreed to by the FWS and the NMFS and were to create new optional processes for consultation between EPA and the FWS and the NMFS about the effects of pesticides on

¹²51 Fed. Reg. at 19928.

¹⁷*Forest Guardians v. Forsgren*, 478 F.3d 1149, 1159 (10th Cir. 2007).

¹⁸50 C.F.R. § 402.03 (emphasis added); *see also* *Environmental Protection Information Center v. Simpson Timber Co.*, 255 F.3d 1073 (9th Cir. 2001) (finding that because the FWS did not retain discretionary control over the timber company’s incidental take permit for the northern spotted owl, the Agency was not required to reinstate consultation to consider the permit’s effects on other species); *Sierra Club v. Babbitt*, 65 F.3d 1502, 1509 (9th Cir. 1995) (concluding that when “the federal agency lacks the discretion to influence the private action, consultation would be a meaningless exercise . . .”).

¹⁹*Washington Toxics Coalition v. Environmental Protection Agency*, 413 F.3d 1024 (9th Cir. 2005).

²⁰*Washington Toxics Coalition v. Environmental Protection Agency*, 413 F.3d 1024, 1032 (9th Cir. 2005). The court cited an earlier Ninth Circuit decision of *Headwaters, Inc. v. Talent Irrigation Dist.*, 243 F.3d 526 (9th Cir. 2001), holding that the registration and labeling provisions of FIFRA did not exempt a party from its obligations under the Clean Water Act.

endangered species. EPA stated that it intended for the new regulations to make the process more efficient and timely, thereby improving the protections for endangered and threatened species.²¹

In *Washington Toxics Coalition v. Interior*,²² however, the court overturned EPA's promulgation of these "counterpart" regulations under FIFRA. The court's finding was

based not only on the positive fact of the extremely strong technical evidence in the record demonstrating that approval of EPA's risk assessment process fails to 'insure' within the meaning of ESA Section 7, but also on the negative fact of the total absence of any technical and scientific evidence to support or justify the Services' approval of the process.²³

This decision stands in contrast to the decision in *Defenders of Wildlife v. Kempthorne*²⁴ that upheld joint counterpart regulations issued by several agencies, including the DOI, Commerce, and the USDA that allow action agencies to "bypass" the Services entirely on any project within the National Forest Plan subject to development and implementation of an Alternative Consultation Agreement.

In *American Rivers Inc. v. Corps*,²⁵ the court rejected the argument that the ESA did not apply to the operation of the Missouri River Reservoir system because ESA compliance would interfere with downstream navigation that was a project purpose mandated by the Flood Control Act (FCA). The court acknowledged other cases holding that "environmental and wildlife protection statutes do not apply where they would render an agency unable to fulfill a nondiscretionary statutory purpose or require it to exceed its statutory authority."²⁶ The *American Rivers* court held that, unlike the Platte River case, the "ESA does not prevent the Corps from meeting its statutory duty under the FCA to support downstream navigation . . . the FCA does not mandate a particular level of river flow or length of navigation season, but rather allows the Corps to decide how best to support the primary interest of navigation in balance with other interests."²⁷

The Ninth Circuit in *National Wildlife Federation v. State of Idaho*²⁸ ruled that the NMFS' biological opinion addressing the impacts of the Federal Columbia River Power System (FCRPS) on salmon and steelhead violated the ESA. The court rejected the NMFS' argument that it could excuse from the proposed action's impacts the effects of related operations of dams the NMFS deemed "nondiscretionary." In a significant ruling, the court referred to the ESA regulations in holding that "the only actions not subject to ESA requirements are those the agency does not authorize, fund or carry out. Under this approach, any action actually taken is

discretionary.”²⁹ Further, the court held that

an agency cannot escape its ESA obligations merely because it is bound to comply with another statute that has consistent, complementary objectives [and] the very fact that the agencies are unable to define the limits of their discretion here reveals that all FCRPS operations are intertwined and subject to discretionary control.³⁰

The Supreme Court addressed this issue in *Nat’l Association of Homebuilders v. Defenders of Wildlife*,³¹ where, in a 5-4 decision, it limited the applicability of ESA § 7 requirements to only “discretionary” agency action. The Court reversed the Ninth Circuit’s determination that ESA consultation was required prior to transferring permitting authority to a state under § 402(b) of the CWA. Section 402(b) states that the EPA “shall” transfer permitting authority upon a state’s showing of nine statutory criteria. The Court stated that reading the ESA “as the Court of Appeals did would effectively repeal Section 402(b)’s statutory mandate by engrafting a tenth criterion onto the CWA Reading [§ 7] broadly would thus partially override every federal statute mandating agency action by subjecting such action to the further condition that it poses no jeopardy to endangered species.”³² The Court concluded that “when an agency is required to do something by statute, it simply lacks the power to ‘insure’ that such action will not jeopardize endangered species.”³³

This decision stands in contrast to the Eleventh Circuit’s subsequent decision in *Florida Key Deer v. Paulison*,³⁴ which held that FEMA had discretion to consider ESA issues in its administration of the National Flood Insurance Program (NFIP) and was required to consult with the resource agencies under § 7. Unlike the state delegation provision at issue in *NAHB*, the Court held that FEMA “enjoys broad discretion” in developing criteria for participation in the NFIP.³⁵

c. “Incremental Step” Consultation

The concept of agency action is so broadly defined that even relatively small actions can trigger requirements for agency consultation on an entire project. The regulations attempt to prevent agencies from subverting the ESA by taking a potentially harmful project and breaking it up into a series of small steps or pieces that, when viewed separately, appear not to trigger the § 7 consultation obligation.

Many statutes expressly permit agencies to take “incremental steps” toward the completion of certain actions. The ESA regulations, however, instruct the NMFS and the FWS to issue a biological opinion on an incremental step only if an agency submits a request *and* the incremental step is authorized by statute.³⁶ The biological opinion will set out the NMFS’ or the FWS’ opinion on the incremental step, as well

³⁶50 C.F.R. § 402.14(k).

as the entire action.³⁷ Once the biological opinion is issued, the agency may proceed with or authorize its incremental action under the following conditions:

- The biological opinion does not conclude that the incremental step would violate § 7(a)(2);
- The federal agency continues consultation with respect to the entire action and obtains biological opinions, as required, for each incremental step;
- The federal agency fulfills its continuing obligation to obtain sufficient data upon which to base the final biological opinion on the entire action;
- The incremental step does not violate § 7(d) of the ESA concerning irreversible or irretrievable commitments of resources;³⁸ and
- There is a reasonable likelihood that the entire action will not violate § 7(a)(2).³⁹

d. Section 7(a)(3)—Private Applicants

The concept of agency action under the ESA may also include action taken to issue a permit or license sought by a private applicant. Section 7(a)(3) states that consultation may be required on “any prospective agency action” relating to a “prospective permit or license” whenever listed species may be present in the area affected by the application.⁴⁰ The regulations define “applicant” as any person “who requires formal approval or authorization from a federal agency as a prerequisite to conducting the action.”⁴¹

The FWS and the NMFS have adopted a Consultation Handbook for guidance in determining which private applications rise to the level of agency action.⁴² The forward to the Handbook states that its purpose “is to promote efficiency and nationwide consistency within and between the [FWS and the NMFS]. The Handbook addresses the major consultation processes, including informal, formal, emergency and special consultations, and conferences.” It covers all federally authorized activities whether public or private. As discussed below, consultation is particularly significant under the CWA § 404 wetlands permit program where the issuance of both individual and nationwide permit approvals by the Corps has been deemed “agency action” for purposes of § 7 of the ESA.⁴³

§ 21:27 Section 7 consultation policies of particular agencies

a. Consultation Under Corps CWA § 404 Permit Program

The § 7 process has special significance under the CWA’s § 404 program. Many activities involving the discharge of dredged or fill material in waters of the United

⁴³See *Riverside Irr. Dist. v. Andrews*, 758 F.2d 508 (10th Cir. 1985); *Fund for Animals, Inc. v. Rice*, 85 F.3d 535, 35 Fed. R. Serv. 3d 547 (11th Cir. 1996).

States and adjacent wetlands trigger ESA consultation because of the activities' impact on listed species and their habitat. These activities include, for example, infrastructure projects such as water and sewer lines, dams and impoundments, housing and commercial development, and aggregate mining. The consultation process can be lengthy and complex with extensive negotiations between a project applicant, the Corps, and the FWS.

Under the CWA § 404 program, the Corps is the action agency responsible for determining the scope of the analysis for which it consults the FWS and the NMFS under § 7. Specifically, under the ESA implementing regulations, the Corps is responsible for evaluating the "effects of the action" on listed species and habitat.¹ The Corps' Regulatory Guidance Letter (RGL) 92-1 (Federal Agency Roles and Responsibilities) expressly affirms the Corps' exclusive authority as "the decision-maker and project manager for" the Corps' regulatory program.² RGL 92-1 also states that the Corps is "solely responsible for making final permit determinations of compliance with Corps permit regulations."³ The RGL notes that the "*Federal resource agencies have reviewed and concurred with this guidance and have agreed to act in accordance with its provisions.*"⁴ This guidance thus confirms that the resource agencies have agreed that the Corps retains the ultimate responsibility to define the proposed action subject to the permit, to determine the scope of the effects of that action, and to comply with the requirements of § 7.

Further, the Supreme Court's 2006 decision in *Rapanos v. United States* and *Carabell v. Army Corps of Eng'rs*⁵ could have a significant effect on the reach of Corps' CWA jurisdiction that will impact the Corps' consultation duties under § 7 by potentially limiting the scope of federally regulated waters and wetlands. The Court addressed whether the CWA allows the Corps to regulate wetlands and waters that are not physically connected or abutting traditionally navigable waters. In a 5-4 plurality decision, the Court created two tests for determining CWA jurisdiction: (1) the test set out by Justice Scalia for the plurality requires a permanent hydrologic connection thereby excluding channels through which water flows intermittently or ephemerally, or channels that periodically provide drainage for rainfall; and (2) the test set out by Justice Kennedy, in concurrence, requires a wetland to possess the requisite "significant nexus" necessary to restore and maintain the chemical, physical, and biological integrity of "navigable" waters. The issue of which test represents the holding of the Court is emerging as a key issue in the wetlands debate.⁶

The Corps' nationwide permit (NWP) program under § 404(e) of the CWA authorizes specific activities that have minimal individual and cumulative impacts on the aquatic environment. The vast majority of the Corps' authorized activities come under the NWP program. In 2007, the Corps reissued 34 activity-specific NWPs and added 6 new NWPs with a number of new and modified general conditions designed to protect the aquatic environment.⁷ Most NWPs require a 45-day preconstruction notification prior to commencing work. General Condition 17 covers endangered species, stating that "no activity is authorized under any NWP which is likely to jeopardize the continued existence of a threatened or endangered species or

⁶The Corps and EPA issued joint guidance in June 2007 interpreting these cases (**cites**). The discussion of that guidance is beyond the scope of this overview.

⁷72 Fed. Reg. 11092 (Mar. 12, 2007).

a species proposed for such designation or which would destroy or adversely modify critical habitat.”⁸

Nonfederal permittees must notify the Corps if any listed species or designated critical habitat might be affected or is in the vicinity of the project, and permittees then cannot begin work until notified by the Corps that the requirements of the ESA have been met. The Corps will determine whether the proposed activity “may affect” or will have “no effect” on a listed species and designated critical habitat and will notify the nonfederal applicant within 45 days of receipt of a complete preconstruction notification. Where a “may affect” finding is made, the Corps and the FWS or the NMFS will engage in § 7 consultation that may result in the Corps adding species-specific, regional endangered species conditions to the NWP. Further, the NWP rule makes clear that the authorization of an activity by an NWP does not authorize the “take” of a listed species in the absence of separate authorizations under the ESA, e.g., an ESA § 10 permit, a biological opinion with “incidental” take” provisions.⁹

b. EPA-FWS-NMFS MOA on Consultations

In 2001, the EPA entered into a memorandum of agreement (MOA) with the FWS and the NMFS in an effort to enhance coordination between the agencies under the CWA and the ESA.¹⁰ According to the agencies, the MOA seeks to enhance the efficiency and effectiveness of consultations between EPA and the NMFS and the FWS regarding EPA’s promulgation of various rules and standards, including the adoption of water quality standards under the CWA. To achieve this goal, the MOA sets out specific EPA actions that require § 7 consultation. These cover:

- Approval of state/tribal national pollutant discharge elimination system (NPDES) programs;
- Issuance of individual and general federal NPDES permits;
- Approval of new or revised state/tribal water quality standards;
- Promulgation of water quality standards for a state or a tribe; and
- Promulgation of national aquatic life water quality criteria.¹¹

The MOA also provides clearer guidance to regional and field offices and establishes an “elevation process” to resolve various issues that may arise. In addition to promoting ground-level coordination, the MOA seeks to enhance coordination between the agencies at a national level through the establishment of a joint national research plan that prioritizes research on the effects of water pollution on endangered species. It is important to note that the MOA merely provides internal procedural guidance to the agencies. It does not impose any legally binding rules or requirements on the regulated community.

§ 21:28 Analysis of the “effects” of agency action

Once an agency has determined that a particular program or activity rises to the level of “agency action” under the ESA, the next step is evaluating the “effect” of such action. Determining the “effect” of an agency action is important because it dictates the extent of consultation required under § 7, i.e., whether or not formal consultation is required.

⁸72 Fed. Reg. 11092, 11192 (Mar. 12, 2007).

⁹72 Fed. Reg. 11092, 11192 (Mar. 12, 2007).

¹⁰See Memorandum of Agreement Between the Environmental Protection Agency, Fish and Wildlife Service, and National Marine Fisheries Service Regarding Enhanced Coordination Under the Clean Water Act and Endangered Species Act, 66 Fed. Reg. 11201 (Feb. 22, 2001).

¹¹See 66 Fed. Reg. at 11202, 11205 to 06, and 11214 to 15.

In this regard, it should be noted that the terms “affect” and “effect” are often used throughout § 7. The Consultation Handbook defines “affect” as a verb meaning “to bring about change,” e.g., the proposed action is likely to *affect* critical habitat.¹ The term “effect” is a noun used to discuss “beneficial effects” or “adverse effects.” The regulations focus on the “effects of an action” as: (1) direct and indirect effects of an action; and (2) the effects of other activities that are interrelated or interdependent.² Such effects are analyzed in relation to the “environmental baseline.”³ The term “may affect” is the appropriate conclusion when the proposed action poses “any effect” on a listed species.⁴ “Cumulative effects” refers to those future state or private activities *not* involving federal agencies that are reasonably certain to occur *if* the agency action is permitted to proceed.⁵

a. The Environmental Baseline

All direct and indirect effects of an agency action, together with the combined effects of all other activities that are interrelated or interdependent with that action, are added to the “environmental baseline.” The environmental baseline includes: (1) the past and present impacts of all federal, state, or private actions and other human activities in the relevant action area; (2) the anticipated impacts of all proposed federal projects in the action area that have already undergone formal or early § 7 consultation; and (3) the impact of state or private actions that are contemporaneous with the consultation in process.⁶ This baseline is intended to form a basic “snapshot” of the status of the species at a particular moment in time before the action is taken. As the Ninth Circuit held in *NWF v. State of Idaho*, the “environmental baseline” requires consideration of

the effects of [NMFS] actions within the context of other existing human activities that impact the listed species [and that] the proper baseline analysis is not the proportional share of responsibility the federal agency bears for the decline of the species, but what jeopardy might result from the agency’s proposed actions in the present and future human and natural contexts.⁷

b. Direct, Indirect, and Cumulative Effects

In late 2008, the NMFS and the FWS issued the “Consultation Rule,” which changed the definition of direct, indirect, and cumulative effects, to suggest that there must be a close causal connection between the action under consultation and the effect that is being evaluated.⁸ The rule allowed the federal agencies considering a project or action that requires federal authorization or involves federal funding, in certain circumstances, to decide for themselves whether they had to consult with

the appropriate wildlife Service on the effects of that project or action. The rule also established time frames for the informal consultation process, clarified certain definitions, and corrected the standards for effects analysis.

On March 3, 2009, President Obama issued a memorandum to the heads of executive agencies, asking the Secretaries to review the Consultation Rule. In the memo, President Obama asked the Secretaries to “determine whether to undertake new rulemaking procedures with respect to consultative and concurrence processes that will promote the purposes of the ESA.”⁹ President Obama did not formally suspend implementation of the Consultation Rule pending reconsideration. Instead, he asked federal agencies to exercise their discretion under the rule “to follow the prior longstanding consultation and concurrence practices involving the [Services]” until the review is done.

Following the president’s memorandum, Congress took action. The Omnibus Appropriations Act of 2009¹⁰ contained a provision authorizing the Secretaries of Commerce and of the Interior to withdraw the Consultation Rule. Section 429 of the Act authorized the Secretaries to “withdraw or reissue” the Consultation Rule on or before May 10, 2009, “without regard to any provision of statute or regulation that establishes a requirement for such withdrawal.” If the Secretaries withdraw a rule under the Act, they must “implement the provisions of law under which the rule was issued in accordance with the regulations in effect under such provisions immediately before the effective date of such rule, except as otherwise provided by any Act or rule that takes effect after the effective date of the rule that is withdrawn.”

On April 28, 2009, Secretary of Commerce Gary Locke and Secretary of the Interior Ken Salazar announced that their departments were revoking the Consultation Rule. The decision to revoke the consultation rule reinstates a process that has been criticized as unduly burdensome. In light of those concerns, the Administration promised to review the 1986 consultation regulations to propose “identifying potential options and improvements to the section 7 regulations that may be appropriate.”¹¹

The case law provides some meaningful guidance as to the scope of effects that ought to be considered.¹² In *Riverside Irrigation District v. Andrews*,¹³ the Tenth Circuit held that the Corps was obligated to consider the future effects of an increase in water consumption that might result from granting a permit to construct a dam and the impact that consumption may have on the critical habitat of whooping cranes located over 100 miles away from the site. The court held that the Corps could not limit its focus to the localized impacts of the dam. The court explained that the agencies were not permitted to wear “blinders” and ignore the indirect but causally related effects of certain actions.¹⁴

In *National Wildlife Federation v. Norton*,¹⁵ the court held that the FWS had violated the ESA by issuing a biological opinion for Florida Rock Industry’s proposed lime rock quarry that the Corps then relied on in issuing a CWA § 404 permit. The court held that the biological opinion failed to provide a proper analysis of the

¹⁵*National Wildlife Federation v. Norton*, 332 F. Supp. 2d 170 (D.D.C. 2004).

cumulative impact on the endangered Florida panther and did not adequately discuss other private projects that were reasonably likely to move forward in the panther habitat as a result of the mine. The court stated that “[i]f the requirement to evaluate cumulative effects is to mean anything, the FWS must not only explain what its ‘disturbance intensity’ numbers mean for panther habitat now, but what part the Florida Rock project will play in the reasonably expectable degradation over time of the habitat upon which ‘one of the most endangered large mammals in the world’ depends.”¹⁶

The National Wildlife case stands for the proposition that a reviewing court will critically examine the agency’s explanation for whether, and to what extent, it must consider the cumulative effects of numerous reasonably foreseeable private projects in determining if a proposed action will cause what is referred to as “jeopardy.” However, a 2004 decision of the Supreme Court in *Dept. of Transportation v. Public Citizen* could have a significant limiting effect on an Agency’s scope of analysis, subject to § 7, in determining the indirect effects of federal actions. The Supreme Court’s opinion in *Department of Transp. v. Public Citizen*, 541 U.S. 752, 124 S. Ct. 2204, 159 L. Ed. 2d 60 (2004), addressed the scope of analysis used under an analogous environmental statute, NEPA, 42 U.S.C.A. §§ 4321 to 4370(f). The Court held that “where an agency has no ability to prevent a certain effect due to its limited statutory authority over the relevant actions, the agency cannot be considered a legally relevant ‘cause’ of the effect.”

c. Effects of Interrelated and Interdependent Actions

To assess the impacts of an agency action, the action agency and the NMFS or the FWS must consider all direct and indirect “effects of the action.” “Direct effects” include effects of “interrelated and interdependent actions.”¹⁷ An “interrelated activity” is one that is “part of the proposed action and depends on the proposed action for its justification.”¹⁸ An “interdependent activity” is one that has “no independent utility apart from the action under consultation.”¹⁹ “Indirect effects” are defined as those that are “caused by the proposed action and are later in time, but still are reasonably certain to occur.”²⁰

The determination of whether an activity is interrelated to or interdependent with a proposed action depends on a “but for” test.²¹ That is, if a given activity would not occur but for the proposed action, then its effects should be considered in the consultation process.

The Ninth Circuit has commented that the “but for” causation test asks: “But for the federal project, would the activities in question occur?”²² On this basis, in the *Sierra Club* case, the court determined that a pair of proposed private development projects in the vicinity of a highway and flood control project under Corps jurisdiction was “not part of the federal project and [were] *not related to it or dependent on*

¹⁶*National Wildlife Federation v. Norton*, 332 F. Supp. 2d 170 (D.D.C. 2004).

it.”²³ In a later case, a district court considered a DOE easement grant for access to an existing private mining operation.²⁴ The project involved constructing a road across federal land to connect the mining operation with a freeway to “facilitate” the removal of the mined materials.²⁵ The court found that DOE had violated the ESA by failing to consult on the impacts of the mining operation as well as the easement, as the mine and the easement were “‘interrelated’ or ‘connected’ actions because the road *has no purpose other than to provide access to the mine.*”²⁶

§ 21:29 The consultation process

Section 7(a)(2) requires each federal agency to consult with either the NMFS or the FWS to ensure that any action authorized, funded, or carried out by the agency is not likely to jeopardize the continued existence of any listed species or result in the destruction or adverse modification of critical habitat (unless an exemption is obtained under § 7(h)).¹ In turn, a permit applicant may request prospective or “early consultation” if the applicant “has reason to believe that an endangered species or threatened species may be present” at a proposed project.² Hence, § 7(a)(2) or § 7(a)(3) can also require consultation for proposed agency actions that require the issuance of a license or permit to a private applicant.³

The regulations provide detailed requirements for consultation—which may be either “informal”⁴ or “formal.”⁵ They also address “conferencing” of agencies for actions that might affect a species proposed for listing. The ESA also imposes a duty on the agencies to use “the best scientific and commercial data available” when consulting.⁶ Generally, whether formal or informal consultation is required depends on whether an endangered species may be present in the area affected by the agency action and whether or not it appears that the action may affect the species, based on the initial analysis.⁷

a. Conferencing

When a proposed agency action threatens a species *proposed* for listing, the agency must enter into “conference” with the FWS or the NMFS.⁸ The conference concludes with a “conference report,” which contains advisory recommendations to avoid

adverse effects on the species proposed to be listed.⁹

b. Informal Consultation

“Informal consultation” is defined in the ESA regulations as “an optional process that includes all discussions, correspondence, etc. between the Service and the Federal agency or the designated non-Federal representative prior to formal consultation, if required.”¹⁰ As a practical matter, most consultations are conducted informally with the appropriate agency. Informal consultation involves telephone calls, meetings, conversations, and letters that precede formal consultation. Generally, informal consultation focuses on whether formal consultation is required or whether concurrence can be reached that there is no adverse effect on a listed species. The *Consultation Handbook* lists several purposes of informal consultation:

- To clarify whether listed, proposed, or candidate species or critical habitats may be in the action area.
- To evaluate the action’s potential effect on listed species or critical habitat.
- To explore ways to modify proposed actions to reduce or remove adverse effects or critical habitat.
- To determine the need to enter into formal consultation or conference for proposed species or habitat.
- To explore design or modification of a proposed action that would benefit the species.¹¹

The regulations discuss informal consultation as an “optional” process that includes all discussions, correspondence, etc. between the FWS or the NMFS and the agency designed to assist the agency in determining whether formal consultation or a conference is required.¹² Notably, the informal consultation determination is made by the federal agency proposing the actions, not by the FWS or the NMFS.¹³

Three possible results arise from an informal consultation. *First*, the FWS or the NMFS and the agency can determine that the proposed action “may affect” but is not likely to adversely affect any species. In that case, the consultation process would be terminated.¹⁴ *Second*, the FWS or the NMFS can recommend actions necessary to avoid the likelihood of adverse effects to a listed species, in which case consultation would also be terminated.¹⁵ *Third*, the consultation can lead the agencies to conclude that a formal consultation is required.

Prior to a final determination that formal consultation is required, the agency may recommend that additional studies be made to improve the data documenting the effect on a species. In those cases a biological assessment is made to develop the best available scientific and commercial data.

c. Biological Assessment

As part of an informal consultation, an action agency may request from the FWS or the NMFS information on whether any species that are listed or proposed to be listed may be present in the proposed action area. If the FWS or the NMFS “advises, based on the best scientific and commercial data available, that such species may be

¹⁴*See* 50 C.F.R. § 402.13(a).

¹⁵*See* 50 C.F.R. § 402.13(b).

present,” then § 7(c) provides that the action agency “shall conduct a biological assessment for the purpose of identifying any endangered species or threatened species which is likely to be affected by such action.”¹⁶ Section 7(a)(2) requires that the action agency also “use the best scientific and commercial data available” in fulfilling all § 7 consultation obligations, which would include conducting any required biological assessment.¹⁷

A biological assessment has no set format and may be prepared by the action agency, the “designated non-federal representative,”¹⁸ or any other person under the supervision of the action agency and in cooperation with the FWS or the NMFS.¹⁹ Biological assessment is defined as “the information prepared by or under the direction of the Federal agency concerning listed and proposed species and listed and designated and proposed critical habitat that may be present in the action area and the evaluation of potential effects of the action on such species and habitat.”²⁰

The biological assessment is to be completed within 180 days after it is initiated unless a different time is agreed upon.²¹ When an application for a permit or license is involved, the time period for completion of an assessment may not be extended unless the agency provides the applicant with a written statement before the expiration of the 180-day period setting forth the estimated length of the proposed extension and the reasons for the extension.²² Section 7(c) also provides that the assessment may be undertaken as part of a federal agency’s compliance with the requirements of § 102 of NEPA.²³

At its essence, a biological assessment evaluates the potential effects of the action on listed or proposed species and designated or proposed critical habitat.²⁴ Therefore, it must be completed before any contract for construction is entered into and before construction activities are commenced.²⁵

First, the preparer of the assessment must make a determination of whether any such species or habitat is present. The regulations require the action agency to make a written request to the FWS or the NMFS requesting a list of all listed or proposed species and designated or proposed critical habitat that may be present within the action area or notifying the FWS or the NMFS of the species that are being included in the assessment.²⁶ Within 30 days of receipt of such a request, the FWS or the NMFS will either concur with the action agency’s list of species, revise the list that was provided, or provide the action agency with a list of threatened species or habitat that may be within the action area, based on the best available scientific data.²⁷

In addition to listed and proposed species, the FWS or the NMFS will also provide

a list of candidate species that may be present in the action area.²⁸ Candidate species refers to any species currently being considered by the FWS or the NMFS for listing as endangered or threatened but not yet the subject of a proposed rule.²⁹ Although candidate species have no legal status and are accorded no protection under the ESA, their inclusion in the list will provide the agency with advance notice of their potential listing.³⁰

If the FWS or the NMFS determines that there are no listed species or critical habitat present in the action area, the agency is not required to prepare a biological assessment and further consultation is not required.³¹

The contents of a biological assessment are left to the discretion of the action agency and will often depend on the nature of the agency action involved.³² The regulations identify the following items that may be considered for inclusion:

- The results of an on-site inspection of the area affected by the action to determine if listed or proposed species are present or occur seasonally.
- The views of recognized experts on the species at issue.
- A review of the relevant literature and other information.
- An analysis of the effects of the action on the species and habitat, including consideration of cumulative effects, and the results of any related studies.
- An analysis of alternative actions considered by the federal agency for the proposed action.³³

If a proposed action requiring the preparation of a biological assessment is identical, or very similar, to a previous action for which a biological assessment was prepared, the agency may fulfill the biological assessment requirement for the proposed action by incorporating by reference the earlier assessment, plus any supporting data from other documents that are pertinent to the consultation.³⁴

Once the biological assessment is completed, the agency must submit it to the director of the FWS or the NMFS for review. The director will respond in writing within 30 days as to whether he concurs with the findings of the biological assessment.³⁵ The action agency may initiate formal consultation simultaneously with submission of the biological assessment.³⁶

The biological assessment may be used by the FWS or the NMFS in the following manner: (1) in determining whether to request formal consultation; (2) in formulating a biological opinion; or (3) in formulating a preliminary biological opinion.³⁷

d. Formal Consultation—When Is It Triggered?

“Formal consultation” is a process that commences with the federal action agency’s written request and concludes with the issuance of a biological opinion by the FWS

²⁸See 50 C.F.R. § 402.12(d).

²⁹See 50 C.F.R. § 402.12(d).

³⁰50 C.F.R. § 402.12(d).

³¹50 C.F.R. § 402.12(d)(1).

³²50 C.F.R. § 402.12(f); *see* Strahan v. Linnon, 967 F. Supp. 581, 594 (D. Mass. 1997), *aff’d*, 187 F.3d 623 (1st Cir. 1998) (noting that the contents of a biological assessment are discretionary).

³³50 C.F.R. § 402.12(f)(1) to (5).

³⁴See 50 C.F.R. § 402.12(g). The agency must certify that the action involves similar impacts to the same species in the same geographical area and that no new species or critical habitats have been listed/designated or proposed. In addition, the biological assessment must be supplemented with any relevant changes in information. *See* 50 C.F.R. § 402.12(g)(1) to (3).

³⁵See 50 C.F.R. § 402.12(j).

³⁶See 50 C.F.R. § 402.12(j).

³⁷See 50 C.F.R. § 402.12(k)(2).

or the NMFS under § 7(b)(3). The written request from the action agency must include six items: (1) a description of the action to be considered; (2) a description of the specific area that may be affected; (3) a description of any listed species or critical habitat that may be affected; (4) a description of the manner in which a species may be affected by the action and an analysis of cumulative effects; (5) relevant reports, including any environmental impact statement, environmental assessment, or biological assessment; and (6) “any other relevant available information on the action, the affected listed species, or critical habitat.”³⁸ However, formal consultation may not be initiated until the biological assessment has been completed and submitted.³⁹

In determining whether formal consultation is required, the agencies examine the proposed action to determine whether there are listed species or critical habitat within the “action area,” whether the proposed action is a “major construction activity,” and whether the proposed action may affect a listed species. “Action area” is defined broadly to mean “all areas affected directly or indirectly by the Federal action and not merely the immediate area involved in the action.”⁴⁰ The regulations require agencies to consult with the FWS and the NMFS to determine whether species are likely to be present in the area.

If species exist within the “action area,” the next step is to determine whether the proposed action is a “major construction activity.” The regulations define “major construction activity” as a construction project having an impact on the physical environment or significantly affecting the quality of the human environment as referred to in the National Environmental Policy Act.⁴¹

The federal action agency must determine whether the action “may affect” a listed species or critical habitat. The *Consultation Handbook* explains that the term “may affect” essentially means “any effect.”⁴² If this initial information consultation results in a determination that the proposed action will have no effect on a listed species or critical habitat, then the agency or applicant may request a concurrence from the FWS or the NMFS, and the consultation is terminated.⁴³

A federal court in Florida in the Lake Belt overturned the Corps’ and FWS’ “informal consultation” action regarding impacts on the endangered wood stork from the Corps’ issuance of § 404 permits under the Clean Water Act to mining companies for limestone mining activities within an 89-square-mile area in Western Miami Dade County.⁴⁴ The Corps had concluded that the mining would not adversely affect wood stork foraging habitat because more than 90% of the resources to be affected were not high-quality wood stork foraging habitat but rather the area was dominated by the invasive melaleuca tree. The FWS concurred in this determination under the informal consultation process. The court found that this statement was “patently absurd.” The court held that the agencies were arbitrary and capricious in not conducting formal consultation, noting that the analysis was not based on the best available science and had understated and misrepresented information on the potential impacts from mining on destruction of wetlands habitat. The court

³⁸50 C.F.R. § 402.14(c)(1) to (6).

³⁹See 50 C.F.R. § 402.13. The regulations permit the request to encompass a number of similar actions within a geographical area or a segment of a comprehensive plan. However, “this does not relieve the Federal agency of the requirements for considering the effects of the action as a whole.”

⁴⁰50 C.F.R. § 402.02.

⁴¹50 C.F.R. § 402.02.

⁴²U.S. Fish and Wildlife Service and National Marine Fisheries Service, *Endangered Species Consultation Handbook*, at xvi (1998).

⁴³See 50 C.F.R. § 402.14(a).

⁴⁴*Sierra Club v. Flowers*, 423 F. Supp. 2d 1273 (S.D. Fla. 2006).

then remanded the action to the agencies that then proceeded to conduct formal consultation culminating in a biological opinion issued by the FWS.

The district court's decision was subsequently vacated by the Eleventh Circuit. After reviewing the entirety of the record, reading briefs and listening to oral argument, the court determined that the district court did not give the appropriate deference to the agencies pursuant to the Administrative Procedure Act (APA). Specifically, regarding the plaintiff's ESA claims, the court stated that:

[a]fter the district court granted summary judgment, but before the court issued the Remedies Order, the Corps and FWS undertook ESA formal consultation—the only relief Sierra Club sought for [these claims]. It was therefore improper for the district court to rely on those Claims' judgments in crafting a remedy; the claims were moot.⁴⁵

e. Formal Consultation—How Is It Conducted?

Section 7 provides a formal procedure for agencies to determine whether their activities are likely to have an adverse impact on threatened species or habitat. When a federal agency determines that a proposed action *may* affect listed species or critical habitat, a formal consultation is required and a biological opinion must be prepared. The applicable regulations provide, in part, that: “Each Federal agency shall review its actions at the earliest possible time to determine whether any action may affect listed species or critical habitat. If such a determination is made, formal consultation is required”⁴⁶

Conversely, the statute provides that when a federal agency determines that the proposed action is not likely to have *any* adverse effect⁴⁷ on listed species or critical habitat, then formal consultation is not required.⁴⁸ This determination can be made by way of a biological assessment initiated under an informal consultation⁴⁹ or through a preliminary biological opinion issued under early consultation⁵⁰ and confirmed as the final biological opinion.⁵¹

When conducting a formal consultation, the agency is required to provide the best scientific and commercial data available.⁵² This information may include the results of studies or surveys conducted by the federal agency or another appropriate agency. Applicants also have the opportunity to submit information.⁵³

Formal consultations, which follow set timelines, do not begin until the biological assessment has been submitted.⁵⁴ Section 7 provides that a consultation shall conclude within “90 days after its initiation unless extended.”⁵⁵ When a private applicant is involved, the agencies may extend the deadline by submitting a written statement setting forth: (1) the reasons why a longer period is required; (2) the information that is needed to complete the consultation; and (3) the estimated date on

⁴⁵Sierra Club v. Van Antwerp, 526 F.3d 1353, 1359 (11th Cir. 2008).

⁵⁰See 50 C.F.R. § 402.11.

⁵¹See 50 C.F.R. § 402.14(b)(2).

⁵²See 50 C.F.R. § 402.14(d). This is the best information “available or that can be obtained during the consultation for an adequate review of the effects” of the action.

⁵³See 50 C.F.R. § 402.14(d).

⁵⁴See 50 C.F.R. § 402.14(c).

⁵⁵16 U.S.C.A. § 1536(b)(1)(A), ELR Stat. ESA § 7(b)(1)(A).

which the consultation will be completed.⁵⁶ A consultation involving an applicant cannot be extended more than 60 days, however, without the consent of the applicant.⁵⁷ Within 45 days after concluding formal consultation, the FWS or the NMFS must deliver a biological opinion to the agency and any applicant involved.⁵⁸

If, during the consultation, the FWS or the NMFS determines that “additional data would provide a better information base from which to formulate a biological opinion,” the FWS or the NMFS may request an extension of the consultation and request the action agency to provide additional data.⁵⁹ If there is mutual agreement to extend the consultation,⁶⁰ then the action agency must obtain “to the extent practicable” any data that can be obtained within the scope of the extension.⁶¹ It is important to note that the FWS and the NMFS do not take any responsibility for conducting or funding any additional studies.⁶² If no request for an extension is made, then the FWS or the NMFS will issue its biological opinion on the basis of the best data available at that time.

During formal consultation, the responsibilities of the FWS or the NMFS are as follows:

- Review all relevant information provided by the federal agency or that is otherwise available.
- Evaluate the current status of the listed species or critical habitat.
- Evaluate the effects of the action and cumulative effects on the listed species or critical habitat.
- Formulate a biological opinion as to whether the action, taken together with cumulative effects, is likely to jeopardize the continued existence of listed species or result in the destruction or adverse modification of critical habitat.
- Discuss with the federal agency and any applicant the availability of “reasonable and prudent alternatives” that the agency and the applicant can take to avoid a violation of § 7(a)(2).
- Formulate discretionary conservation recommendations to assist the federal agency in reducing or eliminating the impacts that its proposed action may have on listed species or critical habitat.
- Formulate a statement concerning “incidental take,”⁶³ if such take may occur.
- Use “the best scientific and commercial data available” in formulating its biological opinion, any reasonable and prudent alternatives, and any reasonable and prudent measures.⁶⁴

f. Biological Opinions

The result of a formal consultation is the preparation of a biological opinion. The opinion is the compilation of the best available scientific data on the status of the species and how it would be affected by the proposed action. In addition, a biological opinion proposes alternative actions that the agency or applicant could take in order

⁵⁶16 U.S.C.A. § 1536(b)(1)(B), ELR Stat. ESA § 7(b)(1)(B); *see also* 50 C.F.R. § 402.14(e).

⁵⁷16 U.S.C.A. § 1536(b)(1)(B); *see also* 50 C.F.R. § 402.14(e)(3).

⁵⁸*See* 50 C.F.R. § 402.14(e).

⁵⁹*See* 50 C.F.R. § 402.14(f).

⁶⁰*See* 50 C.F.R. § 402.14(e).

⁶¹*See* 50 C.F.R. § 402.14(f).

⁶²*See* 50 C.F.R. § 402.14(f).

⁶³“Incidental takings” is defined as “takings that result from, but are not the purpose of carrying out an otherwise lawful activity conducted by the Federal agency or applicant.” 50 C.F.R. § 402.02.

⁶⁴*See* 50 C.F.R. § 402.14(g)(1) to (8); *see also* U.S. Fish and Wildlife Service and National Marine Fisheries Service, Endangered Species Consultation Handbook, at 4–6 (1998).

to proceed with the project and still comply with the ESA. The pertinent provision of the statute reads as follows:

Promptly after conclusion of consultation under paragraph (2) or (3) of subsection (a), the Secretary shall provide to the Federal agency and the applicant, if any, a written statement setting forth the Secretary's opinion, and a summary of the information on which the opinion is based, detailing how the agency action affects the species or its critical habitat. If jeopardy or adverse modification is found, the Secretary shall suggest those reasonable and prudent alternatives which he believes would not violate subsection (a)(2) and can be taken by the Federal agency or applicant in implementing the agency action.⁶⁵

The regulations, in turn, provide that a biological opinion must include:

- A summary of the information on which the opinion is based.
- A detailed discussion of the effects of the action on listed species or critical habitat.
- The Service's opinion on whether the action is likely to jeopardize the continued existence of a listed species or result in the destruction or adverse modification of critical habitat (a "jeopardy biological opinion") or the action is not likely to jeopardize the continued existence of a listed species or adversely modify critical habitat (a "no jeopardy" biological opinion). A "jeopardy" biological opinion shall include reasonable and prudent alternatives, if any exist.⁶⁶

The *Consultation Handbook* sets forth additional requirements for biological opinions:

- Description of the Proposed Action. The opinion should set forth the proposed action and list the direct and indirect effects in the action area.
- Status of the Species/Critical Habitat. The opinion shall present biological information on the impacted species, their life history, population dynamics, habitat, status and distribution, and other factors necessary for its survival, including areas designated as critical habitat.
- Environmental Baseline. The opinion should outline the current effects of all human activity as it affects the species.
- Effects of the Action. This section of the opinion looks at direct and indirect effects of the proposed action, including proximity of the action, distribution, timing, nature of the effects, duration, disturbance, and frequency.
- Cumulative Effects. The opinion should look at the cumulative effects of the future state, tribal, local, and private actions that are reasonably certain to occur.⁶⁷

As discussed below, there are essentially two possible types of biological opinions: a no jeopardy opinion; and a jeopardy opinion.⁶⁸ In a no jeopardy opinion, a determination (based upon the best available scientific and commercial data) is made that the proposed agency action is *not* likely to jeopardize the continued existence of listed species or critical habitat. In a jeopardy opinion, which is a relatively rare outcome, the Service concludes that the proposed agency action is likely to jeopardize the continued existence of a listed species or adversely modify critical habitat.⁶⁹

Biological opinions are not mandatory directives. Once an opinion is received, it is

⁶⁵16 U.S.C.A. § 1536(b)(3)(A), ELR Stat. ESA § 7(b)(3)(A).

⁶⁶50 C.F.R. § 402.14(h).

⁶⁷U.S. Fish and Wildlife Service and National Marine Fisheries Service, *Endangered Species Consultation Handbook*, at 4-14 to 4-31 (1998).

⁶⁸See 50 C.F.R. § 402.14(h)(3).

⁶⁹50 C.F.R. § 402.14(h)(3).

ultimately within the discretion of the agency to decide how to proceed.⁷⁰ If an agency chooses not to follow the advice set forth in a biological opinion, it will not constitute a violation of the ESA per se, so long as the agency's chosen course is a reasonable alternative measure.⁷¹ Yet, the Supreme Court in *Bennett v. Spear* noted "while the Service's Biological Opinion theoretically serves an 'advisory function,' 51 Fed. Reg. 19928 (1986), in reality it has a powerful coercive effect on the action agency."⁷² As the Court explained:

The Biological Opinion's Incidental Take Statement constitutes a permit authorizing the action agency to "take" the endangered or threatened species so long as it respects the Service's "terms and conditions." The action agency is technically free to disregard the Biological Opinion and proceed with its proposed action, but it does so at its own peril (and that of its employees), for "any person" who knowingly "takes" an endangered or threatened species is subject to substantial civil and criminal penalties, including imprisonment.⁷³

Thus, for all practical purposes, the measures suggested by the FWS or NMFS may be viewed as nondiscretionary by the action agency and permittee.⁷⁴

g. Use of Best Available Science

The biological opinion must be supported by the best scientific information available. As with other provisions of the ESA, what constitutes the "best" and "available" science has engendered considerable controversy. Regarding the preparation of a biological opinion during the § 7 consultation process, the Supreme Court cautioned that the requirement to use the best scientific data available serves to:

ensure that the ESA is not implemented haphazardly, on the basis of speculation or surmise. While this no doubt serves to advance the ESA's overall goal of species preservation, it is readily apparent that another objective (if not indeed the primary one) is to avoid needless economic dislocation produced by agency officials zealously but unintelligently pursuing their environmental objectives.⁷⁵

Some courts have held that the focus is on what type of information is "available" and therefore that even "weak" evidence does not render the opinion of the agency arbitrary and capricious.⁷⁶ Others have held that the FWS or the NMFS must conduct a detailed and "comprehensive" discussion of the effect of the proposed action.⁷⁷

There must be an analysis of the status of the environmental baseline given the listed impacts, not simply a recitation of the activities of the agencies. The [biological opinion] must also include an analysis of the effects of the action on the species when "added to"

⁷⁰50 C.F.R. § 402.15(a); *Aluminum Co. of America v. Administrator, Bonneville Power Admin.*, 175 F.3d 1156, 1160–62 (9th Cir. 1999).

⁷¹*See Tribal Village of Akutan v. Hodel*, 869 F.2d 1185, 1193 (9th Cir. 1988).

⁷²*See Bennett v. Spear*, 520 U.S. 154, 169, 117 S. Ct. 1154, 137 L. Ed. 2d 281 (1997). As the Court quoted from the Service's briefs in *Bennett*, "action agencies very rarely choose to engage in conduct that the Service has concluded is likely to jeopardize the continued existence of a listed species."

⁷³*Bennett v. Spear*, 520 U.S. 154, 169, 117 S. Ct. 1154, 137 L. Ed. 2d 281 (1997) (citing 16 U.S.C.A. § 1540(a) and (b)).

⁷⁴*See Bennett v. Spear*, 520 U.S. 154, 169, 117 S. Ct. 1154, 137 L. Ed. 2d 281 (1997).

⁷⁵*Bennett v. Spear*, 520 U.S. 154, 169, 117 S. Ct. 1154, 137 L. Ed. 2d 281 (1997).

⁷⁶*See Greenpeace Action v. Franklin*, 14 F.3d 1324 (9th Cir. 1992) (citing *Pyramid Lake Paiute Tribe of Indians v. U.S. Dept. of Navy*, 898 F.2d 1410, 1415 (9th Cir. 1990)); *see Pacific Shores Subdivision California Water Dist. v. U.S. Army Corps of Engineers*, 538 F. Supp. 2d 242, 250–51 (D.D.C. 2008) (agreeing with the NMFS that a breach of the sandbar would have occurred naturally and therefore the NMFS' determination was reasonably based on the record).

⁷⁷*See, e.g., Defenders of Wildlife v. Babbitt*, 130 F. Supp. 2d 121, 130 (D.D.C. 2001) (finding that the Service utilized an improperly narrow "action area" and ignored many direct and indirect effects).

the environmental baseline—in other words, analysis of the *total* impact on the species.⁷⁸

The Ninth Circuit in *Gifford Pinchot Task Force v. FWS*⁷⁹ deferred to the FWS' use of a habitat proxy for an actual species count in its biological opinion related to timber harvest impacts on the northern spotted owl.⁸⁰ The court stated that “[b]ecause the ESA does not prescribe how the jeopardy prong is to be determined, nor how species populations are to be estimated, we hold that it is a permissible interpretation of the statute to rest the jeopardy analysis on a habitat proxy.”⁸¹

The Supreme Court has found that parties affected by the conclusions of the § 7 consultation may have standing to sue under the ESA and challenge the validity of the agency's scientific data.⁸² Prior to the Court's decision in *Bennett v. Spear*, courts routinely concluded that private parties whose interests were affected by the ultimate decision of the FWS or the NMFS lacked standing because they asserted “recreational, aesthetic, and commercial interests” that did not fall within the zone of interests sought to be protected by the ESA.⁸³ Hence, landowners could not challenge whether the “best” scientific data were, in fact, used by the Service in formulating an opinion. In *Bennett*, however, the Court held that “the ‘best scientific and commercial data’ provision is . . . intended, at least in part, to prevent uneconomic (because erroneous) jeopardy determinations. [A landowners’] claim that they are victims of such a mistake is plainly within the zone of interests that the provision protects.”⁸⁴ This decision is viewed as having led to a heightened standard of quality and accuracy in the scientific data supporting agency opinions.⁸⁵

Agencies and applicants play a significant role in the development of a biological opinion. They supply the critical information and data and have the opportunity to review and submit comments to the FWS or the NMFS on preliminary opinions.⁸⁶

h. Reasonable and Prudent Alternatives and Conservation Measures

If a biological opinion concludes that the agency action will not result in jeopardy

⁷⁸*Defenders of Wildlife v. Babbitt*, 130 F. Supp. 2d 121, 128 (D.D.C. 2001) (citing *Greenpeace v. National Marine Fisheries Service*, 80 F. Supp. 2d 1137, 1149 (W.D. Wash. 2000)); *see also* *Pacific Coast Federation of Fishermen's Ass'n, Inc. v. National Marine Fisheries Service*, 265 F.3d 1028 (9th Cir. 2001) (finding that the biological opinion was inadequate because it failed to consider and explain cumulative effects and short-term impact of actions).

⁷⁹*Gifford Pinchot Task Force v. U.S. Fish and Wildlife Service*, 378 F.3d 1059 (9th Cir. 2004), opinion amended, 387 F.3d 968 (9th Cir. 2004).

⁸⁵*See* *Todd Williams Roles, Has the Supreme Court Armed Property Owners in Their Fight Against Environmentalists?* *Bennett v. Spear and Its Effect on Environmental Litigation*, 41 *Ariz. L. Rev.* 227, 244–45 (1999).

⁸⁶50 C.F.R. § 402.14(g)(5).

or adverse habitat modification, or if it offers reasonable and prudent alternatives⁸⁷ to avoid that consequence, the FWS or the NMFS must provide the agency with a written statement (known as the Incidental Take Statement)⁸⁸ specifying the “impact of such incidental taking on the species,” any “reasonable and prudent measures that the [Service] considers necessary or appropriate to minimize such impact,” and setting forth “the terms and conditions . . . that must be complied with by the Federal agency . . . to implement [those measures].”⁸⁹

A “reasonable and prudent alternative” is defined as an alternative action that is consistent with the purposes of the proposed action, within the scope of the agency’s jurisdiction and authority, economically and technologically feasible, and is believed would avoid jeopardizing the continued existence of listed species or resulting in destruction or adverse modification of critical habitat.⁹⁰ However, the rules specify that such measures “along with the terms and conditions that implement them, cannot alter the basic design, location, scope, duration, or timing of the action and may involve only minor changes.”⁹¹ The final determination on whether to adopt a proposed alternative is up to the agency, but is not without its consequences. The action agency is under no obligation to accept the first or even the “best” proposed alternative.⁹² Rather, the action agency can select any proposed alternative that otherwise meets the requirement of avoiding jeopardy to listed species or destruction or adverse modification of critical habitat.⁹³

The Ninth Circuit considered the appropriateness of specific reasonable and prudent alternatives in *Pacific Coast Federation of Fisherman’s Associations v. U.S. Bureau of Reclamation*,⁹⁴ where the Court reviewed whether the Bureau of Reclamation’s operation of an irrigation project on the Klamath River complied with the ESA in protecting the threatened Southern Oregon/Northern California Coast coho salmon and its habitat. The Ninth Circuit reversed the district court in holding that the reasonable and prudent alternatives developed under the government’s phased-in approach violated the ESA. The court held that the short-term flow limitation measures developed as part of the first phase of an eight-year plan were too limiting. In rejecting the state’s argument that the phased approach was based on sound scientific evidence, the court focused on the need to protect the species throughout five generational cycles, noting that “[it] is not sufficient for the agency to impose these flows without explaining how the flows will protect critical habitat and ensure that sufficient water is in the main stem for Coho to survive during these first five generations.”⁹⁵

In addition to reasonable and prudent alternatives, a biological opinion may also include “conservation recommendations” to assist the agency in further avoiding or

reducing the impact of the project.⁹⁶ Unlike the reasonable and prudent alternatives, recommended conservation measures are unquestionably “discretionary” and are “advisory and are not intended to carry any binding legal force.”⁹⁷ Conservation recommendations should be consistent with an adopted recovery plan for a listed species.⁹⁸

i. Jeopardy Opinions

When the FWS or the NMFS concludes that a proposed agency action is likely to jeopardize the continued existence of a listed species or adversely modify critical habitat, it must issue a “jeopardy biological opinion,” which includes a detailed discussion of the effects of the action on listed species and critical habitat.⁹⁹ Under the regulations, to “jeopardize the continued existence” of a species means “to engage in an action that reasonably would be expected, directly or indirectly, to reduce appreciably the likelihood of both the survival and recovery of a listed species in the wild by reducing the reproduction, numbers, or distribution of that species.”¹⁰⁰ A jeopardy opinion should include a discussion of various reasonable and prudent alternative courses of action that the agency could take, if any exist.¹⁰¹ The Ninth Circuit’s opinion in *NWF v. State of Idaho*¹⁰² reaffirmed the circuit’s prior holding in *Gifford Pinchot Task Force v. FWS* that the jeopardy regulation requires the NMFS and the FWS to consider both recovery and survival impacts. As a result, the biological opinion in *NWF* was found to be legally deficient because it inadequately considered the impacts on salmon and steelhead survival and failed to consider the additional impact on recovery.¹⁰³

Jeopardy opinions are relatively rare, owing to the fact that reasonable and prudent alternatives will be adopted to minimize and avoid the impact of the action on the species.¹⁰⁴ If a jeopardy finding has been made and the agency or project proponent nonetheless wishes to go forward with the project as proposed, then an exemption must be sought from the ESA’s § 7 prohibition of jeopardy. As discussed below, the exemption procedure is rarely used.

j. Incidental Take Statements

Often a biological opinion that includes reasonable and prudent alternatives will still result in some level of “take” of a listed species. The taking of the listed species would otherwise violate § 9 of the ESA, but § 7 allows the FWS or the NMFS to issue an “incidental take permit” as part of a biological opinion.¹⁰⁵ An incidental take

¹⁰³*National Wildlife Federation v. National Marine Fisheries Service*, 481 F.3d 1224, 1236 (9th Cir. 2007), for additional opinion, see, 230 Fed. Appx. 659 (9th Cir. 2007) and opinion amended and superseded, 524 F.3d 917 (9th Cir. 2008).

¹⁰⁴Some have argued that the FWS or the NMFS use the jeopardy opinion aggressively in order to leverage greater concessions from an applicant. See National Association of Home Builders, Developers Guide to the Endangered Species Act, at 54 (1996).

¹⁰⁵16 U.S.C.A. § 1536(b)(4), ELR Stat. ESA § 7(b)(4); 50 C.F.R. § 402.14(i). The Supreme Court has described the biological opinion’s incidental take statement as a “permit authorizing the action agency to ‘take’ the endangered or threatened species as long as it respects the Service’s ‘terms and

statement is to be issued when the Secretary concludes, after consultation under § 7(a)(2), that: (1) the agency action will not lead to jeopardy or adverse modification of critical habitat or that reasonable and prudent alternatives have been offered; (2) the taking of an endangered species or a threatened species incidental to the agency action will not lead to jeopardy or adverse modification of critical habitat; and (3) if an endangered species or threatened species of a marine mammal is involved, the taking is authorized pursuant to § 101(a)(5) of the Marine Mammal Protection Act.¹⁰⁶ The Secretary is required to issue an incidental take written statement that:

- (1) Specifies the impact of the incidental taking.
- (2) Sets forth the reasonable and prudent measures necessary or appropriate to minimize such impact.
- (3) In the case of marine mammals, specifies those measures that are necessary to comply with § 101(a)(5) of the Marine Mammal Protection Act with regard to such taking.
- (4) Sets forth the terms and conditions that must be complied with in implementing the reasonable and prudent measures identified in the statement.¹⁰⁷

The incidental take statement effectively shields the project proponent from liability for take of the species, as long as the take is in compliance with the terms and conditions of the take statement, and “no other authorization or permit under the Act is required.”¹⁰⁸ The FWS or the NMFS can also require the agency or applicant to report the progress of the action and its impact on the species so that the FWS or the NMFS can monitor the impacts of the take.¹⁰⁹ In addition, if the amount or extent of incidental taking is exceeded, the action agency must immediately reinstate consultation.¹¹⁰

The authority of the FWS or the NMFS to condition projects under the § 7 process is not unlimited, and courts have demonstrated their willingness to review these statements in light of the statutory requirements. In *Arizona Cattle Growers’ Ass’n v. U.S. Fish & Wildlife*,¹¹¹ the Ninth Circuit placed limits on the FWS’ ability to issue and attach terms and conditions to incidental take statements. The Bureau of Land Management (BLM) initiated a consultation with the FWS over grazing permits, which led to the FWS issuing two no jeopardy biological opinions and an incidental take statement. The Cattle Growers’ Association challenged the incidental take conditions on the grounds that the FWS had offered no evidence that protected species were actually on the land for which grazing permits would be issued and that there was no evidence that the grazing activities would actually result in a taking of any such species. The FWS insisted that it was statutorily required under the ESA to issue incidental take statements in *all* no-jeopardy determinations, and therefore, such evidence was unnecessary.¹¹²

The court rejected the FWS’ interpretation of the ESA finding it to be “contrary to

conditions.” *Bennett v. Spear*, 520 U.S. 154, 170, 117 S. Ct. 1154, 137 L. Ed. 2d 281 (1997).

¹⁰⁸50 C.F.R. § 402.14(i)(5). The incidental take statement is the equivalent of and replaces the need for obtaining a § 10(a) permit. See 16 U.S.C.A. § 1539, ELR Stat. ESA § 10.

¹⁰⁹50 C.F.R. § 402.14(i)(2).

¹¹⁰50 C.F.R. § 402.14(i)(4).

¹¹¹*Arizona Cattle Growers’ Ass’n v. U.S. Fish and Wildlife*, Bureau of Land Management, 273 F.3d 1229 (9th Cir. 2001).

¹¹²*Arizona Cattle Growers’ Ass’n v. U.S. Fish and Wildlife*, Bureau of Land Management, 273 F.3d 1229, 1240 (9th Cir. 2001). The Service also argued that requiring such evidence would be inappropriately restrictive, and that the Service should be permitted to issue take statements whenever

clear congressional intent.”¹¹³ Citing legislative history, case law, prior agency representations, and the plain language of the ESA, the court held that incidental take statements must be predicated on the finding of an actual take that would result from the proposed activities. The court went on to find that the FWS had acted in an arbitrary and capricious manner by issuing take statements imposing conditions of land use permits, when there was either no evidence that the protected species actually existed on the land or no evidence that a take would occur if the permit was issued.

The Ninth Circuit later relied on its decision in *Arizona Cattle Growers’ Ass’n* when it invalidated an incidental take statement in *Oregon Natural Resources Council v. Allen*.¹¹⁴ The incidental take statement in that case supplemented a biological opinion that found that a timber harvest would not jeopardize the Northern Spotted owl or destroy or adversely modify its critical habitat.¹¹⁵ After the scope of the harvest and biological opinion were modified, the FWS failed to adjust the scope of the incidental take statement to reflect the change. The court held that the incidental take statement was arbitrary and capricious because there must be a “rational connection between the authorization of take and the scope of the underlying proposed action.”¹¹⁶ The Ninth Circuit also invalidated the incidental take statement because it failed to place a numerical cap on spotted owl takings under the project, noting that “[w]here possible, the impact should be specified in terms of a numerical limitation on the Federal agency or permittee or licensee.”¹¹⁷ The court recognized that the numerical limitation on incidental takes was also intended to serve a triggering function for reinitiating consultation when that number has been exceeded.¹¹⁸ In a subsequent case, a district court held that generally, where the FWS fails to numerically quantify the authorized incidental take of listed species, it must offer evidence that it was impractical to do so, or the incidental take statement would be considered invalid.¹¹⁹

In *Pacific Shores Subdivision California Waste District v. United States Army Corps of Engineers*,¹²⁰ a specific number for the level of take was unobtainable, but the incidental take statement was not ruled invalid on this basis because the NMFS had used “ecological conditions” as a surrogate for determining extent of incidental take. In *Pacific Shores*, the NMFS and the FWS were in consultation with the Corps regarding the artificial breach of a sand bar that could affect coho salmon, the tidewater goby and other listed species. In the biological opinion, the FWS had identified three reasonable and prudent measures, but had only provided terms and conditions for two of those measures. The district court concluded that the incidental

there is even a remote possibility that a listed species will be taken.

¹¹⁹See *Center for Biological Diversity v. Bureau of Land Management*, 422 F. Supp. 2d 1115, 1137–38 (N.D. Cal. 2006), subsequent determination, 2006 WL 2788252 (N.D. Cal. 2006).

¹²⁰*Pacific Shores Subdivision California Water Dist. v. U.S. Army Corps of Engineers*, 538 F. Supp. 2d 242 (D.D.C. 2008).

take statement violated the ESA due to the failure to include terms and conditions for the third measure. Quoting *Ctr. for Biological Diversity v. Bureau of Land Mgmt.*, the court stated that “[a]n incidental take statement that fails to include terms and conditions governing the implementation of reasonable and prudent measures is ‘arbitrary and capricious.’”¹²¹ Accordingly, the Corps’ reliance on this inadequate incidental take statement was arbitrary and capricious as well.¹²²

k. Irreversible/Irretrievable Commitments of Resources

Once a consultation has begun, § 7(d) of the ESA prohibits agencies and applicants from making any “irreversible” or “irretrievable” commitments of resources toward the proposed action that would have the effect of foreclosing the formulation or implementation of any reasonable and prudent alternative measures.¹²³ This restriction on resource commitment remains in effect until the agency either receives a no jeopardy opinion or chooses a valid reasonable and prudent alternative, thus indicating that the requirements of § 7(a)(2) have been fully satisfied.¹²⁴ The restrictions of § 7(d) are actually quite narrow. Two criteria must be satisfied before the resource commitment restrictions take effect: (1) the commitment must be “irreversible or irretrievable”; and (2) the commitment must effectively foreclose the implementation of any reasonable alternative courses of action. Courts have recognized that committing money to a project does not, by itself, violate § 7(d).¹²⁵

§ 21:30 Exemptions from § 7

Jeopardy opinions typically lead to a request for an exemption from the prohibition of jeopardizing a species’ existence. As a result of the Supreme Court’s decision in *Tennessee Valley Authority v. Hill*,¹ Congress created an exemption process in § 7 and established a new committee to administer the exemption process.² Called the Endangered Species Committee in the ESA, the Committee is generally referred to as “the God Squad” because it is said to hold life or death power over a particular species.

a. The Exemption Process

The Endangered Species Committee is akin to the president’s Cabinet. The Committee is chaired by the Secretary of the Interior and includes the Secretaries of Agriculture and the Army, the Chairman of the Council of Economic Advisors, the Administrators of EPA and the National Oceanic Atmospheric Administration, and a presidential appointment to represent each state affected by a particular application.³ The Committee may hold hearings, issue subpoenas, take testimony, and take any action authorized. The Committee may also promulgate rules, regula-

¹²²*Pacific Shores Subdivision California Water Dist. v. U.S. Army Corps of Engineers*, 538 F. Supp. 2d 242, 259 (D.D.C. 2008).

¹²³16 U.S.C.A. § 1536(d), ELR Stat. ESA § 7(d).

¹²⁴50 C.F.R. § 402.09; 51 Fed. Reg. 19926, 19940 (1986).

¹²⁵*See, e.g., Bays’ Legal Fund v. Browner*, 828 F. Supp. 102, 112 (D. Mass. 1993) (finding that sinking over \$100 million into project prior to completion of consultation did not violate § 7(d) because sufficient flexibility was retained to change the project design if necessary).

[Section 21:30]

¹*Tennessee Valley Authority v. Hill*, 437 U.S. 153, 98 S. Ct. 2279, 57 L. Ed. 2d 117 (1978).

²16 U.S.C.A. § 1536(e), ELR Stat. ESA § 7(e).

³16 U.S.C.A. § 1536(e)(3), ELR Stat. ESA § 7(e)(3).

tions, and procedures and issue orders as it deems necessary.⁴

A federal agency, state governor, or applicant may apply to the Committee for an exemption from the ESA if the biological opinion following a formal consultation indicates that the proposed agency action would violate the ESA.⁵ The application for exemption must be submitted no more than 90 days after completion of consultation or no more than 90 days after the agency takes final action on the permit or license application.⁶

Upon receiving an application, the Secretary of the Interior conducts a threshold review to ensure that applicants have, in fact, consulted and completed all other required steps prior to seeking an exemption.⁷ If the application is deemed to be sufficient,⁸ the Committee is required to hold a hearing on the application for the exemption and prepare a written report.⁹ The written report must address the availability of reasonable and prudent alternatives, the nature and extent of the benefits of the agency action consistent with conserving the species or its critical habitat, whether the action is in the public interest and of regional or national significance, reasonable mitigation measures that should be considered by the Committee, and whether the agency and exemption applicant refrained from making irreversible or irretrievable commitments of resources.¹⁰

The Committee must grant the exemption if it (1) determines on the record that there are no reasonable and prudent alternatives available, that the benefits of the action outweigh the benefits of alternative courses and are consistent with conserving the species or its critical habitat, and that the action is in the public interest and of regional or national significance, and (2) if it establishes such reasonable mitigation and enhancement measures as are necessary and appropriate to minimize the adverse effects of the action.¹¹ The Committee's decision is subject to judicial review, and "any person" may file a petition for review within 90 days of the decision.¹² The exemption proceeding is a "*formal adjudication*" under the APA,¹³ and therefore, the standard of review is whether the decision is supported by "substantial evidence."¹⁴

b. Exemption Cases

The exemption process is rarely used in practice. Only six applications for exemp-

⁴16 U.S.C.A. § 1536(e)(8), ELR Stat. ESA § 7(e)(8). The implementing regulations governing exemption process and the actions of the Endangered Species Committee are set out in 50 C.F.R. Parts 450 to 453.

⁵16 U.S.C.A. § 1536(g)(1), ELR Stat. ESA § 7(g)(1).

⁶16 U.S.C.A. § 1536(g)(1), ELR Stat. ESA § 7(g)(1).

⁷16 U.S.C.A. § 1536(g)(3), ELR Stat. ESA § 7(g)(3). Before seeking an exemption, the applicant must satisfy three requirements: (1) the applicant must show that it consulted in "good faith" and gave adequate consideration to any reasonable and prudent alternatives to the proposed action; (2) any biological assessment required by § 7(c) was completed; and (3) the applicant has refrained from making any irreversible or irretrievable resource commitments prohibited by § 7(d).

⁸The Committee has adopted specific requirements for the content of an exemption application and must review the application in accordance with these provisions. 50 C.F.R. §§ 451.02, 452.03.

⁹16 U.S.C.A. § 1536(g)(4), ELR Stat. ESA § 7(g)(4). The hearing must be held within 140 days after making the determination that the applicant has satisfied the necessary criteria, unless the secretary and applicant agree otherwise.

¹⁰16 U.S.C.A. § 1536(g)(5), ELR Stat. ESA § 7(g)(5); 50 C.F.R. § 452.04.

¹¹16 U.S.C.A. § 1536(h), ELR Stat. ESA § 7(h); 50 C.F.R. § 453.03.

¹²16 U.S.C.A. § 1536(n), ELR Stat. ESA § 7(n). The petition for review can be filed in (1) the U.S. Court of Appeals for any circuit in which the agency action will occur; or (2) the District of Columbia if the action is taking place outside of any circuit.

¹³See 5 U.S.C.A. §§ 554 to 557 (governing "formal" adjudications).

¹⁴See 5 U.S.C.A. § 706(e).

tions have been filed in the 20-year history of the exemption process, and three of those applications were withdrawn. Two leading exemption cases involved the Grayrocks project and the northern spotted owl.

The Grayrocks Project. The Grayrocks project involved the construction of a dam on the Laramie River in Wyoming. The Laramie River is a tributary to the Platte River in central Nebraska. In 1978, the FWS designated a section of the Platte River as critical habitat for the whooping crane, a species listed as endangered. Concern that the construction of the Grayrocks Dam would adversely affect the whooping crane and its habitat led to a lawsuit aimed at putting a halt to the project. The court found that the federal agencies involved in the project had violated, among other laws, § 7 of the ESA and enjoined the construction.¹⁵ The parties eventually entered into a settlement after negotiating an agreement to modify the construction plans to reduce potential harm to the whooping cranes.

After this agreement was reached, the FWS issued a new biological opinion in which it determined that the modified project would not jeopardize the whooping crane or adversely modify its critical habitat. Meanwhile, an application for exemption was filed under the newly enacted exemption provision in § 7 of the ESA. The Committee voted unanimously in favor of the exemption for Grayrocks but made compliance with the settlement an express condition for the exemption.

The Northern Spotted Owl. In 1991, the northern spotted owl (the owl), a subspecies of the spotted owl that lives in the “old-growth” forests of the Northwest, was listed as endangered. Following the owl’s listing, the BLM adopted a plan for allowing timber sales in the owl’s forest habitat in Oregon. After being sued for failing to consult the FWS prior to development of the plan, the BLM submitted the plan for the first year sales to the FWS for consultation. The FWS concluded that less than half of the proposed sales were likely to jeopardize the owl. Rather than abandoning the problematic sales or pursuing reasonable alternatives, the BLM took the unusual step of applying for an exemption. On the same day the BLM announced its decision to seek an exemption, a district court in Oregon issued a decision in the initial suit filed against the BLM finding that the Bureau’s plan was adopted in violation of the ESA’s consultation requirements. Despite the court’s ruling, the exemption application was pushed through and certified to the Committee.

Following an extensive hearing before an administrative law judge, the Committee granted an exemption for 13 of the 44 proposed timber sales at issue and denied exemptions for the remaining 31 sales. The Committee did attach a condition to the exemptions requiring the BLM to consult with the FWS to develop a conservation plan for the owl. A petition for review of the Committee’s decision was promptly filed in the Ninth Circuit. The court ultimately held that the Committee was subject to the APA and remanded the case for a special evidentiary hearing to determine whether the Committee had violated the APA’s restrictions on ex parte communications.¹⁶ The case was put finally to rest, however, when the new Secretary of the Interior, Bruce Babbitt, withdrew the exemption application.

c. Exceptions From § 7 Exemption Procedures

The ESA does carve out three situations in which the § 7 exemption procedures do not apply. First, the president may exempt declared major disaster areas from ESA compliance related to projects to repair or replace public facilities if he determines that the exemption is necessary to prevent recurrence of the natural di-

¹⁵State of Nebraska v. Rural Electrification, 12 Env’tl. Rep. Cas. 1156 (D. Neb. 1978). The injunction was later stayed pending the outcome of an appeal to the Eighth Circuit.

¹⁶Portland Audubon Soc. v. Endangered Species Committee, 984 F.2d 1534 (9th Cir. 1993).

saster and reduce the potential loss of human life.¹⁷ Second, the Endangered Species Committee shall grant an exemption for any agency action if the Secretary of Defense finds that such an exemption is necessary for national security.¹⁸ Finally, the Committee cannot even consider an exemption application if the Secretary of State determines that the grant of the exemption would violate an international treaty or other international obligations.¹⁹

§ 21:31 Completion of consultation and reinitiation

Once the biological opinion and incidental take permit are issued, the consultation process may be completed. The regulations state that “[f]ollowing the issuance of a biological opinion, the Federal agency shall determine whether and in what manner to proceed with the action in light of its Section 7 obligations and the Service’s biological opinion.”¹ Presumably, the agency will determine to go forward with the project in conformity with the conditions of the biological opinion. If a jeopardy biological opinion is issued, the regulations state that the agency must notify the FWS or the NMFS of its final decision on the action.² If the agency finds the conditions unacceptable, then it can apply for an exemption,³ as discussed above.

Under certain circumstances, however, the consultation can be reopened. The regulations provide that “reinitiation” of § 7 consultation is necessary under limited circumstances, “where discretionary Federal involvement or control over the action has been retained or is authorized by law”⁴ The four circumstances in which reinitiation is necessary are:

- (1) If the amount or extent of taking specified in the incidental take statement is exceeded.
- (2) If new information reveals effects of the action that may affect listed species or critical habitat in a manner or to an extent not previously considered.
- (3) If the identified action is subsequently modified in a manner that causes an effect to the listed species or critical habitat that was not considered in the biological opinion.
- (4) If a new species is listed or critical habitat designated that may be affected by the identified action.⁵

Thus, there is a re-opener provision that could be triggered when new information is discovered. There does not, however, appear to be an affirmative duty to seek out such new information.

The issue of “retained federal justification” necessary to reinitiate consultation is not always clear. The *Consultation Handbook* states:

Federal action agencies should be informed of the advisability of maintaining a Federal nexus for the project so that consultation can be reinitiated, if necessary. This is usually done by making the terms of the [biological opinion] a condition of the license, permit or

other authorization that is issued for project approval.⁶

As one commenter has noted, “it is becoming increasingly common for agencies to include carefully crafted ‘reopener’ provisions in their authorizations. As a result, the terms and conditions in existing permits or licenses for a given activity become very important in determining the appropriateness and proper scope of any subsequent reopener.”⁷

The issue of retained jurisdiction and duty to reinitiate consultation was considered in *Environmental Protection Information Center v. Simpson Timber Co.*,⁸ in which the plaintiffs sued to force reinitiation of consultation when two new threatened species, the coho salmon and the marbled murrelet, were listed. The FWS took the position that because the original permit only allowed additional conditions relating to the northern spotted owl, the FWS did not retain any discretion to impose new conditions or reinitiate consultation on behalf of the new species. The court agreed, “holding that the degree of continuing federal involvement over logging activities was not sufficient to prompt [§ 17] reinitiation requirements.”⁹

According to one commenter, upon reinitiation “the scope of consultation should be consistent with and tailored to the nature and scope of the federal action that triggered reinitiation.”¹⁰ The scope of both direct and indirect effects of a proposed action is quite broad. The courts have looked to a variety of considerations in defining the effects that must be considered, such as requiring the U.S. Forest Service to reinitiate consultation with respect to its existing land resource management plans for two national forests following the listing of a salmon species (noting an ongoing and long-standing effect even after adoption) and requiring the EPA to reinitiate consultation on regulations permitting use of strychnine for certain above-ground purposes in response to new impact data¹¹ and to assess the impacts of ongoing Forest Service even-aged timber management practices on the red-cockaded woodpecker.¹²

VII. PROHIBITED ACTS AND THE “TAKE” DEFINITION

§ 21:32 Overview

Once a species is listed pursuant to § 4 of the ESA, § 9 identifies the acts that are prohibited and subject to penalties under § 11.¹ The prohibitions of § 9 apply to individuals, businesses, government agencies, and private entities subject to federal jurisdiction. Any violation of § 9 subjects the violator to possible civil penalties, criminal penalties, and/or the issuance of an injunction resulting from an enforce-

ment action or citizen suit.² However, as discussed in the next section, § 10 of the ESA provides a number of exceptions to § 9's prohibitions, the most significant of which authorizes the FWS or the NMFS to issue an "incidental take permit" for takings that are "incidental to, and not the purpose of, the carrying out of an otherwise lawful activity."³

§ 21:33 General scope of § 9 prohibited conduct

Section 9 sets out categories of prohibited activities and draws distinctions between prohibitions for fish and wildlife (as opposed to plants) and between endangered and threatened species.

1. Prohibitions for Fish and Wildlife

Under § 9, there are five main prohibitions with respect to endangered fish and wildlife. Specifically, it is unlawful to:

- (1) Import or export endangered species.¹
- (2) "Take" endangered species within the United States or its territorial sea, or upon the high seas.²
- (3) Possess, sell, carry, deliver, transport, or ship any endangered species unlawfully "taken" in the course of commercial activity.³
- (4) Engage in any activity involving interstate or foreign commerce in endangered species.⁴
- (5) Violate any regulation pertaining to endangered or threatened species.⁵

2. Prohibition for Plants

Section 9 sets out a slightly different list of prohibitions with respect to endangered plants. Specifically, it is unlawful to:

- (1) Import or export such species.
- (2) Remove and reduce to possession such species or maliciously damage or destroy such species in areas under Federal jurisdiction.
- (3) Remove, cut, dig up, damage, or destroy such species in any other area in knowing violation of any state law.
- (4) Deliver, receive, carry, or transport any such species in interstate commerce and in the course of a commercial activity.
- (5) Violate any regulation issued under § 4 of the ESA for any threatened or endangered plant.⁶

[Section 21:33]

¹16 U.S.C.A. § 1538(a)(1)(A), ELR Stat. ESA § 9(a)(1)(A). "Import" is defined as, "to land or, bring into, introduce into, any place subject to the jurisdiction of the United States, regardless of the definition of import for customs laws." See 16 U.S.C.A. § 1532(10), ELR Stat. ESA § 3(10).

²16 U.S.C.A. § 1538(a)(1)(B), (C), ELR Stat. ESA § 9(a)(1)(B), (C).

³16 U.S.C.A. § 1538(a)(1)(D), ELR Stat. ESA § 9(a)(1)(D). "Commercial activity" is defined as "all activities of industry and trade, including, but not limited to, the buying or selling of commodities. . . . Provided, however, That it does not include exhibition of commodities by museums or similar cultural or historical organizations." 16 U.S.C.A. § 1532(2), ELR Stat. ESA § 3(2).

⁴16 U.S.C.A. § 1538(a)(1)(E), (F), ELR Stat. ESA § 9(a)(1)(E), (F).

⁵16 U.S.C.A. § 1538(a)(1)(G), ELR Stat. ESA § 9(a)(1)(G).

⁶16 U.S.C.A. § 1538(a)(2)(A) to (E), ELR Stat. ESA § 9(a)(2)(A) to (E).

It is fairly clear that endangered listed plants may not be imported, exported, or involved in any act of interstate commerce;⁷ however, mere possession of an endangered listed plant is not expressly prohibited by § 9.⁸

3. *Threatened Species and Rules Under § 4(d)*

Although § 9 has tremendous reach in its prohibition of activities, the specific prohibitions on categories of activities only expressly apply to endangered species.⁹ However, both for fish and wildlife and for plants, § 9 prohibits the violation of any regulation issued under § 4 of the ESA for either threatened *or* endangered fish or threatened or endangered plants.¹⁰ Section 4 of the ESA permits the agencies to promulgate regulations that are “necessary and advisable” in order to conserve threatened species.¹¹ Therefore, it is within the discretion of the Secretaries of Commerce and of the Interior to apply § 9 prohibitions to threatened species via formal rulemaking.¹²

The Secretary of Commerce extends § 9 prohibitions on an individualized basis to threatened species.¹³ Thus, § 9 prohibitions generally do not apply to species listed as threatened by the NMFS unless a specific ruling is made with respect to that species.¹⁴

By contrast, the Secretary of the Interior extends § 9 prohibitions to all threatened species unless a specific ruling has been made otherwise.

Furthermore, even though animals listed as threatened are generally covered by § 9 via the Department of the Interior’s blanket regulations, threatened plants are exempted.¹⁵

§ 21:34 The prohibited “take” and “harm” debate

The general take prohibition in § 9 is one of the most significant protections afforded a species under the ESA. Section 9 prohibits the “taking” by any private, state, federal, or foreign entity of any species of fish or wildlife that has been listed as endangered. Furthermore, the take provision in § 9 applies to most threatened species of fish and wildlife under regulations promulgated by the listing agencies.

1. *Key Definitions*

“Take” is broadly defined by the ESA as “to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, collect, or attempt to engage in any such conduct.”¹ Congressional intent with respect to the “take” definition has often been described as being “defined in the broadest possible manner to include every conceivable way in which a person can ‘take’ or ‘attempt to take’ any fish or wildlife.”² The “take” defi-

²S. Rep. No. 93-307 (1973).

nition includes two key terms: “harass” and “harm.” “Harass” is defined as the intentional or negligent act or omission that created the likelihood of injury to wildlife by annoying it to such an extent as to significantly disrupt normal behavioral patterns, which include but are not limited to breeding, feeding, or sheltering.³ “Harm” is defined as an act that actually kills or injures wildlife.⁴ These two definitions, especially the “harm” definition, have been the subject of extensive litigation.

2. *Palila I and II: Habitat Modifications May Result in Prohibited Harm*

Perhaps the most far-reaching early decision on “take” liability was the Ninth Circuit’s ruling in *Palila v. Hawaii Department of Land & Natural Resources*.⁵ The court ruled that the state of Hawaii was harming the endangered Palila bird for purposes of § 9 of the ESA by maintaining feral sheep and goats. The court reasoned that this was because the sheep and goats ate seedlings of the mumane trees, which denied the Palila bird the benefit of trees that would have otherwise grown to maturity.⁶ Thus, the Ninth Circuit was the first court to determine that mere habitat modification alone could become a prohibited “take.”⁷

Because of the Palila decision, the FWS clarified its definition of “harm,” stating that “habitat modification alone without any death or injury of the protected wildlife” was not a § 9 violation.⁸ However, the original plaintiffs in the Palila decision brought suit again, this time claiming that another species of sheep was harming the bird because it too was grazing on the mumane tree.⁹ Even with the benefit of the new “harm” definition, the Ninth Circuit ruled that Hawaii was still violating § 9.¹⁰ This determination was based on the court’s view that permanent degradation that causes actual injury remained prohibited under § 9 despite the FWS’ revised regulatory definition.¹¹ Other courts followed the Ninth Circuit’s lead in the Palila decisions.¹² However, when one circuit did not,¹³ the Supreme Court intervened in an attempt to resolve the issue.

3. *Sweet Home Chapter Litigation*

In *Sweet Home Chapter of Communities for a Great Oregon v. Babbitt*,¹⁴ a coalition representing the timber industry brought a facial challenge to the validity of the FWS’ harm regulation, to the extent it prohibited habitat modifications as a taking under § 9. The plaintiffs represented interests in property inhabited by the

³See 50 C.F.R. § 17.3.

⁴Significant habitat modification or degradation can be “harm” under this definition when it significantly impairs essential behavioral patterns including breeding, feeding, or sheltering. See 50 C.F.R. § 17.3. NMFS’ definition mirrors this definition. See 50 C.F.R. § 222.102.

threatened northern spotted owl and the endangered red-cockaded woodpecker. The timber industry sued, contending that the harm regulation interfered with its livelihood because modification of the owl's or woodpecker's habitat by logging activities would expose the industry to potential "take" liability.

After the U.S. Court of Appeals for the District of Columbia, by a 2-1 vote, held that the regulation defining "harm" and "take" to include habitat modification was invalid, the Supreme Court granted the federal government's petition for certiorari¹⁵ to decide whether the FWS' regulation defining harm to include "significant habitat modification . . . that actually kills or injures wildlife" was facially invalid, i.e., whether the regulation was invalid in every circumstance involving modification of wildlife habitat.¹⁶ In reversing the D.C. Circuit, the Court held that the FWS' regulation defining "harm" was a reasonable interpretation of an ambiguous provision of the ESA¹⁷ under *Chevron, U.S.A., Inc. v. Natural Resources Defense Council*.¹⁸ The Court agreed with the FWS that a developer could "take" a species by modifying habitat and concluded that the FWS' interpretation of harm to include habitat modification was reasonable for five reasons. It ruled that the ordinary dictionary definition of the word "harm" supported the FWS' construction.¹⁹ Justice John Paul Stevens found that "harm" meant "to injure,"²⁰ and stated that this definition "naturally encompasses habitat modification that results in injury or death to members of an endangered or threatened species."²¹ The majority reasoned that the dictionary definition of harm does not limit the word to direct application of force against protected species because "the dictionary definition does not include the word 'directly' or suggest in any way that only direct or willful action that leads to injury constitutes 'harm.'" ²² Justice Stevens added:

Moreover, unless the statutory term "harm" encompasses indirect as well as direct injuries, the word has no meaning that does not duplicate the meaning of other words that § 3 uses to define "take." A reluctance to treat statutory terms as surplusage sup-

¹⁵*Sweet Home Chapter of Communities for a Great Oregon v. Babbitt*, 17 F.3d 1463 (D.C. Cir. 1994), judgment rev'd, 515 U.S. 687, 115 S. Ct. 2407, 132 L. Ed. 2d 597 (1995).

¹⁶*Babbitt v. Sweet Home Chapter of Communities for a Great Oregon*, 515 U.S. 687, 115 S. Ct. 2407, 132 L. Ed. 2d 597 (1995). The Court did not, however, address the issue of whether the FWS' definition was facially void for vagueness. The court of appeals rejected this facial challenge to the FWS' definition of harm. *Sweet Home Chapter of Communities for a Great Oregon v. Babbitt*, 1 F.3d 1, 3-5 (D.C. Cir. 1993), opinion modified on reh'g, 17 F.3d 1463 (D.C. Cir. 1994), judgment rev'd, 515 U.S. 687, 115 S. Ct. 2407, 132 L. Ed. 2d 597 (1995).

¹⁷*Babbitt v. Sweet Home Chapter of Communities for a Great Oregon*, 515 U.S. 687, 115 S. Ct. 2407, 2416, 132 L. Ed. 2d 597 (1995). Justice John Paul Stevens delivered the opinion for a majority of six Justices with three Justices (Antonin Scalia, William Rehnquist, and Clarence Thomas) dissenting. The majority rejected the respondent's argument that "the rule of lenity should foreclose any deference to the secretary's interpretation of the ESA because the statute includes criminal penalties." *Babbitt v. Sweet Home Chapter of Communities for a Great Oregon*, 515 U.S. 687, 115 S. Ct. 2407, 2416 n.18, 132 L. Ed. 2d 597 (1995).

ports the reasonableness of the Secretary's interpretation.²³

The Court further held that the "harm" regulation naturally fits within the ESA's broad purposes to protect habitat and ecosystems of endangered and threatened species.²⁴ Thus, having been persuaded that the 1982 enactment of the ESA's incidental taking provision²⁵ reflected Congress' understanding that § 9 prohibits "indirect as well as deliberate takings" and "that activities not intended to harm an endangered species, such as habitat modification," could rise to the level of a "take,"²⁶ Justice Stevens found support for the FWS' interpretation of harm in three specific sections of the ESA: the definition of "take";²⁷ § 5²⁸ (which expressly authorizes the federal government to acquire land to protect wildlife habitat); and § 7²⁹ (which regulates activities of federal agencies).³⁰ In addition, Justice Stevens found sufficient evidence in the ESA's legislative history to support the FWS' interpretation.³¹

Justice Stevens rejected the respondent's argument that Congress intended § 5 of the ESA to be the exclusive means to prevent harmful habitat modification on private lands. Section 5 can provide "for protection of habitat before the seller's activity has harmed any endangered animal, whereas the Government cannot enforce the § 9 prohibition until an animal has actually been killed or injured."³² He added that "the Secretary [of the Interior] may also find the § 5 authority useful for preventing modification of land that [has] not yet, but may in the future, become habitat for an endangered or threatened species."³³

Justice Stevens' opinion also addressed the interface between § 7 and § 9 of the

²³Babbitt v. Sweet Home Chapter of Communities for a Great Oregon, 515 U.S. 687, 115 S. Ct. 2407, 2413, 132 L. Ed. 2d 597 (1995) (citation omitted).

²⁵16 U.S.C.A. § 1539(a)(1)(B), ELR Stat. ESA § 10(a)(1)(B).

²⁶Babbitt v. Sweet Home Chapter of Communities for a Great Oregon, 515 U.S. 687, 115 S. Ct. 2407, 2414, 132 L. Ed. 2d 597 (1995).

²⁷16 U.S.C.A. § 1532(19), ELR Stat. ESA § 3(19).

²⁸16 U.S.C.A. § 1534, ELR Stat. ESA § 5.

²⁹16 U.S.C.A. § 1536, ELR Stat. ESA § 7. The pertinent substantive provision of § 7 is found in § 7(a)(2), 16 U.S.C.A. § 1536(a)(2), ELR Stat. ESA § 7(a)(2), which provides in pertinent part:

Each federal agency shall . . . insure that any action authorized, funded, or carried out by such agency . . . is not likely to jeopardize the continued existence of any endangered species or threatened species or result in the destruction or adverse modification of habitat of such species which is determined by the Secretary . . . to be critical.

"Critical habitat" is defined as habitat that is "essential to the conservation of the species," 16 U.S.C.A. § 1532(5)(A)(i), (ii), ELR Stat. ESA § 3(5)(A)(i), (ii), with conservation defined as "to use and the use of all methods and procedures which are necessary to bring any endangered species or threatened species to the point at which the measures provided pursuant to this chapter are no longer necessary." 16 U.S.C.A. § 1532(3), ELR Stat. ESA § 3(3).

³⁰Babbitt v. Sweet Home Chapter of Communities for a Great Oregon, 515 U.S. 687, 115 S. Ct. 2407, 2414–16, 132 L. Ed. 2d 597 (1995).

³¹Babbitt v. Sweet Home Chapter of Communities for a Great Oregon, 515 U.S. 687, 115 S. Ct. 2407, 2416–18, 132 L. Ed. 2d 597 (1995). Justice Stevens held that the ESA's legislative history "make[s] clear that Congress intended 'take' to apply broadly to cover indirect as well as purposeful actions," and "support the Secretary's interpretation that the term 'take' in section 9 reached far more than the deliberate actions of hunters and trappers." Babbitt v. Sweet Home Chapter of Communities for a Great Oregon, 515 U.S. 687, 115 S. Ct. 2407, 2416, 132 L. Ed. 2d 597 (1995).

³²Babbitt v. Sweet Home Chapter of Communities for a Great Oregon, 515 U.S. 687, 115 S. Ct. 2407, 2416–18, 132 L. Ed. 2d 597 (1995).

³³Babbitt v. Sweet Home Chapter of Communities for a Great Oregon, 515 U.S. 687, 115 S. Ct. 2407, 2416–18, 132 L. Ed. 2d 597 (1995). Justice Stevens also concluded that statements by Representative Sullivan, the House floor manager, about the endangered species bills enacted as the ESA do not "even [suggest] that [§] 5 would be the Act's exclusive remedy for habitat modification by private land-

ESA:

The § 7 directive applies only to the Federal Government, whereas the § 9 prohibition applies to “any person.” Section 7 imposes a broad, affirmative duty to avoid adverse habitat modifications that § 9 does not replicate, and § 7 does not limit its admonition to habitat modification that “actually kills or injures wildlife.” Conversely, § 7 contains limitations that § 9 does not, applying only to actions “likely to jeopardize the continued existence of any endangered or threatened species,” . . . and to modifications of habitat that has been designated “critical” pursuant to § 4 Any overlap that § 5 or § 7 may have with § 9 in particular cases is unexceptional . . . and simply reflects the broad purpose of the Act set out in § 2.³⁴

Significantly, Justice Stevens recognized that not all land use activities affecting habitat would be a take. He recognized that activities causing “minimal or unforeseeable harm” will not rise to the level of a statutory take, even though the harm regulation may prohibit them.

Justice Stevens concluded the Court’s opinion by stressing the principle of “deference” to the FWS’ expertise, noting that

[w]hen it enacted the ESA, Congress delegated broad administrative and interpretive power to the Secretary The proper interpretation of a term such as “harm” involves a complex policy choice. When Congress has entrusted the Secretary with broad discretion, we are especially reluctant to substitute our views of wise policy for his In *this* case, that reluctance accords with our conclusion, based on the text, structure, and legislative history of the ESA, that the Secretary reasonably construed the intent of Congress when he defined “harm” to include “significant habitat modification or degradation that actually kills or injures wildlife.”³⁵

In a significant concurrence, Justice Sandra Day O’Connor provided two limiting principles on causation for take liability. First, “the challenged regulation is limited to significant habitat modification that causes actual, as opposed to hypothetical or speculative, death or injury to identifiable protected animals.”³⁶ Second, “even setting aside difficult questions of scienter, the regulation’s application is limited by ordinary principles of proximate causation, which introduces notions of foreseeability.”³⁷

In a strongly worded dissent, Justice Antonin Scalia argued that the definition of

owners or that habitat modification by private landowners stood outside the ambit of [§] 9. Respondent’s suggestion that these statements identified [§] 5 as the ESA’s only response to habitat modification contradicts their emphasis elsewhere on the habitat protections in [§] 7.” *Babbitt v. Sweet Home Chapter of Communities for a Great Oregon*, 515 U.S. 687, 115 S. Ct. 2407, 2417 n.19, 132 L. Ed. 2d 597 (1995).

³⁴*Babbitt v. Sweet Home Chapter of Communities for a Great Oregon*, 515 U.S. 687, 115 S. Ct. 2407, 2415–16, 132 L. Ed. 2d 597 (1995) (footnote omitted).

³⁵*Babbitt v. Sweet Home Chapter of Communities for a Great Oregon*, 515 U.S. 687, 115 S. Ct. 2407, 2418, 132 L. Ed. 2d 597 (1995). Justice Stevens also stated, in the final paragraph of his opinion, that

[i]n the elaboration and enforcement of the ESA, the Secretary and all persons who must comply with the law will confront difficult questions of proximity and degree; for, as all recognize, the Act encompasses a vast range of economic and social enterprises and endeavors. These questions must be addressed in the usual course of the law, through case-by-case resolution and adjudication.

Id. See *Loggerhead Turtle v. County Council of Volusia County, Fla.*, 896 F. Supp. 1170, 1179 (M.D. Fla. 1995) (holding that the Court’s reference in this passage to “economic and social enterprises” did not authorize a court to balance and consider economic and social interests and consequences in deciding a motion for a preliminary injunction in a suit alleging a prohibited taking in violation of § 9 of the Act).

³⁶*Babbitt v. Sweet Home Chapter of Communities for a Great Oregon*, 515 U.S. 687, 115 S. Ct. 2407, 2418, 132 L. Ed. 2d 597 (1995) (O’Connor, J., concurring).

³⁷*Babbitt v. Sweet Home Chapter of Communities for a Great Oregon*, 515 U.S. 687, 115 S. Ct. 2407, 2418, 132 L. Ed. 2d 597 (1995). Justice O’Connor believed that these two understandings (or “limitations”) call into question *Palila*. Despite these concerns, she concurred with the majority

“take” under § 9 of the ESA should encompass only “affirmative conduct intentionally, directed against a particular animal or animals.” He argued that the FWS’ definition of harm violated the ESA and was invalid under the Chevron doctrine because of three features: (1) it prohibits habitat modification that is merely the cause-in-fact of death or injury to wildlife, without regard to intent or foreseeability, “no matter how long the chain of causality between modification and injury”;³⁸ (2) it applies to omissions as well as to acts;³⁹ and (3) “it encompasses injury inflicted, not only upon individual animals, but upon populations of the protected species.”⁴⁰ Justice Scalia contended that “take” under the ESA “describes a class of acts (not omissions) done directly and intentionally (not indirectly and by accident) to particular animals (not populations of animals).”⁴¹ He also asserted that, under the FWS’ definition, § 9 would be duplicative of the § 7 critical habitat provision.⁴²

Justice Scalia also argued that the FWS’ definition of harm provided a definition of “take” under § 9 that is inconsistent with the meaning of “take” used in other sections of the ESA.⁴³ He asserted that § 9’s taking prohibition should not apply to habitat modification because such an interpretation makes § 9 duplicative of § 7’s critical habitat provision.⁴⁴

Congress’ explicit prohibition of habitat modification in . . . [§ 7] would bar the inference of an implicit prohibition of habitat modification in . . . section [9] [I]t would be passing strange for Congress carefully to define “critical habitat” as used in § 1536(a)(2), but leave it to the Secretary to evaluate, willy-nilly, impermissible “habitat modification” (under the guise of “harm”) in § 1538(a)(1)(B).⁴⁵

Sweet Home is indeed a very important ESA decision. However, the Court’s emphasis on foreseeability suggests that courts must conduct fact-specific analysis of whether habitat modification would actually violate the take standard.

§ 21:35 Takings and consideration of future harm

Almost anything that negatively impacts a species, and certainly any action or omission that results in the injury or death of even one individual listed species, is a take. This definition is simple to apply when the animal is taken with a gun or a

“because there is no need to strike a regulation on a facial challenge out of concern that it is susceptible of erroneous application . . . and because there are many habitat-related circumstances in which the regulation might validly apply.”

³⁸Babbitt v. Sweet Home Chapter of Communities for a Great Oregon, 515 U.S. 687, 115 S. Ct. 2407, 2421, 132 L. Ed. 2d 597 (1995).

⁴⁵Babbitt v. Sweet Home Chapter of Communities for a Great Oregon, 515 U.S. 687, 115 S. Ct. 2407, 2425–26, 132 L. Ed. 2d 597 (1995).

snare, but in the post-Sweet Home era, the question becomes muddier when courts consider the significant impacts that humans have on natural habitats.

While the regulatory definition of “harm” includes the phrase “actually kill or injure,” future harm to a listed species is often determined to be a sufficient “actual injury” for purposes of § 9. Considering the enormous gravity Congress ascribed to species extinction, this is hardly surprising.¹ The Sweet Home decision seemed to preclude this interpretation, stating that every term in the regulation’s definition of “harm” is subservient to the phrase “an act which actually kills or injures wildlife.”² However, this aspect of the Court’s ruling does not appear to reflect the current state of the law.

In *Marbled Murrelet v. Babbitt*,³ the Ninth Circuit stated that the facial challenge in Sweet Home did not require that court to rule on the question of future harm.⁴ The *Murrelet* court pointed out that since the Sweet Home majority had held that because habitat modification that arrests breeding and sheltering amounts to “harm” under the upheld regulation, regulation of these activities anticipates the harmful future effects of a failure to breed or find shelter. Accordingly, future harm was clearly included in the regulatory definition of “harm.”⁵ However, the court in *Hawksbill Sea Turtle v. Federal Emergency Management Agency*⁶ seems to have staked out a compromise position building largely on the holding in *Marbled Murrelet*. That court held that future harm may form the basis for an ESA suit, but it must be demonstrated that this harm is not speculative but proven to a reasonable certainty.⁷ This “imminent harm” test is related to the proof required to demonstrate causation.⁸

§ 21:36 Causation litigation under the ESA

Significantly, the Sweet Home decision incorporated the traditional notion of proximate causation into the analysis of “harm” under § 9. Faced with the ESA’s broad mandate to protect listed species, the Court rejected the narrow construction of the plaintiffs. Indirect actions without specific intent, such as habitat modification, could cause harm punishable under the ESA. However, what are the limits of this indirect connection? How tenuous is too tenuous?

[Section 21:35]

⁷*Hawksbill Sea Turtle v. Federal Emergency Management Agency*, 11 F. Supp. 2d 529, 552 (D.V.I. 1998) (“Although federal regulations define ‘harm’ as ‘an act which actually kills or injures wildlife,’ injunctive relief may issue under Section 9 where a plaintiff makes a claim of future harm . . . proving] a ‘reasonably certain threat of imminent harm to a protected species.’ ”).

⁸*Defenders of Wildlife v. Bernal*, 204 F.3d 920, 46 Fed. R. Serv. 3d 120 (9th Cir. 2000) (recognizing that imminent harm test allowed injunction of future harm, but ruling that environmental group had failed to show convincingly that construction of school complex would certainly cause harm to endangered pygmy owl).

Far-reaching as the Sweet Home ruling was, it created as many critical legal questions as it answered. Justice Stevens' ruling clearly allowed for the possibility that some harm proceeding from habitat modification will be "minimal and unforeseeable" and not in violation of the ESA. The line drawn between punishable and nonpunishable take has become a daunting proof problem, as courts struggle through the "difficult questions of proximity and degree" presented by such a case-by-case approach.¹

Federal courts have often found sufficient proof for this causation standard by performing the type of case-by-case analysis prescribed by Sweet Home. For example, in *Strahan v. Coxe*,² the First Circuit held that Massachusetts had committed a § 9 violation by allowing commercial fishing in right whale habitat. The court employed a "but for" test to find the state liable—but for the issuance of the permits, the taking would never have occurred.³ In arriving at this conclusion, the court evaluated the unrebutted scientific testimony that over one-half of all right whales examined bore scars from the fishing equipment. Further, 11 cases of actual entanglement were documented and introduced. Confronted with this record, the court held that while causation was "indirect," it was amply supported by the facts.⁴

Though it was decided three months prior to Sweet Home, the Ninth Circuit case of *Forest Conservation Council v. Rosboro Lumber Company*⁵ is consistent with the Supreme Court's reasoning and has been cited by subsequent, post-Sweet Home decisions.⁶ In *Rosboro*, the court held that proposed clearcutting was reasonably certain to significantly impair "essential behavioral patterns" of the spotted owl.⁷ The court examined actual evidence of behavior among the owls in the area and concluded that although the injury alleged was still in the future, the evidence was sufficient to make this "actual" injury a near certainty.⁸

An expert's testimony regarding dead piping plover chicks found in treadmarks left by off-road vehicles was enough for the court in *United States v. Town of Plymouth*.⁹ The court granted the government's request to enjoin the town government from permitting off-road vehicles to drive on a beach without conservation measures. This decision is also notable because the court disregarded evidence that the population of plovers in the area was actually increasing.¹⁰ Clearly, danger to the entire population was not a requirement, or even a factor, for the court in *Town of Plymouth*.

In *Loggerhead Turtle v. County Council of Volusia County, Fla.*,¹¹ a county's authorization of vehicular beach traffic during turtle mating season constituted a tak-

¹¹*Loggerhead Turtle v. County Council of Volusia County, Fla.*, 896 F. Supp. 1170 (M.D. Fla. 1995). This suit was renewed and eventually dismissed after the defendant county obtained an incidental take permit from the FWS. Though the second action resulted in dismissal of all of plaintiff's claims, the dismissal was based entirely upon mootness and standing grounds, and does not affect the district

ing based on documents from the FWS that stated that the permitted vehicle traffic was causing an “unlawful taking” of the sea turtles.¹² This specific evidence, along with other expert testimony, was enough to meet the evidentiary burden.

The court also looked at the liability of Volusia County’s indirect actions. This stemmed from the claim that the county had extended exemptions to several smaller municipalities within its borders allowing illumination at the beach after dark, in contravention of a countywide prohibition.¹³ The court acknowledged that scientific data strongly suggested that the lights could cause newly hatched turtles to become disoriented and spend more time exposed to starvation, exhaustion, and predation on the open beach. However, the plaintiffs failed to present evidence tying their scientific proof to the actual exempted lights.¹⁴ Therefore the government’s request for an injunction on the beach lighting was denied.

Compelling science, without more direct evidence of causation, will not always be sufficient in the post-Sweet Home era. In *Defenders of Wildlife v. Bernal*,¹⁵ the Ninth Circuit upheld a district court’s refusal to permanently enjoin construction of a school complex. The complex was located in an area known to be habitat of an endangered subspecies of pygmy owl. The district court performed extensive fact-finding and subjected the testimony of the plaintiff’s expert to rigorous analysis, before concluding that despite some “solid factual premises and well-founded expert opinion” the plaintiff’s theory was only “speculation” and not sufficient to support the injunction. Indeed, the court noted that “plaintiffs had the burden of proving by a preponderance of the evidence that the proposed construction would harm a pygmy owl by killing or injuring it.”¹⁶

The court, in *Greenpeace Foundation v. Mineta*,¹⁷ considered two fishing operations that were alleged to be causing take of the critically endangered Hawaiian monk seal, a species unique to Hawaii. The plaintiffs alleged that the seal’s numbers were dwindling due to low birth rate, shrinking food supply, and attrition caused by fishing operations and the fishermen themselves.¹⁸

The first operation, a lobster fishery, utilized traps, but did not physically harm the seals. Significant amounts of data were adduced by the plaintiffs to prove that operation of the lobster fishery significantly reduced availability in the area of lobster, a staple of the monk seal’s diet.¹⁹ The court found that while the habitat was being modified, the plaintiff had not shown sufficient proof that the lobster was “absolutely critical”²⁰ to the seal’s diet, i.e., that availability of lobster was the difference between life and death for the seal. Some of the study findings introduced by the plaintiff were preliminary and hedged with disclaimers. The court evinced some skepticism and concluded that while there were clear indications that lobster was

court’s initial ruling on sufficiency of evidence of causation. *See* *Loggerhead Turtle v. County Council of Volusia County, Fla.*, 148 F.3d 1231, 41 Fed. R. Serv. 3d 563 (11th Cir. 1998).

an important factor in the monk seal's diet, this was not enough.²¹ Citing *Palila II*, the court in *Mineta* articulated an “imminent harm” test, allowing that habitat change could support a § 9 allegation only if the action modified “a feature of the species’ habitat that was decidedly critical” to the continued future existence of the species.²² The court found the data insufficient and dismissed the claim against the lobster fishery but implied that a more definite showing would have produced a different result.²³

The second activity at issue in *Mineta* was the so-called bottomfish operation, involving the trailing of long lines of hooks along the sea floor. The court found that this practice had resulted in several accidental seal deaths, as seals became tangled up with these lines as they tried to pilfer catch from the hooks. Additionally, it was found that some seals had been killed by the fishermen to prevent them from stealing catch from the lines.²⁴ The court did not hesitate to find that both the accidental and intentional killings were takes under the ESA.²⁵ The death of the animal ended the inquiry.

§ 21:37 Vicarious state and local government “take” liability

Potential governmental action as a basis for imposing “vicarious” take liability under the Sweet Home doctrine has become an increasingly important area of ESA law. As stated by one commentator, “almost no private action takes place in the complete absence of some connection to government regulation or licensing. Driving, boating, water use, power consumption, appear reduction, homebuilding, eating, farming—you name it, the government has its hands in it somehow.”¹ Thus, environmental advocates see such governmental approvals as “simply irresistible” targets providing great “leverage.”² As another commentator stated:

As a practical matter, enforcing the taking prohibition of the ESA against these myriad actors is exceedingly difficult. However, if the activities of these actors are subject to regulation by some intermediary, such as a city or county government, it may be much more practical to influence what the various individual actors do by influencing how the intervening regulatory body wields its influence. Indeed, if a regulatory body could itself be deemed liable for the taking of endangered species by those whose activities it regulates, the practical alternative to enforcing the ESA’s prohibitions against thousands of individual actors would be to enforce those prohibitions against the regulatory body.³

Under the plain language of the ESA, state and local governments may be held liable. “Person” is defined in the ESA to include “any state, municipality, or political

²¹Greenpeace Foundation v. Mineta, 122 F. Supp. 2d 1123, 1134 (D. Haw. 2000).

subdivision of the state.”⁴ Therefore, these governments may be liable under the “take” prohibition in § 9(a)(1).⁵ Section 9(g) of the ESA seems to suggest that liability may be imposed for “indirect” acts that lead to a “take.”⁶

The issue of vicarious governmental liability under the ESA has been considered in a number of cases. The first two cases dealt with federal agency liability and predated *Sweet Home*. In *Defenders of Wildlife v. Administrator*,⁷ the Eighth Circuit held that the EPA’s decision to register a pesticide under the Federal Insecticide, Fungicide, and Rodenticide Act made EPA liable for the illegal “take” of the black-footed ferret. The court reasoned that even though the direct cause of the “take” was the use of bait laced with strychnine for eradication of rodents, the EPA could be held liable because the EPA’s registration of strychnine was necessary before the bait could be distributed for sale. In another decision, *Sierra Club v. Yeutter*,⁸ the Fifth Circuit found that the Forest Service’s approval of a timber management plan made that agency liable “when the private timber harvesting carried [out] pursuant to the plan impaired habitat of the cockaded woodpecker.”⁹

Several post-Sweet Home decisions have extended ESA liability to actions of state and local governments. The first decision, *Strahan v. Coxe*,¹⁰ not only dealt with the issue of causation under Sweet Home but also directly addressed state liability for governmental actions. In holding that the state’s licensing of commercial fishing through the use of gillnets exacted a “taking” of protected whales, the court reasoned that § 9(g) of the ESA “not only prohibits the acts of those parties that directly exact the taking, but it also bans those acts of a third party that bring about the acts exacting the taking.”¹¹ The second post-Sweet Home case to address local government liability was *United States v. Town of Plymouth*.¹² There, the court focused on the affirmative conduct of the town in issuing off-road vehicle (ORV) driving permits for beach driving in an area known to be populated by endangered piping plovers. The court held that the town’s “current management practices with respect to ORV access to Plymouth Long Beach have actually harmed piping plovers and will continue to cause harm if they remain unchecked.”¹³

The Eleventh Circuit addressed this theory of indirect liability in *Loggerhead Turtle v. County Council of Volusia County, Florida*.¹⁴ The court upheld the standing of the listed turtles to sue the county based on alleged “harmfully inadequate regulation” of beach lighting.¹⁵ The county subsequently adopted an ordinance setting out more stringent restrictions on beach lighting, and the turtles again sued, alleging that the ordinance was inadequate by creating a form of “implied permission” to take turtles. However, while the court found beachfront lighting indisput-

ably caused the “take” of turtles, the county was not liable because the county’s regulatory program “acts to prohibit, restrict and limit artificial beachfront lighting, not to authorize, entitle or legitimize it.”¹⁶ The court reasoned that the county did “not permit an act otherwise unlawful or license an act in expressly a manner likely to result in an ESA violation.”¹⁷

The issue of state and local vicarious “take” liability on the indirect effects of governmental approvals will undoubtedly continue to gain prominence as more courts grapple with this issue. Indeed, if courts continue to expand this theory of ESA liability, state and local governments could become special “targets” of environmental plaintiffs seeking to halt or delay various activities under these approvals.¹⁸

§ 21:38 Interface between § 7 incidental take statements and § 9 “take” liability

The issue of whether the same standard for § 9 “take” liability should also apply to § 7 incidental take statements has been controversial. A significant opinion by the Ninth Circuit analyzed that issue in depth in *Arizona Cattle Growers’ Association (ACGA) v. U.S. Fish and Wildlife Service*.¹ The court held that the FWS acted arbitrarily and capriciously by issuing incidental take statements under the ESA that impose terms and conditions on land use permits, where there either was no evidence that the endangered species existed on the land or no evidence that a “take” (defined as “habitat modification resulting in the actual death or injury to a listed species”) would occur if the permit were issued. The court held that the FWS would have to demonstrate that a “take” of protected species was “reasonably certain to occur.”² This holding could curtail the ability of the FWS to condition or to restrict land use in situations where endangered species or their habitats are not clearly present. Under this ruling, for activities covered by the Ninth Circuit (Arizona, California, Guam, Hawaii, Idaho, Montana, Nevada, Oregon, and Washington), the FWS will have to provide specific evidence that the activity would lead to a “take” of the species in situations where it issues an incidental take statement as part of a § 7 ESA consultation.

The litigation stemmed from a challenge by the cattlemen to the incidental take statements set forth in the biological opinions issued by the FWS in consultation with the Bureau of Land Management and the U.S. Forest Service in response to ACGA’s application for cattle grazing permits in southeastern Arizona. In its biological opinion on the permits, the FWS concluded that ongoing grazing activities on 21

¹⁶*Loggerhead Turtle v. County Council of Volusia County, Florida*, 92 F. Supp. 2d 1296, 1306 (M.D. Fla. 2000).

¹⁷*Loggerhead Turtle v. County Council of Volusia County, Florida*, 92 F. Supp. 2d 1296, 1306 (M.D. Fla. 2000).

¹⁸*See Animal Protection Institute, Center for Biological Diversity v. Holsten*, 541 F. Supp. 2d 1073 (D. Minn. 2008). Conduct of trappers which led to the incidental takings of Canada Lynx was not an independent, intervening cause that broke the chain of causation between the Minnesota Department of Natural Resources (DNR) and the incidental takings and, thus, did not preclude liability of DNR in action alleging that DNR violated the Endangered Species Act (ESA) by authorizing and allowing trapping and snaring activities that took Canada Lynx, a threatened species under the ESA; DNR’s licensure and regulation of trapping activities stimulated the conduct of trappers that resulted in the incidental takings.

[Section 21:38]

¹*Arizona Cattle Growers’ Ass’n v. U.S. Fish and Wildlife, Bureau of Land Management*, 273 F.3d 1229 (9th Cir. 2001).

²*Arizona Cattle Growers’ Ass’n v. U.S. Fish and Wildlife, Bureau of Land Management*, 273 F.3d 1229, 1232 (9th Cir. 2001).

of the 22 allotments at issue would not jeopardize the continued existence of any protected species or result in the destruction or adverse modification of any critical habitat. The FWS determined, however, that ongoing grazing activities would incidentally take members of one or more protected species in each of the 22 allotments, and it issued incidental take statements for each of those allotments.³

The statements included specific conditions that would immunize the ranchers from ESA § 9 take liability and penalties for harm to endangered species committed during activities that are otherwise lawful. The court noted that although the action agency and permittee are “technically free to disregard the biological opinion and proceed with its proposed action . . . ‘it does so at its own peril.’ . . . Consequently, if the terms and conditions of the [statements] are disregarded and a taking does occur, the action agency or the applicant may be subject to potentially severe civil and criminal penalties under Section 9.”⁴ Hence, given the potential liability of not complying with the conditions in the incidental take statements, the conditions “exert a powerful coercive effect” that cannot be ignored. As a practical matter, parties that hope to receive approval for federal permits must agree to comply with the terms and conditions of the statements.

The court addressed the standards for determining when the FWS must issue an incidental take statement. Fundamentally, “an [incidental take statement] must be predicated on a finding of an incidental take.”⁵ The court concluded that the FWS “acted in an arbitrary and capricious manner by imposing terms and conditions on land use permits, where there either was no evidence that the endangered species existed on the land or no evidence that a take would occur if the permit were issued.”⁶ In making its finding that there was “no rational basis” to conclude that a take will occur, the court rejected the FWS’ position that the definition of “take” under § 7 of the ESA should be interpreted broadly to require issuance of an incidental take statement when harm to a listed species is “possible” or “likely.”⁷ The court rejected the notion that §§ 7 and 9 ought to be interpreted differently, holding that there must be a reasonable basis for concluding that a taking will occur as a result of the activity in question. Significantly, the court then noted that “there is no evidence that Congress intended to allow the [FWS] to regulate any parcel of land that is merely capable of supporting a protected species.”⁸

Central to this finding was that the FWS failed to present evidence that an indirect taking would occur absent the existence of the species on the property. The practical effect is that the FWS has to present more than speculative evidence that habitat modification would impact a listed species. As the court stated:

The agency has a very low bar to meet, but it must at least attain it. It would be improper to force [the ranchers] to prove that the species does not exist on the permitted area, as the [FWS] urges, both because it would require [the ranchers] to meet the burden statutorily imposed on the agency, and because it would be requiring it to prove

a negative.⁹

Hence, the FWS must “establish a link between the activity and the taking of species before setting forth specific conditions.”¹⁰

VIII. INCIDENTAL TAKE PERMITS AND HABITAT CONSERVATION PLANS

§ 21:39 Overview

In 1982, Congress amended the ESA to provide a mechanism by which landowners could potentially take a listed species “if such taking is incidental to, and not the purpose of, the carrying out of an otherwise lawful activity.”¹ To apply for relief under this provision and obtain an Incidental Take Permit (ITP), however, landowners must overcome various regulatory hurdles, including preparing a Habitat Conservation Plan (HCP), which details the permitted development and the required mitigation measures.² Although the ITP process has proven to be demanding and resource-intensive, there have been success stories, and the ITP remains the primary tool available to landowners to engage in activities on their property, otherwise prohibited by the ESA. In fact, new and creative applications of ESA § 10 procedures, such as the “no surprises” and “safe harbor” rules have made § 10 permits a more attractive mechanism to balance and potentially resolve the conflicts between private activities of landowners and the protection of endangered and threatened species.

§ 21:40 Incidental take permits

Section 10 of the ESA provides exceptions to the § 9 take prohibition in the form of an ITP that is issued after the approval of the mitigation and minimization measures set forth in the HCP. Congress enacted this provision in 1982 in direct response to a proposed HCP being prepared and negotiated by the FWS and developers of San Bruno Mountain.

In 1975, private developers of San Bruno Mountain, a mountain located south of San Francisco, proposed to develop the San Bruno Mountain area with 2 million square feet of office and commercial space and more than 7,000 residential units.¹ During the local review process, opposition arose from a land use perspective, and the San Mateo County Board of Supervisors approved a reduced development scheme.² As a result of a subsequent lawsuit and settlement, the developer further reduced the development and agreed that two-thirds of the mountain would be preserved for open space and parks, while the remaining one-third could be developed.³

After this settlement, the FWS discovered that the mission blue butterfly, an endangered species, inhabited San Bruno Mountain. In 1980, a steering committee

was formed to perform a biological study of the mission blue butterfly to determine its population size and distribution. After two years of study, the committee determined that the butterfly primarily inhabited grassland on the mountain, where development was proposed. The committee also concluded that if development did not occur, the grassland habitat would be inevitably lost to encroaching brush, thereby seriously threatening the butterfly's continued existence. Subsequent to this study, a HCP was prepared, which proposed reduced development, conveyance of significant acreage to local agencies as permanent open space, annual financial contributions by the developer to finance a permanent habitat conservation program, preservation of 86% of the present habitat of the mountain's mission blue butterfly, and protection of other endangered and vulnerable species.⁴ Although it was determined that the overall development, with the corresponding preservation, would enhance the survival of multiple species, including the mission blue butterfly, there were no provisions within the ESA that allowed such incidental take. As a result, various parties involved in the San Bruno Mountain case approached Congress to authorize a take, which would result from the adoption of the proposed HCP. Congress subsequently amended the ESA by adopting § 10(a), making it clear that future HCPs should be modeled after the HCP prepared for San Bruno Mountain.⁵

In its adoption of § 10(a), Congress expressed its clear intention of providing regulatory incentives to landowners to protect and enhance wildlife habitat. Congress expected that the public/private partnerships, formed pursuant to an HCP would provide long-term commitments regarding the conservation of listed and unlisted species and long-term assurances to the proponent of the conservation plan that the terms of the plan will be adhered to and that further mitigation requirements will only be imposed in accordance with the terms of the plan.⁶

The impetus for such partnerships is, in part, the realization that private landowners can comply with the ESA by avoiding "taking" species. Traditionally, the regulatory process has provided a landowner with "adequate assurances" and "sufficient incentives for the private sector to participate in the exceedingly costly and time-consuming process of voluntarily preparing and implementing an HCP."⁷ In exchange for this regulatory certainty, some landowners are willing to undertake measures that would not otherwise be required. Some of this regulatory certainty, however, was eroded by the FWS' adoption of a rule that provides that the FWS may revoke its approval of an HCP "as a last resort in the narrow and unlikely situation in which an unforeseen circumstance results in likely jeopardy to a species covered by the permit and the Service has not been successful in remedying the situation through other means."⁸

§ 21:41 HCPs

1. *Scope of HCPs*

In order to obtain an ITP, an applicant must submit an HCP that specifies the impact of the take, the steps to be taken to "minimize and mitigate such impacts," the funding available, the "alternative actions to such taking the applicant considered and the reasons why such alternatives are not being utilized," and such

measures as the FWS requires.¹ In addition to the implementing regulations,² the FWS and the NMFS have published a comprehensive guidance document entitled the *Habitat Conservation Planning Handbook (HCP Handbook)*.³ The *HCP Handbook* provides applicants with guidance as to how the FWS and the NMFS implement the HCP regulations. As described in the *HCP Handbook*, the HCP is initiated by the applicant and is the applicant's document.⁴ Thus, the descriptions of take, mitigation, and the alternatives considered and rejected are based on the applicant's evaluation of the project purpose and feasible mitigation measures.

An HCP may either address one or many different species, including listed and unlisted species.⁵ Alternatively, an HCP may focus on particular habitat types and address all species within certain habitat types in the area covered by the HCP.⁶ The applicant is advised to include all listed species of plants⁷ and wildlife that might be incidentally taken during the life of the proposed project. In addition, an HCP and the ITP must expressly identify all proposed activities. Failure to include a listed species that is subsequently taken may result in significant delays and prosecution.⁸ HCPs may be narrow in scope and include, for example, just the construction of a house. They may be as broad as encompassing a county building permit program, which will affect a listed species.⁹

Preparing a multispecies HCP, as was done in the San Bruno Mountain HCP, has benefits. As discussed in the *HCP Handbook*, multispecies planning can increase the biological value of HCPs by providing early evaluation of the impacts of a development on species listed, or proposed for listing.¹⁰ In addition, regional multispecies planning also helps to prevent habitat degradation before it occurs.¹¹ An important aspect of large-scale multispecies HCPs is the assurances that are provided to a landowner about the level of mitigation that will be expected over the life of the plan. As discussed below, these assurances are facilitated through the "no surprises policy." Since the adoption of this policy, and the accompanying assur-

¹¹See *National Wildlife Federation v. Babbitt*, 2001 WL 128425 (E.D. Cal. 2001); see also *National Wildlife Federation v. Norton*, 2005 WL 2175874 (E.D. Cal. 2005) (upholding new HCP because it focused on the two permittees and explained why further development or action by any other entity would require federal approval).

ances, there has been a significant increase in the number of HCPs proposed, including those that cover multiple species.

In *National Wildlife Federation v. Babbitt*, (NWF),¹² environmental organizations challenged the FWS' issuance of an incidental take permit to allow development in the Natomas Basin, a 53,000-acre tract of largely undeveloped land stretching north to the city of Sacramento. Plaintiffs argued that substantial uncertainty remained regarding the extent and effectiveness of proposed habitat reserves, the scientific information used in the multispecies HCP, and funding sources for the proposed plan.

The court agreed with most of the plaintiffs' arguments, holding that the approval of an HCP is dependent in part on the following criteria:

- HCPs that are dependent on mitigation across multiple jurisdictions must involve a multijurisdictional regional planning effort, and permits must be issued to all jurisdictions involved in preparing the plan, not just one (in this instance, a permit was issued only to the city of Sacramento).¹³
- A regional cumulative effects analysis is necessary to evaluate the habitat value of lands being destroyed and conserved so that land of equal habitat value is exchanged.¹⁴
- An alternative involving mitigation must be analyzed that supports the conclusion that the proposed plan minimizes and mitigates impacts to "the maximum extent practicable," with explicit findings as to why certain mitigation is infeasible.¹⁵
- The permit applicant must make a clear showing of a reliable funding source for the mitigation proposed, as well as identify a responsible party in the event of a funding gap. The court noted that the threat of permit revocation by the FWS is not a strong enough mechanism to ensure adequate funding.¹⁶
- The permit applicant must agree to adaptive management provisions that attach financial responsibility for their success to either the applicant or a third party.¹⁷
- An environmental impact statement (EIS) under NEPA is required for regional HCPs in almost all cases. In this case, there were factors that pointed to a need for an EIS, including substantial controversy and uncertainty regarding the effects on listed species and their habitats.¹⁸
- It is reasonable to estimate the level of take based on the extent of suitable habitat rather than the number of individuals, and the adaptive management plan was adequate in the face of scientific uncertainty.¹⁹

The NWF court concluded that the FWS had acted arbitrarily and capriciously by failing to adequately develop an HCP in line with ESA requirements and set aside the issuance of the ITP.

Subsequently, in *National Wildlife Federation v. Norton*,²⁰ the court found that the revised Natomas Basin HCP satisfied the requirements of the ESA. Unlike the first HCP, where the plan was a broad regional conservation plan with no guarantee all jurisdictions would participate, the subsequent HCP focused on the two permit-

tees and explained why further development or action by any other entity would require additional federal approvals.²¹ The plan also did not assume or require the participation of any third parties to be effective. The court noted that, even without participation by other jurisdictions, the goal of the HCP would not be undermined.²² Finally, the court found the plaintiffs' claim that the plan depended on the voluntary actions of third parties to be without merit. The Court concluded that the revised HCP satisfied the requirements of the ESA and that the Secretary's actions were not arbitrary and capricious.²³

Under § 10, a programmatic HCP can be issued to a governmental county or state entity. One wishing to conduct activities that are included within the programmatic HCP may obtain incidental take protection under certain instances.²⁴ Where the NMFS issues a § 10 programmatic permit, a person seeking coverage under the permit must apply for and receive a "certificate of inclusion."²⁵ When the FWS issues a programmatic § 10 permit, the permit may identify persons under the jurisdiction of the permittee who are allowed to engage in activities in accordance with the permit.²⁶

In reviewing the HCP, the ESA requires the FWS to determine, among other factors, that: (1) the taking will be incidental to an otherwise lawful activity; (2) the applicant will, to the maximum extent practicable, mitigate and minimize the impacts of the taking; (3) the applicant will ensure that adequate funding is provided for the HCP; (4) the taking will not appreciably reduce the likelihood of the survival and recovery of the species in the wild; and (5) the HCP meets other measures as determined by the Secretary as necessary or appropriate for purposes of the HCP.²⁷

2. Mitigation Requirements

A landowner must be cognizant in the preparation of an HCP that the primary question is what mitigation actions will be required in order to obtain government approval. Section 10 requires that a landowner "to the maximum extent practicable, minimize and mitigate the impacts" of a proposed take.²⁸ The FWS and the NMFS require that any mitigation be based on "sound biological rationale" and be "commensurate with the impacts" addressed.²⁹

The *HCP Handbook* provides two criteria for determining the adequacy of proposed mitigation: (1) the extent to which the proposed measures provide substantial benefits to the species; and (2) whether the amount of mitigation proposed is the maximum practicable in light of such factors as the costs and benefits

²⁹HCP Handbook, *supra* note 3, at 3–19. Mitigation actions typically take the following forms:

- (1) Avoiding the impact (such as through relocation of facilities within the project area);
- (2) Minimizing the impact (such as through timing restrictions and buffer zones);
- (3) Rectifying the impact (such as through restoration and revegetation of disturbed project areas);
- (4) Reducing or eliminating the impact over time (such as through proper management, monitoring, and adaptive management); or
- (5) Compensating for the impact (such as through restoring or protecting habitat at an onsite or offsite location).

See HCP Handbook, *supra* note 3, at 3–19 to 3–20.

of additional mitigation, the abilities of the applicant, and the amount of mitigation provided by other applicants in similar situations.³⁰ The FWS and the NMFS require that mitigation relating to the same species be as consistent as possible.³¹ Federal courts typically rely on the administrative record to provide some “rational basis” to substantiate the decision to approve an HCP and ITP and to substantiate the determination that the level of mitigation is to the “maximum extent practicable.”³²

The FWS has, in the past, shown great deference to applicants through the HCP process. Courts have determined, however, that deference has its limits, as evidenced by the decision in *Gerber v. Norton* holding that the FWS failed to follow required procedures and make a statutorily required finding.³³

3. No Surprises Policy

In 1998, the FWS and the NMFS adopted a final rule that implemented a “No Surprises Policy.”³⁴ The purpose of this policy was to remedy an existing conflict in the approval of an HCP and the issuance of an ITP regarding ensuring the protection of listed species, but providing landowners with long-term assurances. For example, an HCP must be malleable enough to adapt to changed circumstances and new information regarding protected species, but at the same time provide landowners long-term economic and regulatory certainty regarding their HCP and the associated obligations.

The FWS and the NMFS indicated that the purpose of the No Surprises Policy was to provide:

regulatory assurances to the holder of a Habitat Conservation Plan (HCP) incidental take permit issued under § 10(a) of the ESA that no additional land use restrictions or financial compensation will be required of the permit holder with respect to species covered by the permit, even if unforeseen circumstances arise after the permit is issued indicating that additional mitigation is needed for a given species covered by the permit.³⁵

In effect, the purpose of the No Surprises Policy was to allow the HCP to become a plan upon which a landowner and the government could rely. In other words, if the No Surprises Policy were applied as originally intended, a landowner would not be responsible for significant additional measures that might become necessary to respond to “unforeseen circumstances.” As discussed below, the subsequent adoption by the FWS and the NMFS of the so-called Permit Revocation Rule raises a ques-

³⁰HCP Handbook, *supra* note 3, at 7-3.

³¹HCP Handbook, *supra* note 3, at 3-23. *See* *Sierra Club v. Babbitt*, 15 F. Supp. 2d 1274, 1281 (S.D. Ala. 1998) (overturning the issuance of a § 10 ITP because, in part, the FWS had inconsistently applied mitigation standards regarding the affected species along the Alabama coast).

³²*Sierra Club v. Babbitt*, 15 F. Supp. 2d 1274, 1282 (S.D. Ala. 1998) (overturning the FWS’ issuance of ITPs for the Alabama beach mouse, determining that the government had not demonstrated in the administrative record that the effects of the development were minimized and mitigated to the maximum extent practicable).

³³*Gerber v. Norton*, 294 F.3d 173 (D.C. Cir. 2002) (finding that the FWS failed to allow public comment on a key component of the developer’s permit application and did not make the statutorily required finding that the developer’s plan reduced the impact of the taking to the maximum extent practicable); *see also* *National Wildlife Federation v. Babbitt*, 2001 WL 128425 (E.D. Cal. 2001) (finding that certain of the FWS’ findings regarding the ITP application were not supported by the administrative record). For a decision upholding an ITP, *see* *Center for Biological Diversity v. U.S. Fish and Wildlife Service*, 202 F. Supp. 2d 594 (W.D. Tex. 2002) (Order Concerning Pending Motions for Summary Judgment) (finding that the FWS negotiated and regulated vigorously and at arms length to discharge its duty under the ESA).

³⁴Habitat Conservation Plan Assurances Rule, 63 Fed. Reg. 8859 (Feb. 23, 1998) (codified at 50 C.F.R. pt. 17 (FWS regulations) and 50 C.F.R. pt. 222 (NMFS regulations)).

³⁵Habitat Conservation Plan Assurances Rule, 63 Fed. Reg. 8859 (Feb. 23, 1998) (codified at 50 C.F.R. pt. 17 (FWS regulations) and 50 C.F.R. pt. 222 (NMFS regulations)).

tion, however, as to how much a landowner truly can rely on the HCP as a final plan with regards to mitigation requirements.³⁶

The regulations provide that the No Surprises Policy has limited applicability: (1) it is applicable only to nonfederal parties seeking an ITP; (2) the assurances provided to the permit holder are valid for the life of the permit and only with respect to species “adequately covered” by the permit; and (3) the assurances provided to a permittee are only valid when the HCP is being “properly implemented.”³⁷ The extent and nature of the assurances depend on whether a particular change in circumstances, impacting a species covered by an HCP, is foreseeable or unforeseeable.

The FWS and the NMFS do not define the term “foreseeable,” but instead use their respective definitions of the term “changed circumstances” to apply to the No Surprises Policy. The implementing regulations define “changed circumstances” as:

[c]hanges in circumstances affecting a species or geographical area covered by a conservation plan that could not reasonably have been anticipated by plan developers and the Service at the time of the conservation plan’s negotiation and development, and that result in a substantial and adverse change in the status of the covered species.³⁸

Because of the uncertainty in the definition of what is or is not “foreseeable,” it is advised that the FWS or the NMFS and the permittee attempt to address all reasonable foreseeable changes in circumstances.³⁹ In effect, the listed “changed circumstances” are by definition “foreseeable,” and the permittee should be prepared to address them if they occur during the life of the HCP in a manner described in the HCP.⁴⁰ Under the No Surprises Policy, if a foreseeable change in circumstances occurs, but is not addressed in the HCP, the permittee will not be required to implement additional conservation and mitigation measures without the permittee’s consent.⁴¹

Under the No Surprises Policy, if an unforeseen circumstance should occur, the Services may only mandate minimal additional measures of the permittee. The original terms of the HCP must be maintained to the maximum extent possible and the Services may not require “commitments of additional land, water or financial compensation or additional restrictions on the use of land, water or other natural resources” without the permittee’s consent.⁴² The No Surprises Policy does recognize that some action may need to be taken on behalf of the affected species. Consequently, the No Surprises Policy rule provides that nothing in the rule should be construed to constrain or limit any governmental entity or private party from taking additional action, at its own expense, to protect or conserve a species included in an HCP.⁴³

Subsequent to adoption of the No Surprises Policy Rule, the FWS modified certain

⁴³50 C.F.R. § 17.22 (FWS); 50 C.F.R. § 222.307(h) (NMFS).

aspects of its rules governing the revocation of permits (the Permit Revocation Rule (PRR)). These changes provided that the FWS could revoke its approval of an HCP “as a last resort in the narrow and unlikely situation in which an unforeseen circumstance results in likely jeopardy to a species covered by the permit.”⁴⁴ The PRR specifically allows the FWS to unilaterally revoke an ITP if the implementation of the HCP, through no fault of the permit applicant, will result in jeopardy to a covered species.⁴⁵ This rule may have the effect of deterring some from participating in the HCP process.

Both the No Surprises Policy Rule and the PRR have been susceptible to procedural and substantive challenges. In *Spirit of the Sage Council v. Norton*,⁴⁶ organizations with members that photograph, study, and observe listed species challenged the FWS’ No Surprises Rule and the PRR as being in violation of the ESA and the APA. Based on the merits, the court found that the PRR was promulgated without required notice and comment and therefore in violation of the APA’s procedural requirements.⁴⁷ Without reaching plaintiff’s substantive claims, the court remanded the PRR to the FWS for public notice and comment. The court also found that the No Surprises Rule was “sufficiently intertwined” with the PRR that it needed to be remanded for reconsideration as well.⁴⁸ After a failed appeal by the FWS,⁴⁹ the FWS solicited public comment on both the PRR and the No Surprises Rule and repromulgated both without substantial change.⁵⁰

In *Spirit of the Sage Council v. Kempthorne*,⁵¹ the court held that all procedural defects in the PRR and the No Surprises Rule had been addressed. The plaintiffs filed again for summary judgment on substantive grounds, arguing that the No Surprises Rule and the PRR contravened the ESA and were arbitrary and capricious under the APA. In determining whether the rules were contrary to the ESA, the court applied the Chevron test. Plaintiffs argued that, based on the ESA’s definition of “conservation” to include both the survival and recovery of a listed species, the PRR was contrary to law because the rule provided that an ITP could only be revoked if activity hindered survival of species and did consider the species’ recovery.⁵² The court rejected this argument after a close review of § 10 of the ESA and the necessary components of an HCP. The court noted that § 10 requirements for an ITP applicant’s conservation plan only speak to minimizing impact on species and do not address the recovery of the species.⁵³ Consequently, the court found that ITPs do not have to promote the recovery of a species and “applicants are only required to minimize and mitigate the impact on species ‘to the maximum extent possible.’”⁵⁴

Since the court found that “Congress did not intend ITPs to have to promote or

maintain the recovery of listed species,”⁵⁵ under Chevron, the court further considered whether the FWS’ action was a permissible construction of the ESA. Relying on its analysis of the requirements of § 10, the court found that the “PRR adopts a facially reasonable policy for revocation.”⁵⁶ The court concluded that the No Surprises Rule was not contrary to the ESA either.

The court also rejected the plaintiffs’ arguments that the FWS did not articulate a reasoned basis for the rules and that the rules were inconsistent with the goals of the ESA.⁵⁷ The court systematically rejected all of the plaintiffs’ arguments, referencing back to its analysis of § 10 and concluding that the rules were not arbitrary and capricious under the APA.⁵⁸

4. *The Five-Point Policy*

Potential applicants must be aware of an addendum to the *HCP Handbook* (the Five-Point Policy) that adopts an adaptive management approach.⁵⁹ Adaptive management is a “method for examining alternative strategies for meeting measurable biological goals and objectives, and then, if necessary, adjusting future conservation management actions according to what is learned.”⁶⁰ Adaptive management contemplates that HCP conservation strategies will be adjusted as new information is developed. The Five-Point Policy provides that HCPs using adaptive management “should clearly state the range of possible operating conservation program adjustments due to significant new information, risk, or uncertainty. This range defines the limits of what resource commitments may be required of the permittee.”⁶¹ Despite this guidance, in practice, the FWS has been reluctant to agree to limits on adaptive management strategies.

5. *Section 7 Consultation Requirement*

During a review of an HCP/ITP application, the FWS and the NMFS engage in consultation, in accordance with § 7 of the ESA.⁶² The consultation requirements are triggered by actions with a federal nexus, and the federal action agency may proceed with the federal action only after completing the consultation, which may include preparation of a biological opinion.⁶³ The biological opinion sets forth the “incidental take statement” that permits the private party to incidentally “take” a listed species under limited circumstances.⁶⁴ Once a project has been initiated, the § 7 consultation may be reinitiated only under limited circumstances.⁶⁵ The exacting standards regarding reinitiation provide applicants with some level of comfort that a completed project will not be continually reopened over time.

⁶⁵50 C.F.R. § 402.16.

an effort to enhance the propagation or survival of a listed species.¹ Such enhancements have included capture, study, tagging, banding, and other scientific activities.

In 1999, the FWS adopted regulations that formalized the use of a “tool” entitled the Safe Harbor Agreement (SHA),² to be used in connection with an application for an “enhancement of survival” permit. In other words, an SHA is appropriate when a landowner is proposing to engage in activities that may restore, enhance, or maintain habitat for a listed species on one’s private land. An HCP, on the other hand, is used in connection with an ITP when a landowner proposes to engage in an activity that will result in a take of a listed species. The benefit of an SHA is that a landowner is given assurances that in exchange for its activities that will enhance the survival of a species, future land use restrictions will be limited and some future incidental take of a covered species will be allowed. Any person seeking an SHA-based permit must submit a permit application (FWS Form 3-200.54).³

§ 21:43 Other taking exceptions

In addition to the incidental take and enhancement of survival permits, the ESA provides for certain other limited exceptions to the general rule of protection of listed species. These exceptions are applicable to specific situations, involving specific species and/or persons.

The ESA’s hardship exemption provides, for example, that under certain instances, the FWS may, to minimize economic hardship, issue a permit exempting a person from applying the ESA’s prohibitions for up to one year. The hardship exemption applies in circumstances in which a person has entered into a “contract with respect to a species” prior to publication in the *Federal Register* of a notice of consideration of the species for listing and prior to the final listing of the species, but only if applying the ESA’s prohibition would cause “undue economic hardship.”¹

Section 10 of the ESA also authorizes: takings and trade of listed species by Alaska natives,² trade in specific “[p]re-Act endangered species parts” (including sperm whale oil),³ and importation or possession of certain antique articles (at least 100 years old) consisting of listed species.⁴ Certain takes are also allowed with respect to the defense of human safety, as well as activities associated with wildlife that was held in captivity or in a controlled environment, for noncommercial

purposes, on December 28, 1973, or on the date that the particular species was listed under the ESA.⁵

§ 21:44 Candidate conservation agreements with assurances

The Candidate Conservation Agreements (CCA) Policy provides incentives for nonfederal property owners to conserve candidate species.¹ “Candidate species” are defined differently by the FWS and the NMFS. The FWS defines “candidate species” as species for which the “. . . FWS has sufficient information on file relative to status and threats to support issuance of proposed listing rules.”² The NMFS defines “candidate species” more broadly as “. . . species for which NMFS has information indicating that listing may be warranted but for which sufficient information to support actual proposed listing rules is lacking.”³

CCAs are formal agreements between the FWS and/or the NMFS and one or more parties to address the conservation needs of proposed or candidate species, or species likely to become candidates, before they are listed.⁴ Participants voluntarily commit to implement specific actions that will remove or reduce the threats to these species, thereby stabilizing or restoring the species so that listing is no longer necessary. The goal of CCAs is to remove enough threats to the target species to eliminate the need for protection under the ESA. The benefit to a landowner for entering into a CCA is that the FWS or the NMFS will provide assurances that, in the event a species covered in the CCA is subsequently listed as endangered or threatened, the FWS or the NMFS will not assert additional restrictions or require additional actions above those the property owner voluntarily committed to in the CCA.⁵ In other words, a CCA assures landowners that if they install, for example, watering facilities or fencing, or replant native vegetation to benefit candidate species, they will not be required to implement further measures or be subject to additional restrictions on the use of their land or water if the species subsequently is listed.⁶

The FWS and the NMFS evaluate whether to enter into a CCA by considering “the extent to which the agreement reduces threats to proposed and candidate species and species likely to become candidates or proposed in the near future, so as to preclude or remove any need to list these species as threatened or endangered under the ESA.”⁷ The FWS and the NMFS realize that while “the actions of a single property owner usually will not preclude or remove any need to list a species, they also realize the collective effect of the actions of many property owners may be to preclude or remove any need to list.”⁸

CCAs have resulted in the withdrawal of several proposals to list species. For example, in Utah, the FWS signed a CCA to protect a fish called the virgin spinedace. The goal of the CCA was to bring back this species to 80% of its habitat. Based on the efforts of the state, the virgin spinedace was removed from the

candidate species list in 1996.⁹

IX. ENFORCEMENT AND CITIZEN SUITS

§ 21:45 Generally

Section 11 of the ESA sets forth the penalties that a violator may face.¹ These cover a wide range, including civil penalties,² criminal fines and prison terms,³ injunctions,⁴ reimbursement of plaintiffs' litigation costs in the case of citizen suits,⁵ forfeiture of vehicles and equipment,⁶ and loss of federal operating permits, licenses, and leases crucial to the operation of a business.⁷

§ 21:46 Tiered system of penalties

Section 11 of the ESA also operates to punish in proportion to the value of the species affected.¹ For a violation affecting a species listed as *endangered*, the ESA offers penalties of up to \$25,000 per occurrence,² along with criminal penalties of \$100,000 and a year in jail.³ For activity affecting a *threatened* species, the penalties are somewhat more modest: \$12,000 per occurrence in civil damages⁴ and a criminal penalty of \$25,000 and up to six months in jail.⁵ Other violations may bring \$500 fines.⁶

In addition, § 11 allows for the seizure of all guns, traps, nets, and other equipment, vessels, vehicles, aircraft used to aid in an ESA violation,⁷ though the parameters of this provision have not been tested by the courts. Successful ESA plaintiffs may recover their litigation costs, including attorneys fees.⁸

§ 21:47 Intent and ESA liability

In a 1978 amendment to the ESA, Congress lowered the intent requirement from

willfully committed to knowingly committed, and thus from a “scienter” requirement of specific to general intent.¹ Thus, accidental killings of an endangered species may be considered take, so long as the action that unintentionally results in the death of a listed species was being done intentionally.² It is not necessary to show that someone who has killed an endangered species knew it was endangered or even knew there was such a thing as the ESA; all that is required is that that person be aware that he or she is killing an animal. A commonly cited example of this point is the decision in *United States v. McKittrick*,³ in which a Montana man shot an endangered grey wolf. The court held that even if the defendant McKittrick was unaware of the endangered status of the wolf, the ESA still permitted a finding of guilt.

In *United States v. Ivey*,⁴ the Fifth Circuit noted that the ESA did not proscribe specific intent crimes. The court quoted the legislative history: “The conferees do not intend to make knowledge of the law an element of either civil penalty or criminal violations of the [ESA].”⁵ In other words, the government must only show a defendant acted with general intent to commit the act, because Congress did not intend to make knowledge of the law an element of criminal violations.⁶ To require specific intent would render the ESA ineffective because it would be nearly impossible to demonstrate that the defendant intended to violate the ESA.⁷ The court also held that the protections provided by designation as a threatened or endangered species are triggered only by the taking of a species on the list at the time of the taking, not at the time of the list’s original creation.

In *United States v. Clavette*,⁸ the defendant was convicted of killing a grizzly bear in violation of the ESA. The Ninth Circuit stated the elements of the ESA case in its discussion. The court stated that, to find the defendant guilty of knowingly taking an endangered species, the government had to prove beyond a reasonable doubt that (1) the defendant knowingly killed the bear, (2) the bear was a threatened or an endangered species listed on the ESA, (3) the defendant had no permit from the FWS to kill a grizzly bear, and (4) the defendant did not act in self-defense or in the defense of others.⁹ The judgment was affirmed.

§ 21:48 Bodily harm defense

Even though specific intent is not required in order to show liability for a viola-

[Section 21:47]

¹The purpose of this amendment was to make “criminal violations of the act a general rather than a specific intent crime.”

The House report explicitly stated that it did “not intend to make knowledge of the law an element of either civil penalty or criminal violations of the Act.” See H.R. Rep. No. 1625, 95th Cong., 2d Sess. 26, *reprinted in* 1978 U.S.C.C.A.N. 9453, 9476; H.R. Conf. Rep. No. 1804, 95th Cong., 2d Sess. 26, *reprinted in* 1978 U.S.C.C.A.N. 9484, 9493.

⁹The government must disprove self-defense beyond a reasonable doubt. 16 U.S.C.A. §§ 1538(a)(1), 1540(b)(1), ELR Stat. ESA §§ 9(a)(1), 11(b)(1).

tion of the ESA, some exceptions to liability exist within § 11. For example, § 11 expressly provides that no civil or criminal liability will attach when the defendant committed the violating act “based on the good faith belief that he was acting to protect himself, or a member of his or her family, or another individual from bodily harm from any endangered or threatened species.”¹ However, this exception does not apply to any action taken to protect property of any kind, including livestock and pets, subject to regulatory allowances for specific species.²

§ 21:49 ESA citizen suits under § 11(g), generally

Section 11(g) of the ESA authorizes citizens to sue as “private attorneys general.”¹ This section has been the focus of much scrutiny and the subject of several significant constitutional standing cases. The ESA provides that any person may commence a civil suit on his own behalf,² and the definition of who may sue under § 11(g) is just as broad as the definition of who may be prosecuted under § 9(a). Environmental advocacy groups have traditionally sued under the ESA to protect species and their habitat. In addition, in 1997, the Supreme Court, in *Bennett v. Spear*,³ extended the universe of plaintiffs to cover property owners primarily asserting an economic interest affected by the ESA.

The citizen suit provision of the ESA authorizes any person to commence a civil suit:

- (1) to enjoin any person, including the United States and any other governmental instrumentality or agency (to the extent permitted by the eleventh Amendment to the Constitution), who is alleged to be in violation of any provision of [the ESA or its regulations]; or
- (2) to compel the Secretary to apply [§ 4(d) or § 9 prohibitions] with respect to the taking of any resident endangered species or threatened species within any State; or
- (3) against the Secretary where there is alleged a failure of the Secretary to perform any act or duty under [§ 4 of the ESA] which is not discretionary with the Secretary.⁴

This provision is extremely broad. Subsection (A) allows enforcement actions to be brought against any alleged violator of the ESA, including governmental agencies. Subsection (B), however, is limited in that it authorizes suits against the Secretary only with respect to the actions that violate § 4(d) regarding threatened species and § 9 take liability within a state. Subsection (C) allows suits against the Secretary for breach of nondiscretionary duties contained in § 4. These duties include responsibil-

[Section 21:48]

⁴16 U.S.C.A. § 1540(g)(1)(A) to (C), ELR Stat. ESA § 11(g)(1)(A) to (C).

ities such as acting on petitions to list species and designate critical habitat within the time frames set out in that section. There has been considerable litigation over these procedural requirements. In contrast, challenges to the Secretary's discretionary implementation of provisions of the ESA are reviewable under the APA's "arbitrary and capricious" provision.⁵

§ 21:50 ESA citizen suits under § 11(g)—60-day notice provision

A crucial feature of the citizen suit provision is the requirement that the citizen give the target a 60-day notice of intent to file an ESA suit.¹ The Supreme Court has held that this requirement is a mandatory, nondiscretionary, condition precedent to suit.² The provision was intended to grant the defendant-to-be an opportunity to prepare a defense, mitigate or stop the activity, or cut a deal with the plaintiff. The notice also provides the FWS or the NMFS with ample time to evaluate whether the agency would be involved, based upon the plaintiff's allegations.³ The 60-day notice provision has been strictly construed,⁴ and failure to give proper notice can result in the flat dismissal of the suit.⁵

The notice must be in writing, and must be delivered to the intended defendant, as well as to the proper Secretary, depending on who regulates the affected species. The letter must specify the exact terms upon which the suit will be brought. General notice of intent to sue, or notice of intent to sue on grounds that differ from the actual grounds of the eventual suit, will not be deemed sufficient.⁶ Failure in delivery is failure of the suit; even when the contents of a letter were discussed between the plaintiff and the Secretary, failure to mail the notice resulted in the dismissal of the case.⁷ Theories of constructive notice are generally not available.

§ 21:51 ESA citizen suits under § 11(g)—Preliminary injunctions under the ESA

Preliminary injunctions are frequently sought by plaintiffs seeking to prevent impending harm to an endangered species. In considering an application for a preliminary injunction, courts typically invoke the traditional four-part balancing test, which weighs the following factors: (1) the movant's likelihood of success on the merits; (2) the potential irreparable injury to the movant in the absence of an injunction; (3) the balance of hardships among the parties; and (4) the public interest.¹

The law is unsettled, however, as to whether this traditional test for injunctive

relief applies in the context of the ESA. In *Tennessee Valley Authority (TVA) v. Hill*,² the Supreme Court seemingly foreclosed the traditional balancing of the equities test, noting that Congress has declared endangered species to be of an “incalculable” value and on that basis refused to consider the economic harm that would result from efforts to preserve the species.³

However, subsequent interpretation of the TVA decision by lower courts has called the breadth of the TVA holding into question. In *The Fund for Animals v. Turner*,⁴ the court rejected the argument that TVA compels judges to grant injunctions once a plaintiff has demonstrated a strong likelihood of success on the merits of its ESA claim. In distinguishing TVA, the Turner court noted that TVA involved a post-trial permanent injunction (not a preliminary injunction) and also featured an extreme set of facts, including a concession by the government that the challenged action (the building of a dam) would eradicate an entire endangered species.⁵

Commentators have also seized upon other Court decisions, including *Babbitt v. Sweet Home Chapter of Communities for a Greater Oregon*⁶ and *Bennett*, as evidence that the Supreme Court is backing away from the uncompromising position articulated in TVA.⁷

The slow retreat from the TVA decision is well illustrated by two cases decided in the First and Ninth Circuits. Both of these circuits had initially adopted the TVA holding in toto and refused to conduct traditional balancing in ESA cases.⁸ Subsequent decisions, however, have moved away from this strict no-balancing rule and adopted a case-by-case approach.⁹

With the law unsettled, many judges have resorted to applying the traditional balancing test as an alternative ground to support a ruling, in order to protect the decision on appeal.¹⁰

§ 21:52 ESA citizen suits under § 11(g)—Standing

While the terms of ESA § 11(g) seem to offer only modest barriers to citizen suits, the Court has held that the ESA cannot reduce or evade the significant *constitutional*

²*Tennessee Valley Authority v. Hill*, 437 U.S. 153, 98 S. Ct. 2279, 57 L. Ed. 2d 117 (1978).

³*Tennessee Valley Authority v. Hill*, 437 U.S. 153, 187–88, 98 S. Ct. 2279, 57 L. Ed. 2d 117 (1978).

⁶*Babbitt v. Sweet Home Chapter of Communities for a Great Oregon*, 515 U.S. 687, 115 S. Ct. 2407, 132 L. Ed. 2d 597 (1995).

⁷See, e.g., Federico Cheever, *Butterflies, Cave Spiders, Milk-Vetch, Bunchgrass, Sedges, Lilies, Check-Mallows and Why the Prohibition Against Judicial Balancing of Harm Under the Endangered Species Act Is a Good Idea*, 22 Wm. & Mary Env'tl. L. & Pol'y Rev. 313, 319–27 (1998).

⁸See *Strahan v. Coxe*, 127 F.3d 155 (1st Cir. 1997); *Sierra Club v. Marsh*, 816 F.2d 1376 (9th Cir. 1987).

⁹See *Water Keeper Alliance v. U.S. Dept. of Defense*, 271 F.3d 21, 34 (1st Cir. 2001) (distinguishing *Strahan* and applying the traditional balancing of the equities test because the national security interest asserted by the government was deserving of “greater weight than the economic harm at issue in *Strahan*”); *Southwest Center for Biological Diversity v. U.S. Dept. of Agriculture*, 314 F.3d 1060 (9th Cir. 2002) (declining to issue injunction despite finding of ESA procedural violation); *National Wildlife Federation v. Burlington Northern R.R., Inc.*, 23 F.3d 1508 (9th Cir. 1994) (affirming the lower court’s refusal to issue an injunction even though the ESA had been violated because there was little threat of future harm and therefore no irreparable injury).

¹⁰See, e.g., *House v. U.S. Forest Service*, U.S. Dept. of Agriculture, 974 F. Supp. 1022, 1027 n.8 (E.D. Ky. 1997); *Bensman v. U.S. Forest Service*, 984 F. Supp. 1242, 1247 (W.D. Mo. 1997).

requirements of Article III standing applicable to suits brought in a federal court.¹ In the pivotal case of *Lujan v. Defenders of Wildlife*,² Justice Antonin Scalia stressed the permanence of these requirements and applied them to the context of an ESA citizen suit. In *Lujan*, the plaintiffs sought to challenge a DOI regulation requiring consultation only on federal projects taking place within the United States or on the oceans, excluding government activities in foreign countries.³

a. Injury-in-Fact, or What Is “Harm”

Lujan placed the word “harm” in the center of another definitional battle with broad consequences to the ESA. This time, the question was not what constitutes harm to a species, but what constitutes sufficient harm to a plaintiff to allow him to claim standing to sue in federal court.⁴ This standing debate has been no less contentious or significant for ESA litigation than the disputes over the reach of the take provision.

In *Lujan*, the plaintiffs alleged that they had traveled overseas for the purpose of observing endangered wildlife in its native habitat in the past and that they “hoped” and “intended” to return to do so again.⁵ The court found that this failed to meet the constitutional standard, stating that “[t]he plaintiff must have suffered an injury-in-fact—an invasion of a legally protected interest which is (a) concrete and particularized, and (b) actual or imminent, not conjectural or hypothetical.”⁶

Several years later, the Court again addressed the standing under the ESA in *Bennett*. There, farmers in an irrigation district in Oregon brought suit challenging a biological opinion issued by the FWS. They alleged that the opinion, which was adopted by the Bureau of Reclamation and required minimum water levels for operation of the Klamath Project to protect the endangered snort nose sucker, caused injury by reducing water necessary for crop irrigation. The Court held that the farmers and ranchers had alleged sufficient Article III injury, even though they could not demonstrate that the opinion itself actually resulted in them receiving less water because the Bureau retained ultimate authority on water allocations. Significantly, the Court held that the issuance of the biological opinion under the ESA had such a “powerful coercive effect” that injury could be presumed.⁷

b. Causation

[Section 21:52]

¹*Lujan v. Defenders of Wildlife*, 504 U.S. 555, 112 S. Ct. 2130, 119 L. Ed. 2d 351 (1992).

²*Lujan v. Defenders of Wildlife*, 504 U.S. 555, 112 S. Ct. 2130, 119 L. Ed. 2d 351 (1992).

³*Lujan v. Defenders of Wildlife*, 504 U.S. 555, 559, 112 S. Ct. 2130, 119 L. Ed. 2d 351 (1992).

⁴*Lujan v. Defenders of Wildlife*, 504 U.S. 555, 561, 112 S. Ct. 2130, 119 L. Ed. 2d 351 (1992).

⁵*Lujan v. Defenders of Wildlife*, 504 U.S. 555, 563, 112 S. Ct. 2130, 119 L. Ed. 2d 351 (1992).

⁶*Lujan v. Defenders of Wildlife*, 504 U.S. 555, 560, 112 S. Ct. 2130, 119 L. Ed. 2d 351 (1992) (citations omitted).

⁷While not an ESA case, the Court’s 2000 ruling in *Friends of the Earth, Inc. v. Laidlaw Environmental Services (TOC), Inc.*, 528 U.S. 167, 120 S. Ct. 693, 145 L. Ed. 2d 610, 163 A.L.R. Fed. 749 (2000), may signal a change in the weather for the definition of harm. In this case, a group of property owners in the vicinity of a chemical facility alleged that the facilities’ operators were exceeding the mercury emissions authorized by their national emissions permit. They alleged that once this fact became known, they were placed in fear of the health consequences of swimming or fishing in the North Tyger River. The court held that this subjective fear was sufficient harm to survive the standing inquiry. This stands in marked contrast to the *Lujan* Court’s requirement of actual or imminent harm, as even by the Court’s admission, the additional emission had no measurably harmful impact on the quality of the water. See Daniel A. Farber, *Environmental Litigation After Laidlaw*, 30 ELR 10516 (July 2000); Michael P. Healy, *Standing in the Environmental Citizen Suits: Laidlaw’s Clarification of the Injury-in-Fact and Redressability Requirements*, 30 ELR 10455 (June 2000); Craig N. Johnston, *Standing and Mootness After Laidlaw*, 30 ELR 10317 (May 2000).

The second standing “prong” requires plaintiffs to demonstrate that there is a causal connection between the injury and the conduct complained of—the injury has to be fairly traceable to the challenged action of the defendant, and not the result of the independent action of some third party not before the court.⁸

This requirement has real consequences for plaintiffs who wish to bring suit against federal defendants for regulating or supervising activities by private entities. Plaintiffs must demonstrate that the federal agency is taking an action or refraining from an action that demonstrably affects the actions of third parties not before the court. However, this does not mean that the presence of a third party is always a disqualification under *Lujan*; so long as the alleged shared responsibility includes the plaintiff, standing is still possible. Given the purpose of the citizen suit provision, it is not surprising that courts have been willing to find causation in many ESA cases.

As noted above, the Bennett Court found such a causal connection from the FWS’ issuance of a biological opinion, even though such an opinion is technically only advisory under § 7 of the ESA—that is, the Bureau of Reclamation was not obligated to adopt it when establishing minimum water levels for the Klamath Reservoir. The Court noted that, under the ESA, the biological opinion’s incidental take statement essentially authorizes the action agency to take the species as long as it complies with the FWS’ “terms and conditions.” While the Bureau was “technically free to disregard the Biological Opinion and proceed with its proposed action . . . it does so at its own peril” in light of the potential criminal and civil penalties for “take” under the ESA.⁹ Thus, for the first time, the Court found a sufficient (although indirect) causal connection between an FWS action and the potential harm to nonenvironmental property interests of farmers dependent on sufficient water so as to establish Article III standing under the ESA. The Bennett Court’s reasoning was subsequently followed in the case of *Building Industry Ass’n v. Babbitt*.¹⁰ There, the court held that industry plaintiffs had standing to challenge the listing of five species of fairy shrimp in the central valley of California because the listing decision had a “determinative or coercive effect” on other agencies, and in particular, on the Corps with regard to the issuance of permits under § 404 of the Clean Water Act.¹¹

In *Loggerhead Turtle v. County Council of Volusia County, Fla.*,¹² the court found a sufficient causal connection between a municipality’s regulatory action and the plaintiff’s interests in the effects of maintaining bright lights alongside a strip of beach, in the context of the plight of hatchling turtles on the beach, which mistook the bright artificial light for sunlight and headed toward it, away from the water. The court found that while third parties were also involved in the harm, the lights would not be present but for the actions of the county in locating them there and ruled in favor of the plaintiff.

c. Redressability

Under the redressability test, a court must determine whether a plaintiff’s injury may be redressed by a favorable decision. In *Lujan*, the Court articulated that standard as requiring a finding that redressability of the injury is likely, as opposed to

⁸See *Lujan v. Defenders of Wildlife*, 504 U.S. 555, 560, 112 S. Ct. 2130, 119 L. Ed. 2d 351 (1992).

⁹*Bennett v. Spear*, 520 U.S. 154, 170, 117 S. Ct. 1154, 137 L. Ed. 2d 281 (1997).

¹⁰*Building Industry Ass’n of Superior California v. Babbitt*, 979 F. Supp. 893 (D.D.C. 1997).

¹¹*Building Industry Ass’n of Superior California v. Babbitt*, 979 F. Supp. 893, 899 (D.D.C. 1997).

¹²*Loggerhead Turtle v. County Council of Volusia County, Fla.*, 148 F.3d 1231, 41 Fed. R. Serv. 3d 563 (11th Cir. 1998).

merely speculative.¹³ Thus, the Court held that invalidation of the regulation at issue making § 7 consultation inapplicable to federal agency actions in foreign countries would not redress the claimed injury because action by nonparty agencies would be required (including terminating funding of foreign projects). Thus, it was “entirely conjectural” that new § 7 regulations would alter the activity that was allegedly causing harm to listed species.¹⁴

In contrast, in *Bennett* the Court found that the FWS’ biological opinion on the operation of the Klamath Project had such a “powerful coercive effect” on the Bureau that overturning the biological opinion would redress the grievances of the irrigation district plaintiffs. The ruling was also buttressed by the Court’s recognition that plaintiffs had relied on the fact that the Bureau had operated the Klamath Project in the same manner for most of the 20th century. In support of this analysis, the Court noted that the citizen suit provision allowed courts to review whether the Secretary had breached its nondiscretionary duty to “ensure that the ESA was not implemented haphazardly, on the basis of speculation or surmise” and to “avoid needless economic dislocation.”¹⁵

d. Prudential Standing Requirements

In addition to establishing constitutional standing, an ESA plaintiff must also satisfy the so-called prudential standing requirements. Prudential standing is a judicially created doctrine designed to promote judicial efficiency and restraint. Unlike constitutional standing, prudential standing requirements can be modified or abrogated by congressional fiat.¹⁶

In deciding whether a plaintiff has established prudential standing, courts consider three factors:

- (1) Whether the alleged injury to the plaintiff falls within the zone of interests protected by the statute or constitutional provision at issue.
- (2) Whether the complaint raises nothing more than abstract questions, amounting to generalized grievances that are more appropriately resolved by the legislative and executive branches.
- (3) Whether the plaintiff is asserting his or her own legal rights and interests, rather than those of third parties.¹⁷

The first of these requirements, the so-called zone of interests test, has traditionally proven vexing for litigants, particularly for industry representatives attempting to challenge environmental actions taken by the government. But in the context of the ESA, the barriers to suit are significantly lower due to the Court’s decision in *Bennett*.

In *Bennett*, the Court held that the citizen suit provision of the ESA applies “not only [to] . . . actions against private violators of environmental restrictions . . . but also to actions against the [government] asserting overenforcement of [the ESA].”¹⁸ This landmark holding opened the door to a wave of lawsuits from industry representatives seeking to curtail the government’s enforcement of the ESA and thereby created another chapter in the history of the much-litigated statute.¹⁹

e. The APA Alternative

¹³*Lujan v. Defenders of Wildlife*, 504 U.S. 555, 560, 112 S. Ct. 2130, 119 L. Ed. 2d 351 (1992).

¹⁴*Lujan v. Defenders of Wildlife*, 504 U.S. 555, 571, 112 S. Ct. 2130, 119 L. Ed. 2d 351 (1992).

Many suits under the ESA, indeed many environmental suits in general, involve additional allegations that a government agency has acted arbitrarily and capriciously in carrying out its responsibilities. These suits offer an appealing route for the environmental plaintiff. However, courts have been careful not to allow plaintiffs to utilize APA claims to short-circuit the 60-day citizen suit notice provision. A plaintiff may not choose her statutory weapon, as the APA is not an avenue for duplicative review. The APA is only available when there is no other way to obtain review of the agency's findings.²⁰ It should also be noted that plaintiffs who choose to sue under the APA may not present any evidence to the trial court outside of the administrative record.²¹

Review under the APA is available only when the challenged governmental decision constitutes "final agency action."²² While this limitation prevents review of mere recommendations issued by an agency, the Court has held that in the context of the ESA, a biological opinion issued by the FWS constitutes final agency action, even though the opinion is not technically binding upon the agency requesting it. In justifying this broad interpretation of the term "final," the Court noted that an FWS biological opinion has a "powerful coercive effect" upon the requesting agency and that agencies "very rarely chose to engage in conduct that [the FWS] has concluded is likely to jeopardize the continued existence of a listed species."²³ Based on these findings, the Court concluded that a biological opinion has "direct and appreciable legal consequences" and therefore constitutes final agency action reviewable under the APA.²⁴

§ 21:53 ESA citizen suits under § 11(g)—Attorneys fees under the ESA

The ESA authorizes courts to "award costs of litigation (including reasonable attorneys and expert witness fees) to any party whenever the court determines such an award is appropriate."¹ The courts have interpreted "as appropriate" as "modifying but not completely rejecting the traditional rule that a fee claimant must 'prevail' before it may recover attorneys fees."² Thus, the Court has held that "absent some degree of success on the merits by the claimant, it is not appropriate for a federal court to award attorneys fees."³ The interpretation of this standard has been addressed by courts under the ESA in response to the Supreme Court decision in *Buckhannon Board & Care Home, Inc. v. West Virginia Department of Health & Human Resources*.⁴ In *Buckhannon*, the Court invalidated the "catalyst theory" (in which a suit results in the defendant's voluntary change of conduct) as a basis for an award of fees, holding that only a party who obtains a judgment on the merits or a similar court-ordered change in the party's legal relationship, such as a consent decree, may be considered a "prevailing party" for the purposes of a fee award.⁵

³*Ruckelshaus v. Sierra Club*, 463 U.S. 680, 694, 103 S. Ct. 3274, 77 L. Ed. 2d 938 (1983).

⁴*Buckhannon Bd. and Care Home, Inc. v. West Virginia Dept. of Health and Human Resources*, 532 U.S. 598, 121 S. Ct. 1835, 149 L. Ed. 2d 855 (2001).

⁵*Buckhannon Bd. and Care Home, Inc. v. West Virginia Dept. of Health and Human Resources*,

In *Loggerhead Turtle v. County Council of Volusia County, Florida*,⁶ the Eleventh Circuit, citing two other rulings,⁷ held that *Buckhannon* does not invalidate the use of the catalyst test as a basis for awarding fees under the ESA. The court upheld an award of \$286,082 in fees and costs based on a citizen suit that eventually resulted in the county amending its beach lighting ordinance to provide greater protection for the turtles. The court gave three reasons for its ruling: First, “and most important . . . there is clear evidence that Congress intended that a plaintiff whose suit furthers the goal of a ‘whenever appropriate’ statute be entitled to recover attorneys fees” (relying on such evidence in other environmental statutes such as the Clean Air Act).⁸ Second, the Court’s opinion in *Buckhannon* made no reference whatsoever to “the whenever appropriate class of fee-shifting statutes. Instead, the Court’s opinion expressly addressed only the meaning of prevailing party.”⁹ Finally, an important policy consideration in the *Buckhannon* opinion did not apply under the ESA because only equitable relief is available.¹⁰ The court commented that “[a] contrary rule would cripple the citizen suit provision of the [ESA], in derogation of Congress’ abundantly clear intent to ‘afford’ endangered species the highest of priorities.”¹¹ In sum, it appears that attorneys fees would be available for a citizen suit plaintiff who can establish that the suit furthered the purposes and goals of the Act, even though it may not have resulted in complete court-ordered relief.

X. FEDERAL AND STATE INTERACTION UNDER THE ESA

§ 21:54 Generally

As of November 2008, the FWS reported 1,358 species of animals and plants listed as either endangered or threatened,¹ with an additional 56 proposed for listing and 251 candidate species.² With roughly one-half of these species having at least 80% of their habitat on private lands,³ it is evident that an effective endangered species conservation program is dependent upon a healthy and cooperative interaction between the federal government and private landowners, communities, and tribes, with states serving as integral catalyzing agents to the species conservation

532 U.S. 598, 603–04, 121 S. Ct. 1835, 149 L. Ed. 2d 855 (2001).

⁶*Loggerhead Turtle v. County Council of Volusia County, Fla.*, 307 F.3d 1318 (11th Cir. 2002).

⁷*Southwest Center for Biological Diversity, California Native Plant Society v. Carroll*, 182 F. Supp. 2d 944 (C.D. Cal. 2001) (*Buckhannon* did not intend to affect “whenever . . . appropriate” status for statutes such as the ESA); *Center for Biological Diversity v. Norton*, 262 F.3d 1077, 1080 n.2 (10th Cir. 2001).

⁸*Loggerhead Turtle v. County Council of Volusia County, Fla.*, 307 F.3d 1318, 1325 (11th Cir. 2002).

⁹*Loggerhead Turtle v. County Council of Volusia County, Fla.*, 307 F.3d 1318, 1326 (11th Cir. 2002).

¹⁰*Buckhannon* noted the absence of the possibility that a “mischievous defendant could avoid liability for attorneys fees in a meritorious case by voluntarily changing their conduct and mooting the case” as long as the plaintiff has a cause of action for damages.

¹¹*Loggerhead Turtle v. County Council of Volusia County, Fla.*, 307 F.3d 1318, 1327 (11th Cir. 2002) (citing *Tennessee Valley Authority v. Hill*, 437 U.S. 153, 98 S. Ct. 2279, 57 L. Ed. 2d 117 (1978)).

effort.⁴ With the passage of the ESA in 1973, Congress sought to maximize this relationship through a number of key provisions and programs, at the same time that it greatly expanded the federal role in the stewardship of wildlife throughout the United States.

§ 21:55 The Federal role enhanced

The Endangered Species Protection Act of 1966 and the Endangered Species Conservation Act of 1969¹ essentially only offered protection for endangered species occurring/residing on federal lands. However, in enacting the ESA in 1973, Congress extended the reach of federal law to prohibit the taking of endangered and threatened species on all land in the United States, whether it be state-owned, municipality-owned, or privately held.² The clear and unprecedented objective of the 1973 ESA was to address species extinction as a national concern and in the process, to “better [safeguard], for the benefit of all citizens, the Nation’s heritage in fish, wildlife and plants.”³

Congress undertook this bold expansion of the ESA, like so much other social and economic legislation, through its Commerce Clause⁴ authority to “regulate Commerce with foreign nations and among the several States”⁵ For the better part of the 20th century, Congress’ Commerce Clause authority was broadly construed and deferentially reviewed by the courts, with little distinction given between activities impacting interstate commerce, whether they be directly or indirectly.⁶ In 1995, however, the U.S. Supreme Court, for the first time in almost 60 years, struck down certain federal legislation as unconstitutional under the Commerce Clause. In *United States v. Lopez*,⁷ the Court held that the Gun-Free School Zones Act of 1990, which declared possession of a gun within a school zone to be a federal offense, exceeded Congress’ authority under the Commerce Clause.

The *Lopez* Court explained that Congress could regulate three broad categories of activities: (1) “the use of the channels of interstate commerce”; (2) “the instrumentalities of interstate commerce, or persons or things in interstate commerce, even though the threat may come only from intrastate activities”; and (3) “other activities having a substantial relation to interstate commerce . . . i.e., those activities that

⁴Under the ESA, “State” is defined as “any of the several States, the District of Columbia, the Commonwealth of Puerto Rico, American Samoa, the Virgin Islands, Guam, and the Trust Territory of the Pacific Islands.” 16 U.S.C.A. § 1532(17), ELR Stat. ESA § 3(17).

[Section 21:55]

¹The Endangered Species Protection Act of 1966 established a National Wildlife Refuge System and prohibited the disturbance of animals or habitat within that system. Pub. L. No. 89-669, 80 Stat. 926 (repealed 1973). The Endangered Species Conservation Act of 1969 required the Secretary of the Interior to develop a list of endangered species and prohibited the importation of said species absent a permit. Pub. L. No. 91-135, 83 Stat. 275 (repealed 1973).

²*See Gibbs v. Babbitt*, 214 F.3d 483 (4th Cir. 2000).

³*See* 16 U.S.C.A. § 1531(a)(3), ELR Stat. ESA § 2(a)(3) (“these species of fish, wildlife, and plants are of esthetic, ecological, educational, historical, recreational, and scientific value to the Nation and its people”); 16 U.S.C.A. § 1531(a)(5), ELR Stat. ESA § 2(a)(5).

⁴U.S. Const. art. 1, § 8, cl. 3.

⁵U.S. Const. art. 1, § 8, cl. 3.

⁶This deferential standard of review was established by the Court in the seminal 1937 case of *N.L.R.B. v. Jones & Laughlin Steel Corp.*, 301 U.S. 1, 57 S. Ct. 615, 81 L. Ed. 893, 108 A.L.R. 1352 (1937), wherein the Court held that intrastate activities having a close and substantial relationship to interstate commerce such that their control is essential or appropriate to protect interstate commerce are within the scope of the Commerce Clause.

⁷*U.S. v. Lopez*, 514 U.S. 549, 115 S. Ct. 1624, 131 L. Ed. 2d 626, 99 Ed. Law Rep. 24 (1995).

substantially affect interstate commerce.”⁸ As the Lopez Court noted, gun possession within a school zone clearly did not fit either of the first two categories, nor could it be regulated under the third category as an activity that “substantially affects” interstate commerce, because it was not commercial in nature nor an essential part of a larger regulation of economic activity. For all these reasons, the Court concluded that Congress had no rational basis for finding that gun possession within school zones had a substantial effect on interstate commerce.

Some saw the Lopez case as a harbinger that federal environmental legislation might be rolled back as violative of Congress’ jurisdiction under the Commerce Clause. However, subsequent federal court decisions have upheld Congress’ broad regulation of endangered species under the ESA through its Commerce Clause power. In *National Ass’n of Home Builders v. Babbitt*,⁹ the court upheld the prohibition against taking of endangered species under § 9 of the ESA as a valid exercise of Congress’ Commerce Clause authority. Moreover, the Home Builders court upheld the authority to prohibit the take of a listed species, even if the species, the Delhi Sands flower-loving fly, resided solely within the borders of a single state. That court found the first two prongs of the Lopez test applicable to the fly, whose habitat was located solely within an eight-mile span in two counties in California. Judge Patricia M. Wald, writing for the majority, relied upon the third, or substantial relation, test in Lopez, and the court concluded that Congress had intended to protect listed species from takings in part in order to maintain:

the continuing availability of a wide variety of species to interstate commerce . . . each time a species becomes extinct, the pool of wild species diminishes. This, in turn, has a substantial effect on interstate commerce by diminishing a natural resource that could otherwise be used for present and future commercial purposes.¹⁰

Whereas the majority opinion in *Home Builders* found support for Congress’ § 9 taking authority, under all three prongs of the Lopez test, the Fourth Circuit, in *Gibbs v. Babbitt*,¹¹ focused almost exclusively on the third prong of the Lopez test, the “substantial relation to interstate commerce” test. The court undertook an extensive explanation of the impacts, both direct and indirect, of ESA protection of red wolves occurring only within a single state to the larger interstate commerce issues. The court went on to engage in an exhaustive discussion in support of historical federal interests in the protection of endangered wildlife and its recognition among the federal courts. The U.S. District Court for the District of Columbia has also considered the Commerce Clause authority issue with respect to § 4 of the ESA regarding proposed listing and critical habitat designation for a species of fairy shrimp present only in California.¹²

Having denied *certiorari* in the *Building Industry Association* case,¹³ the Supreme Court has yet to examine the Commerce Clause argument in the ESA context since its decisions in Lopez and in 2000 in *United States v. Morrison*.¹⁴ Further, it is unlikely the Court will undertake to address the issue until any split in the holdings of the various circuits demands resolution.

§ 21:56 Role of the states

While Congress established through the ESA a pervasive federal role in species protection, extending to “any person subject to the jurisdiction of the United States,”¹ it also acknowledged the primary role of the states in species protection by formalizing a series of interrelationships between federal and state authorities throughout the ESA.

In its declaration of policy for enacting the ESA, Congress expressed its intent that federal agencies cooperate with state and local agencies to resolve water resource issues in concert with conservation of endangered species.² Several provisions of the ESA implement the cooperative approach envisioned by Congress.

1. Section 4—Listing and Critical Habitat Designation

Section 4 of the Act establishes the process by which the FWS and the NMFS make listing determinations for particular species as endangered or threatened with extinction and concurrently designate critical habitat for these species. Section 4(b)(1)(A) requires these agencies, prior to making listing determinations regarding a particular species, to take into account any efforts being made by any state or its political subdivision to protect the species in question, including efforts at habitat conservation and predator control.³ Similarly, § 4(b)(1)(B)(ii) also requires the FWS and the NMFS to give consideration to species that have been identified by any state wildlife conservation agency as in danger of extinction or likely to become so within the foreseeable future.⁴

The FWS and the NMFS are also required to give actual notice of proposed rules for listing particular species to any potentially affected state agency and to each county or equivalent jurisdiction where a subject species is believed to exist. This notice must be given no fewer than 90 days before the regulation takes effect, and the FWS and the NMFS are required also to invite comments from these state or local agencies.⁵ If the state agency files comments disagreeing with any part of the proposed rule, the FWS or the NMFS may still issue final regulation(s) in conflict with said state’s comments. However, in those cases of disagreement, the FWS or the NMFS is required to submit to the state or local agency a written justification for the failure to adopt a rule consistent with that state’s comments.⁶

Section 4 of the ESA also requires the FWS and the NMFS to issue such regulations as are deemed necessary to provide for the conservation of a listed species.⁷ As discussed above, § 4(d) authorizes the FWS and the NMFS to extend § 9 protection to threatened species, and the FWS has extended this protection to threatened species by way of regulation.⁸ As a result, § 4(d) has developed into a frequently utilized means of easing local land use conflicts created by the ESA’s general prohibition against the take of a particular threatened species. Thus, for species listed as threatened, rather than endangered, the FWS can create a special rule, which effectively delegates ESA “no take” compliance to the states and thus allows for reso-

lution by reference to state regulation and planning.⁹ This approval to regulate is available to all states that have entered into cooperative agreements (established in § 6 of the Act and discussed below) and only to the extent that the implementing § 4(d) regulations have also been adopted by the states pursuant to the cooperative agreements.¹⁰

Finally, with respect to species that have recovered from the brink of extinction under the ESA, § 4(g) carves out a key role for federal-state cooperation. That section implements a system of cooperation with the states to monitor the status of the recovered species for no fewer than five years from the time the species is deemed to have recovered and is delisted.¹¹

2. Section 6—Cooperation With the States

In § 6 of the ESA, Congress established its most explicit road map for federal-state relations in the pursuit of the conservation of endangered and threatened species. Under § 6, the FWS and the NMFS are to cooperate to the maximum extent practicable with the states in carrying out the purposes and policies of the ESA. This mandate includes consultation between the FWS and the NMFS and the states prior to any federal acquisition of land or water for the purposes of species conservation.¹²

The FWS and the NMFS have adopted an interagency policy to guide their work with state agencies to accomplish ESA directives.¹³ The policy reminds the federal agencies that states possess broad trustee and police powers over wildlife and their habitats within their respective borders and that, unless preempted by federal authority, states possess primary authority and responsibility for protection of fish, wildlife, plants, and their habitats. The policy notes that state agencies enjoy closer working relationships with local governments and landowners than do their federal counterparts and often possess valuable data and expertise on resident wildlife and their habitats that may not otherwise be available at the federal level. Overall, the policy recognizes the unique and integral role that states can play in implementing the ESA to its fullest potential. The policy lays out a framework and steps for federal and state agency cooperation in implementing key activities under the ESA, namely: (1) prelisting conservation; (2) listing; (3) consultations; (4) habitat conservation planning; and (5) recovery.

a. Agreements With the States

Section 6 of the ESA formalizes the relationship between federal and state agencies by establishing a program of management agreements and conservation agreements. Section 6(b) of the ESA authorizes the FWS and the NMFS to enter into agreements with the states to administer and manage any area established for the conservation of endangered or threatened species.¹⁴

The more expansive state management tool created under § 6 is the cooperative agreement mechanism. The FWS and the NMFS are authorized to enter into a cooperative agreement with each state that demonstrates it has established and maintains an “adequate and active program for the conservation of endangered and

threatened species.”¹⁵ Cooperative agreements may be entered into with states for the conservation of both animal species and plant species.¹⁶ The FWS and the NMFS are to periodically review the conservation program of each state with which it has a cooperative agreement to confirm that state programs continue to meet the criteria for “an adequate and active program,” but such review is to occur no more frequently than at annual intervals.¹⁷

b. Funding the States

Under § 6, the FWS and the NMFS are also authorized to provide financial assistance to state agencies for species and habitat conservation activities on nonfederal lands. This funding is appropriated annually to the Cooperative Endangered Species Conservation Fund.¹⁸ In fiscal year (FY) 2008, approximately \$66 million was available to states that had entered into cooperative agreements pursuant to § 6.¹⁹ State agencies generally are required to contribute 25% of the estimated program costs of approved projects, or 10% when more than one state implements a joint project. The federal allocation may cover the remainder of the project costs, and these funds may be advanced to the states to finance the federal share agreed upon in a cooperative agreement.²⁰

Four grant programs are available through the fund, providing financial assistance from prelisting to recovery stages. The conservation grant program provides assistance to state agencies to implement such conservation projects as habitat restoration, surveys, education and outreach, captive propagation and reintroduction, genetic studies, and development of management plans. The habitat conservation planning assistance grants provide funding to states to support HCPs under § 10. Habitat conservation planning land acquisition grants, constituting the great bulk of the funding pool, e.g., \$35 million for FY 2008, fund state efforts to acquire land associated with approved HCPs.²¹ Finally, recovery land acquisition grants assist states in acquiring habitat for endangered and threatened species in support of approved recovery plans. All 50 states, Guam, Puerto Rico, and the Virgin Islands have entered into cooperative agreements for animal species, and almost all have entered into such agreements for plant species.

3. Section 7—Interagency Cooperation

In addition to the programs established under § 6 to coordinate federal and state conservation efforts, the ESA includes multiple additional “safety nets” in other sections that support this multilateral approach to species conservation.

This is nowhere better exemplified than in § 7, which proscribes any federal agency “jeopardy” to the continued existence of endangered or threatened species or designated critical habitat, absent certain limited and delineated exemptions. In the course of this federal interagency conservation process, the states maintain an active and integral decisionmaking role. The states act as “consulting” partners to the

FWS and the NMFS in the designation of critical habitat.²² State governors are authorized under § 7(g)(1) to apply for an exemption under § 7 for any federal agency action occurring within said state(s) that may result in “jeopardy” to a listed species.

Finally, states that are affected by federal agency actions that may result in jeopardy to a listed species occurring within such state are granted representation on the Endangered Species Committee created by § 7. The Committee establishes a process to allow activities to go forward despite a jeopardy finding.²³

§ 21:57 Conflicts between the ESA and state laws

The ESA preempts inconsistent or less restrictive state laws regarding species conservation. As provided in § 6(f), “any State law or regulation respecting the taking of an endangered species or threatened species may be more restrictive than the exemption or permits provided for in this chapter or in any regulation which implements this chapter but not less restrictive than the prohibitions so defined.”¹ Furthermore, the ESA voids any state law or regulation with respect to the import/export and interstate or foreign commerce in endangered or threatened species to the extent that such law or regulation effectively authorizes conduct that is prohibited under the ESA or, conversely, prohibits conduct authorized by a permit or exemption under the ESA.²

An apparent inconsistency to the above-referenced preemption language may be found in § 6(g)(2), which appears to exempt application of the takings prohibition to endangered and threatened species located within any state that is party to a cooperative agreement, unless such taking is also contrary to that state’s laws. Notwithstanding this apparent loophole, it is important to note that the provision only applies to states that have entered into cooperative agreements with the FWS or the NMFS. Prior to entering into a cooperative agreement with a state, the FWS and the NMFS must first determine and annually confirm, among other things, that the state agency has authorization to conserve resident species determined by the state agency to be endangered or threatened³ and furthermore, that the agency has established acceptable conservation programs, consistent with the ESA, for all resident species of wildlife and plants within the state that are deemed to be endangered or threatened.⁴

In creating this series of federal and state interrelationships in the ESA, Congress did not simply sweep away the role of the states by enacting a national solution to the problems of species conservation. Instead, the ESA embodies principles of cooperative federalism and seeks to involve the states in the conservation efforts by defining roles for both federal and state actors in the process of species conservation.

XI. THE INTERFACE BETWEEN THE ESA, THE NATIONAL ENVIRONMENTAL POLICY ACT, AND THE FREEDOM OF INFORMATION ACT

§ 21:58 NEPA and the ESA

The National Environmental Protection Act (NEPA) sets forth a national policy

⁴16 U.S.C.A. § 1535(c)(1)(B), (c)(2)(B), ELR Stat. ESA § 6(c)(1)(B), (c)(2)(B).

“to create and maintain conditions under which man and nature can exist in productive harmony, and fulfill the social, economic, and other requirements of present and future generations of Americans.”¹ NEPA establishes goals to protect the nation’s resources and requires all federal agencies to interpret and administer their individual policies, regulations, and laws in accordance with NEPA’s goals to “the fullest extent possible.”

Section 102(2)(c) of NEPA requires preparation of a detailed environmental impact statement (EIS) for every “major Federal action significantly affecting the quality of the human environment.”² The president’s Council on Environmental Quality (CEQ) interprets the EIS requirement and other provisions of NEPA through detailed regulations and other policy guidance.³ Accordingly, each federal agency is required to prepare detailed implementation procedures to carry out the CEQ regulations. While NEPA establishes substantive policy goals, the U.S. Supreme Court has stated that NEPA’s mandate is essentially procedural and is intended primarily to ensure a fully informed and well-considered decision.⁴

The CEQ regulations emphasize the full NEPA process in every phase of agency decisionmaking from early planning through final agency action and subsequent follow-up. Specifically, these regulations underscore the importance of assessing planning process, evaluating important alternatives, preparing analytic and accurate EISs, facilitating public involvement, preparing clear records of agency actions, and encouraging the use of mitigation and monitoring techniques.⁵

Prior to 1983, the FWS routinely prepared EISs for all regulations issued under § 4 of the ESA covering listings and critical habitat. However, in that year, the CEQ found that NEPA did not apply to these listing decisions based on the theory that the FWS was exempt as a matter of law or that such actions could be considered “categorically exempt” from NEPA.⁶ In 1983, the FWS issued a notice in the *Federal Register* stating that a NEPA analysis was not required for § 4 regulations based on two grounds: (1) ESA listing decisions are limited to considering only biological data; socioeconomic data were not a factor; and (2) the Sixth Circuit decision in *Pacific Legal Foundation (PLF) v. Andrus*⁷ found, as a matter of law, that an EIS was not required for listings.⁸

The issue of NEPA applicability has been addressed by only a few courts since the PLF case, in both the listing and critical habitat contexts. In *Douglas County v. Babbitt*,⁹ the court held that the FWS did not need to comply with NEPA for the designation of certain federal lands as critical habitat for the northern spotted owl. Citing the PLF case, the court stated that:

⁸48 Fed. Reg. 49244 (Oct. 25, 1983).

⁹*Douglas County v. Babbitt*, 48 F.3d 1495 (9th Cir. 1995).

[t]he purpose of the ESA is to prevent extinction of species, and Congress has allowed the Secretary to consider economic consequences of actions that further that purpose. But *Congress has not given the Secretary the discretion to consider environmental factors, other than those related directly to the preservation of the species.* The Secretary cannot engage in the very broad analysis NEPA requires when designating a critical habitat under the ESA.¹⁰

In 1996, the Tenth Circuit in *Catron County Board of Commissioners v. U.S. Fish & Wildlife Service*¹¹ took a position directly contrary to the holding in *Douglas County*. The court held that the FWS was required to comply with NEPA when designating critical habitat for the spikedace and loach minnow. The court stated that “merely because the Secretary says [NEPA] does not [apply] does not make it so.”¹² The court expressly disagreed with *Douglas County*, holding that “the legislative history . . . indicates that Congress intended that the Secretary comply with NEPA when designating critical habitat,”¹³ noting that “[w]hen the environmental ramifications of such designations are unknown, we believe Congress intends that the Secretary prepare an EA leading to either a FONSI or an EIS.”¹⁴ The Tenth Circuit in *Middle Rio Grande Conservancy District v. Norton*¹⁵ followed *Catron County* in upholding the district court’s ruling that the FWS was required to prepare an EIS for critical habitat designation of the silvery minnow.

The district court in *Cape Hatteras Access Preservation Alliance (CHAPA) v. Dep’t of the Interior*¹⁶ followed the Tenth Circuit’s *Catron County* decision in rejecting the FWS’ finding that NEPA does not apply in designations because “while a designation may restrict certain human activities on land, it does not involve ‘changes’ to the physical environment”¹⁷ The court then stated that “NEPA’s language does not talk of changes to the environment but of actions that ‘significantly affect[]’ its quality”¹⁸ and that because designation of critical habitat significantly affects the human environment, the FWS “needs to determine the extent of the impact in compliance with NEPA.”¹⁹

With regard to the listing of species, the 2007 decision in *Trout Unlimited v. Lohn*²⁰ supports the holding of PLF. In that case, the NMFS had utilized the Hatchery Listing Policy (HLP) as a guidance document in its listing decision. The court stated that “it made little sense to require the Secretary to comply with the EIS requirement when, ultimately, the determination as to whether to list the spe-

cies would be controlled by the factors enumerated in the ESA.”²¹ The court concluded that exempting the HLP from NEPA procedures would not harm the conservationist purposes of NEPA and the ESA.²²

Thus, while the case law is sparse, the trend of courts is to find that NEPA is applicable to critical habitat designations. However, courts generally have not considered NEPA applicable to listing decisions where the FWS or the NMFS may only consider biological factors.

§ 21:59 The ESA and the Freedom of Information Act

Over the years, the Freedom of Information Act (FOIA)¹ has been used by public and private groups to seek data on the location of species and their habitat. The FWS has, at times, resisted disclosure of such information on various theories, allegedly in order to protect species from harm. However, a decision in *National Ass’n of Homebuilders (NAHB) v. Norton*,² held that the FWS had improperly asserted four FOIA exemptions in withholding records pertaining to the presence of endangered species on private property.

The case originated with a 1998 FOIA request from the NAHB to the FWS seeking information regarding the location of populations of the cactus ferruginous pygmy owls, an endangered species resident in the American Southwest. The NAHB sought the information in part because the FWS was using it in an ongoing rulemaking proceeding on a proposal to designate more than 700,000 acres of land in Arizona as “critical habitat” for the owl.

Although the FWS had agreed to provide printouts of the Arizona Game and Fish Department’s records of the owl, the government redacted “section information, site directions, [and] site names”³ In effect, the FWS would not divulge information that would identify the specific locations where owls had been observed. The FWS initially based its decision on FOIA exemptions 3 (claiming the ESA exempted this information from disclosure), 4 (commercial data), 5 (privileged government deliberation), and 6 (privacy).

The NAHB filed suit in U.S. District Court for the District of Columbia. The district court rejected the FWS’ arguments under FOIA exemptions 3, 4, and 5, but ruled in favor of the FWS on exemption 6.⁴ The court was particularly concerned that a release of the information would lead to birdwatchers trespassing on private lands for a glimpse of the owls. Thus, the court held that the landowners’ privacy rights outweighed the right of access to the information.

In reversing the district court, the D.C. Circuit focused primarily on exemption 6.⁵ The court held that the FWS had failed to demonstrate a “substantial probability” that disclosure would cause an interference with personal privacy. The lower court

⁵FOIA exemption 6 provides that documents may be withheld only if they are “personnel and medical files and similar files the disclosure of which would constitute a clearly unwarranted invasion of personal privacy.” In order to prevail on an Exemption 6 claim, an agency must demonstrate two elements. First, the agency must show that the withheld data qualifies as a personnel, medical or similar file. Second, if the agency can meet that threshold burden, it must show that the privacy interests protected by withholding the requested data outweigh the public interest in obtaining the withheld information. 5 U.S.C.A. § 552 (b)(6).

had permitted the FWS to rely on an affidavit by the director of the FWS citing a prior incident where knowledge of the location of the owls resulted in birdwatchers seeking out the bird. The D.C. Circuit found this evidence unconvincing, noting that “one incident in which there is no claim that unlawful trespass occurred hardly demonstrates a general problem, and there is nothing to suggest that property owners cannot be protected against unlawful trespassers.”⁶ In addition, the court found it significant that property owners who allowed the agencies to survey their properties for owls signed agreements stating that the data may be subject to public disclosure laws and court orders. The court also emphasized that the NAHB had indicated that it did not need the names of the property owners.

The court also considered the extent to which disclosure of the information sought would shed light on an agency’s performance of its statutory duties. The NAHB had asserted a broad interest in the public’s effective participation in the upcoming critical habitat process, as well as in understanding the FWS’ other land use decisions based on the owl data. The court found a significant public interest in the public’s use of the information to explore how the FWS uses the information. The court considered such a use to be related to “citizens’ right to be informed about ‘what their government is up to.’”⁷ This has some significance in that the court found that the raw data alone would allow the public to ascertain how the agency was performing its duties.

The circuit court also affirmed the district court’s rulings on FOIA exemptions 3, 4, and 5, rejecting the FWS’ argument that these exemptions protected the owl data from disclosure. FOIA exemption 3 provides that federal agencies may withhold information that is “specifically exempted from disclosure by statute.”⁸ However, the court ruled that the ESA does not qualify under exemption 3, because the statute contains no explicit language that refers to withholding information. The court also declined to consider the legislative history of the ESA, holding that “legislative history will not avail if the language of the statute itself does not explicitly deal with public disclosure.”⁹

FOIA exemption 4 permits a federal agency to withhold information that qualifies as “trade secrets and commercial or financial information obtained from a person and privileged or confidential.”¹⁰ The FWS had argued that owl data qualifies as commercial information because the federal government provides funding to the state of Arizona in exchange for access to the owl data. In rejecting this rationale, the court held that the agreement between Arizona and the federal government was merely a “quid pro quo exchange,” which “does not constitute a commercial transaction in the ordinary sense.”¹¹ Thus, the court reasoned, because the owl data were created by a noncommercial entity (the state of Arizona) which had no commercial stake in the data’s disclosure, owl data did not qualify as commercial information under exemption 4, and exemption 4 therefore did not apply.

Finally, the court rejected the FWS’ reliance on exemption 5, which protects information that qualifies as “inter-agency or intra-agency memorandums or letters which would not be available by law to a party other than an agency in litigation with the agency.”¹² The court held that the owl data were merely factual information that did not reveal the FWS’ “mode of formulating or exercising policy-

implicating judgment.”¹³

The *NAHB* decision is significant, as it demonstrates that the courts will critically evaluate efforts by the FWS to protect data on listed species from FOIA requests, even where the FWS’ action is asserted to be furthering the goals of the ESA.¹⁴

XII. THE ESA AND CLIMATE CHANGE

§ 21:60 Introduction

Climate change is of increasing concern in the context of the ESA. The annual global emission of carbon dioxide (CO₂) grew by approximately 80% between 1970 and 2004,¹ which has led to rising global surface temperatures and rising sea levels.² Those effects led one preeminent ecologist to conclude in 2005 that climate change is “a major threat to the survival of species and integrity of ecosystems worldwide.”³ In 2007, the Intergovernmental Panel on Climate Change (IPCC) concluded that pressures from climate change and associated disturbances will likely overcome the natural resilience of many ecosystems, and as a result, 20 to 30% of plant and animal species will be subject to an increased chance of extinction in this century.⁴

On June 16, 2009, the Obama Administration released its first climate change report, *Global Climate Change Impacts in the United States*, which assesses the current and future impacts of climate change on the nation.⁵ The report, which uses stronger language than any prior presidential assessment, breaks down the effects of global warming in the United States by region and sector; it describes how urban infrastructure will be placed in danger by hurricanes and storm surges; how heat waves, poor air quality, and insects will increase; and how it will be difficult for society and natural resources to adapt to rapid climate change. The report lists the following recommendations for dealing with climate change: expand our understanding of climate change impacts; refine our ability to project climate change; expand our capacity to provide decisionmakers and the public with relevant information on climate change and its impacts; improve our understanding of thresholds likely to lead to abrupt changes in climate or ecosystems; improve our understanding of the most effective ways to reduce the rate and magnitude of climate change, as well as unintended consequences of such activities; and enhance our understanding of how

¹³National Ass’n of Home Builders v. Norton, 309 F.3d 26, 39 (D.C. Cir. 2002).

¹⁴In *Flathead Joint Bd. of Control v. U.S. Dept. of Interior*, 309 F. Supp. 2d 1217 (D. Mont. 2004), a state irrigation district negotiating state water rights with Indian tribes sued the United States, seeking disclosure under FOIA of federal water rights information. The court distinguished *Norton*, holding that the federal water rights information sought by the state irrigation district in that case differed from information regarding the location of a noncommodity animal sought in *Norton*. The court therefore held that the information fit within the “commercial or financial” information FOIA exception. The court declined to hold that *Norton* stood for the proposition that “natural resource information” generally falls outside of Exemption 4.

society can adapt to climate change. The Obama Administration hopes that the report will generate public and political support for strong climate change legislation.

These recent reports are the latest examples of the increase in awareness of climate change evolving over the last several decades. In 1978, Congress passed the National Climate Program Act (NCPA), which required the president to establish a program to “assist the Nation and the world to understand and respond to natural and man-induced climate processes and their implications.”⁶ In response to President Carter’s directive under the NCPA, the National Research Council concluded that continued increases in CO₂ levels would lead to climate change and that a “wait-and-see policy may mean waiting until it is too late.”⁷ In 1987, Congress enacted the Global Climate Protection Act,⁸ finding that man-made pollution “may be producing a long-term and substantial increase in the average temperature on Earth.”⁹ During the 1990s, the United Nations took a series of steps to respond to climate change, culminating in the adoption of the Kyoto Protocol, which assigned mandatory targets for industrialized nations to reduce greenhouse gas (GHG) emissions. While the United States declined to ratify the Kyoto Protocol,¹⁰ evidence of climate change has steadily increased,¹¹ as has the pressure on the U.S. government to respond.

This pressure increased further following the landmark 2007 *Massachusetts v. EPA* decision, in which the U.S. Supreme Court acknowledged that the “harms [already] associated with climate change are serious and well recognized”¹² and stated unequivocally that “global warming threatens . . . a precipitate rise in sea levels, severe and irreversible changes to natural ecosystems, a significant reduction in winter snowpack with direct and important economic consequences, and increases in the spread of disease and the ferocity of weather events.”¹³ Addressing the challenges for agencies to implement regulations taking into account climate change, the Court noted that “agencies, like legislatures, do not generally resolve massive problems in one fell swoop, but instead whittle away over time, refining their approach as circumstances change and they develop a more nuanced understanding of how best to proceed.”¹⁴ However, proceed they must, as the Supreme Court made it clear that simply because Congress did not have climate change in mind when it drafted a law does not mean that agencies can ignore the effects of climate change.¹⁵

With the ESA’s primary goal being to “provide a means whereby the ecosystems upon which endangered and threatened species depend may be conserved,”¹⁶ and with a growing scientific consensus regarding ecosystem-level impacts related to climate change, the ESA will be a focal point of climate change discussion. Indeed, many conservation groups are already utilizing the ESA in an effort to force regula-

tion of GHG emissions,¹⁷ and federal courts have begun to require consideration of climate change in conjunction with the application of the ESA.¹⁸

This section examines the implications of the findings on climate change and its effects on ecosystems for ESA application and implementation. The initial discussion describes the impacts that climate change is having or is predicted to have on wildlife and plant species. Then, using the 2008 polar bear listing and cases considering climate change in the context of § 7 consultation as examples, the analysis examines the current and potential use of climate change impacts in application of the ESA.

§ 21:61 The impact of climate change on species and their habitat

Climate change has numerous adverse implications for a variety of wildlife and ecosystems. Some scientists have predicted that within the next 50 years, up to one-third of species in certain areas will be extinct as a result of global warming.¹ The consequences of climate change for wildlife species and habitats appear in a variety of forms, as discussed below.

1. Forced Relocation Due to Rising Temperatures

Rising temperatures have already forced some species to relocate. Since the mid-20th century, wildlife has moved toward the poles an average of four miles per decade and upslope an average of 20 feet per decade.² For example, researchers in Yosemite National Park have found that in the past 90 years, the altitude of pika (*Ochotona pinceps*) population locations has risen from 7,800 feet to 9,500 feet.³ Additionally, there are currently almost no native bird species below 4,500 feet in Hawaii due to migration to higher elevations.⁴

Such relocation can be hindered by obstacles, such as lack of food supply and other ecological conditions necessary to support the displaced species.⁵ In addition, migration to suitable new habitats may be impeded or blocked by “natural obstacles to movement, such as large water bodies (which create barriers for terrestrial species) and coastlines (for marine and estuarine species).”⁶

Rising temperatures may also cause spring to arrive earlier than in previous years,⁷ resulting in ripple effects throughout ecosystems. For example, migratory patterns may be disrupted, along with the patterns of the plant and prey species

upon which migratory species rely for food. As a result, some migratory species may arrive at their destinations at a time that is mismatched with the plants or prey that would ordinarily be present at the location.⁸ Because “the timing of arrival on breeding territories and over-wintering grounds is a key determinant of reproductive success, survivorship, and fitness,” any variation in timing of these events can have drastic consequences for the survival of those species.⁹

2. Reduced Habitat Due to Rising Sea Levels, Melting Sea Ice and Snowpack, and Increased Frequency and Intensity of Hurricanes and Typhoons

The dramatic effect of climate change on sea ice and snow pack is a significant concern. There has been a downward trend in the extent of sea ice since 1978 with the past few years exceeding previous low records.¹⁰ Between 2000–2005, there was a 21% reduction of sea ice for the Arctic Ocean.¹¹ Significant warming has been occurring in the Arctic, as evidenced by earlier onset of spring melt and the increase in the duration of the melt season.¹² With the exception of 1996, the years 1995–2006 were the warmest on record since 1850.¹³ The effect of this warming has been greatest at higher northern latitudes, where polar bear habitats are found.¹⁴ In the last three decades of the 20th century, “sea-ice thickness has declined by about 40% in the late summer and early autumn,”¹⁵ and the polar ice cap is now melting at a rate of 9% per decade,¹⁶ which may be a conservative estimate.¹⁷ These drastic changes have led to increased concern for the species that rely on sea ice habitat, most notably evident in the listing of the polar bear as a threatened species under the ESA.¹⁸

More generally, in the past 40 years, the average snow cover in the Northern Hemisphere has decreased by 10%.¹⁹ The lack of snow cover is impacting the flow levels and temperatures of trout-bearing and salmon-bearing rivers and streams and could ultimately render some of those rivers uninhabitable.²⁰

Rising sea levels have similarly dramatic habitat impacts. In the past century,

the average global sea level rose between 4 and 8 inches, and sea levels are expected to rise between 4 and 35 inches by 2100.²¹ This will disrupt many species that rely on areas of shallow water for habitat, such as dolphins and manatees. In combination with the more frequent and intense hurricanes predicted to result from higher water temperatures, rising sea levels will lead to diminished beach habitats due to the flooding and erosion of coastal areas.²² This could lead to drastic consequences for those species that rely on those coastal areas for habitat, such as seals and sea turtles. Rising sea levels will also impact freshwater species in coastal areas where the ocean water will increase the salinity of rivers and irrigation water in those regions.²³

3. *Invasive Species Adapting to Ecosystems Altered by Climate Change*

The adverse impacts of invasive species on native species are expected to be exacerbated due to invasive colonization of vegetation communities. These communities have suffered dieback as a result of new temperature and precipitation conditions and poleward and upslope expansion in the wake of climate change.²⁴

Research has also indicated that due to increased moisture and warmth in higher latitudes and higher elevation habitats, “tropical and subtropical diseases are projected to move poleward or upslope.”²⁵ Not only will new pathogens creep into new areas that are unsuited to accommodate those species, but climate zones that generally experience seasons with average cold temperatures are predicted to experience longer annual periods of warmer temperatures that will facilitate increased pathogen growth and reproduction.²⁶ For example, increased temperatures have been cited as the cause of avian malaria in several thousand birds in Hawaii, distemper in African lions due to an insect-borne pathogen in Tanzania, and diseases that cause deadly bleaching in coral reefs.²⁷

§ 21:62 Potential implications for ESA application

In light of the growing evidence of climate change impact on species and their habitats, as described above, Congress has urged the FWS and the NMFS to take

climate change into consideration with regard to effects on species.¹ However, considering climate change in the context of the ESA will be challenging due to the global nature of sources contributing to the problem and the difficulty of addressing these causes and impacts for individual species and small-scale ecosystems. Given the statutory framework of the ESA, the impacts of climate change will have to be assessed in regard to the core issues the ESA addresses: what species to protect and where and which threats to regulate and how. The following discussion examines these questions, focusing on the role of climate change in the listing process under § 4, the take prohibition under § 9, and the incidental take permitting processes (no jeopardy standard) under § 7 and § 10.

1. *Section 4: Listing Decisions, Critical Habitat Designation, and Recovery Plans*

a. Listing of Endangered and Threatened Species

The listing of species as threatened or endangered under § 4 is based on the following criteria: “(a) the present or threatened destruction, modification, or curtailment of its habitat or range; (b) overutilization for commercial, recreational, scientific, or education purposes; (c) disease or predation; (d) the inadequacy of existing regulatory mechanisms; or (e) other natural or manmade factors affecting its continued existence.”² The 2008 listing of the polar bear is probably the most prominent listing primarily based on climate change-induced impacts.³

In its listing of the polar bear as a threatened species, the FWS found that sea ice, the polar bear’s primary habitat, was declining throughout its range and that this decline was expected to continue.⁴ The FWS concluded that arctic sea ice would “continue to be affected by climate change” and more dramatically, that “catastrophic mortality events that have yet to be realized on a large scale are expected to occur.”⁵ In light of the five statutory criteria listed above, the FWS issued its listing determination primarily because “[c]hanges in sea ice negatively impact polar bears by increasing the energetic demands of movement in seeking prey, causing seasonal distribution of substantial portions of populations into marginal ice or terrestrial habitats with limited values for feeding, and increasing the susceptibility of bears to other stressors”⁶ The FWS concluded that these adverse impacts on the polar bear’s habitat threatened the species throughout its range.

[Section 21:62]

¹See *Appropriators Urge Interior to Deepen Review of How Global Warming Is Affecting Species*, 38 Env’t Rep. (BNA) 1015 (2007).

²16 U.S.C.A. § 1533(a)(1), ELR Stat. ESA § 4(a)(1).

³See 73 Fed. Reg. 28212 (May 15, 2008) (listing the polar bear as threatened); 71 Fed. Reg. 26852 (May 9, 2006) (listing the elkhorn coral and staghorn coral as threatened). The FWS had also considered climate change in earlier listing decisions. See 69 Fed. Reg. 76428, 76429 (Dec. 21, 2004) (withdrawn) (stating “we recognized in the proposal that the butterfly [Karner blue] may be vulnerable to changes in climate”); 56 Fed. Reg. 28712 (June 24, 1991) (“because of global warming and the [Uncompahgre Fritillary] butterfly’s susceptibility to drought its chances for long-term survival were nil”); 68 Fed. Reg. 7580, 7607 (Feb. 14, 2003) (stating that although the FWS ultimately decided that listing the California spotted owl was unwarranted at the time, it thoroughly discussed the implications of greenhouse gases and climate change on spotted owl populations).

⁴Determination of Threatened Status of the Polar Bear Throughout Its Range, 73 Fed. Reg. at 28212.

⁵Determination of Threatened Status of the Polar Bear Throughout Its Range, 73 Fed. Reg. at 28275.

⁶Determination of Threatened Status of the Polar Bear Throughout Its Range, 73 Fed. Reg. at 28275. Such other stressors include the reduced availability of prey seal species, whose populations are also expected to decline. Indeed, the NMFS initiated a status review in September 2008 of three ice seal species in response to a listing petition based in large part on climate change-induced impacts similar to those described in the polar bear listing. See 73 Fed. Reg. 51615 (Sept. 4, 2008).

The FWS' findings on the impacts of climate change on the polar bear are considered likely to lead to additional listings of polar species subject to the same stressors. Petitions to list 10 penguin species⁷ and 3 seal species⁸ have been filed, as well as petitions for species in the lower 48 states, like the American pika,⁹ that may be impacted by decreasing snow pack and rising temperatures. Such listings will continue to be at the center of ESA-based climate change litigation.

b. Protective Regulations Under § 4(d)

The polar bear listing also indicates that the distinction between listing a species as “threatened” and “endangered” will be critical. The take prohibitions of § 9 do not apply automatically to threatened species. Section 4(d) allows the FWS and the NMFS to adopt regulations deemed “necessary and advisable for the conservation of” threatened species.¹⁰ The NMFS has issued such regulations for a number of species,¹¹ but the FWS has typically extended the same protections to threatened species as endangered species.¹² In conjunction with its listing of the polar bear as threatened, the FWS issued a Special Rule under § 4(d) that essentially incorporated by reference the protective provisions of the Marine Mammal Protection Act that already applied to activities affecting the polar bear.¹³ Notably, the Special Rule explicitly exempted any taking of polar bears incidental to “an otherwise lawful activity within any area subject to the jurisdiction of the United States except Alaska,” complementing its guidance (discussed *infra*) concerning § 7 and consultations that could theoretically be triggered by GHG emissions in the lower 48 states with attenuated climate change effects in polar regions. Thus, listing species as “threatened” provides the Services with a great deal more flexibility in formulating protective measures than the “endangered” status and the strict prohibitions of § 9. On May 8, 2009, Interior Secretary Salazar announced that the DOI will retain § 4(d) Special Rule for Polar Bears.¹⁴

c. Critical Habitat Designation

The polar bear listing provides a fairly straightforward model for future climate change-based species listings, but the inherently dynamic effects of climate change

¹³Special Rule for the Polar Bear, 73 Fed. Reg. 28306, 28318 (May 15, 2008) (to be codified at 50 C.F.R. pt. 17).

¹⁴Press Release, Salazar Retains Conservation Rule for Polar Bears, U.S. Department of the Interior, May 8, 2009, available at http://www.doi.gov/news/09_News_Releases/050809b.html (News Release) [hereinafter Salazar Press Release]. Under the Omnibus Appropriations Act of 2009, Congress granted Secretary Salazar authority until May 10, 2009, to revoke the 4(d) rule. Secretary Salazar declined to exercise this authority, explaining that “the best course of action for protecting the polar bear under the Endangered Species Act is to wisely implement the current rule, monitor its effectiveness, and evaluate our options for improving the recovery of the species.”

make the designation of critical habitat for these species substantially more complicated. As discussed above, climate change is expected to force species and their prey to relocate, and rising sea levels and decreasing snow pack will result in substantial physical changes to certain habitats. Critical habitat designations in the context of climate change thus pose another new challenge for the Services.

Section 4 of the ESA provides the FWS and the NMFS with considerable flexibility in designating critical habitat. First, critical habitat may include “specific areas outside the geographical area occupied by the species” upon a determination that such areas are “essential for conservation of the species.”¹⁵ This provision provides the opportunity to potentially address the habitat-shifting effects of climate change described above by, for example, using predictive modeling to determine those areas to which species affected by climate change may be migrating and to concentrate conservation efforts on those areas. The FWS applied this kind of approach when considering critical habitat designation for the Preble’s meadow jumping mouse. The FWS included small streams in the species’ critical habitat even though larger streams are more important to the species, on the ground that “Preble’s populations along mountain streams may be less subject to certain threats including . . . long-term climate change.”¹⁶

On the other hand, the ESA and its regulations also provide the flexibility to decline to designate critical habitat if it would not be “prudent,” based on a determination that it would not be beneficial to the species. The Services may also conclude that critical habitat is “indeterminable” in the face of the uncertainty posed by climate change. This was the position adopted by the FWS with respect to the polar bear. The FWS concluded that there was too much uncertainty as to which specific areas within the United States “might be essential to the conservation of the polar bear” and consequently found that critical habitat was indeterminable.¹⁷

d. Recovery Plans

ESA § 4(f) requires the FWS and the NMFS to develop recovery plans “for the conservation and survival of endangered species and threatened species listed pursuant to this section, unless [they find] that such a plan will not promote the conservation of the species.”¹⁸ This caveat gives the FWS and the NMFS the discretion not to prepare recovery plans, which may be more likely in climate change-based listings where there may be few practical domestic mechanisms to promote recovery in the face of a globalized problem. But in at least one case, the FWS has suggested that integration of climate change in the recovery plan can “support recovery actions to protect and restore local habitat and restore local habitat conditions as a buffer against larger-scale changes.”¹⁹ Thus, climate change can inform the development of localized recovery plans. Recovery plans in general can also provide extensive information about a species and can guide and inform complementary local, state, and private conservation and recovery efforts, in addition to informing incidental take authorizations under §§ 7 and 10 of the ESA.

2. Section 9: The Take Prohibition

Section 9 prohibits acts that “harass, harm, pursue, hunt, shoot, wound, kill, trap,

capture, or collect” listed species.²⁰ In *Babbitt v. Sweet Home Chapter of Communities for a Great Oregon*, the Supreme Court upheld the FWS’ definition of “harm” to include any modification of the species’ habitat that results in “actual death or injury” to a species “by significantly impairing essential behavioral patterns, including breeding, feeding, or sheltering.”²¹ This raises the question in the climate change context of whether GHG emissions contributing to climate change can proximately cause “harm” for ESA purposes.²² In *Sweet Home*, the Court emphasized the importance of “proximate causation and foreseeability”²³ when defining harmful activities, but these elements can be rather attenuated when dealing with climate change. On the other hand, the Supreme Court in *Massachusetts* allowed a less proximate causal chain in order to establish the “injury in fact” element to determine that the plaintiffs had standing in that case.²⁴ There, the Court first noted that there is indeed “a causal connection between man-made greenhouse gas emissions and global warming” and concluded that the Court may require the EPA to regulate automobile emissions in order to reduce domestic production of those GHGs, even if doing so would merely be a “tentative step” toward combating global climate change.²⁵ This illustrates that, in the context of takings caused by climate change, causation may take many forms, so agency discretion will have an especially important role in implementing the regulatory scheme.

3. Section 7: Jeopardy Consultations

Consideration of climate change in § 7 consultations presents two issues: (1) whether federal actions that cause, fund, or authorize greenhouse gas emissions are “likely to jeopardize the continued existence of any endangered or threatened species or result in the destruction or adverse modification of [critical] habitat,”²⁶ and (2) how the FWS and the NMFS should consider the effects of other federal actions in the context of climate change. The direct and indirect effects requiring consideration under the § 9 jeopardy standard include those effects “that are caused by the proposed action and are later in time, but still are reasonably certain to occur,” and “those effects of future State or private activities, not involving Federal activities, that are reasonably certain to occur within the action area of the Federal action subject to consultation.”²⁷ Based on these definitions, a causal connection can be drawn between GHG emissions and climate change-induced effects on species, such that federal authorizations resulting in GHG emissions could theoretically trigger § 7 consultation.

In anticipation of such arguments, the FWS issued guidance in the wake of the polar bear listing. The guidance explicitly stated that the FWS did not anticipate that such federal authorizations of projects involving GHG emissions would present a sufficient causal connection between, for example, emissions at an individual facility and individualized impacts on a species like the polar bear that is affected by

²⁷50 C.F.R. § 402.02.

climate change in general.²⁸ The U.S. Geological Survey concluded in concurrent guidance that “current science and models cannot link individual actions that contribute to atmospheric carbon levels to specific responses of species, including polar bears.”²⁹ Similarly, the FWS concluded:

The best scientific data available today do not allow us to draw a causal connection between GHG emissions from a given facility and effects posed to listed species or their habitat, nor are there sufficient data to establish that such impacts are reasonably certain to occur. Without sufficient data to establish the required causal connection—to the level of reasonably certainty—between a new facility’s GHG emissions and impacts to listed species or critical habitat, Section 7 consultation would not be required to address impacts of a facility’s GHG emissions.³⁰

The FWS and the NMFS subsequently proposed an update to the consultation regulations to reflect this guidance on the scope of consultation, specifically focusing on requiring a clear causal connection between a federal project and impacts to listed species.³¹ Consultation is not triggered where the

effects of [the] action are manifested through global processes and: (i) Cannot be reliably predicted or measured at the scale of a listed species’ current range, or (ii) Would result at most in an extremely small, insignificant impact on a listed species or critical habitat, or (iii) Are such that the potential risk of harm to a listed species or critical habitat is remote; or (3) The effects of such action on a listed species or critical habitat: (i) Are not capable of being measured or detected in a manner that permits meaningful evaluation; or (ii) Are wholly beneficial.³²

In issuing the final revisions to the § 7 consultation regulations on December 16, 2008, the FWS and the NMFS clarified the phrase “manifested through global processes” as covering “those effects that are the result of a specific source but become well mixed and diffused at the global scale such that they lose their individual identity.”³³ They recognized that these combined effects become a “potential contributor to a separate phenomenon with possible global impacts,” but that the contribution of any particular source to the global process that then affects a global environment is typically “very, very small.”³⁴ However, the FWS and the NMFS also explained that the term “manifested through global processes” does not refer to effects “that can be evaluated for the immediate effects on the surrounding area caused by their primary physical and chemical characteristics [because] they would be traced and measured to the extent possible”³⁵ and that the term does not “preclude the appropriate consideration of climate change, generally, for purposes of establishing the environmental baseline and the status of the species in the action area [for example, information on different precipitation patterns than experienced in the past].”³⁶

In explaining the intent behind this revision and behind the rule more generally,

the FWS and the NMFS stated unequivocally that they “believe that section 7(a)(2) simply was not intended to deal with global processes at individual project level consultations.”³⁷ The FWS and the NMFS captured the practical problem of using the ESA to regulate climate change by observing that “to attempt to regulate effects at a global scale would have the untenable consequence of transforming the ‘action area’ for consultation into the globe itself.”³⁸ Directly addressing the intent of the ESA, the FWS and the NMFS stated further that they do not believe “that Congress designed or intended the ESA to be utilized as a tool to regulate global processes.”³⁹ This discussion concluded with the following statement, which goes to one of the essential policy debates in climate change regulation and clearly indicates on which side of the policy debate the prior Bush Administration landed: it is not “appropriate to hold an agency responsible for global processes.”⁴⁰ Although the Obama Administration subsequently rescinded the December 16, 2008, revised § 7 consultation rule, it retained the Polar Bear Conservation Rule.⁴¹ In so doing, Secretary of the Interior Salazar clarified the Obama Administration’s position that the ESA is not the proper regulatory mechanism for addressing climate change.⁴²

This recent policy reflects a balancing act by the FWS and the NMFS between, on the one hand, acknowledging and responding to climate change in its listing process, and on the other hand, reining in a potentially far-reaching ESA interpretation that could require federal agencies to consult on the attenuated GHG-related effects of a project on species ranging from the polar bear to tropical corals.

While the policy position of the FWS and the NMFS on the appropriateness of regulating climate change through the ESA is clear, the language itself appears to present ripe opportunities for confusion and litigation. Phrases like “global processes,” “extremely” or “very, very” small, and “well mixed” are vague and ill-defined and have not been used in past ESA practice.⁴³ In fact, Secretary Salazar and Commerce Secretary Locke requested public comments on numerous ESA causation issues, including the issue of effects related to global climate change.⁴⁴

Recently, there have been several cases that raise the issue of global climate change as a necessary “effect” to be considered in the formal consultation between the agency and the FWS or the NMFS. Two companion cases in California (the Delta Cases) involved challenges to biological opinions issued for the federally managed Central Valley Project and the state of California’s State Water Project authorizing incidental take of the Delta smelt and several listed salmonids.⁴⁵ Among other issues, the court held that the FWS acted arbitrarily and capriciously by failing to address the issue of climate change, which the court described as a failure to analyze a potentially “important aspect of the problem” of water supply in California.⁴⁶ Citing the statutory requirement to use the “best scientific and commercial data available,” the court found that the FWS’ conclusions were impermissibly “based in part on the assumption that the hydrology of the water bodies af-

fectured by [the projects] will follow historical patterns for the next 20 years”⁴⁷ and that there was “readily available scientific data . . . regarding the potential effects of global climate change”⁴⁸ on the project area. The Delta Cases thus provide an example of how climate change may enter into the consultation process more indirectly.

4. *Section 10: Incidental Take Permits and Experimental Populations*

a. Incidental Take Permits

The assessment of climate change-induced impacts to listed species in the context of § 10 presents the same challenges described above with respect to § 7 of the ESA. The same questions that could be raised about the need to consult on attenuated GHG-related impacts to species in the consultation context could also be raised in the context of incidental take permit applications under § 10. Two related elements unique to the habitat conservation planning under § 10, however, raise additional issues relevant to climate change: adaptive management and the No Surprises Policy. Under the No Surprises Policy, habitat conservation plans (HCPs) typically provide assurances that the FWS and the NMFS will not impose additional mitigation requirements to address future impacts by “unforeseen circumstances,” while prescribing certain additional mitigation requirements in the event of identified “changed circumstances.”⁴⁹ The court’s analysis in the Delta Cases suggests that climate change-induced impacts would be reasonably foreseeable changed circumstances for which additional mitigation measures could be required. Adaptive management principles that have been long incorporated into HCPs to address changed circumstances can be used to address those reasonably foreseeable effects of climate change, such as rising sea levels and changes in precipitation, and provide flexibility in the HCP process.

b. Experimental Populations

Section 10(j) of the ESA authorizes the FWS to transport and release members of a listed species into new areas as “experimental populations,” upon the determination that “such release will further the conservation of such species.”⁵⁰ The areas available for release include the species’ “probable historic range” or other suitable natural habitat that may not have been previously occupied by the species.⁵¹ This option for release and reintroduction of listed species to new habitats creates potential opportunities for climate change application with regard to necessity for relocation and impacts on prior and current habitats available for assisted migration. The process would potentially allow facilitation of the migrations that are already occurring as a result of displacement caused by climate change.⁵²

5. *The “Best Science” Standard*

Overarching the ESA provisions discussed above is the “best scientific and commercial data available” standard, which applies to loss of habitat considerations for

listing decisions,⁵³ critical habitat designation,⁵⁴ and no jeopardy/no adverse modification standards.⁵⁵ The court in the Delta Cases made clear that a defense of “scientific uncertainty” with respect to climate change and its effects is unlikely to prevail in the ESA context. The level of certainty will likely vary with each case, but it is clear that climate change is a factor to be included in the scientific analysis throughout the ESA.

§ 21:63 Conclusion on ESA and climate change

Given the substantial evidence that climate change is causing and is likely to continue to cause ecosystem disruptions, the various regulatory programs and determinations under the ESA can be expected to provide an increasingly contentious venue for climate change-related litigation. While the FWS and the NMFS under both the Bush and Obama Administrations have recently been more willing to acknowledge and address climate change in the context of the ESA, with the listing of the polar bear and additional listings likely to follow, the FWS and the NMFS have, so far, taken a hard line on attempting to actually regulate GHG emissions through the lens of the ESA. But recent decisions like the Delta Cases make clear that climate change will need to be taken into account in the application of the “best science available” standard, whether in the listing, consultation, or HCP processes.

XIII. INTERNATIONAL APPLICABILITY OF THE ESA

§ 21:64 Introduction

The threat of species extinction is a problem that knows no national border.¹ Both national and international attempts to promulgate broadly sweeping environmental legislation have been inevitably faced with the balance between conservation and consumption. Conservation of biodiversity, the protection of live specimens, the prevention of the spread of disease, and the avoidance of the introduction of injurious exotic species have become the foci of the U.S. approach to environmental legislation. These aspirations, however, have been tempered by the competing interests of economic development and population growth, especially in developing countries. The effectiveness of international treaties has also been hampered by inconsistent enforcement. Perhaps most staggering, illegal commerce of threatened and endangered species is the third largest illegal trade worldwide (after drugs and weapons), and generates between \$10 and \$20 billion in revenue worldwide.²

§ 21:65 The ESA and international issues

In 1973, Congress enacted the ESA, which was a far-reaching attempt to provide

⁵³See 16 U.S.C.A. § 1533(b)(1)(A), ELR Stat. ESA § 4(b)(1)(A).

⁵⁴See 16 U.S.C.A. § 1533(b)(2), ELR Stat. ESA § 4(b)(2).

⁵⁵See 16 U.S.C.A. § 1536(c), ELR Stat. ESA § 7(c); 50 C.F.R. 402.14(g)(8).

[Section 21:64]

¹Loss of habitat due to development is cited as the greatest threat to threatened and endangered wildlife. Poaching of large game also poses a significant threat. Both of these causes of wildlife destruction are heavily influenced by international trade. Furthermore, many animals travel great distances to perform their life functions. These ranges often encompass the territory of more than one country.

²See generally Robert J. Shaw, *Nabbing the Gourmet Club: Utilizing RICO Enforcement and Punitive Provisions to Curb the International Trade of Endangered Species*, 42 N.Y.L. Sch. L. Rev. 283, 284 (1998). See also Donovan Webster, *The Looting and Smuggling and Fencing and Hoarding of Impossibly Precious, Feathered, and Scaly Wild Things*, N.Y. Times Mag., Feb. 16, 1997, at 28. Illegally trafficked wildlife, according to a 1994 report, includes approximately 27,500 primates, 3.5 million birds, 5.5 million reptiles, 12.5 million reptile skins, 550 million fish, 1,500 tons of live coral, and many other types of wildlife and wildlife products. World Wildlife Fund, *World Trade in Wildlife* (1994).

for conservation, protection, and propagation of endangered species of fish and wildlife, both by federal action and by encouraging the establishment of state endangered species conservation programs.¹ In a statement accompanying the passage of the ESA, Congress declared that “the United States has pledged itself as a sovereign community to conserve to the extent practicable the various species of fish or wildlife and plants facing extinction pursuant to”² various international treaties, international standards, and commitments that will benefit all citizens. The ESA was designed to protect and restore listed fauna and flora, with the eventual goal of species recovery and removal from the lists. The ESA purposefully does not draw a distinction between domestic and exotic animals and plants. The ESA was intended to protect endangered species regardless of origin.

Internationally, the ESA provides financial incentives and U.S. expertise in addressing the preservation and restoration of threatened or endangered species to foreign countries. Sections 8(a) and (b) state:

(a) Financial assistance.

As a demonstration of the commitment of the United States to the world wide protection of endangered species and threatened species, the President may . . . provide to any foreign country (with its consent) assistance in the development and management of programs in that country which the Secretary determines to be necessary or useful for the conservation of any endangered species or threatened species listed by the Secretary pursuant to section 4 of this Act. The President shall provide assistance (which includes, but is not limited to, the acquisition, by lease or otherwise, of lands, waters, or interests therein) to foreign countries under this section under such terms and conditions as he deems appropriate

(b) Encouragement of foreign programs.

In order to carry out further the provisions of this Act, the Secretary, through the Secretary of State, shall encourage:

(1) foreign countries to provide for the conservation of fish or wildlife including endangered species and threatened species listed pursuant to section 4 of this Act;

(2) the entering into of bilateral or multilateral agreements with foreign countries to provide for such conservation; and

(3) foreign persons who directly or indirectly take fish or wildlife in foreign countries or on the high seas for importation into the United States for commercial or other purposes to develop and carry out with such assistance as he may provide, conservation practices designed to enhance such fish or wildlife or plants and their habitat.³

§ 21:66 The Convention on International Trade in Endangered Species of Wild Fauna and Flora

The ESA also implements the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES).¹ CITES, which has 175 signatory par-

ties,² attempts to protect more than 30,000 threatened and endangered species from the overexploitation caused by unregulated international wildlife trade.³ It was the first international treaty to effectively address the conflicting interests of international wildlife conservation and trade⁴ and is credited with continually meeting its two stated goals: (1) to reduce the harmful effects of the commercial trade of threatened or endangered species of fauna and flora; and (2) to establish an international system for sustainable wildlife trade.⁵ Permits are required to trade in threatened or endangered species by member countries.⁶ Sanctions are suggested by CITES to bring signatory country violators into compliance. There is no obligation, however, for CITES signatory governments to enforce CITES' provisions. Due to the experience and affluence of the United States, it has taken the lead in the implementation and enforcement of CITES throughout the world. Enforcement by other countries, however, has been less aggressive.⁷

Despite the elaborate framework it provides, CITES is of limited effectiveness. Its most noteworthy deficiency is not providing for any mandatory enforcement or implementation mechanisms.⁸ CITES only compels the return of the protected speci-

²A State for which the Convention has entered into force is called a Party to CITES. For the list of Parties, visit the CITES website at <http://www.cites.org/eng/disc/parties/alphabet.shtml> (last visited Mar. 22, 2010).

³See the CITES Preamble:

Recognizing that wild fauna and flora in their many beautiful and varied forms are an irreplaceable art of the natural systems of the earth which must be protected for this and the generations to come; Conscious of the ever-growing value of wild fauna and flora from aesthetic, scientific, cultural, recreational, and economic points of view; Recognizing that peoples and States are and should be the best protectors of their own wild fauna and flora; Recognizing, in addition, that international cooperation is essential for the protection of certain species of wild fauna and flora against over-exploitation through international trade; Convinced of the urgency of taking appropriate measures to this end; Have agreed [to commit to the provisions of CITES].

⁴CITES is both a conservation and a trade instrument.

⁵See CITES Preamble, *supra*.

⁶CITES has three categories of protected species. Category I species is comprised of the species most likely to become extinct. As such, these species receive the highest protection. Article II(1) states:

Appendix I shall include all species threatened with extinction which are or may be affected by trade. Trade in specimens of these species must be subject to particularly strict regulation in order not to endanger further their survival and must only be authorized in exceptional circumstances.

Category II species are likely to become endangered unless trade is restricted. Article II(2) states:

Appendix II shall include (a) all species which although are not necessarily now threatened with extinction may become so unless trade in specimens of such species is subject to strict regulation in order to avoid utilization incompatible with their survival; and (b) other species which must be subject to strict regulation in order that trade in specimens in certain species referred to in sub-paragraph (a) of this paragraph may be brought under effective control.

Category III is comprised of species whose trade needs to be regulated to avoid exploitation. Article II(3) states:

Appendix II shall include all species which any Party identifies as being subject to regulation within its jurisdiction for the purpose of preventing or restricting exploitation, and as needing the cooperation of other parties in the control of trade.

See generally CITES arts. I-V.

⁷The European Union, for example, does not provide either criminal or civil sanctions for illegal wildlife trade.

⁸Compare the ESA, 16 U.S.C.A. § 1538(a)(1), ELR Stat. ESA § 9(a)(1), which imposes penalties for any person subject to the jurisdiction of the United States to import, export, offer, or sell in interstate or foreign commerce, or to receive, carry, transport, or ship in interstate or foreign commerce any threatened or endangered species. The Department of the Interior publishes lists of threatened and endangered species. The ESA also makes it unlawful to harass, harm, pursue, shoot, kill, wound, trap, capture, or collect or attempt to engage in any such conduct any threatened or endangered species within the United States, its territories, or on the high seas.

men to its country of origin.⁹ Beyond the return of the specimen, each signatory country must promulgate its own legislation to provide for civil and/or criminal punishment for violations. To compound the problem, many endangered species live in developing countries.¹⁰ These countries are less likely to take action to comply with CITES or any other international treaty due to the competing interests of their citizens for resources.

The United States, however, has been effective in effectuating sanctions in the spirit of CITES to pressure compliance. In 1994, the United States announced an unprecedented trade sanction against Taiwan for its repeated CITES violations.¹¹ Prior to the imposition of the sanctions, the United States repeatedly and publicly warned Taiwan to cease and desist in its trading of endangered tiger and rhinoceros parts.¹² Although the sanctions were lifted one year later, the punitive action was widely viewed as a powerful symbolic and political effort by the United States to follow through on its oft-articulated commitment to protect wildlife without respect to borders.

Previous to the Taiwan sanctions, trade embargoes instituted for environmental purposes had been considered to violate the General Agreement on Tariffs and Trade (GATT).¹³ The World Trade Organization (WTO), on June 15, 2001, approved a trade sanction to punish nations exporting shrimp and shrimp products caught using nets that did not protect endangered sea turtles.¹⁴ This act by the WTO was significant in signaling to other nations that enforcement actions against violators of CITES and other international environmental treaties would be supported by the international trade community.

Not surprisingly, international punitive actions, such as the imposition of trade sanctions by the United States against Taiwan under CITES, cause significant political fallout. Many offending countries have escaped punitive action by other CITES signatory countries by virtue of preexisting trade and diplomatic relations. One such country is China, which at the time of the Taiwan sanctions also had received notice that it was in frequent violation, arguably to a greater degree than Taiwan. Due to an evaluation of the potential political and economic consequences of imposing a trade sanction against China, action was not taken. Furthermore, with respect to Asia generally, a fundamental conflict arises between traditional medicine and what is perceived as the West continuing to impose its will on the lifestyles of others.

Despite these difficulties, many prosecutions have been brought under CITES. In cases where aggressive ESA prosecution of a species trafficker may be complicated, CITES can be uniquely useful to the government, as the proceeding is brought directly against the contraband the government seeks to seize, thus obviating constitutional problems that might arise from a proceeding directly against the ille-

⁹See CITES art. VII(4)(b) (When a living specimen is seized, "the Management Authority shall . . . return the specimen to . . . [the State of origin] at the expense of that State.").

¹⁰The majority of the world's rainforests, which have the greatest concentration of species of any ecosystem, exist within developing countries. Developmental and population demands have led to an epidemic of deforestation since the 1960s.

¹¹Taiwan is a signatory country.

¹²The demand for endangered animal parts for use in Asian medicinal remedies has put a profoundly serious strain on certain species of threatened and endangered fauna and flora. In fact, exploitation of certain species by the medicinal remedy industry of Asia has driven many species, including the white rhinoceros, to the brink of extinction.

gal transporter. For example, in *United States v. 1000 Raw Skins of Caiman Crocodilus Yacare, Etc.*,¹⁵ the court found that the shipment of the skins in question did constitute a violation of CITES¹⁶ by virtue of a positive identification of the species from which the skins came and a comparison with that finding to the statements made on the CITES permits. The court also refused to apply the innocent owner defense to the CITES prosecution under the ESA. As the court in *Carpenter v. Andrus*¹⁷ noted, all imported endangered species are subject to forfeiture by the United States, and the claimant's innocence is not a defense to forfeiture.

Thus, by imposing strict liability on the defendant, the court reasoned that the dual purposes of fulfilling congressional intent and minimizing the ability of individuals from capitalizing on misdeeds would be best served. To this end, the Ninth Circuit reasoned, in *United States v. 53 Electus Parrots*,¹⁸ that the application of strict liability in wildlife forfeiture actions is necessary to effect congressional intent, as diligence by the importer and disincentives to traffic in protected wildlife would be chilled by heightening the burden to the prosecution.¹⁹

This topic was developed further in *United States v. One Handbag of Crocodilus Species*,²⁰ where the United States sought the forfeiture of 57 items allegedly manufactured from the skins of endangered crocodiles. The skins were also improperly identified on their CITES importation certificates. The court held that the importance of protecting endangered species justified the placing of responsibility for compliance squarely upon the shoulders of those who seek to traffic in animal products and that the difficulty of clearly distinguishing an endangered species of crocodilian from a common one could not be used as either a constitutional or factual defense. The court determined that making that distinction was the importer's problem and that the government can hold all importers of contraband strictly liable, regardless of what they knew or believed about their product. Further, the court noted that there are no "innocent owners" of contraband; simply by possessing it, one commits a criminal act.²¹ Further, challenges alleging problems with the delay of proceedings and the possible illegality of the search were subsequently dismissed, as the court's jurisdiction over the items were not affected by possible constitutional complaints of the transporter.²²

In another ESA prosecution, *United States v. Ivey*,²³ the Fifth Circuit held that CITES may be invoked to prosecute individuals for trade in listed threatened or endangered species regardless of whether the country of the specimen's origin was a

²⁰*U.S. v. One Handbag of Crocodilus Species*, 856 F. Supp. 128 (E.D. N.Y. 1994).

²¹*See Secretary of Labor v. DeSisto*, 929 F.2d 789, 32 Fed. R. Evid. Serv. 723 (1st Cir. 1991). The U.S. District Court for the Eastern District of New York stated in *1000 Raw Skins*:

The application of strict liability in wildlife forfeiture actions is necessary to effect Congressional intent. To permit the importer to recover the property because he or she lacks culpability would lend support to the continued commercial traffic of the forbidden wildlife. Additionally, a foreseeable consequence would be to discourage diligent inquiry by the importer, allowing him or her to plead ignorance in the face of an import violation. Furthermore, it is not unreasonable to expect the importer to protect his or her interest by placing the risk of noncompliance on the supplier in negotiating the sales agreement.

²²*See U.S. v. One Handbag of Crocodilus Species*, 856 F. Supp. 128, 133 (E.D. N.Y. 1994). *See U.S. v. Daccarett*, 6 F.3d 37 (2d Cir. 1993).

²³*U.S. v. Ivey*, 949 F.2d 759 (5th Cir. 1991).

signatory.²⁴ The court held that the United States (and all signatories) are obliged to enforce CITES within their borders and that, again, it is the importer's problem to obtain the proper certifications, even if the country of origin is not a signatory to CITES and does not produce such certifications as a matter of course.²⁵ This paperwork burden was further discussed in *Underwater Exotics, Ltd. v. Secretary of the Interior*.²⁶ In this case, the plaintiff brought suit against the Secretary of the Interior, seeking equitable relief. The plaintiff challenged the imposition of restrictions to the renewal of the plaintiff's import/export license. The court found that the FWS' CITES actions against the plaintiff were reasonable in light of three factors: (1) the plaintiff's failure to include CITES documents in shipments; (2) the inclusion of misinformation on CITES documents, when present; and (3) shipments where the plaintiff failed to declare the specimens at all. These violations were charged against the plaintiff under a theory of strict liability. The court, affirming the FWS' imposition of conditions on the plaintiff's license, stated that "[d]ocumentation and recordkeeping of trade in endangered species, such as the paperwork violations at issue in this case, play a critical role in CITES."²⁷

Even importers who are approved may face restrictions upon their use of the specimens they bring into the country. In *World Wildlife Fund v. Hodel*,²⁸ the plaintiffs sought to enjoin the importation of two giant pandas from China. The court stated that both the ESA and CITES must be satisfied before a permit to import an endangered species may be issued. The court held that under CITES: (1) the import must be for purposes that are not detrimental to the survival of the species; (2) the proposed recipient of a living specimen must be suitably equipped to house and care for it; and (3) the specimen must not be used for primarily commercial purposes.²⁹ The court went on to state that "[t]he ESA forbids the importation of endangered species except where the Secretary [of the Interior] has determined that the importation is for scientific purposes or [will] enhance the propagation or survival of the affected species."³⁰ After a discussion of each factor and their application to the facts of the case, the court issued a portion of the requested equitable relief, enjoining the defendant from charging an exhibition fee to the public to view the pandas.

It should be noted that possession of endangered species or byproducts is a crime regardless of how long the contraband item is possessed prior to the prosecution. Applicable statutes or doctrines of limitation do not begin to run until the defendant gives up possession. Otherwise, the offense is ongoing. In *United States v. Winnie*,³¹ a CITES prosecution was brought against a U.S. citizen for possession of a cheetah head and pelt that he obtained while on safari in Africa in 1981. The court had no patience for Mr. Winnie's argument that the charges, brought in 1992, were "stale":

The cheetah was contraband, just like heroin, and the passage of time never made its possession legal. Otherwise, someone like Winnie could hide a cheetah hide for five years and then display it (or even wear it) with impunity. That scenario was not what

Congress had in mind when it prohibited the possession of endangered species.³²

Since it is often difficult to seize threatened or endangered specimens at their time of importation, due to their small size and the relatively low number of enforcement agents,³³ any other holding would simply allow importers and poachers to store their product in secret for longer.

§ 21:67 The Lacey Act

The Lacey Act, which was enacted in 1900, is the oldest U.S. national wildlife protection statute. Today, the Act is an antitrafficking statute that protects all nondomesticated animals, alive or dead, and any of their offspring. The Lacey Act is used by federal prosecutors to supplement federal, state, Native American, and foreign wildlife protection laws by requiring the accurate labeling of wildlife shipments. It imposes civil penalties,¹ forfeiture of wildlife and equipment used in trafficking,² criminal penalties including fines and incarceration,³ and permit revocation for violations.⁴ In its application, the Lacey Act provides the most comprehensive mechanism for combating wildlife trafficking.

Today, the Lacey Act prohibits both the trade in wildlife or plants that have been illegally possessed, transported or sold, and the falsification of documents or the

³²U.S. v. Winnie, 97 F.3d 975, 976 (7th Cir. 1996).

³³According to a 1994 U.S. GAO report, there were only 74 wildlife inspectors at 11 designated ports in the United States. Furthermore, under 25% of the nearly 80,000 annual wildlife shipments to and from the United States were inspected. U.S. GAO, Wildlife Protection 11 (1994).

[Section 21:67]

¹The Lacey Act provides for fines of up to \$10,000 under the trafficking prohibitions of 16 U.S.C.A. § 3372(a) or the fraudulent marking provisions of 16 U.S.C.A. § 3372(d).

Section 3373(a)(1) states:

Any person who engages in conduct prohibited by any provision of this chapter and in the exercise of due care should know that the fish or wildlife or plants were taken, possessed, transported, or sold in violation of, or in a manner unlawful under, any underlying law, treaty, or regulation, and any person who knowingly violates section 3372(d) of this title may be assessed a civil penalty by the Secretary of not more than \$10,000 for each such violation: Provided, that when the violation involves fish, wildlife, or plants with a market value of less than \$350, and involves only the transportation, acquisition or receipt of fish or wildlife or plants taken or possessed in violation of any law, treaty, or regulation of the United States, any Indian tribal law, any foreign law, or any law or regulation of any State, the penalty assessed shall not exceed the maximum provided for violation of said law, treaty, or regulation, or \$10,000, whichever is less.

²The fish, wildlife, or plant specimen itself may be seized, which is imposed on a strict liability basis, as well as any vessels, vehicles, aircraft, or other equipment involved in the violation. The forfeiture, however, may only occur after a felony conviction for the sale of the specimen, and the innocent owner defense may be invoked. A strict liability approach is not applied to the instrumentalities of trafficking.

Section 3374(a)(2) states:

All vessels, vehicles, aircraft, and other equipment used to aid in the importing, exporting, transporting, selling, receiving, acquiring, or purchasing of fish or wildlife or plants in a criminal violation of this chapter for which felony conviction is obtained shall be subject to forfeiture to the United States if (a) the owner of such vessel, vehicle, aircraft, or equipment would be used in a criminal violation of this chapter, and (b) the violation involved the sale or purchase of, the offer of sale, or purchase of, or the intent to sell or purchase, fish, wildlife, or plants.

³The Lacey Act provides for Class A misdemeanors which proscribe a one-year period of incarceration and maximum fines of \$100,000 for individual violators and \$200,000 for organizational violators. The Act also provides for Class E felonies, which are punishable by a maximum penalty of five years incarceration and \$250,000 individual and \$500,000 organizational maximum fines. See 18 U.S.C.A. §§ 3559(a)(5), 3571(b)(3), (c)(3), 16 U.S.C.A. §§ 3373(d)(1), (d)(2), (d)(3)(A).

⁴16 U.S.C.A. §§ 1801 to 1882, 3373(e).

failure to mark wildlife and plant shipments,⁵ and provides criminal and civil penalties for these actions, respectively.⁶ The Lacey Act protects all animals, as it defines the term broadly:

Any wild animal, whether alive or dead, including without limitation any wild mammal, bird, reptile, amphibian, fish, mollusk, crustacean, arthropod, coelenterate, or other invertebrate, whether or not bred, hatched, or born in captivity, and includes any part, product, egg, or offspring thereof.⁷

This language encompasses all of the world's animal life and any derivative therefrom.⁸

It should be noted that the Lacey Act itself cannot be used to punish a taking, as the Lacey Act only applies to what is done with a specimen after a violation of the ESA or other protection law has already occurred. In *United States v. Carpenter*,⁹ a goldfish farmer shot and killed many of the flock of birds that was stealing his crop. He was charged with violation of the Migratory Bird Treaty Act¹⁰ and the Lacey Act. The Ninth Circuit, in reversing the defendant's Lacey Act conviction, held that the Lacey Act did not apply to this situation. The court explained:

In order to violate the Lacey Act a person must do something to wildlife that has already been taken or possessed in violation of law. The government's position collapses the two steps required by the statute into a single step—the very act of knowingly taking the bird in violation of laws is, in the government's view, the act of acquiring the bird. That is not the meaning of the statute. The bird must be taken before acquiring it violates the Lacey Act.¹¹

In this instance, all the defendant did was kill the birds; he did not do anything with them afterward. Thus, while he was guilty of the Migratory Bird Treaty Act violation, the Lacey Act did not apply to his conduct.

The Lacey Act's definition of plants is much more restrictive than that governing animals:

Any wild member of the plant kingdom, including roots, seeds, and other parts thereof, (but excluding common food crops and cultivars) which is indigenous to any State and which is either (a) listed on an appendix to the Convention on International Trade in Endangered Species of Wild Fauna and Flora, or (b) listed pursuant to any State law that provides for the conservation of species threatened with extinction.¹²

In contrast to the Lacey Act's protections of animal life, the plant provisions of the Act do not protect plant species native to other countries. For the Lacey Act to apply, the plant species must be both indigenous to the United States and expressly protected by state law.¹³ Thus, trafficking in endangered exotic plants is not subject to the Lacey Act, while the same conduct for endangered animals is a felony.¹⁴

¹⁰16 U.S.C.A. §§ 701 et seq. (1939).

¹¹*U.S. v. Carpenter*, 933 F.2d 748, 750, 32 Fed. R. Evid. Serv. 1278 (9th Cir. 1991).

¹²16 U.S.C.A. § 3371(f).

¹³16 U.S.C.A. § 3371(f).

¹⁴16 U.S.C.A. §§ 3372(a)(1), (a)(2)(A), 3373(d)(1)(A).

Among the most noted Lacey Act prosecutions is *United States v. McKittrick*.¹⁵ McKittrick, a hunter, killed, skinned, and beheaded a grey wolf that had been brought to the United States for reintroduction to the wild. The defendant was charged with three counts: (1) taking the wolf in violation of the ESA; (2) possessing the wolf in violation of the ESA; and (3) transporting the wolf in violation of the Lacey Act. The Ninth Circuit held, in affirming the defendant's conviction on all three counts, that the experimental conservation program established in the United States was effective to give rise to the wolf's threatened or endangered status. This status change came despite the fact the wolf was not threatened or endangered where it originated. When the wolf entered the United States, it became a member of a threatened or endangered population and was thus subject to the protections of the ESA and the Lacey Act.¹⁶

The ESA has been widely considered "the most comprehensive legislation for [the] preservation of endangered species ever enacted by any nation."¹⁷ Similarly, CITES has been characterized as "the most successful of all international treaties concerned with the conservation of wildlife."¹⁸ The Lacey Act has also provided an effective mechanism for antitrafficking enforcement since its enactment in 1900. Together, these three enactments have provided the legal framework necessary to punish international violators of wildlife law. Further rigorous enforcement of these acts will be one of the keys to addressing the worldwide crisis of overexploitation of threatened or endangered wildlife.

XIV. APPLICATION OF THE ESA TO INDIAN TRIBES AND THEIR LANDS

§ 21:68 Introduction

The applicability of the ESA to Indian tribes¹ and their members' use of tribal lands and resources and exercise of tribal rights remains unclear.² This uncertainty arises because of the potentially conflicting rights and duties of both the Indian tribes and the federal government, including the following: (1) the federal trust responsibility to Indian tribes, Indian lands, and tribal resources; (2) tribal sovereignty; (3) tribal reserved rights³ and other rights; (4) freedom of religion; and

¹⁵*U.S. v. McKittrick*, 142 F.3d 1170 (9th Cir. 1998). The *McKittrick* decision is also significant because the court also held that there is no specific intent requirement for prosecution under § 9 of the ESA. The prosecution was not required to prove that McKittrick knew he was shooting a member of a threatened or endangered species to violate the ESA. All that was required by the ESA was the knowledge that the defendant was shooting an animal and that the animal turned out to be member of an endangered species protected under the ESA.

¹⁶Listing of threatened and endangered species is "the keystone of the Endangered Species Act." This is because civil and criminal penalties are not triggered until a species is listed. H.R. Rep. No. 97-567, at 10 (1982).

¹⁷*Tennessee Valley Authority v. Hill*, 437 U.S. 153, 180, 98 S. Ct. 2279, 57 L. Ed. 2d 117 (1978).

[Section 21:68]

¹The term "Indian tribes" refers to federally recognized Indian tribes. This discussion will only examine the application of the ESA to federally recognized Indian tribes and their members and does not address the application of the ESA to nonfederally recognized Indian tribes or their members.

²See U.S. Dept. of the Interior (DOI) Secretarial Order No. 3206, § 1. (Purpose and Authority) (June 5, 1997), available at http://elips.doi.gov/elips/sec_orders/html_orders/3206.htm [hereinafter Secretarial Order No. 3206].

³As discussed herein below, reserved rights are those rights not transferred to the federal government but "reserved" by Indian tribes pursuant to treaties, agreements, executive orders, and statutes. These rights can be referred to as "treaty rights" or "reserved rights." Generally, this discussion will

(5) the federal duty to protect endangered species.⁴

In 1997, the Secretaries of the Department of Interior and the Department of Commerce (the Departments) issued Secretarial Order No. 3206 aimed at harmonizing these potentially conflicting duties and rights. The purpose of the order was to ensure that the Departments “carry out their responsibilities under the [ESA] in a manner that harmonizes the Federal trust responsibility to tribes, tribal sovereignty, and statutory missions of the Departments and that strives to ensure that Indian tribes do not bear a disproportionate burden for the conservation of listed species, so as to avoid or minimize the potential for conflict and confrontation.”⁵

These conflicting rights and duties raise many questions, some of which remain unresolved, regarding the application of the ESA to Indian tribes. Key questions are:

- What role does the federal fiduciary trust obligation to an Indian tribe and its resources play in the administration of the ESA?
- Can tribal reserved rights be asserted as a defense to a take violation of the ESA?
- Can freedom of religion rights be asserted as a defense to a take violation of the ESA?
- Does tribal sovereign immunity from lawsuit bar citizen actions brought under the ESA against a tribe?
- Does the doctrine of primary jurisdiction require the staying or dismissal of ESA citizen actions against a tribe?

This section will examine these questions and the policies and procedures set forth in Secretarial Order No. 3206 aimed at harmonizing these conflicting duties and rights.

§ 21:69 What role does the federal government’s fiduciary trust obligation to an Indian tribe and its resources play in the administration of the ESA?

The federal government has a trust responsibility toward Indian tribes. As Secretarial Order No. 3206 acknowledges, the “unique and distinctive political relationship between the United States and Indian tribes . . . has given rise to a special federal trust responsibility, involving the legal responsibilities and obligations of the United States toward Indian tribes and the application of fiduciary standards of due care with respect to Indian lands, tribal trust resources, and the exercise of tribal rights.”¹

Under its trust responsibility, the federal government owes a fiduciary duty to its beneficiaries, the tribes and each tribal member, including a duty to conserve trust

use the term “reserved rights,” since courts have held that both treaty and nontreaty tribes have reserved rights. However, this discussion will occasionally use the term “treaty rights” in discussing cases that dealt with reservations created by treaty.

⁴See U.S. Dept. of the Interior (DOI) Secretarial Order No. 3206, § 1. (Purpose and Authority) (June 5, 1997), available at http://elips.doi.gov/elips/sec_orders/html_orders/3206.htm.

⁵See U.S. Dept. of the Interior (DOI) Secretarial Order No. 3206, § 1. (Purpose and Authority) (June 5, 1997), available at http://elips.doi.gov/elips/sec_orders/html_orders/3206.htm.

[Section 21:69]

¹See U.S. Dept. of the Interior (DOI) Secretarial Order No. 3206, § 4. (Background) (June 5, 1997), available at http://elips.doi.gov/elips/sec_orders/html_orders/3206.htm. This statement not only affirms a general fiduciary duty with respect to tribes and their lands and resources, but also applies fiduciary standards of due care to the “exercise of tribal rights.” Such a statement, along with a trustee’s general duty of loyalty to the beneficiary’s interest, could be interpreted to require the federal government to ensure, or at the least support, the exercise of tribal rights.

lands for the benefit of its beneficiaries, the tribe and its members, and a duty of loyalty to such beneficiaries' interests.² In fact, the federal government and its officials are held to the most exacting fiduciary standards, including the standards of a private fiduciary, in administering federal Indian programs and Indian property.³

The federal government acknowledges that such trust responsibility should be taken into account in applying the ESA to Indian tribes. As discussed above, the purpose of Secretarial Order No. 3206 was to ensure that the Departments "carry out their responsibilities under the [ESA] in a manner that harmonizes the Federal trust responsibility to tribes"⁴ Accordingly, the application of the ESA to a federally recognized Indian tribe should take into consideration the interests of the tribe and the benefits that will be received by the tribe by a proposed action that invokes the ESA.

Indian tribes have sued the federal government for breach of this fiduciary duty.⁵ For example, in *Pyramid Lake Paiute Tribe of Indians v. Morton*,⁶ the Secretary of the Interior had issued a series of regulations establishing a basis on which water would be provided from the Truckee River to the Truckee-Carson Irrigation District. The Pyramid Lake Paiute Indian Tribe (the Tribe) challenged the Secretary's action of issuing the regulations alleging, among other grounds, that the Secretary failed his trust responsibilities to the Tribe by unnecessarily diverting water from Pyramid Lake located on the Tribe's lands.⁷ The district court agreed with the Tribe and set aside the regulations. Accordingly, an Indian tribe could in theory sue the federal government for breach of its fiduciary duty based on the administration and enforcement of the ESA.

§ 21:70 The scope and significance of tribal reserved rights

The question of whether tribal reserved rights can be asserted as a defense to a violation of the ESA remains unresolved.¹ The debate revolves around whether Congress intended the ESA to abrogate tribal reserved rights. To understand this debate, it is important to first examine the origin, nature, and extent of tribal reserved rights.

²See U.S. Dept. of the Interior (DOI) Secretarial Order No. 3206, § 4. (Background) (June 5, 1997), available at http://elips.doi.gov/elips/sec_orders/html_orders/3206.htm; see also Donald C. Baur & William Robert Irvin, *Endangered Species Act: Law, Policy & Perspective* ch. 9, 158 (2002).

[Section 21:70]

¹See *U.S. v. Dion*, 476 U.S. 734, 106 S. Ct. 2216, 90 L. Ed. 2d 767 (1986) (Court declined to resolve the question of whether Congress through the ESA abrogated Indian treaty rights to hunt, fish, and gather). See also Donald C. Baur & William Robert Irvin, *Endangered Species Act: Law, Policy & Perspective* ch. 9, 160–63 (2002). It should be noted that *U.S. v. Nuesca*, 945 F.2d 254 (9th Cir. 1991), a case in which the ESA was applied to native Hawaiians, is inapplicable since at the time of its decision native Hawaiians were not a federally recognized Indian tribe.

Simply put, tribal reserved rights are those tribal rights that have not been transferred to the federal government by treaty or through executive orders and statutes. In order to resolve conflicts over lands and rights, the United States and certain Indian tribes signed treaties pursuant to which Indian reservations were created. The U.S. Supreme Court has held that such treaties are not merely a transfer of land and rights to the United States from the tribes, but also represent a reservation by the tribes of all rights not transferred to the federal government.² These nontransferred rights are referred to as “reserved rights” or treaty rights. After the signing of the last Indian treaty in 1871, the federal government continued to create and regulate Indian reservations by executive orders and statute.³ Such orders and statutes have also been found to provide a reservation of Indian rights.⁴ An individual member of an Indian tribe, as well as the tribe, can assert tribal reserved rights.⁵

Such reserved rights can include the right to hunt, fish, and gather both on-reservation and off-reservation. As stated by the Supreme Court, “[a]s a general rule, Indians enjoy exclusive treaty rights to hunt and fish on lands reserved to them, unless such rights were clearly relinquished by treaty or have been modified by Congress.”⁶ Similarly, “Indian reservations created by statute, agreement, or executive order normally carry with them the same implicit hunting rights as those created by treaty.”⁷

Courts have interpreted the scope of the tribal reserved right to hunt, fish, and gather by interpreting the treaty language or executive order as it would have been understood at the time such document was signed.⁸ Accordingly, to understand a tribe’s right to hunt, fish, and gather, one needs to look at the historical hunting, fishing, and gathering practices of the tribe.⁹ However, tribal members are not required to hunt and fish in the same manner as they did, but can adopt modern

practices.¹⁰ Accordingly, courts have held that tribes that traditionally conducted commercial fishing maintained the right to commercially fish using modern methods.¹¹

Courts have also held that Indian tribes have reserved water rights both on-reservation and off-reservation.¹² For example, in *Winters v. United States*,¹³ the Supreme Court held that the tribe had impliedly reserved the right to use the waters of a river when it signed a treaty with the United States.¹⁴ The Court found that the tribal lands needed water to be used in agriculture or ranching.¹⁵ Since the tribe needed such agriculture to survive on the reservation, the court reasoned that the water rights were reserved when the treaty creating the reservation was signed.¹⁶ In 2000, the Working Group on the ESA and Indian Water Rights published its final recommendations in the *Federal Register*.¹⁷ Among other things, this document lists the issues raised by and comments received from tribes and acknowledges that tribes view the implementation of the ESA as a major obstacle to current efforts to develop water resources for use on Indian lands.¹⁸

§ 21:71 The conflict between tribal reserved rights and the ESA

There is a direct conflict between the ESA's prohibition against taking and certain tribal reserved rights, such as hunting. Arguably, such tribal reserved rights cannot coexist with the prohibition against taking where endangered species are involved. Accordingly, either the ESA was not meant to apply to takings done pursuant to tribal reserved rights or Congress intended the ESA to abrogate such reserved rights.

However, the courts that have ruled on whether Congress intended the ESA to abrogate tribal reserved rights to hunt have taken conflicting positions. For example, in *United States v. Dion*,¹ the Eighth Circuit held that the ESA did not abrogate the tribal reserved right to hunt on the reservation. The Supreme Court reviewed and reversed *Dion* on other grounds but expressly left unresolved the question whether

[Section 21:71]

¹*U.S. v. Dion*, 752 F.2d 1261 (8th Cir. 1985).

the ESA abrogates Indian hunting rights.² In *United States v. Billie*,³ the Southern District of Florida decided not to follow the Eighth Circuit's ruling in *Dion* and held that the ESA does abrogate tribal reserved rights to hunt.⁴ A review of the *Dion* and *Billie* cases is instructive to understanding the issues surrounding the debate as to whether the ESA should be used to limit the exercise of tribal rights and use of tribal resources.

In *Dion*, Dwight Dion, a member of the Yankton Sioux Tribe, was charged, among other things, with violating both the Eagle Protection Act⁵ and the ESA for shooting protected eagles on the Yankton Reservation.⁶ The trial court convicted Dion of violating both the Eagle Protection Act and the ESA.⁷ The Eighth Circuit affirmed all of the convictions except those under the ESA.⁸ In so ruling, the court relied on its ruling in *United States v. White*,⁹ in which the court found that the Yankton Sioux Indians reserved a right to hunt eagles on the reservation, based in part on evidence that the Sioux Indians historically captured eagles in a religious ceremony for religious purposes. The court, however, found that the Yankton Sioux had no treaty right to commercially sell parts or carcasses of eagles, since there was no historical evidence of a Yankton Sioux practice of selling such parts or carcasses.¹⁰

The Eighth Circuit then established that it would use an "express reference" test in judging whether Congress intended to abrogate the tribal reserved right to hunt eagles in cases involving criminal violations of the ESA.¹¹ Under the express reference test, the court would look for express references either in the Act itself or its legislative history. The court chose this test over a more lenient standard, the "surrounding circumstances test," which would also consider the surrounding circumstances of the enactment of the law, because the express reference test "leads to greater clarity and more consistent results" and such clarity is "critical where criminal sanctions may be imposed."¹²

In applying the express reference test, the Eighth Circuit could not find any express reference in the ESA or the legislative history that Congress intended to abrogate Indian tribal reserved rights.¹³ The court rejected the idea that intent be construed from the consideration, but ultimate rejection by Congress of a companion bill that would have exempted American Indians from the ESA reasoning that "failure to pass a bill creating a specific exception for American Indians does not show that Congress expressly intended that the Act would abrogate Indian treaty hunting rights."¹⁴

The Eighth Circuit stated that it would reach the same conclusion even under the congressional intent test.¹⁵ Under the congressional intent test, the court considered but did not find persuasive the argument that the broad purpose of the ESA shows

that Congress intended the ESA to abrogate tribal reserved rights.¹⁶

Unlike the Billie court, the Eighth Circuit dismissed those cases that allow for the regulation of tribal hunting rights and those cases holding in dicta that treaty rights do not give the Indians a right to hunt a species to extinction, for two reasons.¹⁷ First, the court held that such cases deal with off-reservation hunting rights, not on-reservation rights.¹⁸ Second, the court held that it was not confronted with the problem of imminent extinction and thus, Congress still has time to expressly abrogate Indian rights if it wishes to do so.¹⁹

The Supreme Court reversed the Eighth Circuit's *Dion* holding that the Eagle Protection Act abrogated the reserved rights of Indians to take bald and golden eagles.²⁰ Furthermore, the Court held that even if the ESA did not expressly abrogate such reserved rights, Indians could not assert such reserved rights as a defense to prosecution under the ESA, since the Eagle Protection Act divested the Indians of such reserved rights.²¹ In making these determinations, the Court acknowledged that it had enunciated different standards for determining if Congress had abrogated Indian reserved rights, but concluded that "what is essential is clear evidence that Congress actually considered the conflict between its intended action on the one hand and the Indian treaty rights on the other, and chose to resolve that conflict by abrogating the treaty."²² The Court applied this standard to the Eagle Protection Act and found that Congress considered the special and religious interests of Indians and balanced those needs against the conservation purposes of the statute, providing a specific, narrow exception in which Indians would be allowed to take eagles.²³ The Court made this finding based upon the fact that the legislative history of the 1962 amendments to the Eagle Protection Act set forth a provision allowing the Secretary to permit the taking of an eagle for Indian religious purposes.²⁴ That was seen as both an indication that Congress believed it was abrogating Indian reserved rights to take eagles and an indication that Congress had considered the conflict between the ESA and Indian reserved rights to take eagles.²⁵

Notably, the Court decided not to rule on three issues before it. First, the Court specifically stated that it was not resolving the question of whether the ESA abrogated Indian reserved rights.²⁶ However, the Court in one section of its opinion indicated that it agrees that the ESA does not address tribal reserved rights. The Court stated that "Congress' failure to discuss [Indian treaty shield to hunt eagles] in the context of the [ESA] did not revive that right."²⁷ One might conclude from such a statement that the Court would have found that the ESA did not abrogate Indian reserve rights if it had chosen to consider this issue. Second, the Court also expressly stated that it would not address the government's argument that "Dion's hunting is outside the scope of the treaty right because that right does not protect

hunting ‘to extinction.’”²⁸ Finally, the Court did not rule on religious freedom claims raised by amici.²⁹ As discussed below, the Billie court considered all three of these issues and resolved them against the tribal rights.

In *Billie*, James Billie, a member and chairman of the Seminole Indian Tribe, was charged with violating the ESA for taking an endangered Florida panther on the Big Cypress Seminole Indian Reservation.³⁰ The Florida District Court found that the question of whether the ESA abrogates Indian hunting rights “presents a question of first impression in the Eleventh Circuit” since the Court had “expressly left unresolved the question of whether the [ESA] abrogates Indian hunting rights” in *Dion* and the Eighth Circuit’s en banc opinion was “not binding on this court.”³¹ The Billie court then went on to hold that the ESA did abrogate Indian hunting rights “based on both the character of their hunting rights and on the Act’s abrogation of those rights.”³² As to the character of Indian hunting rights, the Billie court relied upon non-ESA cases in which Indian rights to hunt and fish were regulated to conclude that “Indian rights to hunt and fish are not absolute.”³³

As to the abrogation of Indian hunting rights, the Billie court rejected the “express reference” test adopted by the Eighth Circuit in *Dion*.³⁴ Instead, the Billie court concluded that congressional intent could also be found by a reviewing court from clear and reliable evidence in the legislative history of a statute.³⁵ As to such intent, the Billie court stated that “[w]hat is essential is clear evidence that Congress actually considered the conflict between its intended action on the one hand and Indian treaty rights on the other, and chose to resolve that conflict by abrogating the treaty.”³⁶

In applying the clear evidence of congressional intent standard, the Billie court reviewed the following evidence in the statute and the legislative history:

- (1) Congress choose to make an exemption to the ESA for Alaskan natives³⁷ (§ 1539(e) of the ESA).
- (2) Congress considered but rejected an exemption to the ESA for consumption and ritual use by American Indians and others.
- (3) Congress was informed in subcommittee hearings on H.R. 13081 that if Congress deletes the consumption and ritual use exemption for American Indians and others, Indian treaty rights will be preserved since such rights must be expressly eliminated.
- (4) Congress was informed in connection with H.R. 13081 that treaty rights would be preserved if the Alaskan exemption were stricken and did not strike such exemption.
- (5) A statement by an official in the hearing on H.R. 13081 that statements made by the Committee indicate a desire to prohibit American Indians from continuing to hunt and fish because of a concern for the perils of our endangered species and presumed inconsistency therewith.

³⁷16 U.S.C.A. § 1539(e), ELR Stat. ESA § 10(e).

- (6) The ESA defines “person”³⁸ to include “any other entity subject to the jurisdiction of the United States.”³⁹

“From this evidence, the court inferred that Congress must have known that the limited Alaskan exemption would be interpreted to show congressional intent not to exempt other Indians.”⁴⁰ The court held that

[t]he narrow Alaskan exception, the inclusion of Indians within the Act’s definition of “person,” the Act’s general comprehensiveness, and the evidence that the House Committee desired to prohibit Indians from hunting and fishing protected species all provide “clear evidence that Congress actually considered the conflict between its intended action on the one hand and Indian treaty rights on the other, and chose to resolve that conflict by abrogating the Indian rights.”⁴¹

The court further reasoned that “[w]hen Congress passed ‘the most comprehensive legislation for the preservation for endangered species ever enacted by any nation,’ . . . it could not have intended that the Indians would have the unfettered right to kill the last handful of Florida panthers.”⁴²

It is unclear whether other courts will consider such facts as “clear” evidence of congressional intent to abrogate Indian tribe reserved rights. However, even the Billie court considered whether the fact that Congress was told that it should but did not expressly abrogate Indian treaty rights “might be evidence that Congress believed it would not extinguish non-Alaskan Indian hunting and fishing rights without an express provision and that the lack of such a provision evinces congressional intent not to abrogate those rights.”⁴³ The Billie court rejected that this could be the case, since H.R. 13081, a companion bill that closely paralleled the ESA, was not the bill that eventually passed.⁴⁴ Moreover, this rejection of this particular statement made in hearings on H.R. 13081 does not square with the court’s reliance on other statements made in the hearings on H.R. 13081, including the statement that Congress indicates that it desires to prohibit Indians from hunting endangered species.⁴⁵ It is also unclear whether such courts will rely on those cases that regulate Indian hunting or those cases that discuss whether Indians should have the right to hunt a species to its extinction like the district court did in Billie or distinguish such cases as the Eighth Circuit did in Dion.

Assuming that the ESA does not abrogate all tribal reserved rights that would lead to a taking, a court will look at the following to see if a tribe or tribal member can assert a defense to an ESA violation: (1) whether the act that is the alleged violation of the ESA is in the scope of the tribal reserved right; and (2) whether the tribal reserved right has been abrogated by Congress other than by the ESA.

§ 21:72 Can religious freedom rights be asserted as a defense to a take violation of the ESA?

As recognized in Secretarial Order No. 3206, “Indian cultures, religions, and spirituality often involve ceremonial and medicinal uses of plants, animals, and

specific geographic places.”¹ Accordingly, any restriction of the “plants, animals, and specific geographic places” used by Indians with religious significance could lead to a claim that such restriction violated the right to freedom of religion under the First Amendment. The First Amendment guarantees that “Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech, or of the press; or the right of the people peaceably to assemble, and to petition the Government for a redress of grievances.”² However, “not all burdens on religion are unconstitutional.”³ The freedom to believe is absolute and cannot be burdened, but the freedom to act “remains subject to regulation for the protection of society.”⁴

The Billie court examined whether the ESA placed unconstitutional burdens on the defendant Billie’s right to freedom of religion. In doing so, the Billie court first examined whether the ESA passed the following “two threshold tests” of constitutionality: (1) the law must regulate conduct rather than belief; and (2) the law must have both a secular purpose and a secular effect.⁵ The Billie court held that “the [ESA] passes both of these tests” since the “Act regulates conduct, not belief, and is facially neutral in its application” in that its purpose and effect is to protect endangered and threatened wildlife.⁶

The Billie court next turned to “the difficult task of balancing governmental interest against the impugned religious interest.”⁷ The Billie court referred to the Eleventh Circuit’s “basic principle” that “the balance depends upon the cost to the Government of altering its activity to allow the religious practice to continue unimpeded versus the cost to the religious interest imposed by the Government activity.”⁸ The Billie court then weighed the fact that there are approximately 20 to 50 black Florida panthers in the wild in South Florida and therefore the loss of one breeding adult would be great and found the government’s interest in protecting the Florida black panther on the Seminole Indian Reservation “compelling” and that “the cost to the Government of altering its conservation efforts would also be substantial.”⁹

The Billie court then balanced such governmental interest and costs against the defendant Billie’s asserted religious interest in hunting and possessing the Florida black panther.¹⁰ The Billie court held that for an alleged infringement of religious rights to be cognizable, the practice in question must be central or indispensable to

religious observances.¹¹ The court considered testimony that panther claws and tails are used by Seminole medicine men in the treatment of different ailments, including cramps.¹² However, the Billie court noted that the defendant testified that “he had no thoughts regarding what he would do with the panther carcass after he shot it until the morning on which it was seized” and that he then thought that he could give it as a gift to a medicine man in order to humble himself and in the hope of learning more medicine.¹³ The court was “not convinced that panther parts are critical or essential” or “indispensable.”¹⁴ The court also inferred that because the defendant had failed to put on evidence that only Florida black panthers could be used in Indian religious ceremonies that other subspecies of panther may be available to use.¹⁵ The Billie court then concluded that “the evidence has not adequately shown that Billie’s religious interest in possessing panther parts should outweigh the compelling governmental interest in protecting the Florida panther.”¹⁶

Despite the outcome in Billie, the balancing of interest test used by the court could, in a different scenario, lead to a successful claim that the ESA violates freedom of religion by prohibiting a central and indispensable religious observance. For example, a successful religious freedom claim could occur in a case where the violation does not involve a direct take of a species whose numbers are dangerously close to the brink of extinction and where the violative act is more closely linked to a religious necessity than an afterthought once charges under the ESA have been brought.

§ 21:73 Does tribal sovereign immunity against lawsuits bar non-consensual citizen actions under the ESA against Indian tribes?

Another legal question that remains unresolved is whether Congress has abrogated tribal sovereign immunity against non-consensual citizen actions under the ESA. As with tribal reserved rights, the debate revolves around Congress’ intent to abrogate tribal sovereign immunity.

1. Tribal Sovereignty and Sovereign Immunity From Lawsuit

Indian tribes are domestic dependent nations that exercise inherent sovereign authority over their members and territories.¹ As such, Indian tribes have the right to form their own government, promulgate their own laws, and have police powers over their own tribal members and tribal lands.²

Tribal sovereignty bars suits brought by individuals and nonfederal government entities, such as states, against Indian tribes absent a clear waiver by the tribe or

¹Oklahoma Tax Com’n v. Citizen Band Potawatomi Indian Tribe of Oklahoma, 498 U.S. 505, 509, 111 S. Ct. 905, 112 L. Ed. 2d 1112 (1991); U. S. v. Wheeler, 435 U.S. 313, 328, 98 S. Ct. 1079, 55 L. Ed. 2d 303 (1978). See also Felix S. Cohen, Handbook of Federal Indian Law ch. 3, § C, 246–57 (1982 ed.).

²Oklahoma Tax Com’n v. Citizen Band Potawatomi Indian Tribe of Oklahoma, 498 U.S. 505, 509, 111 S. Ct. 905, 112 L. Ed. 2d 1112 (1991). Because of their sovereign authority, Indian tribes and their lands are not subject to state laws, including environmental laws, and states have no jurisdiction over Indian tribes or their lands. See Worcester v. State of Ga., 31 U.S. 515, 558, 8 L. Ed. 483, 1832 WL 3389 (1832).

congressional abrogation of such tribal sovereign immunity.³ In fact, tribal sovereign immunity has been held to bar actions based on off-reservation activities by an Indian tribe.⁴ The Court has held that a tribe's sovereign immunity extends to the tribe's off-reservation commercial activities, noting "to say substantive state laws apply to off-reservation conduct . . . is not to say that a tribe no longer enjoys immunity from suit."⁵ The Court reasoned that "there is a difference between the right to demand compliance with state laws and the means available to enforce them."⁶

Tribal sovereign immunity is, however, not a defense against lawsuits brought by the federal government.⁷ Accordingly, assuming that the ESA can be used to curtail the use of Indian reserved rights, the federal government should be entitled to enforce the ESA against tribes, even in the absence of a congressional abrogation of tribal sovereign immunity.

2. *Has Congress Waived Tribal Sovereign Immunity From Citizen Suits?*

"[A] waiver of sovereign immunity 'cannot be implied but must be unequivocally expressed.'"⁸ Furthermore, the issue of the waiver of sovereign immunity is separate from the issue of the waiver of tribal reserved rights, since the mere "fact that a statute applies to Indian Tribes does not mean that Congress abrogated Tribal immunity in adopting it."⁹ As stated by the Eleventh Circuit, "whether an Indian tribe is subject to a statute and whether the tribe may be sued for violating the statute are two entirely different questions."¹⁰ Accordingly, the ESA could apply to Indian tribes but could not be enforced through citizen actions.

Congress does not appear to have waived tribal sovereign immunity from citizen lawsuits when it enacted the ESA. As discussed above, the ESA does not expressly mention Native American Indians nor does it mention their sovereign immunity from lawsuit. Moreover, the ESA does not contain the same language as other environmental statutes that courts have found to be an express and unequivocal congressional abrogation of sovereign immunity from citizen lawsuits. For example, a court has found that Congress expressly and unequivocally abrogated tribal sovereign immunity in the Resource Conservation and Recovery Act (RCRA) of 1976

Miccosukee Tribe of Indians of Florida*, 166 F.3d 1126, 1129–33 (11th Cir. 1999) (holding the Americans With Disabilities Act applies to Indian tribes, but that the Act does not abrogate tribal sovereign immunity, and therefore that private entities may not sue tribes under the Act).

to allow citizens to bring lawsuits against Indian tribes.¹¹ RCRA allows citizens to bring compliance suits against a “person” who is alleged to be in violation of the statute. The court found that the definition of “person,” which specifically includes “municipalities,” encompasses Indian tribes, since the definition of “municipalities” includes “an Indian Tribe or authorized tribal organization.” Similarly, courts found that the Clean Water Act (CWA) and the Safe Drinking Water Act (SDWA) abrogate tribal sovereign immunity from citizen suits because such acts define “person” to include “municipality” and define “municipality” to include “an Indian tribe.”¹² Unlike the CWA, RCRA, and the SDWA, the ESA does not include Indian tribes or authorized tribal organization within any of its definitions.

Although the ESA does not include Indian tribes within its definitions, the ESA does define “person” to include “any other entity subject to the jurisdiction of the United States.”¹³ Whether this broad language could be interpreted to constitute an express and unequivocal abrogation of tribal sovereign immunity against citizen suits under the ESA remains untested. However, in light of the Court’s ruling that “[i]t is settled that a waiver of sovereign immunity cannot be implied but must be unequivocally expressed,”¹⁴ a court must find more than an inference that Congress intended to abrogate tribal sovereign immunity against citizen suits.

§ 21:74 Does the doctrine of primary jurisdiction require the staying or dismissal of citizen actions brought pursuant to the ESA?

In addition to the sovereign immunity defense, an Indian tribe could argue that the doctrine of primary jurisdiction requires a federal court to stay or dismiss any ESA citizen action over which they have jurisdiction pending resolution of ESA issues by the regulatory agency administering the ESA, the NMFS, or the FWS. The primary jurisdiction doctrine “requires judicial abstention in cases where protection of the integrity of a regulatory scheme dictates preliminary resort to the agency which administers the scheme.”¹ In fact, failure to defer to the primary jurisdiction of an administrative agency when required by the doctrine is reversible error.²

Courts have invoked the doctrine of primary jurisdiction in cases where the following factors were present: “(1) the need to resolve an issue that (2) has been placed by Congress within the jurisdiction of an administrative body having regulatory authority (3) pursuant to a statute that subjects an industry or activity to a comprehensive regulatory scheme that (4) requires expertise or uniformity in administration.”³

Arguably, all four factors are present anytime a citizen suit to enforce the ESA would be brought against an Indian tribe. The issue that would need to be resolved is the harmonizing of the potentially conflicting rights and duties of both the specific Indian tribe and the federal government, including the federal trust responsibility to the Indian tribe and its lands and resources, tribal sovereignty, reserved and

other tribal rights, and the federal duty to protect endangered species.⁴ Furthermore, pursuant to Secretarial Order No. 3206, the Departments have acknowledged that they and their administering agencies, the FWS and the NMFS, are charged with resolving these conflicting rights and duties in administering and enforcing the ESA.⁵ Finally, it can be argued that the resolution of the issue of conflicting rights and duties requires expertise and uniformity of administration that can only be achieved by allowing the Departments and their administering agencies, the FWS and the NMFS, to apply the ESA to all Indian tribes.⁶

§ 21:75 Secretarial Order No. 3206's attempt to harmonize the conflicting rights and duties of Indian tribes and the federal government in applying the ESA

Secretarial Order No. 3206 was the result of consultation between federal and tribal participants.¹ As acknowledged by the federal government, the tribes did not acknowledge that the ESA applies to them by participating in the consultation but instead agreed to set aside legal differences to focus on the mutual goals of maintaining and restoring healthy ecosystems and promoting species conservation.²

The Secretarial Order sets forth guidelines for the Departments and the FWS and the NMFS to follow in applying the ESA.³ However, the Order does not preempt, modify, grant, expand, create, or diminish the ESA or any other legally enforceable

⁴Secretarial Order No. 3206 provides ample evidence that there is a need to resolve an issue that has been placed by Congress with the jurisdiction of an administrative body having regulatory authority pursuant to a statute that requires expertise or uniformity in administration. For example, such order provides in part that “the Departments will carry out their responsibilities under the [ESA] in a manner that harmonizes the Federal trust responsibility to tribes, tribal sovereignty, and the statutory missions of the Departments.” U.S. Dept. of the Interior (DOI) Secretarial Order No. 3206, § 1. (Purpose and Authority) (June 5, 1997), *available at* http://elips.doi.gov/elips/sec_orders/html_orders/3206.htm [hereinafter Secretarial Order No. 3206].

⁵Secretarial Order No. 3206 provides ample evidence that there is a need to resolve an issue that has been placed by Congress with the jurisdiction of an administrative body having regulatory authority pursuant to a statute that requires expertise or uniformity in administration. rights, including Indian reserved rights or tribal sovereignty.⁴

Although the Order does not change the legally enforceable rights of the parties, it does give an additional administrative remedy to Indian tribes by providing that an Indian tribe can file a complaint with the appropriate Secretary of the Departments if the Indian tribe feels that certain provisions of the order have been violated.⁵ It also provides for the employment of alternative dispute resolution processes to resolve disputes on technical or policy issues within statutory frames, except for investigative or prosecutorial law enforcement activities.⁶

The Order has several guidelines aimed at ensuring that Indian tribes do not bear an unnecessary burden under the ESA.⁷ For example, the Order provides that critical habitat shall not be designated in areas that may impact tribal trust resources, tribally owned fee lands, or the exercise of tribal rights, unless it is determined essential to conserve a listed species and the FWS and the NMFS have evaluated and documented the extent to which the conservation needs of the listed species can be achieved by limiting the designation to other lands.⁸ The FWS and the NMFS are also directed to try to avoid or minimize effects on tribal management or economic development or the exercise of reserved Indian fishing, hunting, gathering, or other rights, “to the maximum extent allowed by law.”⁹ In addition, the Order provides that in cases involving an activity that could raise the potential issue of an incidental take under the ESA, an analysis and determination shall be undertaken that such activity meets all of the following conservation standards: “(i) the restriction is reasonable and necessary for conservation of the species at issue; (ii) the conservation purpose of the restriction cannot be achieved by reasonable regulation of non-Indian activities; (iii) the measure is the least restrictive alternative available to achieve the required conservation purpose; (iv) the restriction does not discriminate against Indian activities, either as stated or applied; and (v) voluntary tribal measures are not adequate to achieve the necessary conservation purpose.”¹⁰

The Order also has numerous provisions attempting to harmonize the potential conflicts between tribal and federal government rights and duties discussed above. The “government to government consultation” with Indian tribes is a key provision to further such harmony. The Order requires that “whenever the agencies, bureaus,

⁴See U.S. Dept. of the Interior (DOI) Secretarial Order No. 3206, § 2. (Scope of Limitations) (June 5, 1997), available at http://elips.doi.gov/elips/sec_orders/html_orders/3206.htm.

⁵See U.S. Dept. of the Interior (DOI) Secretarial Order No. 3206, § 5. (Responsibilities, Principle 1) (June 5, 1997), available at http://elips.doi.gov/elips/sec_orders/html_orders/3206.htm.

⁷In fact, one of the purposes of Secretarial Order No. 3206 is to strive “to ensure that Indian tribes do not bear a disproportionate burden for the conservation of listed species, so as to avoid or minimize the potential for conflict and confrontation.” U.S. Dept. of the Interior (DOI) Secretarial Order No. 3206, § 1. (Purpose and Authority) (June 5, 1997), available at http://elips.doi.gov/elips/sec_orders/html_orders/3206.htm.

⁸Appendix to U.S. Dept. of the Interior (DOI) Secretarial Order No. 3206, § 3(B)(4) (June 5, 1997), available at http://elips.doi.gov/elips/sec_orders/html_orders/3206.htm. The FWS states that “the Services believe that this is consistent with the special trust responsibility the Federal government has to Indian people to preserve and protect their lands and resources.” See U.S. Fish & Wildlife Service, *supra* note 1.

⁹Appendix to U.S. Dept. of the Interior (DOI) Secretarial Order No. 3206, § 3(B)(5) (June 5, 1997), available at http://elips.doi.gov/elips/sec_orders/html_orders/3206.htm.

¹⁰U.S. Dept. of the Interior (DOI) Secretarial Order No. 3206, § 5. (Responsibilities, Principle 3(C)) (June 5, 1997), available at http://elips.doi.gov/elips/sec_orders/html_orders/3206.htm. This is a restatement of the federal enforcement policy as applied to incidental take of listed species. See U.S. Fish & Wildlife Service, *supra* note 1.

and offices of the Departments are aware that their actions planned under the [ESA] may impact tribal trust resources, the exercise of tribal rights, or Indian lands, they shall consult with, and seek the participation of, the affected Indian tribes to the maximum extent practicable.”¹¹ This duty to have a government-to-government consultation with tribes was reinforced by issuance of Executive Order No. 13175 on November 6, 2000.¹²

To facilitate such government-to-government consultation, the Order requires the FWS and the NMFS to give “timely notification” of petitions to list species and proposed and final rules to list species, designate critical habitat, reclassify or remove a species, and designate experimental populations.¹³ The Order also provides that the FWS and the NMFS notify the affected tribes and the Bureau of Indian Affairs to solicit information on

tribal cultural values, reserved hunting, fishing, gathering, and other Indian rights or tribal economic development for use in: (i) the preparation of economic analyses involving impacts on tribal communities and (ii) the preparation of “balancing tests” to determine appropriate exclusions from critical habitat and in the review of comments or petitions concerning critical habitat that may adversely affect the rights or resources of Indian tribes.¹⁴

The Order also adopts a principle of assisting Indian tribes in developing and expanding tribal conservation and management programs and self-governance.¹⁵ This includes giving deference to tribal conservation and management plans for supporting tribal measures that preclude the need for conservation restrictions and, at the request of a tribe, providing technical assistance and review of and assistance with tribal conservation and resource management plans.¹⁶ In addition, the Order provides that the FWS and the NMFS can, at the request of an Indian tribe, enter into a cooperative law enforcement agreement and that such agreement may include the delegation of enforcement authority under the ESA, within limitations, to full-time tribal conservation law enforcement officers.¹⁷ The duty to support and to give deference to tribal regulations is also embodied in Executive Order No. 13175.¹⁸

XV. EXPERIMENTAL POPULATIONS

§ 21:76 Generally

Since its passage in 1973, the ESA has recognized “live trapping and transplantation” of endangered species as a means to promote conservation and recovery efforts.¹ Until the ESA was amended in 1982, however, species transplantation was rarely utilized, due to vociferous political opposition from landowners who feared that reintroduced, ESA-protected species would be uncontrollable, and in some cases, dangerous.

Unsatisfied with the slow pace of transplantation efforts, Congress amended the ESA in 1982 to reinvigorate the government’s transplantation program. The centerpiece of this effort was the newly created “experimental population” designation created by § 10(j) of the ESA. This new statutory language was designed to give the Secretary of the Interior and affected landowners greater flexibility in dealing with transplanted species by exempting such populations from many of the protections of the ESA.

§ 21:77 Establishment of the experimental population

In order to establish an experimental population, the Secretary of the Interior must first determine that transplanting the species will further conservation efforts. In order to reach this conclusion, the Secretary must consider four factors:

- (1) Possible adverse effects resulting from removal of members of the species from an existing population.
- (2) The likelihood that the experimental population will become established and survive in the foreseeable future.
- (3) The relative effects that the experimental population will have on the overall recovery of the species.
- (4) The effects of existing or anticipated federal or state or private activities within or adjacent to the experimental population area.¹

If the Secretary concludes the transplantation will be beneficial to the species, then an area to release the species must be chosen. The only requirement for the selected area is that it be outside the current range of the chosen species, so that the experimental population will be “wholly separate geographically from non-experimental populations of the same species.”²

Ideally, the transplantation site will be within the “probable historical range” of the species.³ If such an area is not available, however, the Secretary may choose any area outside the species’ current range.⁴

Before an experimental population can be released, the Secretary must determine

possible” and “encourage Indian tribes to develop their own policies to achieve program objectives” and “where possible, defer to Indian tribes to establish standards”); § 5(b) (providing restriction and procedure for promulgating any regulation that has tribal implications and that preempts tribal law).

whether the new population is “essential to the continued existence” of the species.⁵ Essential populations are those whose loss would likely appreciably reduce the likelihood of the survival of the species as a whole in the wild.⁶ All other experimental populations are to be classified as nonessential.⁷ The FWS’ regulations establish very stringent requirements for establishing an experimental population:

- (1) Appropriate means to identify the experimental population, its location, migration, numbers, and so forth.
- (2) Management restrictions, protective measures, or other special management concerns.
- (3) A process for the periodic review and evaluation of the success or failure of the release and the effect of the release on the conservation and recovery of the species.⁸

§ 21:78 Legal protections afforded to experimental populations

The level of protection afforded to experimental populations under the ESA depends on their classification as “essential” or “nonessential.” Under the statute, essential experimental populations are designated as “threatened species,” even if the species would otherwise be entitled to the more stringent “endangered” status.¹ Nonessential experimental populations are given even less protection, as they are treated as species proposed to be listed under the ESA.²

By weakening the protections of the ESA for experimental populations, Congress sought to increase public support for transplantation efforts by defusing the argument that reintroduced species would be uncontrollable and would cause innocent parties to run afoul of the ESA:

The Committee fully expects that there will be instances where the regulations [promulgated pursuant to the 1982 Amendments] allow for the incidental take of experimental populations, such as the inadvertent taking of experimental fish species by those fishing for other species in the same body of water. The Committee also expects that, where appropriate, the regulations could allow for the directed taking of experimental populations. For example, the release of experimental populations of predators, such as red wolves, could allow for the taking of these animals if depredations occur or if the release of these populations will continue to be frustrated by public opposition.³

As discussed in the next section, Congress’ efforts to alleviate the concerns of affected landowners have not been entirely successful.

§ 21:79 Litigation under § 10(j)

After years of study and debate, in 1994, the Department of the Interior finalized its plans to reintroduce the gray wolf into Yellowstone National Park and central Idaho pursuant to § 10(j) of the ESA.¹ The decision was immediately challenged by interest groups representing local farmers and ranchers with land near the

designated reintroduction areas.²

Among other claims, the landowners alleged that the Department of the Interior had violated § 10(j)'s requirement that experimental populations be wholly separate geographically from nonexperimental populations of the same species. According to the landowners, nonexperimental gray wolves, which wander for hundreds of miles, routinely entered the transplantation area, and therefore the experimental population could not be considered wholly separate.³

The Department of the Interior did not dispute the landowner's allegation of intermingling. Instead, it relied on its interpretation of the term "population," which it defined to include only self-sustaining groups and not lone animals which have temporarily wandered into the transplantation area.⁴

In a holding with considerable significance for the future of the § 10(j) program, the Tenth Circuit deferred to the Department of the Interior's interpretation of population, finding it consistent with the "language and objectives of the [ESA] as a whole."⁵ In a related holding, the court also upheld the agency's right to classify all wolves within the transplantation area as experimental, even if some of the wolves had wandered into the area and were not part of the original experimental population.⁶

The importance of the holding in *Wyoming Farm Bureau Fed'n v. Babbitt* to the § 10(j) program is difficult to overstate. Since the probable historical range of species is often adjacent to areas with existing populations of the species, some degree of intermingling is difficult to avoid. By adopting a loose interpretation of the "wholly distinct" requirement, the Tenth Circuit prevented this biological reality from crippling the § 10(j) program.

Overall, though, the FWS has rarely exercised its authority under the Experimental Population Program. Where it has done so, the FWS has developed special regulations. Subsequent litigation has highlighted the particular conflicts that can arise in this program under the ESA.

XVI. FIFTH AMENDMENT TAKINGS AND THE ESA

§ 21:80 Generally

The Takings Clause of the Fifth Amendment prohibits the government from taking property for public use without "just compensation."¹ This prohibition under the Fifth Amendment must be distinguished from "taking" of a listed species under § 9 of the ESA.² Implementation of the ESA and other statutes and regulations that protect wildlife also presents many situations that raise the question of whether such a Fifth Amendment taking has occurred. These wildlife protection-related situations seldom arise from an attempt by the federal or state authorities to condemn properties utilizing their power of eminent domain. More commonly, these issues

[Section 21:80]

¹U.S. Const. amend. V.

²16 U.S.C.A. § 1538, ELR Stat. ESA § 9. The ESA § 9 prohibition on "taking" of a listed species is premised on the statutory definition of "take" to mean "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct." 16 U.S.C.A. § 1532(19), ELR Stat. ESA § 3(19).

originate from situations in which agencies, in implementing the ESA (or some other wildlife regulation), arguably may have appropriated private property. This distinction may lead to difficulties for property owners. A “taking” may more readily be found when the interference with property can be characterized as a physical invasion by government, than when interference arises from some public program adjusting the benefits and burdens of economic life to promote the common good.³ Indeed, the Supreme Court has recognized two general types of takings. First, where the government encroaches upon or occupies private land for its own proposed use, the Court has held that even a minimal permanent physical occupation of real property requires compensation under the Fifth Amendment.⁴ Second, a taking also occurs where a government regulation, although not encroaching upon or occupying property, simply “goes too far.”⁵

In making the determination as to whether such a “taking” has occurred, a court will engage in a two-step process. First, a court determines whether the plaintiff possesses a valid interest in the property affected by the governmental action, i.e., whether the plaintiff possessed a “stick in the bundle of property rights.” If so, the court proceeds to the second step, determining whether the governmental action at issue constituted a taking of that “stick.”⁶

§ 21:81 What is the property interest?

In the first instance, a court will consider whether a prospective plaintiff claims a valid property interest that is potentially subject to protection. While it is normally clear in cases where entire parcels are condemned for public use that such an ownership right exists, such a conclusion is often not as clear in situations involving the protection of wildlife. Such situations generally involve the restriction of an owner’s right to utilize his property.

It has been held that such an alleged right will not be protected if it is not consistent with the restrictions that “background principles of the State’s law of property and nuisance already place upon land ownership.”¹ This means that, in order to be protected, the property owner’s anticipated use of the property must be one that has been (or would be) recognized under existing law as being appropriately subject to protection.

For example, in *United States ex rel. Bergen v. Lawrence*,² the court ordered the removal of a fence on privately owned property that prevented pronghorn from reaching their range. The court found that no protected ownership interest in the fence existed. As part of its reasoning, the court held that the owner never had the right to exclude wildlife from the property in that manner. The court stated that “[a]ll that [plaintiff] lost is the right to exclude others, including wildlife, from the public domain—a right he never had.”³

³*See, e. g.*, *U.S. v. Causby*, 328 U.S. 256, 66 S. Ct. 1062, 90 L. Ed. 1206 (1946).

⁶*Karuk Tribe of California v. Ammon*, 209 F.3d 1366, 1374 (Fed. Cir. 2000) (internal citation omitted).

[Section 21:81]

¹*Lucas v. South Carolina Coastal Council*, 505 U.S. 1003, 1029, 112 S. Ct. 2886, 120 L. Ed. 2d 798 (1992).

²*U.S. ex rel. Bergen v. Lawrence*, 848 F.2d 1502, 1507–08 (10th Cir. 1988).

³*U.S. ex rel. Bergen v. Lawrence*, 848 F.2d 1502, 1508 (10th Cir. 1988).

Similarly, in *dicta* in *Lucas v. South Carolina Coastal Council*,⁴ the Supreme Court indicated that, in the context of coastal regulation, imposition of a restriction on coastal development would not constitute the interference with such a property right. The Court stated:

[T]he owner of a lake bed—would not be entitled to compensation when he is denied the requisite permit to engage in a landfilling operation that would have the effect of flooding other's land. Such regulatory action may well have the effect of eliminating the land's only economically productive use, but it does not proscribe a productive use that was previously permissible under relevant property and nuisance principles. The use of these properties for what are now expressly prohibited purposes was always unlawful, and (subject to other constitutional limitations) it was open to the State at any point to make the implication of those background principles of nuisance and property law explicit.⁵

Similarly, a property right will not be found if to do so would contravene the public trust doctrine. That doctrine protects the public's rights in natural resources, particularly those associated with navigable waters.⁶ Arguably, in situations where this doctrine applies, it would supersede any conflicting rights that a plaintiff could potentially assert based upon property ownership.

§ 21:82 Has a taking of the property right occurred?

Assuming that a property right subject to protection is identified, the inquiry must then proceed to the second step: determining whether there has been governmental action that constitutes a taking of that "property right."

In this regard, it should first be noted that mere enforcement of regulations protective of wildlife on private property does not constitute a taking.¹ Moreover, it has generally been held that damage to private property resulting from the actions of protected wildlife does not constitute a taking.² Further, "mere 'fluctuations in value' during the process of governmental decision-making, absent extraordinary delay, are incidents of ownership" and do not constitute takings.³

§ 21:83 The development of regulatory takings law

The following cases are important building blocks in the analysis that needs to be undertaken when considering takings in the wildlife context. In *Penn Central Transportation Co. v. City of New York*,¹ the Court considered a preservation law designed to preserve the aesthetic qualities of Pennsylvania Station in New York

[Section 21:83]

¹*Penn Cent. Transp. Co. v. City of New York*, 438 U.S. 104, 98 S. Ct. 2646, 57 L. Ed. 2d 631 (1978).

City. However, the law would also have prevented the construction of a 55-story office complex above the station. The developer claimed that the law restricted his ability to develop his property and should be viewed as a taking. Instead of focusing on whether the law would divide the parcel into several segments (a type of analysis that had been previously utilized in takings cases), the Court rather considered “the nature and extent of the interference with rights in the parcel as a whole.” In reaching its decision, the Court set forth three factors in an ad hoc analysis that should be considered in determining whether a regulatory taking had occurred. These factors were: (1) the economic impact of the regulation on the claimant; (2) the extent to which the regulation has interfered with distinct investment-backed expectations; and (3) the character of the governmental action.

In *Agins v. City of Tiburon*,² the Court further considered these issues. Because of density restrictions, *Agins* was prevented from building a high-density development on his parcel. In considering whether the ordinance constituted a taking, the Court considered not only whether the regulation had a substantial relationship to a legitimate state interest, but also whether the regulation denied an owner the “economically viable use of his land.” The Court held that, although the ordinance prevented the construction of some types of structures on the property, it still permitted the owner some use for the property. The Court therefore held that there had been no taking.

These issues were again considered in *Lucas v. South Carolina Coastal Council*.³ There, the plaintiff had purchased property for the purpose of building a residence. However, a South Carolina coastal statute prohibited the construction of any habitable structure on the property. The plaintiff contended that the statute removed all value from his property and therefore constituted a taking. The trial judge found that the law left his land without value and awarded him damages.⁴ The South Carolina Supreme Court ruled that, as the regulation was intended to prevent serious public harm, no compensation was owed under the Takings Clause, no matter what the resulting effect on the value of the property. The U.S. Supreme Court reversed, stating that when a property owner is forced to “sacrifice *all* economically beneficial uses in the name of the common good, that is, to leave his property economically idle, he has suffered a taking.”⁵

However, although the Court’s opinion articulated the requirement that a landowner must suffer a taking of the *entire* property to be awarded compensation, the Court also signaled that it might be willing to consider whether a regulation would qualify as a taking even though it affects only a portion of a particular property.⁶ This possibility was directly considered in *Loveladies Harbor, Inc. v. United States*.⁷ There, the court held that a denial of a § 404 dredging permit under the Clean Water Act for a portion of a property constituted a taking. However, the decision raised the critical issue of defining the relevant parcel, or “denominator” in the takings

²*Agins v. City of Tiburon*, 447 U.S. 255, 100 S. Ct. 2138, 65 L. Ed. 2d 106 (1980) (abrogated by, *Lingle v. Chevron U.S.A. Inc.*, 544 U.S. 528, 125 S. Ct. 2074, 161 L. Ed. 2d 876 (2005)).

⁴*Lucas v. South Carolina Coastal Council*, 505 U.S. 1003, 1009, 112 S. Ct. 2886, 120 L. Ed. 2d 798 (1992).

⁵*Lucas v. South Carolina Coastal Council*, 505 U.S. 1003, 1019, 112 S. Ct. 2886, 120 L. Ed. 2d 798 (1992).

⁶*Lucas v. South Carolina Coastal Council*, 505 U.S. 1003, 1016 n.7, 112 S. Ct. 2886, 120 L. Ed. 2d 798 (1992).

⁷*Loveladies Harbor, Inc. v. U.S.*, 28 F.3d 1171 (Fed. Cir. 1994).

calculus.⁸

In another decision, *Palazzolo v. Rhode Island*,⁹ the Court addressed another key aspect of the Penn Central ad hoc balancing analysis: a claimant's reasonable investment-backed expectations. There, a property owner was denied a permit to fill 11 of his property's 18 wetland acres under a state's coastal resources management program in order to build a private beach club. The Rhode Island Supreme Court held that he could not assert a taking based on a denial of all economic use of his property because the regulation at issue predated his acquisition. The Court reversed, holding that (1) his claim was ripe because the state had reached a final decision on his application, and (2) his acquisition of title after the state regulations effective date did not bar his takings claim. The Court stated that "a blanket rule that purchasers with notice have no compensation right when a claim becomes ripe is too blunt an instrument to accord with the duty to compensate for what is taken."¹⁰ Thus, the Court remanded the case to address the Penn Central factors. The important rule is that a claimant is not automatically barred from seeking just compensation simply because he had some notice of preexisting environmental legal restrictions on his property.

Another key dichotomy in regulatory takings is whether compensation may be awarded for a "temporary" as compared to a "permanent" taking. In *First English Evangelical Lutheran Church of Glendale v. County of Los Angeles*,¹¹ the Court ruled that (1) land use regulations could result in a taking even when the regulations are temporary, and (2) compensation must be available for any such "temporary taking." However, the Court did not decide what factors would be used to decide whether a temporary taking had occurred. The landmark decision of *Tahoe-Sierra Preservation Council, Inc. v. Tahoe Regional Planning Agency*¹² addressed this issue, holding that a temporary taking should not be determined using the Lucas factors for a categorical taking, even if the government regulation denied the property owner all economically viable use of the land.¹³ Instead, the Court held that a court, faced with a possible temporary regulatory taking, must apply the Penn Central factors.¹⁴ In so doing, the Court held that the Tahoe Regional Planning Commission's 32-month moratorium on development, so that it could study the environmental impact of development on Lake Tahoe and design a corresponding land use strategy, was a reasonable restriction and did not rise to the level of a regulatory taking.

⁸*Deltona Corp. v. U. S.*, 228 Ct. Cl. 476, 657 F.2d 1184 (1981), the court broadly construed this concept, suggesting that the relevant parcel included sections of the original purchase subject to prior development and sale prior to denial of a § 404 permit. Hence, the court denied compensation. More recently, the Court of Federal Claims, in *Loveladies Harbor, Inc. v. United States*, 15 Cl. Ct. 381, 19 Env'tl. L. Rep. 20092 (1988), narrowly defined the term by refusing to include two pieces of the developer's original 250-acre purchase that had been developed and sold off by the date of the alleged taking (193 acres), as well as developed, but unsold, upland lots not contiguous to the parcel subject to § 404 permit denial. On appeal, the Federal Circuit Court found a taking defining the relevant parcel as only the 11.5-acre wetlands parcel, denied a permit, and awarded plaintiffs \$2.6 million. The court enunciated the position that, in defining a parcel as a whole, courts should use "a flexible approach designed to account for factual nuances." *Loveladies Harbor, Inc. v. U.S.*, 28 F.3d 1171 (Fed. Cir. 1994).

⁹*Palazzolo v. Rhode Island*, 533 U.S. 606, 121 S. Ct. 2448, 150 L. Ed. 2d 592 (2001).

¹⁰*Palazzolo v. Rhode Island*, 533 U.S. 606, 609, 121 S. Ct. 2448, 150 L. Ed. 2d 592 (2001).

¹²*Tahoe-Sierra Preservation Council, Inc. v. Tahoe Regional Planning Agency*, 535 U.S. 302, 122 S. Ct. 1465, 152 L. Ed. 2d 517, 10 A.L.R. Fed. 2d 681 (2002).

¹³*Tahoe-Sierra Preservation Council, Inc. v. Tahoe Regional Planning Agency*, 535 U.S. 302, 122 S. Ct. 1465, 1489, 152 L. Ed. 2d 517, 10 A.L.R. Fed. 2d 681 (2002).

¹⁴*Tahoe-Sierra Preservation Council, Inc. v. Tahoe Regional Planning Agency*, 535 U.S. 302, 122 S. Ct. 1465, 1489, 152 L. Ed. 2d 517, 10 A.L.R. Fed. 2d 681 (2002).

Takings jurisprudence has also focused heavily on regulatory exactions. That is, separate from the Penn Central ad hoc balancing test and the Lucas total deprivation analysis, compensation may be awarded if regulatory exactions such as an easement or dedication meet certain tests enumerated by the Court. The first test was addressed by the Court in *Nollan v. California Coastal Commission*.¹⁵ The Court held that in such situations, the governmental authority would be required to demonstrate an “essential nexus” (some logical connection) between the exaction and the purpose of the law under which the exaction is required. Such a requirement prevents the use of permit conditions as a subterfuge that would enable the governmental entity to take property while avoiding the payment of compensation to the property owner altogether. Thus, the Court held that requiring owners of beach-front property to allow the public an easement across the beach portion of their property did not substantially advance the state’s interest in allowing the public to view the beach.

The Court set forth the second test in *Dolan v. City of Tigard*.¹⁶ In *Dolan* a store owner desired to make certain improvements to her property. The municipality conditioned the approval of this request upon the performance of two conditions required under the city’s Community Development Code. These conditions involved the dedication of certain portions of the property to the city. The storeowner requested a variance from these requirements, and the request was denied.

The Court disagreed with this action, holding that such an exaction not only needed to meet the “essential nexus” standard articulated in *Nollan*, but that it would also be necessary for it to be demonstrated that the exaction must be “roughly proportional” to the impact of the permitted action. The Court stated that the governmental agency must make a determination that the requirement is related both in nature and extent to the impact of the proposed development.¹⁷ The Court held that the city had not met this requirement and ultimately that the required dedications constituted a compensable taking.¹⁸

§ 21:84 Fifth Amendment takings cases and the ESA

Takings cases directly involving the presence of listed species or their habitat have been rare but are increasing in number. In *Boise Cascade Corporation v. United States*,¹ a case involving ESA restrictions established to protect spotted owls in logging forest land in Oregon, the Court of Appeals for the Federal Circuit considered whether an action that temporarily interrupted Boise’s logging activities on its property due to the owls constituted (for that period) a taking for which compensation would be required. After one owl died and the other moved off the property, the Oregon Department of Forestry (ODF) allowed logging but warned Boise that the FWS might consider logging the property to be a violation of the ESA.

Boise notified the FWS, which then inspected the property. The FWS determined that logging the parcel could harm other spotted owls that might use the site for nesting. The FWS notified Boise that it could either file an application for an Incidental Take Permit (ITP) under § 10 of the ESA, or it could attempt to swap the tract with the state of Oregon. Boise’s response was to file suit in the federal district

¹⁵*Nollan v. California Coastal Com’n*, 483 U.S. 825, 107 S. Ct. 3141, 97 L. Ed. 2d 677 (1987).

¹⁷*Dolan v. City of Tigard*, 512 U.S. 374, 391, 114 S. Ct. 2309, 129 L. Ed. 2d 304 (1994).

¹⁸*Dolan v. City of Tigard*, 512 U.S. 374, 395–96, 114 S. Ct. 2309, 129 L. Ed. 2d 304 (1994).

[Section 21:84]

¹*Boise Cascade Corp. v. U.S.*, 296 F.3d 1339 (Fed. Cir. 2002).

court in Oregon seeking a declaratory judgment that its proposed logging operation would not harm any spotted owls and requesting that the court enjoin the FWS from enforcing the ESA against Boise. The United States sought an injunction prohibiting Boise's logging activities.

The district court dismissed Boise's complaint on ripeness grounds and granted the U.S. motion for an injunction pending the results of breeding surveys being conducted by the FWS. During these surveys, a juvenile owl was spotted living on the property. The district court issued an order granting the U.S. request to permanently enjoin Boise from logging the site without an ITP.

However, after the juvenile owl was also subsequently found dead on the property, and surveys indicated that no other owls were in the vicinity, the FWS notified Boise that an ITP would no longer be required. After this notification, Boise filed a complaint at the Court of Federal Claims seeking compensation for a "temporary take of merchantable timber" due to the injunction that had been entered by the district court. The Court of Federal Claims dismissed, based upon the government's argument that the injunction merely prohibited Boise from logging without a permit and that it therefore did not constitute a taking as a matter of law under *Riverside Bayview Homes*.

The Federal Circuit agreed, noting that Boise could have applied for a permit, thus offering it an "escape hatch" that would prevent a taking.² The Court then noted that extraordinary delay in the permitting process could give rise to a taking if the permit has not been denied, but that such situations will be rare and such a taking will generally not be found in the absence of bad faith. The court determined that this was not such a case.

Other takings cases involving actions under the ESA have similarly denied relief. In *Good v. United States*,³ the U.S. Army Corps of Engineers denied a developer a permit to fill wetlands because filling and consequent development would have jeopardized two species listed as endangered under the ESA. The Federal Circuit Court held that *Good* did not show he had reasonable investment-backed expectations because he had bought the land with actual knowledge of the necessity and difficulty of obtaining regulatory approval.⁴ Furthermore, it did not matter to the court that the ESA regulation that was ultimately the basis for the denial was not in effect at the time of the purchase. What the court found relevant was that there was a regulatory climate that gave actual or constructive notice that state or federal regulation could have ultimately prevented *Good* from benefitting economically from his property.⁵

The inability of claimants to satisfy the threshold requirements of (1) a property right⁶ and (2) government action⁷ has also resulted in denials of compensation in takings claims involving ESA regulations. Furthermore, courts have accepted the

²*Boise Cascade Corp. v. U.S.*, 296 F.3d 1339, 1348 (Fed. Cir. 2002).

³*Good v. U.S.*, 189 F.3d 1355 (Fed. Cir. 1999).

⁴*Good v. U.S.*, 189 F.3d 1355, 1362 (Fed. Cir. 1999).

⁵*Good v. U.S.*, 189 F.3d 1355, 1361–62 (Fed. Cir. 1999).

⁶*U.S. v. Hill*, 896 F. Supp. 1057, 1063 (D. Colo. 1995), the owner of animal parts that were listed as endangered species under ESA alleged that the ESA listing deprived him of all economic value of his legally obtained property. The court dismissed the claim reasoning that Hill did not meet the threshold principle of a property interest, because by the time he lawfully obtained the animal parts, their sale was already subject to the ESA and other (lawful) statutes. Therefore, Hill had no vested property right to sell the animal parts and consequently had lost no right for which he could claim "just compensation."

⁷*Christy v. Hodel*, 857 F.2d 1324 (9th Cir. 1988), a livestock owner killed an ESA-protected grizzly bear in order prevent it from eating the sheep. The court held that the ESA grizzly bear regulations did not affect a taking, because the bears were not government agents and consequently any damage

high degree of regulation of personal property that the ESA provisions can impose.⁸ Therefore, a court rarely, if ever, has an opportunity to consider evidence showing that personal property lost substantial or all economically viable use.

In contrast, a 2001 case in the Federal Court of Claims found a taking when the federal government imposed water use restrictions under the ESA. In *Tulare Lake Basin Water Storage District v. United States*,⁹ California water users claimed a taking of their right to certain quantities of water when federal government agencies imposed water use restrictions in order to protect two endangered species. The court found that the federal government's curtailing of the contractually conferred water rights of the users amounted to a physical taking¹⁰ of their property. As mentioned above, background principles of state nuisance and property law provide for protection of wildlife. However, the court held that the background principles of the state of California did not preclude a taking because the allocation scheme at the time of the dispute allowed the allocations the users sought to maintain. Absent a determination otherwise, the Court was reluctant to allow background principles to preclude the takings claim.¹¹

A subsequent case involved newly listed species impacting a 40-year-old water reclamation project. In *Casitas Municipal Water District v. United States*,¹² the government had signed a contract with Casitas in 1956 to build the Ventura River Project (Project) that would provide water supply for irrigation and other uses.¹³ The contract gave Casitas perpetual rights to use all water that became available from the Project. The Court of Appeals for the Federal Circuit considered whether there was a physical taking when the government forced Casitas to build a fish ladder and compelled water to be rerouted to the ladder to protect the West Coast steelhead trout.

In 1997, the NMFS had listed the West Coast steelhead trout as an endangered species in the Project watershed. To avoid a taking under § 9, the Bureau of Reclamation (Bureau) sought a biological opinion by the NMFS. The court notes that "the government concedes that the 2003 directive advising Casitas that it was obligated to comply with [the biological opinion] compelled Casitas to: (1) build a fish ladder facility . . . and (2) divert water from the project to the fish ladder, resulting in permanent loss to Casitas of a certain amount of water per year."¹⁴ The court reasoned that the purpose of the ESA is to protect endangered species because they have esthetic, ecological, and scientific value to the nation and its people. Therefore, protecting an endangered species habitat that is for government and third-party use serves a public purpose. However, the underlying issue was whether the diversion of water was a regulatory or a physical taking. The trial court, relying on *Tahoe-Sierra Preservation Council, Inc.*¹⁵ ruled that it was a regulatory taking,

they caused could not be considered government action for purposes of the Takings Clause.

⁸*U.S. v. Kepler*, 531 F.2d 796 (6th Cir. 1976), the court held that ESA provision prohibiting the sale and transportation in interstate commerce of a leopard, an endangered species under the ESA, did not affect a taking because ESA permissibly regulates the transportation and sale of protected wildlife.

⁹*Tulare Lake Basin Water Storage Dist. v. U.S.*, 49 Fed. Cl. 313 (2001).

¹⁰*Tulare Lake Basin Water Storage Dist. v. U.S.*, 49 Fed. Cl. 313, 319 (2001).

¹¹*Tulare Lake Basin Water Storage Dist. v. U.S.*, 49 Fed. Cl. 313, 321–22 (2001).

¹²*Casitas Mun. Water Dist. v. U.S.*, 543 F.3d 1276 (Fed. Cir. 2008).

¹³*Casitas Mun. Water Dist. v. U.S.*, 543 F.3d 1276 (Fed. Cir. 2008).

¹⁴*Casitas Mun. Water Dist. v. U.S.*, 543 F.3d 1276 (Fed. Cir. 2008).

¹⁵*Tahoe-Sierra Preservation Council, Inc. v. Tahoe Regional Planning Agency*, 535 U.S. 302, 122 S. Ct. 1465, 152 L. Ed. 2d 517, 10 A.L.R. Fed. 2d 681 (2002).

and Casitas conceded that under that framework, they could not prevail.¹⁶ Casitas appealed, and the Federal Circuit reversed. The court reasoned that in protecting the West Coast steelhead trout, the government forced Casitas to divert the water away from the canal in order to feed the fish ladder.¹⁷ The Court held that reducing Casitas' water supply by such diversion was a physical taking and a violation of the Fifth Amendment.¹⁸

§ 21:85 Application to the ESA and wildlife protection regulations

From the foregoing, it appears that property owners have a difficult task in demonstrating Fifth Amendment takings under the ESA and other wildlife protection statutes and regulations. Many of the problems that such laws may present for landowners, e.g., damage caused by protected species, have been held not to be takings under the Fifth Amendment. Moreover, the ESA and most wildlife protection laws and regulations do provide for some flexibility in their operation. Normally, such features as approval of "incidental takes" and variances prevent a property owner from being deprived of all value in its property, the standard that has evolved for such regulatory takings.

In addition, the mere fact that a potential more profitable use of the property is prevented (while others remain) does not equal a taking. In most instances, property owners will have notice of such potential issues and will therefore be unable to demonstrate that they had any reasonable investment-backed expectations that the property could be used for a particular purpose. Moreover, property owners can generally find some alternative use for their property. The issues presented are further minimized when only a portion of the property contains habitat.

It should also be noted that the purpose of the ESA is not to acquire land but to protect species. Consequently, several of the concerns that the Court has expressed, to the effect that regulatory actions may simply be a subterfuge to take property, would not seem to apply to the ESA or most other wildlife protection statutes and regulations.

However, it should not be concluded that such taking claims will always fail. The foregoing cases provide general guidance on the Fifth Amendment "taking" principles that will be applied in the wildlife protection context, as these cases continue to arise. For example, under the ESA's Habitat Conservation Plan (HCP) provisions, a property owner has the right to apply for a permit that allows for "incidental takes" of areas or species under the act. Dolan provides some guidance as to what type of essential nexus or proportionality that might be utilized by courts in evaluating taking claims based upon HCP requirements. It is possible that future ESA taking litigation will address such issues.

XVII. CONCLUSION

§ 21:86 Generally

The Endangered Species Act is one of the most important and most powerful federal environmental statutes. The strict provisions of the ESA impose important procedural and substantive duties on both federal and private actors to ensure both the survival and recovery of listed species. As the Supreme Court stated in 1978 in *Tennessee Valley Auth. v. Hill*, the ESA is "the most comprehensive legislation for

¹⁶Casitas Mun. Water Dist. v. U.S., 543 F.3d 1276 (Fed. Cir. 2008).

¹⁸Casitas Mun. Water Dist. v. U.S., 543 F.3d 1276 (Fed. Cir. 2008).

the preservation of endangered species ever enacted by any nation.”¹ That observation remains true today. This chapter has endeavored to describe the Act’s underpinnings and the major developments in this important and evolving law—a law that is becoming even more relevant today as we face new environmental challenges, such as climate change. Hopefully, this chapter will provide practitioners with the tools to better understand and apply this important law that will likely continue to evolve in the years ahead.

§ 22:1 In General

Non-indigenous species (NIS) have increasingly come to be recognized in scientific and popular arenas as one of the most significant threats to biodiversity. That recognition has yet to extend to law and policy, which, in the United States, remain fractured and incomplete. This chapter surveys the most significant of the many bits and pieces of U.S. federal law that relate to prevention and control of NIS, and argues that a more coherent and powerful legal framework is needed to address the NIS problem.

§ 22:2 Introduction

U.S. law addressing NIS presents a paradox.

The best way to summarize U.S. NIS law is to say that there is very little statutory law, and for important dimensions of the NIS problem, including identifying new NIS invasions, tracking the impact of known harmful invasive species, and responding to emerging threats, there is none. Some federal laws have responded to threats from particular invasive species, or threats from particular pathways for alien species (such as ballast water as a source of aquatic NIS). But no federal law has ever responded directly to the general problem of prohibiting, preventing, screening, identifying, attacking, and understanding NIS.

The law of the various U.S. states is even easier to summarize: with a few interesting exceptions, including NIS legislation in Hawaii and Minnesota, most U.S. states at best offer a weak echo of the general aspects of federal statutory law.

Oddly, the second best way to summarize U.S. NIS law is to say that there is a ton of it, and that no report has yet done it justice. Indeed, there is so much law, of so many kinds, that there is no way this report can do it justice. A comprehensive summary would point to the many dozens of federal statutes that are relevant, or

might be relevant, to NIS issues. It would point to the dozens of federal agencies and hundreds of state agencies that have responded to alien species issues under various kinds of legal authority, including general organic acts for the supervisory agency and annual appropriations bills.

High on the list of evidence supporting the view that invasive species have a broad presence in U.S. law would be two presidential Executive Orders, an odd species of law, that have addressed NIS issues directly, first in a 1977 Executive Order issued by President James Carter, and then, in a new Executive Order issued by President William J. Clinton on February 3, 1999.¹ Indeed, the first piece of evidence in support of the view that the U.S. has broad legal coverage of invasive species issues would be the creation of a National Invasive Species Council staffed by Cabinet-level officers and the promulgation, in January 2001, of a National Invasive Species Management Plan.

To complicate matters still further, to the extent that law reflects culture and popular understanding, there has been a dramatic increase in coverage of NIS issues in the popular press, and to some degree in scientific and legal materials. An increasing flood of news stories has focused on particular invaders and their economic, social, aesthetic, and ecological costs.

One way to resolve the paradox is to shift the terrain of the question from “what laws apply to NIS?” to “what legal authority should exist to deal with harmful NIS, and what purposes would a new or different set of NIS laws serve?” In other words, the proper question is not whether a lawyer or policymaker might be able to find a basis in current legal authority to defend a specific action, but whether a biologist or policy-maker would say that the law adequately guides and mandates appropriate government and private actions, and, more generally, that it responds to the costs and threats imposed by NIS.

From the perspective of coherent law and policy, it is relatively easy to identify the gaps in U.S. federal and state law. It is harder to explain whether and how those gaps should be filled. If government agencies can respond to NIS problems under their current authority, and if increasing public awareness of threats from harmful NIS makes it more likely that agencies will try to deal with NIS issues, then why should anyone care about the absence of clearer, explicit legal authority on NIS issues?

Section 21:3 of this chapter summarizes the increasing awareness of the importance and seriousness of NIS issues in the United States in popular, scientific, and legal literature. Sections 21:4 to 21:13 describe current federal legal authority, focusing first on the limitations of the existing federal statutory law regarding NIS, and then on an unusual legal animal—the presidential Executive Orders—at the heart of modern U.S. legal history regarding NIS. Section 21:14 considers the legal authority regarding NIS in the U.S. states, with a special emphasis on the law of Hawaii and Minnesota.

Sections 21:15 to 21:20 address the need for new statutory provisions in U.S. federal and state law. The chapter concludes that current U.S. statutory law leaves essential aspects of the NIS problem unaddressed. Moreover, as a social and political matter, NIS pose a sufficient threat to justify their separate recognition in positive law, including the structural, substantive, public, and funding issues that such legal identification would generate. At a minimum, as a matter of coherent law and policy, a single, organic NIS law should be articulated, and that model then used to assess gaps in actual current legal authority.

[Section 22:2]

¹Exec. Order No. 11987, 3 C.F.R. § 116 (1977), ELR Admin. Mat. 45015; Exec. Order No. 13112, 64 Fed. Reg. 6183 (Feb. 8, 1999), ELR Admin. Mat. 45105.

§ 22:3 Alien awareness in the United States

Any evaluation of the adequacy of current law must have some metric against which to test its success or failure. In other words, there must be some sense of a social problem or situation that calls for a governmental response. If the values against which the law is being tested are not stated explicitly, or are not clear and compelling, then any critique of current law must stand or fall based on materials or facts not presented with the legal analysis.

Moreover, any assessment of the adequacy of current law must also encompass or reflect some theory of law—what role law plays in society, what subjects are the legitimate and proper domain of regulation (in contrast to private discourse and markets), and how laws work, including both the likely efficacy and the likely costs of any proposed regulation (*i.e.*, a theory of regulation).

The present analysis rests on the assumption that invasive alien species pose a major economic, ecological, and social threat that is not being dealt with adequately. This section provides an overview of the scope of the NIS problem in the United States, and the level of public and professional awareness of that problem. The legal analysis that follows assumes that the multidimensional case for responding to NIS has been more than adequately made elsewhere by ecologists and economists.

Though increasingly outdated, the best overview of the NIS problem in the United States remains the 1993 report *Harmful Non-Indigenous Species in the United States*.¹ The Office of Technology Assessment (OTA), a now-defunct research arm of the U.S. Congress (eliminated in 1995),² produced a 400-page report that for a decade has been the standard reference for the scope of the NIS problem in the United States.

The OTA scientists, after reviewing the literature, concluded that “[a]t least 4,500 species of foreign origin have established free-living populations” in the United States.³ The OTA summary of the estimated numbers of NIS in the United States appears in Table 1. Other scientists have estimated much higher numbers,⁴ and all assessments, including that by the OTA, emphasize the lack of knowledge in this area, and the likelihood that for many kinds of organisms, the counts are probably much higher.

The OTA notes the variety of harms from NIS, including economic, ecological, and aesthetic harms. The report captures the difficulty in adequately describing the scope of harm in the following summary paragraphs:

Approximately 15 percent of the NIS in the United States cause severe harm. High impact species—such as the zebra mussel, gypsy moth, or leafy spurge (*Euphorbia esula*) (a weed)—occur through the country. Almost every part of the United States confronts at least one highly damaging NIS today. They affect many national interests: agriculture, industry, human health, and the protection of natural areas.

[Section 22:3]

¹Office of Technology Assessment (OTA), *Harmful Non-Indigenous Species in the United States* (1993), available at http://www.wws.princeton.edu/~ota/disk1/1993/9325_n.html (last visited Aug. 1, 2003) [hereinafter OTA Report].

²See Wendy Wagner, *Congress, Science, and Environmental Policy*, 1999 U. Ill. L. Rev. 181, 213 n.121; Colleen Krueger, *Congress’ Own “Think Tank” Falls Victim to Cuts by GOP*, L.A. Times, Oct. 25, 1995, at A5.

³OTA Report, at 3.

⁴More recent reports have suggested as many as 50,000 non-indigenous species (NIS) in the United States. See David Pimental, Lori Lach, Rodolfo Zuniga, & Doug Morrison, *Environmental and Economic Costs Associated with Non-Indigenous Species in the United States*, Presentation at American Association for the Advancement of Science, Anaheim, California, Jan. 1999, available at http://www.news.cornell.edu/releases/Jan99/species_costs.html (last visited Aug. 1, 2003).

The number and impact of harmful NIS are chronically underestimated, especially for species that do not damage agriculture, industry, or human health. Harmful NIS cost millions to perhaps billions of dollars annually. From 1906 to 1991, just 79 NIS caused documented losses of \$97 billion in harmful effects, for example. A worst-case scenario for 15 potential high-impact NIS puts forth another \$134 billion in future economic losses. The figures represent only a part of the total documented and possible costs—that is, they do not include a large number of species known to be costly but for which little or no economic data were available, e.g., non-indigenous agricultural weeds. Nor do they account for intangible, nonmarket impacts.

Harmful NIS also have had profound environmental consequences, exacting a significant toll on U.S. ecosystems. These range from wholesale ecosystem changes and extinction of indigenous species (especially on islands) to more subtle ecological changes and increased biological sameness. . . .⁵

It is easy to list harmful NIS that do not seem to be included in the cumulative economic and ecological assessments. For example at the turn of the last century, chestnut blight—a non-indigenous disease—appeared in the United States and decimated Eastern forests by wiping out the American chestnut. The American chestnut was the most important hardwood species in eastern forests⁶ and constituted 25 percent of the trees and a substantial portion of the biomass in those forests. The blight is estimated to have killed as many as one billion trees.⁷ Any estimate of economic harm from chestnut blight is likely to be highly speculative, and it is not clear that this harm was included in the OTA estimates.

Table 22.1⁸
Estimated Numbers of Non-Indigenous Species in the United States^a

Species with origins outside the United States

Category	Number	Percentage of total species in the United States in category
Plants	>2,000	^b —
Terrestrial vertebrates	142	= 6%
Insects and arachnids	>2,000	= 2%
Fish	70	= 8%
Mollusks (non-marine)	91	= 4%
Plant pathogens	<u>239</u>	^b —
Total	4,542	

Species of U.S. origin introduced beyond their natural ranges

Category	Number	Percentage of total species in the United States in category
----------	--------	--

⁵The range of estimates of total NIS since the promulgation of the 1977 Executive Order by President Carter has ranged across two orders of magnitude (1977 Executive Order: several hundred; 1993, OTA Report: 5,000; 1999, David Pimental, Lori Lach, Rodolfo Zuniga & Doug Morrison, *Environmental and Economic Costs Associated with Non-Indigenous Species in the United States*, Presentation at American Association for the Advancement of Science, Anaheim, California, Jan. 1999: 50,000). The problems in assessing the total number of NIS, are in part definitional—including whether only harmful NIS are counted, and whether the range of established agricultural and other familiar species, e.g., dogs and cats, are counted. But the problems with accurate numbers also reflect a basic lack of knowledge. OTA Report, at 5.

⁶OTA Report at 66, citing U.S. Dept. of Agriculture, U.S. Forest Service, Pest Risk Assessment of the Importation of Larch from Siberia and the Soviet Far East, Miscellaneous Publication No. 1495 (1991).

⁷OTA Report, at 66.

⁸OTA Report, at Table 1–1.

Species with origins outside the United States

Category	Number	Percentage of total species in the United States in category
Plants	^b —	^b —
Terrestrial vertebrates	51	= 2%
Insects and arachnids	^b —	^b —
Fish	57	= 17%
Mollusks (non-marine)	^b —	^b —
Plant pathogens	^b —	^b —

^a Numbers should be considered minimum estimates. Experts believe many more NIS are established in the country, but have not yet been detected.

^b Number or proportion unknown.

^c Percentage for fish is the calculated average percentage for several regions. Percentages for all other categories are calculated as the percent of the total U.S. flora or fauna in that category.

Other reports, popular and technical, have tried to capture the scope of harm from NIS in the United States, and have concluded that the impact is even greater than the OTA report suggests. A 1999 Congressional Research Service report cited an unpublished study estimating NIS costs at \$123 billion annually.⁹ Another study concluded in 1998 that NIS are second only to habitat destruction as a cause of modern extinction.¹⁰

Reports on the harm from NIS are equally dramatic when focused on specific areas and specific invaders. For example, among the best state-level evaluations of general NIS issues is a 1992 report by the Nature Conservancy of Hawaii and the National Resources Defense Council, Inc. (NRDC) titled *The Alien Species Invasion in Hawaii: Background Study and Recommendations for Interagency Planning*.¹¹ This report found significant financial impact on Hawaii's \$1 billion annual agriculture industry; ecosystem degradation, especially of watershed forests; financial harm to housing from an introduced termite; harm to rangeland; and threats to human health. The report also found that "[t]he primary cause of [ecosystem changes], and the greatest single threat to native species, is predation or competition by non-native weeds and animal pests."¹²

Breathtaking economic and ecological impacts leap from the pages of various reports that begin with a focus on one area or problem. An excellent 1999 report on NIS in the Great Lakes suggests the scope of alien species issues at regional scales:

Harmful exotic aquatic organisms (aquatic nuisance species) do economic damage in the

⁹M. Lynne Corn et al., Congressional Research Service, Harmful Non-Native Species: Issues for Congress (1999), citing David Pimental, Lori Lach, Rodolfo Zuniga & Doug Morrison, *Environmental and Economic Costs Associated with Non-Indigenous Species in the United States*, Presentation at American Association for the Advancement of Science, Anaheim, California, Jan. 1999, available at http://www.news.cornell.edu/releases/Jan99/species_costs.html (last visited June 4, 2003).

¹⁰David Wilcove et al., *Quantifying Threats to Imperiled Species in the United States*, 48 *Bioscience* 607 (1998). The January 2001 federal National Invasive Species Management Plan synthesizes and quotes these prior reports but does not provide additional estimates or analysis of the scope of the NIS problem in the United States. National Invasive Species Council, National Invasive Species Management Plan (2001), at <http://www.invasivespecies.gov/council/nmp.shtml> (last visited June 4, 2003).

¹¹The Nature Conservancy of Hawaii & Susan Miller & Alan Holt, NRDC, *The Alien Pest Species Invasion in Hawaii: Background Study and Recommendations for Interagency Planning* (1992).

¹²The Nature Conservancy of Hawaii & Susan Miller & Alan Holt, NRDC, *The Alien Pest Species Invasion in Hawaii: Background Study and Recommendations for Interagency Planning* 4 (1992).

range of several billion dollars per year, damage native fishery resources, and cause irreplaceable loss to the biodiversity of the planet. Some of the past invaders of the Great Lakes include the sea lamprey, purple loosestrife, the alewife, furunculosis, Eurasian watermilfoil, protozoan fish parasites, European ruffe, the Asiatic clam, and the zebra mussel. The threat includes organisms throughout the taxonomic scale, from fish and macroscopic plants to bacteria and viruses. The majority of current aquatic invaders of the Great Lakes enter through ballast water of transoceanic commercial shipping. Other major vectors of concern are commercial transportation of aquatic organisms across large ecological zones for use as aquaculture, bait, and aquarium or ornamental pond fish. Genetic modification of native species for use in aquaculture is also a matter of concern.¹³

Both technical and policy literatures reveal widespread agreement that the NIS problem in the United States is substantial on economic, ecological, and aesthetic dimensions. The problems are so substantial and so varied, both in cause and in impact, that they are difficult to frame in policy and research terms. In other words, descriptions of the harm from specific invasive species often show a concreteness and specificity that aggregate descriptions lack. But I have found no serious (or for that matter, non-serious) statement suggesting that modern scientific concerns with NIS are overblown.

Despite this consistent view in the scientific and policy literature about NIS, general concern for NIS has only recently begun to attract much popular—or political—attention. Indeed, until recently, only a handful of NIS had received widespread recognition for the harm they caused. Even the OTA report recognizes that only a handful of economically significant species led to Congress' request for this report. These species include the zebra mussel and Asian clam, the gypsy moth, and leafy spurge. The list might easily and fairly be expanded to include another dozen organisms. However, it would be fair to say that general NIS threats, as opposed to species or location specific concerns, are much more an emerging phenomenon.¹⁴

But, as Bob Dylan noted some years back: "There's a battle outside, and it is ragin' . . . for the times, they are a-changin'."¹⁵ Over the past several years, there has been a dramatic increase in the number of news stories that address the

¹³Eric Reeves, Analysis of Laws and Policies Concerning Exotic Invasions of the Great Lakes 1 (1999), available, along with other documents related to NIS issues in the Great Lakes, at http://www.michigan.gov/deq/0,1607,7-135-3313_3677_8314---,00.html (last visited June 3, 2003).

¹⁴See, e.g., Union of Concerned Scientists, The Science of Invasive Species (2001), available at <http://www.ucsusa.org/publication.cfm?publicationID=451> (last visited June 5, 2003); National Wildlife Refuge Association, Silent Invasion: A Call to Action (2002), available at <http://www.refugenet.org/new-pdf-files/Silent%20Invasion%20pdf.pdf> (last visited June 4, 2003).

¹⁵Bob Dylan, *The Times They Are A-Changin'* (1964). Bob Dylan surely did not have invasive species in mind when he penned these lyrics, but the lyrics make it seem like he did. A portion of the lyrics to that song follow, applicable then to social change and now to ecological change.

Come gather 'round people
Wherever you roam
And admit that the waters
Around you have grown
And accept it that soon
You'll be drenched to the bone.
If your time to you
Is worth savin'
Then you better start swimmin'
Or you'll sink like a stone
For the times they are a-changin' . . .
Come senators, congressmen
Please heed the call
Don't stand in the doorway
Don't block up the hall

potential harm from NIS. Increasingly, the popular media highlights invasive species beyond the handful that have achieved statutory responses and widespread recognition. For reasons that are not hard to understand, news stories tend to focus on invasive species with substantial economic impacts or other impacts on human enjoyment. For example, Africanized honeybees have received widespread coverage, as have concerns about the spread of fire ants. In both cases, the direct impact on peoples' lives may help sell the stories.

News stories have been expanding, in number and scope, to include a wider range of invasive species with a wider range of impacts. Figure 21.1 illustrates the trend towards increasing coverage of NIS issues in the U.S. media.¹⁶ Illustrations of U.S. media coverage of invasive species issues can be found on the National Invasive Species Council web site.¹⁷

The increase in popular attention to NIS issues is reflected in books and magazines as well. The best illustration of this trend may be the 1998 book *Alien Invasion: America's Battle With Non-Native Plants and Animals*.¹⁸ This volume, written by science writer Robert Devine, was published by the National Geographic Society, and appeared with an introduction by then-Secretary of the Interior Bruce Babbitt. Another current popular overview of NIS issues appears in the 1998 book *Life Out of Bounds: Bioinvasion in a Borderless World*.¹⁹

The scientific literature addressing invasive species has been growing steadily, and one journal—the Journal of Biological Invasions²⁰—is devoted to the topic. The legal literature devoted to invasive species is far more sparse, but even among legal scholars there seems to be some increasing attention to NIS issues.

NIS have a substantial presence in scientific discourse, a growing popular recognition, and a small but growing presence in legal literature. But to what extent are they part of our laws? The answer, oddly, is a lot, and a little.

For he that gets hurt
Will be he who has stalled
There's a battle outside
And it is ragin'.
It'll soon shake your windows
And rattle your walls
For the times they are a-changin'

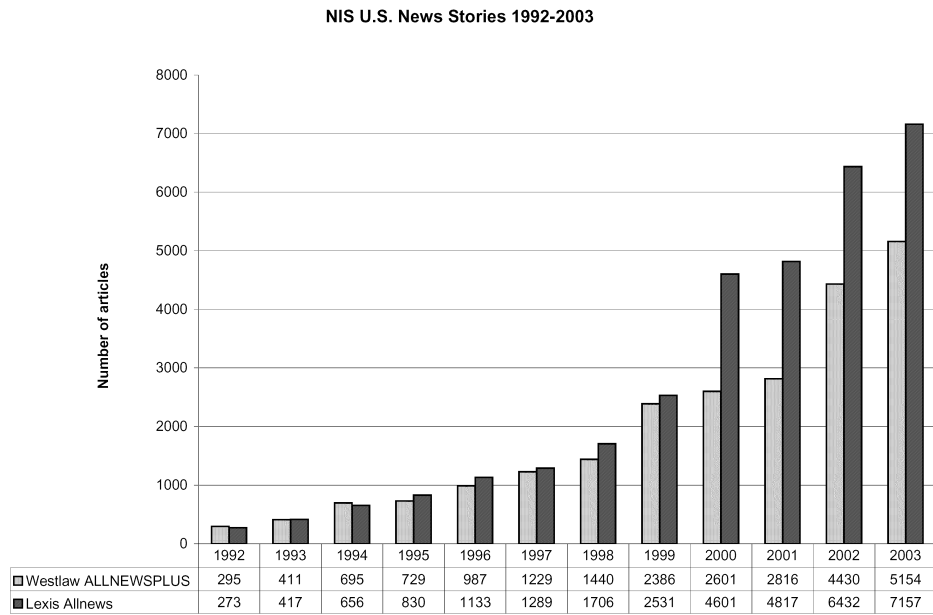

¹⁶There are some data problems with using the Lexis and Westlaw newspaper databases for general topic prevalence and incidence since the database has expanded somewhat over the years as new newspapers were added. The more recent information data is more accurate than the older data. Thus, the numbers before 1990 should be taken as only a loose indication of the prevalence of the terms. A rough calculation suggests that the database essentially doubled in size between the beginning of 1995 and the end of 1999. Since the frequency of references to alien species roughly quadrupled in the same period, the basic point still holds—that NIS have invaded popular media and that the scope of that media invasion is increasing. For a discussion and a more precise calculation of the change in the size of the Westlaw and Lexis news databases, see Ronald Wright, *The Abruptness of Action*, 36 Crim. L. Bull. 401, 424-26 (2000).

Figure 21.1

§ 22:4 U.S. legal authority

The two most important points about U.S. NIS law are that there is very little, and yet, in another sense, there is a lot. There are a small number of U.S. federal laws that address specific NIS issues directly, but there are a huge number of U.S. federal laws that grant authority and funding to agencies that might be used to deal with NIS problems. Moreover, there are two dramatic presidential Executive Orders directly addressing NIS issues, the first issued by President Carter in 1977 and the second by President Clinton in February 1999. Finally, there are a host of regulations and practices in federal agencies and less formal working groups that also address NIS issues.

This paradox—the essential absence and, at the same time, the abundance of relevant legal authority—is the major puzzle that this chapter tries to solve. To do so, I first present summaries of current law, and then suggest the limits of available law to serve as a foundation for a general legal framework to deal with harmful NIS. Finally, given the indirect and odd nature of much of the available legal authority, I point out what does not yet exist—what is missing from this seemingly rich legal bouillabaisse.

The first part of this section describes the federal legal authority that exists, summarizing explicit federal NIS statutory authority and then noting, in passing, the general authorizing legislation for relevant government agencies. It then describes general federal governmental powers under environmental legislation not designed primarily (and perhaps at all) with NIS in mind. The second and more detailed part of this section evaluates the two presidential Executive Orders. In a very direct way, these presidential Executive Orders test the combined powers of all available laws since they rely on those collective powers to direct federal agencies to act.

§ 22:5 U.S. legal authority—Federal statutory authority

The first question regarding current federal statutory authority is whether current law directly addresses the general issue of harmful NIS: it does not. A more interesting question with regard to current authority, however, is whether enough partial and indirect authority exists that, when read expansively, would allow current federal agencies to act appropriately to deal with harmful NIS.

No one has yet published a full accounting of U.S. legal authority that might be applicable to government responses to harmful NIS. The OTA report concluded that “[t]he current Federal effort is largely a patchwork of laws, regulations, policies, and programs. Many only peripherally address NIS, while others address the more narrowly drawn problems of the past, not the broader emerging issues.”¹ An April 1999 Congressional Research Service (CRS) report titled *Harmful Non-Native Species: Issues for Congress*, concluded that “[f]ederal law concerning non-native species is scattered. No laws focus on the broad problems of non-native species, their interception, prevention, and control across a variety of industries and habitats.”² At another point, the CRS report summarized U.S. federal law this way:

[I]n the century or so of congressional responses to harmful, non-native species, the usual approach has been an ad hoc attack on the particular problem, from impure seed stocks, to brown tree snakes on Guam. A few attempts have been made to address specific pathways, e.g., contaminated ballast water, but no current law addresses the general concern over non-native species and the variety of paths by which they enter

[Section 22:5]

¹OTA Report, at 11.

²M. Lynne Corn et al., Congressional Research Service, *Harmful Non-Native Species: Issues for Congress* pt. IV (1999).

this country.³

The CRS report did provide a list of relevant federal laws, but none of the discussions of any one law, even the most relevant, extended more than a few paragraphs. The OTA report made reference to a number of federal laws, but did not analyze any of those laws in detail. The OTA was primarily interested in what federal and state agencies were doing (under whatever authority) and what such agencies might do, rather than in specifying the precise limits on government power under current statutes and regulations. Indeed, some of the assertions about federal law in the OTA report do seem open to challenge.

The reasons that a comprehensive survey of U.S. law on invasive species has not been done is partly practical, but more importantly the challenges are conceptual and functional. The practical challenge arises because of the immense number of minor legal provisions that might be used to justify policy responses to invasive species. Such provisions would include appropriations and spending bills for relevant agencies, and many pieces of legislation with no obvious link to invasive species, such as the organic acts (the initial, general authorization and authority) for the many relevant government agencies.⁴ Thus, practically, a complete listing of all potentially relevant U.S. legal authority would be a dreary project, and it would produce a ponderous product.

More importantly, even an exhaustive survey of potentially relevant statutory authority would not produce a determinate answer to the abstract question “what legal authority might be used to support invasive species policies.” The full answer, if there is ever to be a full answer, would come in light of judicial, executive, or legislative challenges to particular policy initiatives. Moreover, a catalog of all potentially applicable legal authorities would not be especially revealing, since it would be unlikely to answer the most immediate and important questions about how either the federal or state governments are responding, or how they should respond, to harmful NIS.

Providing a comprehensive review of U.S. law might be necessary in defense of some government action that is alleged to be lawless (or less dramatically, beyond current authority). Indeed, it is fair to say that for most conceivable federal government actions with respect to NIS there would probably be a reasonable claim that authority exists, should such actions be challenged in court. But such a study of the plausible outer reaches of the law is not necessary or even useful to answer the question of what general legal authority is currently used in responding to harmful NIS, or whether additional legal authority (and responsibility) would be useful.

While it is useful to consider whether the current authority might be stretched to cover new policy initiatives, the very need to imagine creative readings and understandings of current authority highlights the most important point: most aspects of the harmful NIS problem are not clearly addressed in current law. Moreover, examining the minutiae of the mass of legal authority that might be brought to bear on the problem of harmful NIS could also obscure the important virtues—from the standpoint of efficiency, funding, coherent policy, and public understanding—of designing laws to address serious problems directly.

§ 22:6 U.S. legal authority—Explicit federal statutory NIS authority

“Blacklist” and “exclusion” acts

³M. Lynne Corn et al., Congressional Research Service, *Harmful Non-Native Species: Issues for Congress*, Introduction (1999).

⁴*See, e.g.*, The National Park Service Organic Act, Act of Aug. 25, 1916, 39 Stat. 535, codified at 16 U.S.C.A. §§ 1 to 4.

There is a compensation in the distribution of plants, birds, and animals by the God of nature. Man's attempt to change and interfere often leads to serious results.¹

The recognition that NIS might cause harm has been evident in U.S. federal law at least since the Lacey Act, first enacted in 1900 and substantially revised in recent years.² It was originally enacted for a range of purposes anchored to the idea of protecting native wildlife, especially birds that were being commercially harvested for their feathers. A particular place of concern was the Everglades. The sponsors were not only aware of the lack of controls on commerce in wild species among the states, as well as between nations, but they also recognized that alien species could harm native species and ecosystems (though, of course, Representative Lacey and his colleagues did not use the term "ecosystems"). Harms from sparrows and starlings that had been introduced in the latter half of the 19th century were noted in the legislative history.³

The Lacey Act currently provides the federal government with authority to ban the import, export, or transportation of "any fish or wildlife" or "any plant" that is made illegal by "any law, treaty[, or regulation]" of the United States or of any individual state.⁴ The Act provides for both civil penalties of a modest nature, *e.g.*, knowingly or negligently violating the Act may result in a penalty of "not more than \$10,000 for each such violation,"⁵ and criminal penalties, up to five years in prison and a \$20,000 fine for each violation.⁶

The Lacey Act seems to provide broad authority to the government to ban harmful NIS. There are other aspects of the Lacey Act that also have this sweeping character. For example, the Act provides enforcement authority to the Secretary of the Interior, the Secretary of Transportation, and the Secretary of the Treasury.⁷ The Act also explicitly leaves U.S. states free to make or enforce laws "not inconsistent" with the federal provisions.⁸

The problem with relying on the Lacey Act's general authority to ban animal and plant species is that these powers only apply to animals and plants that are made illegal under federal or state law. The key provision of the Lacey Act that establishes the authority to specify which organisms should be excluded is substantially more restrictive than the general enforcement powers, which relate to organisms identi-

[Section 22:6]

²Lacey Act, as amended, 16 U.S.C.A. §§ 3371 to 3379; 18 U.S.C.A. § 42.

³See Robert Anderson, *The Lacey Act: America's Premier Weapon in the Fight Against Unlawful Wildlife Trafficking*, 16 Pub. Land L. Rev. 27, 36-53 (1995) (discussing history of Lacey Act).

Although its coverage extended to animals, the Lacey Act was essentially a bird preservation and restoration measure designed to enhance and protect agriculture. Its language reflected Rep. Lacey's personal passion for the preservation of agriculturally beneficial birds and the eradication of harmful exotic species. . . . Lacey listed the primary threats to bird populations as excessive hunting of game birds by market hunters, the introduction of harmful exotic species that displaced native populations, and the millinery industry, which at that time consumed millions of birds each year for the production of ladies' hats.

See also Davina Kari Kaile, *Evolution of Wildlife Legislation in the United States: An Analysis of the Legal Efforts to Protect Endangered Species and the Prospects for the Future*, 5 Geo. Int'l Envtl. L. Rev. 441, 446-48 (1993); Stuart McIver, *True Tales of the Everglades* 5 (1989) (attributing passage of the Lacey Act to harvesting of birds from the Everglades).

⁴16 U.S.C.A. § 3372.

⁵16 U.S.C.A. § 3373(a) to (c).

⁶16 U.S.C.A. § 3373(d).

⁷16 U.S.C.A. § 3375(a).

⁸16 U.S.C.A. § 3378(a). The non-preemption of state law would have been clear enough from the general provisions of the Lacey Act since federal agencies are given enforcement power—the power to ban species—made illegal under the law of any state.

fied not only under the Lacey Act, but also under other federal and state laws. Title 18, § 42 provides the following:

The importation into the United States. . . or any shipment between the continental United States [and Hawaii, Puerto Rico, U.S. territories or possessions] . . . of the mongoose of the species *Herpestes auropunctatus*; of the species of so-called flying foxes or fruit bats of the genus *Pteropus*; of the zebra mussel of the species *Dreissena polymorpha* and such other species of wild mammals, wild birds, fish (including mollusks and crustacea), amphibians, reptiles, brown tree snakes, or the offspring of eggs of any of the foregoing which the Secretary of the Interior may prescribe by regulation to be injurious to human beings, to the interests of agriculture, forestry, or to wildlife or the wildlife resources of the United States, is hereby prohibited.⁹

There are three major limitations that prevent the Lacey Act from being or becoming a general harmful NIS law.¹⁰ First, while the Lacey Act provides the Secretary of the Interior the power to exclude several species of particular concern, as demonstrated above, as well as some other animals, it does not provide for the exclusion of plants, seeds, or plant pests.¹¹ This gap in the Lacey Act is partially closed by a host of federal statutes that, together, provide federal officials with power to exclude many kinds of harmful plant pests, seeds, and noxious weeds. These acts are the Plant Pest Act,¹² the Plant Quarantine Act,¹³ the Federal Noxious Weed Act of 1974,¹⁴ and the Federal Seed Act.¹⁵ In May 2000, Congress passed the Plant Protection Act, which consolidated and revised the Plant Quarantine Act, the Plant Pest Act, the Federal Noxious Weed Act, aspects of the Department of Agriculture Organic Act, and several less prominent acts.¹⁶

Second, the Lacey Act focuses on identifying harmful species with the purpose of limiting their importation. But introduction of new NIS, or harmful NIS, is only one aspect of the NIS problem. Many NIS have already been introduced, many have already caused great harm, and even the most stringent barriers to introduction of known harmful NIS will not keep some harmful NIS, known and unknown, from entering the country. A complete law regarding harmful NIS would address not only the identification of potentially harmful NIS, but also the review of proposed introductions not known to be harmful, and the proper response to harmful NIS already in place. In addition, a comprehensive legal response to NIS would address various education and research efforts to limit the cultural and scientific aspects that contribute to expanding or limiting the NIS problem.

The third major problem with the Lacey Act as the foundation for a complete strategy to deal with harmful NIS is that it authorizes the creation of a list of forbidden animals—a “black list” or “exclusion list”—but it does not authorize the

⁹18 U.S.C.A. § 42.

¹⁰An additional minor concern is that the listing powers may not include general ecological concerns, such as protection of ecosystem services, ecosystem function, or appearance. However, the list of concerns that are relevant to exclusion is sufficiently broad that the Secretary of Agriculture can probably find a listed reason to exclude a particular animal species of concern.

¹¹The original Lacey Act did not include fish, a gap that was filled by the Black Bass Act of 1926, 16 U.S.C.A. §§ 851 to 856, repealed Pub. L. No. 97-79, 9b1, 95 Stat. 1079 (1981), and later amendments to both the Lacey and Black Bass acts, including a substantial set of amendments in 1969. See Robert Anderson, *The Lacey Act: America's Premier Weapon in the Fight Against Unlawful Wildlife Trafficking*, 16 Pub. Land L. Rev. 27, 44-48 (1995) (amendments expanded coverage of Lacey Act to include amphibians, reptiles, mollusks, and crustaceans).

¹²7 U.S.C.A. §§ 150aa to 150jj.

¹³Plant Quarantine Act of 1912, 7 U.S.C.A. §§ 151 to 157.

¹⁴7 U.S.C.A. §§ 2801 to 2814.

¹⁵Federal Seed Act, 7 U.S.C.A. §§ 1551 to 1611.

¹⁶See Pub. L. No. 106-224, 114 Stat. 358 (June 20, 2000), codified at 7 U.S.C.A. §§ 7701 to 7772.

exclusion of animals whose threat is unknown.

Laws that are passed for a particular purpose or based on a specific understanding often change over time in light of shifts in knowledge or culture, yet they may still grant sufficient legal authority for government to respond to the newer demands and conceptions. Could the Secretary of the Interior simply declare that all species of animals and plants not previously approved are disapproved, and thus convert the “black” list to a “white” list?

Probably not. Both the text of 18 U.S.C.A. § 42 and the history of the Lacey Act suggest that Congress requires the Secretary of the Interior to make a particular finding that a particular species is “injurious to human beings, to the interests of agriculture, forestry, or to wildlife or the wildlife resources of the United States.”¹⁷ The Secretary of the Interior has issued regulations that appear to limit the importation of any live wildlife or eggs under the Lacey Act, but this broad assertion of authority has not been tested.¹⁸ Even if a court were to uphold this broad reading of the Lacey Act, the limitations of the Act as a general foundation for harmful NIS law would remain.

The May 2000 Plant Protection Act shows clear signs of Congress’ increasing awareness of the importance of NIS issues and the need for more coherent legislative responses. The Plant Protection Act provides a unitary framework for dealing with plant pests and noxious weeds. While the statement of findings recognizes that plant pests and noxious weeds threaten “the agriculture, environment, and economy of the United States,”¹⁹ and noxious weeds are defined to include “any plant or plant product that can directly injure or cause damage to . . . the natural resources of the United States . . . or the environment,”²⁰ it is nevertheless apparent that the principal focus of the Act is to protect against agricultural and other economic harms, since the environment is not a prominent concern in the remainder of the Act.²¹

The 2000 Plant Protection Act suggests the importance of mere reorganization

¹⁷One possible reading of the Lacey Act is that it leaves a technical gap in that there may be no authority for the federal government to limit introduction of species that threaten only wild lands. However, it is difficult to imagine a species that would impact wild lands but not wildlife or “wildlife resources.” There does not appear to be any instance of the federal government failing to list a species because it believed it lacked the authority to do so.

¹⁸Any importation or transportation of live wildlife or eggs thereof, or dead fish or eggs or salmonids of the fish family Salmonidae into the United States or its territories or possessions is deemed to be injurious or potentially injurious to the health and welfare of human beings, to the interest of forestry, agriculture, and horticulture, and to the welfare and survival of the wildlife or wildlife resources of the United States; and any such importation into or the transportation of live wildlife or eggs thereof between the continental United States, the District of Columbia, Hawaii, the Commonwealth of Puerto Rico, or any territory or possession of the United States by any means whatsoever, is prohibited except for certain purposes and under certain conditions as hereinafter provided. . . .

50 C.F.R. § 16.3.

¹⁹Pub. L. No. 106-224, 402(1), codified at 7 U.S.C.A. § 7701.

²⁰Pub. L. No. 106-224, 403(10), codified at 7 U.S.C.A. § 7702.

²¹The agricultural and commercial focus of the Plant Protection Act is readily apparent from the comments of its sponsors. Speaking about the final version of the bill after consideration in conference, Rep. Charles Canady (R-Fla.) explained that the Plant Protection Act

is designed to address a very real problem facing American agriculture. The United States loses thousands of acres and billions of dollars in farm production each year due to invasive species. Exacerbating this serious problem are the outdated and fragmented quarantine statutes that govern interdiction of prohibited plants and plant pests. Our agricultural sector needs a modern, effective statutory authority that will protect our crops from these destructive invasive species.

[I]t was for this reason that I introduced the Plant Protection Act. This legislation, crafted in consultation with the USDA, will help to prevent the introduction and dissemination of invasive plants and pests by giving the Animal and Plant Health Inspection Service greatly enhanced investigatory and enforcement tools. The Plant Protection Act will streamline and consolidate existing statutes into one comprehensive law and eliminate outdated and ambiguous provisions. It will also boost deterrents against trafficking of prohibited species by increasing monetary penalties for smuggling, and it will provide USDA with a comprehensive set of investigatory tools and ensure transparency for our trading partners.

and simplification of laws that relate to harmful invasive species. However, the Plant Protection Act does not merely reorganize existing law. It expands the regulatory and enforcement powers over plant pests and noxious weeds, including new civil penalty structures.²² The Act also encourages a steady use of science,²³ the wide involvement of experts and stakeholders in policy-making, consideration of “systems approaches,” the development of integrated management plans on the basis of geographic and ecological regions, and the authorization of new types of classification systems. While some of these systematic concepts were evident in prior law, the new act joins them to regulatory and enforcement mechanisms and thus offers the hope for more effective, efficient, and informed federal plant pest and noxious weed policies.

Several provisions, however, plant their own substantial seeds for mischief. For example, the Act encourages the use of biological pest controls, finding that “biological control is often a desirable, low-risk means of ridding crops and other plants of plant pests and noxious weeds.”²⁴ Biological controls are themselves invasive species—additional biological pollution.²⁵ Congress does not seem to have considered this fact, or the very mixed record of biological controls over the past century.²⁶

Congress chose to create a strong federal preemption of state efforts to regulate plant pests and noxious weeds.²⁷ States and political subdivisions are forbidden to regulate “any article, means of conveyance, plant, biological control organism, plant pest, noxious weed, or plant product” in an effort to control, eradicate, or prevent the introduction of plant pests, noxious weeds, or biological control organisms.²⁸ States and local subdivisions are also barred from regulating the interstate commerce of these kinds of organisms when there are already federal regulations regarding these organisms.²⁹

Given the varied needs of different states, most notably those with highly unique and susceptible ecosystems, such as Hawaii, these are extraordinary and unwise preemption provisions that go far beyond prior law. Whether or not these preemption provisions prove to be harmful will depend on how courts and agencies interpret the provision that allows regulation of interstate commerce when regulations “are

Conference Report on H.R. 2559, 146 Cong. Rec. H3816-01, 3820 (May 25, 2000).

²²In setting ranges for civil penalties, Congress included several unusual factors, including “ability to pay” and the “effect on ability to continue to do business.” See 7 U.S.C.A. § 7734(b).

²³The references to the use of science have a dual-edged quality. For example, § 412(b) provides that “[t]he Secretary [of Agriculture] shall ensure that the processes used in developing regulations. . . governing consideration of import requests are based on sound science and are transparent and accessible.” 7 U.S.C.A. § 7712(b). The reference to “sound” science may be largely rhetorical; it may also place a burden of scientific proof whereby uncertainty and risk favor continued commerce or the status quo rather than action (or regulation). Other examples of “braking” actions by Congress in the Plant Protection Act include the requirement of “least drastic action” by the government with respect to threats from new plant pests and noxious weeds. 7 U.S.C.A. § 7714(c)(2).

²⁴See, e.g., 7 U.S.C.A. § 7701(2), (5). Further mischief may be caused by defining a “biological control organism” as “any enemy, antagonist, or competitor used to control a plant pest or noxious weed” since this definition does not distinguish between “classical” biological controls, where the control agent has evolved with the target in its home range, and the use of biological agents against unrelated targets. 7 U.S.C.A. § 7702(2). Compare Marc Miller & Gregory Aplet, *Biological Control: A Little Knowledge Is a Dangerous Thing*, 45 Rutgers L. Rev. 285 (1993) (criticizing the increasing proposals for non-classical biological controls).

²⁵Marc Miller & Gregory Aplet, *Biological Control: A Little Knowledge Is a Dangerous Thing*, 45 Rutgers L. Rev. 285 (1993).

²⁶Marc Miller & Gregory Aplet, *Biological Control: A Little Knowledge Is a Dangerous Thing*, 45 Rutgers L. Rev. 285 (1993).

²⁷Pub. L. No. 106-224, 436, codified at 7 U.S.C.A. § 7756.

²⁸7 U.S.C.A. § 7756(a).

²⁹7 U.S.C.A. § 7756(b)(1).

consistent with” federal regulations, and how sympathetic and wise the Secretary of Commerce will be in response to state requests for waivers based on “special need.”³⁰

Some federal laws promote harmful NIS, and make it difficult or impossible for federal or state authorities to deal with important aspects of the harmful NIS problem. One example is the Wild Free-Roaming Horses and Burros Act, which protects some feral horses and burros from elimination or control.³¹ A less clear but perhaps more important example is the sum of trade laws and international agreements that may place limits on the kinds of inspections and regulations the United States and its states can create for detection of harmful NIS.

What other federal laws might be used to fill in the requirements for a general law that responds to harmful NIS?³²

§ 22:7 U.S. legal authority—National Invasive Species Act: Big name, narrow scope

If awards were given for act titles, then anyone concerned with the threat from harmful NIS would give the grand prize to two federal statutes: The National Invasive Species Act (NISA) of 1996¹ and the Alien Species Prevention and Enforcement Act of 1992.²

NISA reauthorized a 1990 federal statute with a less encompassing but more accurate title: the Non-Indigenous Aquatic Nuisance Prevention and Control Act (NANPCA) of 1990.³ The NANPCA focused on one place (the Great Lakes), on one pathway (ballast water), and was driven by concerns about one NIS (zebra mussel). It was a statute designed to organize state and federal forces against the zebra mussel and other NIS that had been, and might be, introduced through ballast water. The Act directed the U.S. Army Corp of Engineers to develop a research program for the control of zebra mussels.⁴ (Clearly, Congress understood the invasion metaphor in this specific context.) The NANPCA created a federal interagency Aquatic Nuisance Species Task Force to reduce risk from harmful NIS. The Task Force was charged with assessing aquatic nuisance species threats to “the ecological characteristics and economic uses of U.S. waters other than the Great Lakes.”⁵

In 1996 NISA expanded the focus of NANPCA to mandate regulations to prevent introduction and spread of aquatic nuisance species.⁶ In NISA, Congress encouraged the federal government to negotiate with foreign governments to develop an

³⁰7 U.S.C.A. § 7756(b)(2)(A), (B). A special waiver for a state or political subdivision requires support by “sound scientific data or a thorough risk assessment.” These are high and costly standards in the face of immediate and short-term threats, and may require substantial assistance by the federal government if the waiver will be in fact a way to take account of quite varied local needs and threats.

³¹Wild Free-Roaming Horses and Burros Act of 1971, 16 U.S.C.A. § 1334.

³²A large number of more focused federal laws dealing with specific invasive species problems might be used to defend particular federal government activities regarding harmful invasive species. Examples include the Virus-Serum-Toxin Act, 21 U.S.C.A. §§ 151 to 158, and various forestry acts, both national and region-specific.

[Section 22:7]

international program for preventing NIS introductions through ballast water. The geographical scope of the Act was expanded as well, to include funding authorization for research on aquatic NIS in the Chesapeake Bay, San Francisco Bay, Honolulu Harbor, and the Columbia River system.⁷

As of March 2003, a bill to reauthorize NISA has been introduced in the Senate and referred to committee.⁸ The NISA of 2003 proposes to require mandatory ballast water regulations, and to encourage both further development of ballast water treatment and the use of best available technologies by the shipping industry, though with substantial lag time for adoption.⁹ Senator Susan Collins (R-Maine) introduced the bill with the following observations:

As with national security, protecting the integrity of our lakes, streams, and coastlines from invading species cannot be accomplished by individual States alone. We need a uniform, nationwide approach to deal effectively with invasive species. . . .

The [NISA] of 2003 is the most comprehensive effort ever to address the threat of invasive species. By authorizing \$836 million over 6 years, this legislation would open numerous new fronts in our war against invasive species. The bill directs the Coast Guard to develop regulations that will end the easy cruise of invasive species into U.S. waters through the ballast water of international ships, and would provide the Coast Guard with \$6 million per year to develop and implement these regulations.

The bill also would provide \$30 million per year for a grant program to assist State efforts to prevent the spread of invasive species. It would provide \$12 million per year for the U.S. Army Corps of Engineers and U.S. Fish and Wildlife Service to contain and control invasive species. Finally, the Levin-Collins bill would authorize \$30 million annually for research, education, and outreach.

The most effective means of stopping invading species is to attack them before they attack us. We need an early alert, rapid response system to combat invading species before they have a chance to take hold. For the first time, this bill would establish a national monitoring network to detect newly introduced species, while providing \$25 million to the Secretary of the Interior to create a rapid response fund to help States and regions respond quickly once invasive species have been detected. This bill is our best effort at preventing the next wave of invasive species from taking hold and decimating industries and destroying waterways in Maine and throughout the country.¹⁰

NISA may well be a good piece of legislation for responding to threats from aquatic invasive species introduced in ballast water; if a version anything like the proposed reauthorization is enacted the legislation will be even better.¹¹ The increase in authority and scope from the NANPCA to NISA in 1996 suggests an increasing

⁸S. 525, 108th Cong. (2003).

⁹149 Cong. Rec. S3179 (daily Mar. 5, 2003). Senator Levin, one of the principal sponsors, explained ballast water treatment requirements in the bill as follows:

I understand that ballast water technologies are being researched and are ready to be tested onboard ships. These technologies include ultraviolet lights, filters, chemicals, deoxygenation, and several others. Each of these technologies has a different pricetag attached to it. It is not my intention to overburden the maritime industry with an expensive requirement to install technology. In fact, the legislation states that the final ballast water technology standard must be based on "best available technology economically achievable." That means that the EPA must consider what technology is available, and if there is not economically achievable technology available to a class of vessels, then the standard will not require ballast technology for that class of vessels, subject to review every 3 years. I do not believe this will be the case, however, because the approach creates a clear incentive for treatment vendors to develop affordable equipment for the market. Since ballast technology will be always evolving, it is important that the EPA review and revise the standard so that it reflects what is the best technology currently available and whether it is economically achievable. Shipowners cannot be expected to upgrade their equipment upon every few years as technology develops, however, so the law provides an approval period of at least 10 years.

Id. at S3179.

¹⁰149 Cong. Rec. S3179-80 (daily ed. Mar. 5, 2003).

¹¹*See* Union of Concerned Scientists, The National Invasive Species Act (Aug. 2002) (supporting reauthorization efforts to strengthen NISA), available at <http://www.ucsusa.org/publication.cfm?publica>

awareness on the part of Congress about the complexity of NIS issues, even in the focused context of the ballast water pathway. The proposed expansion of authority in 2003 and the range of bipartisan sponsorship for the bill suggests that Congress is likely to further expand the mandates and authorities with regard to aquatic invasive species, with a particular emphasis on regulating the introduction of NIS through ballast water.

But NISA fails to suggest a general model for responding to harmful NIS. The 1996 version demonstrates that Congress did not then recognize the NIS problem to be the serious problem that its own research agency, the OTA, had described only three years earlier in its path-breaking report. The reauthorization of NISA in 2003, if it succeeds, will be evidence of Congress' awareness of the nature and scope of the NIS problem, at least in the area of aquatic species.

The second linguistically promising federal statute is the Alien Species Prevention and Enforcement Act (ASPEA) of 1992.¹² Unfortunately, the major (and useful) purpose of this act, despite its grand title, was simply to confirm the authority to make illegal the shipment through the mail of otherwise illegal organisms, including those species identified under the Lacey Act, the Plant Pest Act, and the Plant Quarantine Act. ASPEA does not itself create any new categories of organisms that are illegal to ship, nor does it create any presumptions or institutions to help in responding to harmful NIS.

Individual members of Congress have shown increasing awareness of threats specific to their jurisdictions and especially agricultural, commercial, and industrial interests with strong concerns about harm from invasive species. Thus, in the first session of the 108th Congress alone, Congress passed the Nutria Eradication and Control Act of 2003¹³ and introduced the Tamarisk Research and Control Act of 2003,¹⁴ the Salt Cedar Control Demonstration Act,¹⁵ and the Noxious Weed Control Act of 2003.¹⁶

§ 22:8 U.S. legal authority—General environmental policy acts

There are at least two major federal environmental policy statutes and a set of public lands statutes that might apply to harmful NIS in some situations. The National Environmental Policy Act¹ (NEPA) requires federal government agencies to assess the environmental impact of their actions through the promulgation of an environmental impact statement (EIS). Yet many actions of the federal government that seem as if they could or should trigger EIS requirements, in fact, do not, due to both statutory and regulatory interpretations that limit NEPA to “major” government actions that “significantly” affect the quality of “the human environment.”²

Claimants have argued that the federal government has failed to take account of

¹ [tionID=383](#) (last visited June 5, 2003).

² 39 U.S.C.A. § 3015 note.

³ Pub. L. No. 108-16 (signed into law on Mar. 23, 2003).

⁴ H.R. 695, 108th Cong. (2003).

⁵ S. 1051, 108th Cong. (2003).

⁶ S. 144, 108th Cong. (2003).

[Section 22:8]

¹ 42 U.S.C.A. §§ 4321 to 4370d, ELR Stat. NEPA §§ 2 to 209.

² 42 U.S.C.A. § 4332(c) provides:

- (C) include in every recommendation or report on proposals for legislation and other major Federal actions significantly affecting the quality of the human environment, a detailed statement by the responsible official on—
 - (i) the environmental impact of the proposed action,
 - (ii) any adverse environmental effects which cannot be avoided should the proposal be imple-

the impact of invasive species under NEPA.³ But even an expanded interpretation of NEPA to apply to as many federal actions as possible regarding NIS would cover only a modest portion of the full range of harmful NIS issues.⁴ NEPA is primarily directed at the actions of federal agencies, and therefore would not apply to the myriad actions of individuals relevant to harmful NIS, or to the actions of state and local authorities. Moreover, NEPA assumes the possibility of expertise in recognizing and assessing future environmental harms from present actions. In the case of potentially harmful NIS, this kind of information and expertise often may not be present, and the policy issue will then turn on legal presumptions and risk preferences in the face of great uncertainty. More importantly, even when NEPA applies, it only requires analysis of environmental impacts, but does not itself impose substantive barriers, preferences, or limits on government action.⁵

A second major federal environmental statute with some possible application to

- mented,
- (iii) alternatives to the proposed action,
- (iv) the relationship between local short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and
- (v) any irreversible and irretrievable commitments of resources which would be involved in the proposed action should it be implemented.

Id. The regulations promulgated under the authority of NEPA chose to emphasize the requirements of "major" actions "significantly" affecting the environment. However, the current regulations suggest that intentional applications of biological control agents do trigger EIS requirements. *See* 7 C.F.R. § 520.7:

§ 520.7 Preparation of an Environmental Impact Statement (EIS).

- (a) Actions requiring EIS. An EIS will normally be prepared for
 - (1) Proposals for legislation which are determined to be a major Federal action significantly affecting the quality of the human environment; or
 - (2) Other major Federal actions significantly affecting the quality of the human environment. In the experience of ARS, an environmental impact statement shall normally be required in situations when a research project has advanced beyond the laboratory and small plot testing to full scale field testing over a very large area and involving the introduction of control agents.

Regulations also provide a definition of what constitutes a "major" federal action. *See* 40 C.F.R. § 1508.18:

"Major Federal action" includes actions with effects that may be major and which are potentially subject to Federal control and responsibility. Major reinforces but does not have a meaning independent of significantly (1508.27). Actions include the circumstance where the responsible officials fail to act and that failure to act is reviewable by courts or administrative tribunals under the Administrative Procedure Act or other applicable law as agency action.

- (a) Actions include new and continuing activities, including projects and programs entirely or partly financed, assisted, conducted, regulated, or approved by federal agencies; new or revised agency rules, regulations, plans, policies, or procedures; and legislative proposals (1506.8, 1508.17). Actions do not include funding assistance solely in the form of general revenue sharing funds, distributed under the State and Local Fiscal Assistance Act of 1972, 31 U.S.C. §§ 1221 et seq., with no Federal agency control over the subsequent use of such funds. Actions do not include bringing judicial or administrative civil or criminal enforcement actions. . .

harmful NIS issues is the Endangered Species Act (ESA).⁶ The ESA might apply whenever a government or private action threatens an endangered species. The ESA might also lead to direct actions against harmful NIS in the development of recovery plans for listed species. Since harmful NIS have been identified as a significant source of ecosystem change (which may lead to pressures on rare or endangered species), and in some contexts as a direct extinction threat through predation, competition, or displacement, the ESA might bar some introductions or lead to some efforts at removal.

The situations where the powerful effects of the ESA apply, however, are likely to be few. If the ESA applies at all in terms of introductions, it will most likely apply only to intentional introductions of NIS, and only to those introductions where a nexus can be found between the NIS and a listed species. Perhaps a creative argument under the ESA could focus on the risk of introducing harmful NIS that could have a substantial impact on a listed species. Thus, a claim might be made that particular activities (such as use of wood packing materials or whole log imports or release of ballast water) provide a sufficient risk to a listed species to come within regulation under a recovery plan or a voluntary habitat conservation plan (HCP), but courts might well find such links too distant to support such policies.⁷ More directly, a recovery plan for a species listed under the ESA can involve control of existing harmful NIS. While control of NIS is apparently a common feature of recovery plans according to the OTA report, implementation of recovery plans, at least with respect to components related to harmful NIS, has been poor.⁸

In at least one prominent case the federal courts have several times upheld an order to the Hawaiian Department of Land and Natural Resources to remove non-indigenous goats and sheep that threatened the endangered palila bird. The unlikelihood of the ESA and recovery plans becoming a major mechanism for control of harmful NIS is suggested not only by the limited numbers of species listed under the ESA, but by the very caption of the federal case: *Palila (Psittirostra bail leui), an endangered species v. Hawaii Department of Land and Natural Resources*.⁹ Thus, while the ESA creates government obligations and provides government powers beyond other statutes, for the general range of harmful NIS these obligations and powers are in practice fairly limited.

Another broad class of federal laws that provide authority to federal agencies that have at times been used for regulation and policy with respect to harmful invasive species are the federal public lands laws, especially the Multiple-Use Sustained-

Decline of Substantive Review, 20 Env'tl. L. 505 (1990); William Rodgers, *NEPA at Twenty: Mimicry and Recruitment in Environmental Law*, 20 Env'tl. L. 485 (1990); Nicholas Yost, *NEPA's Promise—Partially Fulfilled*, 20 Env'tl. L. 533 (1990).

⁸OTA Report, at 187.

⁹*Palila (Psittirostra bairdii), an endangered species v. Hawaii Dep't of Land & Natural Res.*, 852 F.2d 1106, 18 Env'tl. L. Rep. 21119 (1998) (*Palila II*); *Palila (Psittirostra bairdii), an endangered species v. Hawaii Dep't of Land & Natural Res.*, 639 F.2d 495, 11 Env'tl. L. Rep. 20446 (9th Cir. 1981) (*Palila I*). The power of the federal government to issue regulations under the ESA that include protection not just of endangered species but of the habitats that support them was upheld by the U.S. Supreme Court in *Babbitt v. Sweet Home Chapter of Communities for a Great Or.*, 515 U.S. 687, 25 Env'tl. L. Rep. 21194 (1995). See Ray Vaughan, *State of Extinction: The Case of the Alabama Sturgeon and Ways Opponents of the Endangered Species Act Thwart Protection for Rare Species*, 46 Ala. L. Rev. 569 (1995). However, in *Sweet Home*, Justice Sandra Day O'Connor questioned whether the link between harm by the feral sheep to a plant that protects the palila bird was too tenuous to support the requirement of a "taking" under ESA. 515 U.S. at 713-14 (O'Connor, J., concurring) (citing *Palila II*, 852 F.2d at 1106).

Yield Act of 1960,¹⁰ the National Forest Management Act of 1976,¹¹ and the Federal Land Policy and Management Act of 1976.¹² These acts, and related historical and contemporary legislation governing grazing, timber, and other uses of federal lands, provide a broad array of authorities and responsibilities with respect to public lands. Similar legislation aimed at the governance of smaller federal land units includes the National Wildlife Refuge System Administration Act.¹³ In addition, the powers granted under these sweeping public land laws may be magnified further still, and extended to some activities on state and private lands, under the expansive interpretation of the U.S. Constitution's "Property Clause," which provides that "[t]he Congress shall have power to. . . make all needful rules and regulations respecting the Territory or other property belonging to the United States."¹⁴

In addition to these major federal environmental statutes, a host of more focused environmental and non-environmental laws also have some relevance to harmful NIS. For example, the Wild Bird Conservation Act of 1992¹⁵ regulates the importation of some wild birds, and thus might limit both the introduction of birds that pose a special risk of becoming harmful NIS should they escape, and might as well reduce the chance of accidental introduction of bird diseases through careless importation of wild birds.¹⁶ Other pieces of legislation, seemingly utterly unrelated to NIS issues on their surface, include a handful of odd provisions, some with very direct relevance. For example, the Violent Crime Control and Law Enforcement Act of 1994 includes a provision authorizing the U.S. Attorney General to convene a multi-agency, federal, and state "law enforcement task force in Hawaii to facilitate the prosecution of violations of Federal laws, and laws of the State of Hawaii, relating to the wrongful conveyance, sale, or introduction of non-indigenous plant and animal species."¹⁷

At this point in our review of federal U.S. authority relating to harmful NIS, a reader might ask why analysis of any additional laws is necessary. If the most direct federal legislation (the various blacklist acts) and the most grandly titled legislation (NISA and ASPEA) and the most sweeping environmental legislation (NEPA and ESA) together leave enormous gaps in terms of government authority to respond to harmful NIS, then why look at less direct laws? Why not declare analytic victory and substantive defeat and move on to an assessment of what kinds of new legal authority might be appropriate?

If only the analytic task were so easy! Tables 2 and 3, taken from the OTA report, suggest one reason why considerable additional analysis is required to understand the federal U.S. NIS legal picture. These tables show 21 different federal agencies that deal with some aspect of harmful NIS. This multitude of government actors suggests (though alone it does not prove) that there must be far greater author-

¹⁷Pub. L. No. 103-322, 108 Stat. 1796 (1994). The task force was charged with facilitating prosecution of federal and state laws relating to NIS, recommending ways to strengthen law enforcement regarding NIS "to prevent introduction of non-indigenous plant and animal species," Pub. L. No. 103-322 320108, codified at 42 U.S.C.A. § 14221, and reporting to various congressional committees and federal agencies. What made Congress in 1994 think that criminal laws were avenue through which to deal with harmful NIS?

ity to deal with NIS than is described by the handful of statutes dealing explicitly with narrow aspects of the NIS problem. This long list of federal government actors also suggests that perhaps the sum of federal legal authority to deal with NIS may be great enough to respond to most NIS problems after all.

§ 22:9 U.S. legal authority—General environmental policy acts—Federal agency legal powers

The 21 government agencies identified by the OTA fall under the cabinet-level direction of 10 different government departments.¹ The most important of these agencies for dealing with NIS, including the Animal and Plant Health Inspection Service (APHIS), the Agricultural Research Service (ARS), the U.S. Forest Service (USFS), the Fish and Wildlife Service (FWS), and the National Park Service (NPS), all fall within the authority of two departments—the U.S. Department of Agriculture (USDA) and the U.S. Department of the Interior (DOI).

Federal government agencies get their power from a number of sources. One source of authority is the original or so-called “organic” acts that generally create a government department or agency and provide it with particular responsibilities and authority. Another common source of authority is a statute, such as the Lacey Act or Plant Pest Act or the other statutes described in previous sections, that direct the agency, or executive generally, to act in some way—whether to achieve a goal, or respond to a problem, or develop procedures, or whatever.² A third source of authority derives from appropriations acts, which can explicitly or implicitly (by appropriating funds for specific purposes) provide government agencies with additional substantive authority.³

For example, and of most relevance to control of harmful NIS, the USDA finds its general authority in legislation known as The Organic Act of 1944.⁴ The general provisions are often expanded and modified by later legislation, including the various substantive acts such as the new Plant Protection Act. Thus, over time, general concepts recognized in organic and other general pieces of legislation can be expanded to include ideas such as whether a plant pest is native or non-indigenous. As early as 1957 Congress recognized that some plant pests are alien or “imported.”⁵

Congress creates some agencies, while others are created by the cabinet level officers under the general authority of the department as a whole. When Congress creates a new agency, then that agency is likely to have its own organic (originating) statute. For example, the NPS, while part of the DOI, has its own National Park Service Organic Act, first passed in 1916.⁶ The organic statutes for particular agencies might provide indirect authority for dealing with harmful NIS. For example, the National Park Service Organic Act directs the NPS to:

[Section 22:9]

¹The cabinet level departments that deal in some way with NIS issues include the U.S. Department of Agriculture, the U.S. Department of the Interior, the U.S. Department of Commerce, the U.S. Department of Defense, the U.S. Environmental Protection Agency, the U.S. Department of Health and Human Services, the U.S. Treasury, the U.S. Department of Transportation, and the U.S. Department of Justice.

²In addition to the statutes described in the prior section—those with substantial and direct links to policy regarding harmful NIS—there are a large number of more or less obscure statutes that provide some authority that might be said to expand an agency’s powers to deal with some aspect of the NIS problem. One example might be the Cooperative Forestry Assistance Act of 1978, which makes the Forest Service responsible for identifying and controlling forest pests. *See* 16 U.S.C.A. §§ 2101 to 2114, and 16 U.S.C.A. § 1606.

³The federal budgetary process is extremely complex. There are actually two required bills before any actual expenditure of funds, first a bill that “authorizes” expenditures, which may be part of a substantive act, and then a later bill that actually appropriates funds.

⁴7 U.S.C.A. §§ 147a et seq.; 7 U.S.C.A. §§ 428a et seq.

⁵1957 Amendments. Subsection (a), Pub. L. No. 85-36 added “insect pests, plant diseases, and nematodes, such as imported fire ant, soybean cyst nematode, witchweed, spotted alfalfa aphid” following “or to prevent or retard the spread of.”

⁶16 U.S.C.A. §§ 1 to 4, 22, 43.

promote and regulate the use of the Federal areas known as national parks, monuments, and reservations. . . to conserve the scenery and the natural and historic objects and the wild life [sic] therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations.⁷

When agencies are created within the executive branch, Congress will both appropriate funds directed towards particular offices, and otherwise grant specific additional authority to those particular agencies. For example, there is no general authorizing act for APHIS,⁸ which is the most important federal agency for preventing harmful NIS introductions, but Congress has granted APHIS authority to contract for services to be performed outside the United States.⁹

Government authority to respond to harmful NIS arises from at least one additional source, which is international law that is reflected in treaties signed by the United States. Perhaps the best example of such legal authority is the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES),¹⁰ which provides additional authority for border inspections and creates an independent basis (indeed, an independent obligation), even in the absence of listing a species under one of the “blacklist” acts, for exclusion. The OTA report lists seven treaties with direct effects on harmful NIS and seven treaties with indirect effects on harmful NIS, including CITES.¹¹

Apparent government authority to deal with harmful NIS appears in two additional settings: regulations and rules issued by relevant government agencies, and the activities of interagency “working groups” or councils. On the one hand, the rules and regulations of government agencies can provide the most specific illustrations of government response to harmful NIS. For example, regulations issued by the National Oceanic and Atmosphere Administration (NOAA), which has a policy role regarding various coastal resources, forbid “any person” from “introducing or releasing an exotic species of plant, invertebrate, fish, amphibian, or mammals” into the Florida Keys National Marine Sanctuary.¹² But regulations can also encourage the introduction of NIS, and even harmful NIS. For example, USDA regulations for a conservation reserve program allows “practices specific in the conservation plan that meet all standards needed to cost-effectively establish permanent vegetative or water cover, including introduced or native species of grasses and legumes, forest

⁷16 U.S.C.A. §§ 1 to 4, 22, 43.

⁸General authority for APHIS is specified in a regulation in which the Secretary of Agriculture delegates relevant authority from various plant protection and pest control statutes. *See* 7 C.F.R. § 371.3.

⁹7 U.S.C.A. § 2277 provides:

Funds available to the Animal and Plant Health Inspection Service (APHIS) under this and subsequent appropriations shall be available for contracting with individuals for services to be performed outside of the United States, as determined by APHIS to be necessary or appropriate for carrying out programs and activities abroad. . . .

This provision was enacted in 1991. *See* Pub. L. No. 102-142, tit. VII, S. 737, 105 Stat. 915 (1991). The provision echoed similar authority first granted in a 1990 appropriation act. *See* Pub. L. No. 101-506, tit. VI, S. 641, 104 Stat. 1350 (1990).

¹⁰27 U.S.T. 1987, T.I.A.S. No. 8249, 993 U.N.T.S. 243 (Mar. 1973).

¹¹*See* OTA Report, at 295. International agreements may also be a source of limitation on a country’s power to develop domestic environmental policy. For example, world trade agreements might restrict NIS policies, such as comprehensive import restrictions and review, that were deemed a discriminatory or excessive restraint on free trade. *See* Marc L. Miller, *NIS, WTO, SPS, WIR: Does the WTO Substantially Limit the Ability of Countries to Regulate Harmful Nonindigenous Species?*, 17 *Emory Int’l L.J.* 1059 (2003).

¹²15 C.F.R. § 922.163.

trees, and permanent wildlife habitat. . . .”¹³

Similarly, interagency working groups, which may also be inter-jurisdictional, and which may (or may not) be authorized specifically by statute, such as the Aquatic Nuisance Species Task Force, and the Federal Interagency Committee for Management of Noxious and Exotic Weeds (FICMNEW), are often the groups with the most direct and substantial interest in harmful NIS.

I refer to both the authority implicit in regulations and the authority in working groups as “apparent” because such regulations and groups can exercise only existing sources of legal authority; they cannot create new legal authority. Where substantial possible sources of authority exist, this may be a distinction without a difference. Moreover, to the extent that interagency working groups do not conduct activities that anyone can challenge, the lack of explicit legal authority may have no practical effect. To the extent, however, that one central question is what legal authority exists to deal with harmful NIS, regulations and working groups are not a source of such authority; indeed, they are not even evidence that such authority exists. Often agencies recognizing the general problem of invasive species or particular problems that appear to be within the agency’s jurisdiction will not recognize or will sidestep questions of legal authority.¹⁴

If this combination of substantive statutes, general agency organic acts, various appropriations provisions, and binding international agreements have allowed 21 federal agencies to respond to varying degrees and in varying ways to harmful NIS, again an observer might fairly say: “Sure, this is a legal mess, but the total is, at least, the sum of the parts, and perhaps the parts, all together, make a working machine.” If this were so, the legal mess would be a lawyer’s quibble, and in the United States at least, those concerned about harmful NIS could focus solely on increasing appropriations and encouraging the various agencies to do more and to do what they do better.

A complete answer to that question requires a closer analysis than the scope of this chapter or the available literature can provide. A partial answer, however, is easy to provide. If the question is changed from “what are these myriad agencies doing?” to “what would we want government agencies to do in response to harmful NIS?” then the gaps are revealed. That there may not be adequate federal legal authority to respond to the full range of issues raised by harmful NIS is suggested by a close examination of one other very important, and very odd kind of legal animal: two presidential Executive Orders directly addressed to the problems of harmful NIS.

§ 22:10 U.S. legal authority—Executive orders addressing harmful NIS

A judge, like an executive adviser, may be surprised at the poverty of really useful and unambiguous authority applicable to concrete problems of executive power as they actually present themselves. Just what our forefathers did envision, or would have envisioned had they foreseen modern conditions, must be divined from materials almost as enigmatic as the dreams Joseph was called upon to interpret for Pharaoh.¹

Two Executive Orders, one issued by President Carter in 1977 and the other is-

¹Justice Robert H. Jackson, *Youngstown Sheet & Tube Co. v. Sawyer*, 343 U.S. 579, 634 (1952) (concurring).

sued by President Clinton in 1999, directly address the problem of harmful NIS.

Executive Orders are an odd species of law, issued on occasion by the president.² They direct one or more federal agencies to act in a particular policy direction specified by the President. Executive Orders do not themselves create new government powers, and they cannot: legislative power is vested in the legislative branch (the Congress). The President can, however, rely on powers already vested in the executive branch by Congress, and those limited powers constitutionally committed to the president.

Why assess the effect of Executive Orders if they cannot create new legal authority? First, as the mass of possible legal authority in the prior sections suggests, the limits of the current authority remain unclear, and simply asserting greater authority might become a basis for some court (if a government action were properly challenged) to find authority in fact. Second, both Executive Orders on invasive species draw on the full range of available legal authority; in other words, they assert the maximum available authority in support of federal NIS efforts. This assertion of maximum authority highlights the necessity of understanding the greatest possible reach of current laws, at least in the absence of possible new or additional authority that might clarify current law, expand it, or fill gaps. Third, and related to the prior point, often the issue with regard to a problem with harmful NIS is not one of authority but of action, and of budgetary allocations, and in a unitary executive branch Executive Orders are the policy command of the president (at least in theory).

§ 22:11 U.S. legal authority—Executive orders addressing harmful NIS—Executive Order 11987 (1977) (Carter): Dramatic, ignored, defunct

President Carter issued Executive Order 11987 on May 24, 1977.¹ Although Executive Order 11987 has been entirely supplanted by Executive Order 13112, issued by President Clinton in 1999, it is still quite useful to review the fortunes of 11987, as it provides several lessons that might offer Executive Order 13112 a different and better fate.

Executive Order 11987 is an astounding document, as striking and unexpected, though not nearly as profound, as Charles Elton's classic book *The Ecology of Invasions By Plants and Animals*.² Some aspects of harmful NIS were of course part of public policy and debate by 1977, but NIS as a general issue had yet to strike public and political consciousness. For example, according to Devine the first effort to control any invasive plant in the Florida Everglades did not occur until 1969.³

Executive Order 11987 is not only unexpected because of its topic, but also because of its brevity, its clarity, and its more local, political timing. Executive Order 11987 is one page long. Discussions about it began within the White House only weeks after Carter took office in January 1977, and the Order itself was issued as part of the

³Robert Devine, *Alien Invasion: America's Battle with Non-Native Plants and Animals* 166 (1998).

first public policy statement on the environment by the Carter Administration. The heart of the Order provides the following authorities:

- (a) Executive agencies shall, to the extent permitted by law, restrict the introduction of exotic species into natural ecosystems on lands and waters which they own, lease, or hold for purposes of administration; and, shall encourage the States, local governments, and private citizens to prevent the introduction of exotic species into natural ecosystems of the United States.
- (b) Executive agencies, to the extent they have been authorized by statute to restrict the importation of exotic species, shall restrict the introduction of exotic species into any natural ecosystem of the United States.⁴

The short Executive Order included at least one other visionary aspect: it directed executive agencies to prevent the export of native (U.S.) species “for the purpose of introducing such species into ecosystems outside the United States where they do not naturally occur.”⁵ President Carter was not just concerned with U.S. ecosystems; he was concerned with the threat of NIS to the naturalness of all ecosystems.

Where did President Carter get the good idea that NIS were a bad idea? The answer, which emerges from a careful study of the Carter Presidential Papers, is that the interest of a handful of political advisors on the NIS issue, as well as Carter’s own sensitivity to the impact of alien species, having lived in a farming area. This individual interest on the part of advisors and Carter himself was bolstered by the need to find early environmental initiatives that did not have substantial budget implications, since the funding decisions for Carter’s first year in office had largely been set by the previous Congress and administration. The background statement issued with the release of the Executive Order included language that in its directness continues to help focus attention on harmful NIS issues even today, 27 years later. President Carter issued the Executive Order as part of an environmental message. The press covered the message, but largely ignored the exotic species Executive Order.

Executive Order 11987 had several dramatic flaws that proved ultimately fatal to its virtues. The most significant flaw was that the Executive Order included no complete procedure for implementing its policy directive. The order did direct the Secretary of the Interior, in consultation with the Secretary of Agriculture and other agencies, to “develop and implement, by rule or regulation, a system to standardize and simplify the requirements, procedures, and other activities appropriate for implementing” the order. The lack of specificity in this procedural language—in contrast to the strong substantive principles of the order—made this provision more harmful than helpful.

Executive Order 11987 disappeared from policy as dramatically as it first appeared. A September 15, 1977, memorandum written by the Council on Environmental Quality (CEQ) summarized the response of all federal agencies to the various aspects of the May 23, 1977, environmental message. Tucked away in this memorandum were a few lines on the question of the DOI’s response to the directive to “develop legislation to restrict the impact of exotic plants and animals into the U.S.” The memorandum stated that “legislation is being developed with Agriculture,” that agency progress was “adequate,” and in what appears to be the final White House file entry on the subject, the “CEQ Progress Evaluation,” that there were “delays in interagency meetings and in focus on problems.”

Another flaw was that Executive Order 11987 defined “exotic species” to mean plants and animals “not naturally occurring, either presently or historically, in any

⁴See Exec. Order No. 11987, 3 C.F.R. § 116.

⁵Exec. Order No. 11987, 3 C.F.R. § 116.

ecosystem of the United States,” while “native species” were those that did occur “in any ecosystem of the United States.” These are political, not ecological boundaries. Executive Order 11987 simply did not recognize that movement of organisms among states and within states could cause problems similar to the introduction of organisms from abroad.⁶

A third problem with Executive Order 11987 was that it focused only on introductions into “natural ecosystems.” While such a limitation reduced, to some extent, possible conflicts with commercial interests in industries such as agriculture and horticulture, the line between introductions in disturbed or artificial ecosystems on one hand and “natural” systems on the other may not be wise as a matter of science or policy. To the extent harmful NIS occur on disturbed or artificial land, and then move to more natural systems, and to the extent that the economic, ecological, or aesthetic harm is to disturbed or artificial systems, Executive Order 11987 may have created a barrier to proper regulation and policy.

A fourth flaw in Executive Order 11987 was the extent to which it focused only on new NIS introductions—the “release, escape, or establishment”—and seemed to ignore the possibility of reducing harm from the many NIS already established. Executive Order 11987 was issued 15 years before the OTA report, and the White House files and public statements suggest concerns for “hundreds” rather than the many thousands of NIS already in the United States. Still, even the most aggressive rules on new introductions would do little to stop the continuing and expanding harm from prior introductions, or from the inevitable occasional introductions that will occur even in a strict regulatory framework. The absence of a direct policy statement on established NIS is surprising to the extent that the signing statement and supporting executive branch documentation highlighted the harms from established invaders.

A fifth point about Executive Order 11987 is not so much a flaw as a warning sign not to read the currently legal authority too optimistically. While federal statutory legal authority to respond to harmful NIS has expanded somewhat since 1977, much of the legal framework, including the various “blacklist” acts and NEPA, were in place in 1977. The Carter White House files include several memoranda written in response to drafts that were circulated to cabinet and environmental agencies expressing support for the exotic species policy but doubts about whether available legal authority could support even the import and export issues that were the focus of the order.

The recognition among scientists, politicians, lawyers, and the public of the problems posed by harmful NIS has increased enormously since 1977, as suggested by the newspaper citation analysis in this chapter. Sophistication about the pitfalls of various kinds of administrative process is also considerably greater among lawyers now than 20 years ago. It is wrong, I think, to judge Executive Order 11987 as anything other than a truly bold, but ultimately ineffectual, statement of wise policy, unfortunately ahead of its time.

§ 22:12 U.S. legal authority—Executive orders addressing harmful NIS—Executive Order 13112 (1999) (Clinton): Hopeful, bureaucratic

What difference has 20 years made on executive policy? For one thing, Executive

⁶The OTA Report reads these definitions as being “sufficiently vague to allow a species presently in one U.S. ecosystem to be ‘exotic’ in other U.S. ecosystems.” OTA Report, at 167. I find this argument highly implausible, both because the language does not seem very “vague” in referring to “any ecosystem in the United States” and because in the face of ambiguous language a court would be likely to interpret the key terms in light of the “legislative history” (here the “executive history”) which focused, with illustrations, only on introductions from outside the United States.

Order 13112,¹ promulgated by President Clinton on February 3, 1999, is a longer and more complex document, substantively and procedurally, than Executive Order 11987, which it replaced. Executive Order 13112 states its goal as preventing “the introduction of invasive species and provide for their control and to minimize the economic, ecological, and human health impacts that invasive species cause.”²

In some ways the policy goals are more sweeping than Executive Order 11987. Executive Order 13112 includes control of existing invasive species as one of its primary goals. “Alien species” is defined in ecological, not political terms, as “with respect to a particular ecosystem, any species, including its seeds, eggs, spores, or other biological material capable of propagating that species, that is not native to that ecosystem.”³ Furthermore, “introduction” is defined to include “intentional and unintentional escape, release, dissemination, or placement of a species into an ecosystem as a result of human activity.”

So far, so good. But Executive Order 11987 fell at least in part on its lack of process. How does Executive Order 13112 pursue this goal? Section 2 of the new Executive Order directs

[e]ach federal agency. . . to the extent practicable and permitted by law to use its programs and authority, subject to available funds, to pursue the following objectives:

- (i) to prevent the introduction of invasive species
- (ii) to detect and respond rapidly to and control populations of such species in a cost-effective and environmentally sound manner
- (iii) to monitor invasive species populations accurately and reliably
- (iv) to provide for restoration of native species and habitat conditions in ecosystems that have been invaded
- (v) to conduct research on invasive species and develop technologies to prevent introduction and provide for environmentally sound control of invasive species; and
- (vi) to promote public education on invasive species and the means to address them⁴

The policy directive to all federal agencies whose actions may affect NIS is sweeping. Unfortunately, saying “everyone” has responsibility is a little like saying no one has responsibility. If the order stopped here, it would be only a more sophisticated, complete and current version of the Carter effort 22 years earlier.

However, Executive Order 13112 also creates an Invasive Species Council, made up of all cabinet officers with significant responsibility for NIS.⁵ The council was required to issue an Invasive Species Management Plan within 18 months. The council is advised by an Advisory Committee whose responsibility is to “recommend plans and actions at local, tribal, State, regional, and ecosystem-based levels to achieve the goals and objectives” of the management plan.⁶

Executive Order 13112 uses many of the hottest federal management tricks in the book. The interagency council made up of cabinet officers places responsibility as high as it can go. Involving a wide range of cabinet level officers increases the likelihood of a full airing of views, revelation of conflicts, and perhaps consistency, effi-

ciency, and success of enforcement. Requiring a plan provides a device for action and commentary. Creating an advisory committee increases the chance of expert input and invests a number of people and organizations outside the government in the details of the council's work.

§ 22:13 U.S. legal authority—The National Invasive Species Management Plan (January 18, 2001): Fail to plan, plan to fail

The National Invasive Species Council issued its first draft management plan on July 10, 2000.¹ This first draft management plan was long (63 pages) and completely incoherent. It called for more funding and staff, but did not delineate either the problems or the solutions with any clarity.² It was a model of bureaucracies run amok.

The second draft management plan, issued on October 2, 2000,³ was completely rewritten, and the main body of the text was half the length of the first draft, but with far greater substantive content. That plan, issued shortly before the 2000 presidential election and in the sunset of the Clinton Administration, was formally adopted by the cabinet officers making up the National Invasive Species Council on January 18, 2001, two days before the inauguration of President George W. Bush.⁴ (By the time the plan appeared in print in October 2001, it was the Bush cabinet members on the Council that appeared to a quick reader to be the plan's author.)

The 80-page *National Invasive Species Management Plan*, bearing the formal title *Meeting the Invasive Species Challenge*, is replete with specific goals for the Council and for specific federal agencies, often with target dates attached. It is highly ambitious in detail if modest (indeed unclear) in ultimate aim. The spirit of the plan—hopeful, bureaucratic, non-specific—can be illustrated with just a few goals for the Council itself:

1. By April 2001, the Council will establish a transparent oversight mechanism for use by Federal agencies in complying with the Order and reporting on implementation. The oversight mechanism will employ an interactive process that engages public involvement. . . .
2. By January 2002, the Council will conduct an evaluation of current legal authorities relevant to invasive species. The evaluation will include an analysis of whether and how existing authorities may be better utilized. If warranted, recommendations will be made for changes in legal authority.
3. Starting in October 2001, each member Department of the Council shall submit an annual written report summarizing their invasive species activities, including a description of their actions to comply with the Order, budget estimates, and steps in implementing the Plan. These reports will be used in preparing

[Section 22:13]

¹National Invasive Species Council, United States Invasive Species Draft Management Plan: Preparing for the Future (2000), available at <http://www.invasivespecies.gov/council/draft711.pdf> (last visited June 10, 2003).

²See, e.g., National Invasive Species Council, United States Invasive Species Draft Management Plan: Preparing for the Future 17 (2000).

It will likely take several years to develop specific programs to phase in [a more effective approach]. Substantial additional funding and staff will also be necessary. These costs must be considered in the context of the additional costs required to implement the fully existing laws and the substantial costs of future invasions that will be avoided through implementation of a more effective approach.

³National Invasive Species Council, Meeting the Invasive Species Challenge (Draft Management Plan) (Oct. 2, 2000), available at <http://www.invasivespecies.gov/council/draft1002.pdf> (last visited June 10, 2003).

⁴National Invasive Species Council, Meeting the Invasive Species Challenge (2001), available at <http://www.invasivespecies.gov/council/mpfinal.pdf> (last visited June 10, 2003).

the invasive species cross-cut budget and will help the Council in drafting the biannual updates to the year Management Plan.

4. By January 2002, the Council will prepare an analysis of barriers to coordinated and joint actions among Federal agencies, including legal and policy barriers and barriers relating to the transfer and pooling of funds for invasive species projects. The analysis will include consideration of a standard Memorandum of Understanding that would allow interagency transfer of funding for invasive species actions identified in the Plan.
5. By July 2002, the Council will identify at least two major invasive species issues, regulations, or policies where coordination is inadequate and will take action that fixes the problem.
6. Beginning with Fiscal Year (FY) 2003, and each year thereafter, the Council will coordinate and provide to the Office of Management and Budget (OMB) a proposed cross-cut budget for Federal agency expenditures concerning invasive species, and in particular will address implementation of the actions recommended in this and future editions of the Plan. The cross-cut budget will take into account views of the Advisory Committee, States, and the full range of stakeholders. In addition, it will be used as a tool for planning and coordination, giving emphasis to funding priorities to implement action items.
7. By January 2003, and every 2 years thereafter, the Council will give a report on success in achieving the goals and objectives of the current Plan, and issue an updated Plan. These updates and reports will be prepared in consultation with the Advisory Committee and through mechanisms securing comment from stakeholders and the general public. . . .⁵

Despite their generality, most and perhaps all of these goals have not been met. It would have been optimistic to think that even a majority of these goals could be met if the plan had appeared at the start or in the middle of a new administration. But the shift to an administration where the Council included Secretary of the Interior Gail Norton as a co-chair and Secretary of Defense Donald Rumsfeld and Secretary of State Colin Powell, among other cabinet officers, as members, made any progress on this plan unlikely.

Two general problems with the Invasive Species Management Plan stand out beyond its hyperactive, overstructured, action-item nature. The first is the extent to which the plan continues to define the invasive species problem largely in terms of current federal agency jurisdiction and authority, rather than as a cross-cutting issue for the federal government (and of immense relevance to states, localities, and private actors). Second, the draft does not include or require any measures of current collective harm and therefore offers no basis other than expenditure of energy and money for determining whether the policies proposed are effective or as efficient as possible. In the words of the old school-room saying, “fail to plan, plan to fail.”

The U.S. General Accounting Office (GAO) issued a report in October 2002 that concurs with these concerns.⁶

While the National Invasive Species Council’s 2001 management plan, *Meeting the Invasive Species Challenge*, calls for actions that are likely to help control invasive species, it lacks a clear long-term outcome and quantifiable performance criteria against which to evaluate the overall success of the plan. . . . [T]he only available performance measure that can be used to assess overall progress is the percentage of planned actions

⁵National Invasive Species Council, *Meeting the Invasive Species Challenge* 27-28 (2001).

⁶U.S. GAO, Report to Executive Agency Officials, *Invasive Species: Clearer Focus and Greater Commitment Needed to Effectively Manage the Problem* (2002), available at <http://www.gao.gov/new.items/d031.pdf>. I write that the GAO report “concurs” with the views in this chapter since GAO staff both discussed these issues with me in several telephone conversations and read an earlier substantial draft of this chapter.

that have been completed by the due dates set in the plan. By this measure, implementation has been slow. Specifically, the council departments have completed less than 20[%] of the planned actions that were called for by September 2000. . . . [W]hile the national management plan calls for many actions that would likely contribute to preventing and controlling invasive species, even if the actions in the plan were more fully implemented their effect would be uncertain because they typically do not call for quantifiable improvements in invasive species management or control.

The national management plan does not clearly define a long-term outcome or measures of success as are called for by sound management principles. The executive order states that the management plan shall “detail and recommend performance-oriented goals and objectives and specific measures of success for federal agency efforts concerning invasive species.” Consistent with that requirement, the council and its advisory committee adopted as one of their guiding principles that efforts to manage invasive species are most effective when they have goals and objectives that are clearly defined and prioritized. . . .

However, the council did not articulate in the plan a long-term outcome or condition toward which the federal government should strive. For example, the plan does not contain overall performance-oriented goals and objectives, such as reducing the introduction of new species by a certain percentage or halting the spread of established species on public lands. Instead, the plan contains an extensive list of actions that, while likely to contribute to preventing and controlling invasive species, are not clearly part of a comprehensive strategy.⁷

In earlier reports to Congress and Executive branch officials in August 2000 and July 2001, the GAO had reported about the delay in developing federal policy under Executive Order 13122 and about the need for better rapid response capabilities, authority and funding across federal agencies.⁸

But in fairness to the drafters, even if the plan had been much better written, with measures of success and more clearly prioritized goals, the likelihood of great progress would be relatively slight given the horrible political timing, the environmental sympathies of the Bush Administration, and the terrible cloud of September 11, 2001, and the several wars that have followed. It is more than a little difficult to imagine Donald Rumsfeld asking for the invasive species report following the update on the invasion of Baghdad.

Much of the success of any federal U.S. invasive species policy, but especially a policy emerging from within the executive branch, will turn on the attitudes of executive branch officials and funding and other direction and encouragement from Congress. At the present time, it is only the increasing, widespread recognition of the threat from invasive species that prevents a prediction that the National Invasive Species Council and Management Plan will follow the path of Carter’s 1977 Executive Order into oblivion.

One intriguing congressional twist to federal policy appeared in 2003 in the form of bills introduced in both the U.S. House of Representatives and the Senate that

⁷U.S. GAO, Report to Executive Agency Officials, *Invasive Species: Clearer Focus and Greater Commitment Needed to Effectively Manage the Problem* 28 (2002).

⁸The GAO has responded to a series of requests from legislators on invasive species issues. In August 2000, the GAO described current federal and state funding for dealing with invasive species, and noted that a year and a half after President Clinton signed Executive Order No. 13112 “[t]he Invasive Species Council has been slow in getting off the ground,” and had yet to name people to two of four permanent staff positions. U.S. GAO, Report to Congressional Committees, *Invasive Species: Federal and Selected State Funding to Address Harmful, Non-Native Species* (2000) (GAO/RCED-00-219), available at <http://www.gao.gov/new.items/rc00219.pdf> (last visited June 10, 2003). In July 2001, the GAO focused on the need for a more coherent national rapid response strategy. U.S. GAO, Report to Congressional Requesters, *Invasive Species: Obstacles Hinder Federal Rapid Response to Growing Threat* (2001) (GAO-01-724), available at <http://www.gao.gov/new.items/d01724.pdf> (last visited June 10, 2003).

would codify and in some important ways modify Clinton's Executive Order 13112.⁹ Rep. Vernon Ehlers (R-Mich.) introduced H. 266, the House version of the bill, on January 8, 2003. He explained the bill:

[The] authority [of the National Invasive Species Council] to coordinate the actions of Federal agencies has been limited. The General Accounting Office (GAO) recently recognized this problem. . . . GAO recommended that the Council study whether or not a lack of legislative authority has hampered its mission. . . .

[H.R. 266 gives] the Council a clear statutory mandate. . . . It also makes the Council an independent entity within the Executive Branch. . . .

[T]he Council must submit an annual list of the top priorities in several different areas related to addressing the threat posed by invasive species. . . . The legislation also calls on the Office of Management and Budget to develop a crosscut budget of all invasive species efforts in the Federal government. This is a necessary tool for the Council to coordinate efforts among the various Federal agencies.¹⁰

Perhaps codifying the responsibilities of Executive Order No. 13112 would increase the change of substantial policy action; certainly it would reduce or eliminate ambiguities with regard to whether existing legal authority supported all of the actions specified in the Executive Order. In addition, in codifying the order Congress would put itself on notice to expect annual requests for funding to support NIS policies. If Congress is serious about invasive species, however, it will set clearer standards and measures, place clearer responsibility on the president and specific cabinet agencies, require far more specific reports, and commit more substantial funds to the area.

Specific agencies have made some visible progress as well on NIS issues, though typically what is evident from *Federal Register* notices and information on department web sites are developments on single topics or in response to identified species. At each agency, progress has been a fraction of the systematic and detailed agency-specific requirements listed in the management plan. For example, APHIS has been moving towards implementing a solid wood packing material regulations.¹¹ Solid wood packing material has been the subject of public concern based largely on invasions of the Asian longhorned beetle in New York City; solid wood packing material has also been the subject of guidelines issues by the International Plant Protection Convention (IPPC),¹² a multilateral convention to which the United States is a signatory. Similarly, following public concern and the directives of the National Invasive Policy Act of 1996, the Coast Guard has continued its efforts to pursue effective regulations and voluntary compliance with ballast water treatment and releases.¹³ There is little evidence that federal agencies are living up to § 2 of Executive Order No. 13112 or the demands of the Management Plan.

⁹S. 535; H.R. 266, 108th Cong. (2003). The bills, creatively titled the "National Invasive Species Council Act," have been referred to committees and have only a few sponsors.

¹⁰H.R. 266, 149 Cong. Rec. E42 (daily ed. Jan. 8, 2003).

¹¹U.S. Department of Agriculture, APHIS, 68 Fed. Reg. 27480 (May 20, 2003) (proposed rule). Issues registering on the federal agenda often generate prior or contemporaneous action in the most severely effected states. States enacting ballast water legislations since 1999 include Alaska (1999), California (1999), Illinois (1999), Maryland (2002), Michigan (1999), Oregon (2001), Washington (2002), and Wisconsin (2001). See Eric Reeves, Analysis of Laws and Policies Concerning Exotic Invasions of the Great Lakes 1 (1999), available, along with other documents related to NIS issues in the Great Lakes, at http://www.michigan.gov/deq/0,1607,7-135-3313_3677_8314---,00.html (last visited July 8, 2003).

§ 22:14 State legal authority regarding harmful NIS

For many states, the range of actual and possible legal authority with regard to harmful NIS presents a picture as complicated as the federal situation. Indeed, inherent in any assessment of state legal authority is the additional dimension of limitations (if any) posed by federal law, and the very interesting and complicated questions raised by multi-state, regional, and state and federal compacts, working groups, and parallel or joint state and federal policy implementation.

To make matters even more complicated, some federal laws specifically provide authority to assist and work with particular states. For example, the Hawaii Tropical Forest Recovery Act of 1992¹ included provisions designed to help Hawaii both protect native species and control non-native species. Other federal laws, including the Lacey Act, provide for federal enforcement of policy decisions made under state law. Still other federal laws have provisions encouraging (but not necessarily mandating) various state policies with respect to NIS. In this overview, I seek only to present the framework for understanding state NIS law generally, and to highlight some of the substantial variations among states in their legal response to harmful NIS.

States retain general power to do whatever they want with state lands. One obvious limitation on this applies to federal lands within state boundaries, a situation especially relevant to states in the West. Another obvious limitation on state lands policies applies to private lands, where an independent set of constitutional and statutory limitations together make up recognized private property rights. Still, as both a theoretical and a practical matter, U.S. states have an enormous range of power to prohibit, ignore, or even encourage harmful NIS within their borders.

In fact, state legal authority addressing harmful NIS varies enormously. Several states have substantial legal structures in place; others have substantial but incomplete legal and administrative structures, while still others seem hardly to have noticed the issue of harmful NIS at all. The OTA report summarized the law in all 50 states as of the early 1990s.²

- States prohibit importation and/or release of a median of only eight potentially harmful fish and wildlife species or groups. In a survey of state fish and wildlife agency officials, about one-third responded that their lists are too short.
- About one-quarter of the states lack legal authority over importation and/or release of one or more of the five major vertebrate groups (mammals, birds, fish, reptiles, and amphibians). Also, about 40 percent of state agencies would like to receive additional regulatory authority from their state legislatures.
- Among those states that do not have decision-making standards for approval of importation and/or release of non-indigenous fish and wildlife, none legally requires adherence to a scientific protocol when considering a proposal. A few states mandate scientific studies for certain proposals. About one-half the states require a general determination of potential impacts, defined broadly enough to include all ecological impacts. The rest lack vigorous decision-making standards.
- Most state agencies rate their own implementation and enforcement resources (staff, funding, or others) as “less” or “much less” than adequate; on average, they would like increases of resources of about 50 percent to meet their responsibilities.
- Several states present exemplary approaches to managing non-indigenous fish and wildlife. On the other hand, many states are under-regulating in several important respects. Overall, states are not adequately addressing non-indigenous fish and

[Section 22:14]

wildlife concerns.³

Which states have “exemplary” approaches to managing NIS? A few states employ a “clean list” approach to new NIS introductions. The OTA Report identifies Hawaii as the only state with a complete presumption against importation or release, and several other states—Florida, Georgia, Idaho, Kentucky, and Vermont—as states with partial “clean list” approaches. Most states have a “dirty” or “black” list approach, following the federal lead. The OTA provides a surprisingly long list of states that, it says, have no prohibitions whatsoever on importation or release, including Arizona, California, Massachusetts, and New Mexico; states with few restrictions include Nevada, New Jersey, Texas, and Virginia, though it is likely that most or all of these states have modified their policies on invasive species since the early 1990s, when the OTA did its research.

The accounting of state laws is incomplete without a full examination of what state agencies actually do, and what kind of funds they have with which to do it. The best illustration of state legislation appears in the 2002 volume from the Environmental Law Institute titled *Halting the Invasion: State Tools for Invasive Species Management*.⁴

States have been changing their laws relating to NIS over the past decade, as awareness of NIS issues has increased, and in light of the emergence of state-level plant pest councils and federal and state policy groups such as the Aquatic Nuisance Species Task Force and FICMNEW.⁵ For example, Minnesota was listed in the OTA Report as a state whose basic legal approach to NIS was a “blacklist” approach, and which listed more than five identified species or groups, *i.e.*, it was among the states that appeared on this measure to be more aware of harmful NIS.⁶ But in 1996, Minnesota passed a statute making it one of the states most aggressive in excluding harmful NIS. The new Minnesota laws create a strong white list approach. The Commissioner of Agriculture is directed to classify all exotic species as prohibited, unlisted, or unregulated.⁷ Listing is to be based on the following criteria:

Subd. 2. Criteria. The commissioner shall consider the following criteria in classifying an exotic species under this chapter:

- (1) the likelihood of introduction of the species if it is allowed to enter or exist in the state
- (2) the likelihood that the species would naturalize in the state were it introduced
- (3) the magnitude of potential adverse impacts of the species on native species and on outdoor recreation, commercial fishing, and other uses of natural resources in the state
- (4) the ability to eradicate or control the spread of the species once it is introduced in the state; and

³OTA Report, at 208-09.

⁴Environmental Law Institute, *Halting the Invasion: State Tools for Invasive Species Management* (2002). The most current and complete list of state invasive species laws can be found at the Northeast Midwest Institute. See Northeast Midwest Institute, *Invasive Species State Laws*, at <http://www.nemw.org/ANSstatelaws.htm>.

⁵See, *e.g.*, National Conference of State Legislatures, Environment, Energy and Transportation Program, *Invasive Species Internet Report* (2001), at <http://www.ncsl.org/programs/ESNR/invaspecies.htm> (last visited June 10, 2003).

⁶Focusing on whether a state has a “black list” or “white list” or no list to introductions looks at only one of several relevant dimensions in dealing with harmful NIS. Perhaps the assumption is that if a state does not try to keep out harmful NIS, it is unlikely to be a leader in responding to NIS already in place.

⁷Minn. Stat. Ann. § 84D.04.

(5) other criteria the commissioner deems appropriate⁸

Unlisted exotic species may not be introduced until the Commissioner of Agriculture has determined that the species is appropriate.⁹ Regulated exotic species can only be introduced after obtaining a permit from the commissioner.¹⁰ A person that allows introduction of an exotic species must notify the commissioner within 48 hours of learning of the introduction, and make every reasonable attempt to recapture or destroy it.¹¹ The person who allows release is liable for costs incurred by the state in capture or control of the animal “and its progeny.”¹² A person who allows introduction and does not provide notice or make an attempt to recapture is subject to minor criminal sanctions.¹³

The new Minnesota law concerning NIS looks to be as strong as any state. These provisions focus on introductions, and therefore do not describe a complete law regarding harmful NIS. The success of these provisions will depend on the administrative decisions made under the law, the willingness of citizens to follow the law, and the funding and support provided by the state legislature for the NIS review process.

Another dimension of state legal authority with respect to harmful NIS is that states will often have multiple agencies, offices, committees, and councils with authority over various aspects of the NIS problem. Because of the severity of NIS issues in Hawaii, for example, there is somewhat more literature on law and policy in the state, typified by an excellent 1992 report by the Nature Conservancy of Hawaii and the NRDC. This chapter includes a chart, reprinted here as Table 21.4, that illustrates the number of state agencies involved with harmful NIS in Hawaii. The chart also suggests the extent to which these state agencies interact or at least overlap with the many federal agencies involved in NIS issues.

Hawaiian law regarding harmful NIS law is among the strongest in the United States, no doubt due to the enormous impact NIS have had in Hawaii, as on many other islands. For example, Hawaiian law includes a general prohibition on the introduction of animals until they are evaluated and placed on a list of conditionally approved, restricted, or prohibited animals by the Hawaii Board of Agriculture.¹⁴

In addition to a strong policy and administrative structure supporting exclusion of NIS, Hawaiian law is striking for its aggressive recognition of the need to survey its lands for areas that are relatively pristine, as well as for those that have been harmed by NIS, and then to follow up by protecting the pristine lands and responding to invasions. The additional dimensions of a complete NIS law, including the identification of invasions and the mechanisms for responding to new invasions, as well as those already in place in Hawaii, seem to be absent from the law of many other states. The spirit, and perhaps the actual text of Hawaii Revised Statutes § 152-6 (with NIS substituted for “noxious weed”), might serve as a model for other states and the federal system:

§ 152-6 Duties of the department; noxious weed control and eradication.

- (a) The department shall maintain a constant vigilance for incipient infestations of specific noxious weeds on islands declared reasonably free from those weeds, and shall use those procedures and methods to control or eradicate the infestations of noxious weeds as are determined to be feasible and practicable
- (b) When the department determines that an infestation of a certain noxious weed exists on an island declared reasonably free from the weed, the department shall immediately conduct investigations and surveys as are necessary to determine the feasibility and practicability of controlling or eradicating the infestation. The department may also conduct investigations and surveys to determine the feasibility and practicability of controlling widespread noxious weed infestations. The methods of control or eradication adopted by the department for any noxious

- weed infestation shall cause as little damage to crops and property as possible
- (c) Upon determining that control or eradication of an infestation is practicable and feasible, the department shall immediately serve notice, either oral or written, on both the landowner of the property and the occupant of the property on which the infestations exist. . . . The notice shall set forth all pertinent information with respect to the infestation and notify the landowner and the land occupant of the procedure and methods of control or eradication
 - (d) Upon the department's notification pursuant to subsection (c) above, the department may enter into a cooperative agreement with the landowner and land occupier for the control or eradication of the noxious weed infestation
 - (e) Upon the department's notification pursuant to subsection (c) above, the department may entirely undertake the eradication or control project when it has been determined that the owner, occupier, or lessee of the land on which the noxious weed infestation is located will not benefit materially or financially by the control or eradication of the noxious weed; or when the noxious weed infestation is on state-owned land not leased or under control of private interest.¹⁵

Islands are special engines of endemism; they also tend to be especially vulnerable to invasion. It is not surprising, therefore, that Hawaii's laws regarding alien species are more developed than in most states, and that there is a steady stream of proposed legislation in the Hawaiian legislature responding, typically, to particular invasions.¹⁶ Indeed, the Hawaiian legislature has enacted more than 20 new laws dealing with invasive species since 2001.

A complete analysis of state NIS laws is beyond the scope of this chapter. A complete analysis would require a state-by-state assessment not only of current laws, but also of current policies and budget allocations. This short survey, the available literature, and a sampling of state statutory and regulatory provisions provides sufficient information to conclude that states vary considerably in their response to invasive species, with most trailing behind the federal government in terms of their legal awareness of harmful NIS issues. This short review confirms that, the intriguing provisions in Hawaii and Minnesota notwithstanding, a complete legal response does not exist in even the most progressive states.¹⁷

¹⁵Haw. Rev. Stat. Ann. § 152-6.

¹⁶*See, e.g.*, Haw. H.B. No. 1949, House Draft 2 (Mar. 3, 2000) (Rep. Brian Schatz, D-25th Dist.) (a bill addressing alien aquatic organisms); Haw. H.B. No. 2973, House Draft 2 (Haw. 2000) (Rep. Joseph Souki, D-8th Dist.) (a bill making appropriations for alien miconia eradication).

¹⁷Perhaps a complete legal response to harmful NIS could be cobbled together from the most thoughtful provisions from among the states and federal system, but this exercise does not seem more useful or promising than addressing directly the most common gaps in federal and state law.

§ 22:15 Gaps in U.S. NIS laws

What *should* the law say about non-indigenous species? What role should government play in regulating NIS? What should the goals of NIS law be? What is the best way to achieve these goals?

This chapter began by asking whether there is any way to resolve the apparent paradox of a legal world with a huge amount of potentially relevant law and very little law that attacks the invasive species issue head-on or comprehensively. One resolution of this apparent paradox was to suggest that it is not a paradox at all when the question is expanded from “what laws exist?” to “what can (or cannot) be done under the laws that exist?” To make a similar point, there is no “much law”/“little law” paradox if the issue of invasive species has yet to be conceived in a unified or coherent fashion, though parts of the issue have been recognized. Indeed, if the issue of harmful invasive species has emerged clearly in U.S. public discourse only in the past decade, the odd incident of the Carter Executive Order in 1977 notwithstanding, then it would be even more surprising—perhaps more of a paradox—for there to be comprehensive legislation yet. Laws are rarely ahead of their time; it is hard enough to draft laws that adequately match the needs of their time.

While the present legal situation regarding harmful invasive species may well be more familiar and common as a matter of the evolution of legal regimes for other issues and areas, that recognition does not obviate the need to consider the continued wisdom of the current framework. In other words, the increasing recognition of a large and coherent problem with harmful invasive species (coherence here does not mean simple, just “connected,” or “understood as a whole”) poses two fair challenges to the many piecemeal laws on the books: first, do the present array of laws address all essential aspects of policy and administration with respect to harmful invasive species, and second, whether or not the current laws address all (or most) essential issues, should the legal regime nonetheless be reworked into a simpler, more coherent, and more unified framework?

This final part identifies some of the important gaps in the collective set of current NIS laws and suggests critical issues that a good NIS law would address. It identifies three major problems with current U.S. NIS law: lack of vision, lack of completeness, and lack of coherence. It concludes with some initial reflections on the virtues of simpler and more coherent laws.

§ 22:16 Gaps in U.S. NIS laws—The vision gap: NIS and natural ecosystems

It is good when legal systems recognize that some NIS are harmful, as most if not all U.S. legal systems now do. But perhaps it is equally important that legal systems recognize that indigenous organisms and complete, functional, natural ecosystems populated by indigenous species have a special place and a special priority in policymaking. The important insight that NIS can cause enormous economic, ecological and aesthetic harms may lead policy-makers to focus on exclusion and control—to deal with the threats and negative consequences. A complete NIS law, though, would include a positive conception of ecological place. Especially for areas that are more natural and more wild, laws should express a general preference for indigenous over non-indigenous species, and treat even familiar non-indigenous species as exceptions to a favored norm.

The issues with respect to less wild and less natural areas, and especially with respect to agricultural land, are quite different. It would be awkward, to say the least, to apply a presumption against alien species to such systems, which are almost entirely defined by introduced species, themselves highly modified through selective

breeding and, now, through direct genetic modification. For agricultural areas, and perhaps in many other artificial or highly disturbed settings (homes, cities, and perhaps urban parks), a different set of presumptions with regards to alien species might apply. In such settings, the primary question might be the risk of alien species in those artificial contexts escaping into more natural or wild areas, or otherwise causing identifiable economic, ecological or aesthetic harms.

Current federal law reveals multiple visions, some antagonistic to harmful NIS, some neutral, and some actually supportive of alien species introductions and protective of even harmful NIS now in place, even in more natural and more wild areas. In the new Executive Order No. 13112 there appears to be a general policy preference for indigenous over non-indigenous species where the order directs federal agencies to “provide for restoration of native species and habitat conditions in ecosystems that have been invaded.” But Executive Order No. 13112 also limits its concerns to harmful NIS, and states no general policy against alien species even in more natural and more wild areas.

There are many different ways to state positive conceptions of the role of indigenous species and natural ecosystems. It would help in the design and implementation of wise NIS law and policies if there were some stated goal. Of course there are enormous philosophical and practical problems in almost any definition based on what is “natural” and what is “wild,” given the pervasive effects of human presence and activities for long periods in much of the United States.¹ Perhaps invasive species laws need a principle of direction as much as one of destination. Perhaps an invasive species law would be a place to include, in a statement of principles, and at least with regards to more natural and more wild areas, Aldo Leopold’s land ethic: “A thing is right when it tends to preserve the integrity, stability, and beauty of the biotic community. It is wrong when it tends otherwise.”²

To point to a “vision gap” in current NIS laws may seem fairly abstract, and might suggest that the NIS problem—or at least its legal dimensions—is not so important after all. However, in the absence of some general statements of principle and identification of the goals to be achieved, it is hard to state coherent and complete legal or policy provisions, or to implement complex and wide-ranging laws, over time and place.

§ 22:17 Gaps in U.S. NIS laws—The knowledge gap

There may be no environmental issue of similar importance that is as little recognized to be a problem by the general public. This is true even as public awareness, in the form of an increase in news coverage, increases. The news stories are, for the most part, related to specific invasive species; they are not about, and often do not reflect, a more general concern with invasive species as a class of problem.

The reasons for the relatively low standing of NIS issues are many and subtle. First, NIS problems are hard to see: it requires knowledge to differentiate between a native and invasive species, and to differentiate between harmful and benign alien species. When people look at their pets and their houseplants and their

[Section 22:16]

See also Bradley Karkkainen, *Biodiversity and Land*, 83 Cornell L. Rev. 1 (1997); J.B. Ruhl, *Biodiversity Conservation and the Ever-Expanding Web of Federal Laws Regulating Nonfederal Lands: Time for Something Completely Different?*, 66 U. Colo. L. Rev. 555 (1995); A. Dan Tarlock, *Local Government Protection of Biodiversity: What Is Its Niche?*, 60 U. Chi. L. Rev. 555 (1993).

gardens, they do not usually think of these organisms as non-indigenous. The problem of NIS, therefore, is a problem in part of psychology (what is “seen”) and in part of culture (what practices are considered proper).¹

But many kinds of pollution other than biological pollution are non-obvious. The harms from other kinds of pollution may be easier, however, to perceive, especially when those harms are directly to human health. In addition, there are more accessible measures for other kinds of pollution, both in technical literature (assessing the risks from different pollutants) and in public and policy discourse (focusing on “smog days” or “superfund sites”).

A complete NIS law would include both authority and process for expanding knowledge about NIS. NIS laws should mandate the development of ready measures for assessing the costs and the benefits of NIS and of the activities (such as trade, travel and horticulture) that may indirectly introduce harmful NIS.

The lack of knowledge extends beyond public awareness to basic science and wise conservation policy. Basic scientific questions that have been answered only in rough and preliminary terms include: How many NIS are there in the United States, and in each of the states? What are the pathways and rates of new introductions?² Which NIS impose the greatest harm, and which NIS pose the greatest risk of harm over time? What are the most effective mechanisms for responding to different NIS? What are the most effective methods for reducing the rate of introductions? What standards should be applied to intentional introductions, including introductions in agricultural settings, of biological controls,³ and of genetically engineered organisms?

Among the most important knowledge gaps address policy issues—applied biological and social science—that might establish a list of priorities with respect to NIS for each available policy dollar, as well as a sound basis for determining a proper total level of resources for NIS issues. It is easy to come up with long lists of invasive species and the various kinds of harm they cause. It is harder to determine a “top 10” list, because that requires an understanding of facts and a choice about values, neither of which exists in most U.S. contexts. It is harder still to determine whether the first priority is to respond to the most costly current invaders, or the most threatening future invaders, or the potential of new introductions, each of which requires a substantial knowledge base, and each of which may require very different administrative processes.

Therefore, a top priority for sound policy development is expanding the knowledge base about these multiple dimensions of the NIS problem, and developing management tools such as measures to assess the priorities across a huge number of needs and demands. Like hurricanes and earthquakes, it would serve sound policy purposes if we knew that a particular NIS (widespread or not yet an invader) was a

[Section 22:17]

¹See John Heinz Center for Science, Economics and the Environment, State of the Nation’s Ecosystems: Measuring the Lands, Waters and Living Resources of the United States 76, 145, 169-70, 204, 222, 251, 261-62 (2002) (wisely suggesting that the presence of non-native species are one measure of ecological health; asks the misguided question “whether there is a time (e.g., 50 or 100 years) after which an introduced species is considered to be native”).

²See generally National Research Council, Committee on the Scientific Basis for Predicting the Invasive Potential of Non-Indigenous Plants and Plant Pests in the United States, Predicting Invasions of Non-Indigenous Plants and Plant Pests (2002), available at <http://www.nap.edu/books/0309082641/html/> (last visited June 10, 2003).

³With Greg Aplet I have previously expressed hesitation about treating biological controls as anything other than invasive species, even if the cost/benefit and risk calculations come out in their favor many times. See Marc Miller & Gregory Aplet, *Biological Control: A Little Knowledge Is a Dangerous Thing*, 45 Rutgers L. Rev. 285 (1993).

“class 5” (or whatever scale was selected) and therefore deserved a particular priority response. Like many other aspects of environmental oversight, it would help to have regular reports, and a basis for establishing changes in the NIS problem over time.

§ 22:18 Gaps in U.S. NIS laws—The crisis response gap

Current U.S. NIS laws are strongest, in general, at providing government agencies with power to exclude particular identified species, and to conduct various kinds of searches at points and through mechanisms of entry and transport. If a war metaphor is justified with respect to NIS—and the familiar and well-established language of invasions and invasiveness suggests the metaphor may be more useful here than in some contexts—then the law and policy should match the metaphor. Current law focuses on the front lines, but pays too little attention to the enemies that have already arrived, and are spreading within.

Among the gaps in most current U.S. laws are substantive and structural provisions aimed at identifying NIS that have been introduced, and responding to those invasions.¹ Like crime reports and the myriad other reports provided by the government to mark and measure important social and physical facts, the authority, tools, and procedures should exist to produce steady information and reports on the NIS problem. The authority should also exist to respond quickly, especially in circumstances where a quick response to a limited invasion might succeed at total suppression, while a delayed response might leave far more restricted options. In other words, a good law would authorize and fund an alien species strike force.

Information about NIS introductions and invasions is critical for assessing the proper response. While federal and state government agencies have found the authority to respond to particular invasions, only Hawaii appears to have a statute in place that creates an obligation to identify new invasions and respond to them. Explicit statutory authority should support both rapid and long-term strategic responses, depending on the scope of the invasion, the risk of harm from and nature of the invasive species, and the availability of control mechanisms.

Another surprising gap in U.S. NIS law involves intentional NIS introductions. Intentional NIS introductions arise in a wide variety of settings. Some of those settings may have notably higher risks for harm than others. In terms of current gaps, some harmful NIS continue to be sold even after their harmful properties are widely recognized, and even after regulatory efforts to control their spread are already in place. Purple loosestrife (*Lythrum salicaria*) is just one common example of such continued commercial distribution in the face of enormous evidence of harmful impacts.

A legal framework should exist for the regularized assessment of all proposed introductions, including the introduction of biological controls and genetically engineered organisms. Decisions about intentional introductions should be made based on explicit, public standards, and public processes.

§ 22:19 Gaps in U.S. NIS laws—Enlisting the citizenry: The role of public education

Again, the war metaphor may come to the aid of good lawmaking. A culture and

[Section 22:18]

¹See U.S. GAO, Report to Congressional Requesters, *Invasive Species: Obstacles Hinder Federal Rapid Response to Growing Threat* (2001) (GAO-01-724) (“A major obstacle to rapid response is the lack of a national system to address invasive species. . . . Without such a system, obstacles to rapid response are less likely to be addressed and invasive species will continue to fall through the cracks.”).

community that does not distinguish between indigenous and NIS is one less likely to recognize or care about *harmful* NIS. When institutions and individuals who should know better—such as zoos and botanical gardens and fishing enthusiasts and nurseries—promote NIS, they illustrate the importance of encouraging a much broader understanding of the threats posed by harmful NIS.¹

NIS laws can create extensive regulatory structures for assessing intentional introductions; they can also create formal civil or criminal liability for intentional and unintentional introductions. Such liability may be especially important with respect to the complex issues associated with intentional introductions for agricultural, pest control, horticulture, and sporting interests. But over time, better education about the threat of harmful NIS, including the training of citizens to help to identify invasive species, may do more to lower the rate of introductions than formal regulatory or liability provisions for the individuals whose harmful behavior can be traced. (The point is not that regulatory and liability provisions are inappropriate, but that public awareness and education may be just as important.)

§ 22:20 Gaps in U.S. NIS laws—Coherence in law

What determines whether an aspect or social policy is addressed by one law, ten laws, or no law at all? What is the proper scope of law in any particular area? There are no absolute answers to these questions. Indeed, as a scholarly field, theories of legislation and lawmaking are fairly impoverished. However, when the history of an area and the habits of lawmaking have led to the promulgation of many related laws, it is probably a good time to consider whether there are logical or policy advantages to having fewer and more coherent laws in the area.

It is hard to imagine an area of law or policy more convoluted than the laws regarding harmful NIS, yet with great legal and knowledge gaps on key issues. This divergence framed the paradox noted at the beginning of this chapter. Pressures have already been brought to bear recently on the array of plant pest and noxious weed acts—one important piece of the much larger harmful invasive species puzzle—which led to the enactment of a new Plant Protection Act and the supplanting of one set of prior statutes. But continued divergence across the broader, coherent range of issues that describe the harmful invasive species problem provides a strong argument in favor of adopting a “uniform” or “organic” or “model” act.

The alternative to conceptualizing a uniform NIS statute is to assess particular problems with various combinations of the current laws in force. The difficulty of this exercise is proportional to the number of relevant laws, to their uncertain scope, and to the absence of some clear statement of goals or measures against which to test the current legal provisions. This chapter has identified some of the typical gaps in current U.S. NIS laws. The OTA Report and other publications have pointed to a variety of other gaps in federal and state law. This chapter has also noted the possibility that the limits of current federal legal authority may be more likely to be tested given the promulgation of the new Executive Order No. 13112 that relies on all available legal authority to support its policy directives.

During the past decade, Congress and executive branch agencies have appeared willing to respond to particular NIS issues, most notably in Executive Order No. 13112, and in statutes such as the Plant Pest Act. States, to varying degrees, also seem to be directing increasing political attention to harmful NIS. Both the federal and state governments could continue along this path, adding specific legal author-

[Section 22:19]

¹Zoos often sell seeds for plants from faraway places in giftshops. At some zoos, signs point out alien plants, and encourage use of plants appropriate to climate (but not necessarily appropriate to the local ecosystem).

ity when needs arise, and encouraging appropriate funding within program, agency, and budget lines that are already established.

One argument in favor of working only with the idea of modifying current legal authorities is that there are many programs in place, and established understandings, under the existing laws. However, a new, organic NIS law would not necessarily need to replace current authorities, but could address general goals and priorities, set presumptions, and fill the kind of large gaps noted in this chapter, including various survey and reporting requirements that would help to increase the political and public awareness of NIS issues.¹ Such a core NIS law, for which there is no model currently in the United States, could dramatically help to increase awareness of NIS issues. A core law could also assist in explaining to Congress and state legislatures the funding priorities and demands for a wise response to harmful NIS.

A core NIS law could link pieces of the harmful NIS puzzle now left separate or un-addressed. It could link issues of intentional and accidental introduction on new NIS, assessment of NIS already released, and various control programs. A core NIS law could also assist in structuring NIS policies around ecological rather than political borders. In the area of intentional introductions, a core NIS law could provide a framework for considering and comparing the benefits and costs of introducing non-indigenous but naturally evolving species, and those that are the product of genetic engineering.

An additional argument in favor of a new core NIS law is the growing evidence that the National Invasive Species Council has failed to demonstrate any substantial capacity to develop, implement, review and report on new policies that can make a difference. Indeed, it does not seem that the Council has a sensible measure of “difference” it is trying to make. A locus of knowledge and policy on NIS is probably a good idea, but the political assumptions, authorities and hopes behind the creation of the Council have not been enough to deliver real progress. Don Schmitz and Daniel Simberloff have suggested the creation of a Center for Biological Invasions, an additional independent agency, modeled after the Centers for Disease Controls, to address the massive knowledge and coordination problems raised by invasive species.²

A new core NIS law would demand the attention of all the political branches, the many interested private industries and individuals, and the public, and would increase the chance that the threat from invasive species will be contained. Every senator and representative with a concern about some particular invasive species should now see that the problem is unlikely to be addressed well, and new problems avoided, without the larger context, structure, and knowledge that better laws and institutions could provide.

§ 22:21 Conclusion

Harmful NIS, and NIS generally, may present the single most important environmental issue overlooked, relative to its importance, in current law and policy. It may seem odd that an area of law that takes 50 pages to sketch and for which there is a “national plan” is an area strongly in need of new and better law. But that seems to be the case.

[Section 22:20]

¹Keith Pitts & Marc Miller, Interim Report: Policy and Regulation Working Group of the National Invasive Species Council (2000), available at <http://www.invasivespecies.gov/council/PR%20interim%20final2%20703.doc> (last visited June 2003).

²Don Schmitz & Daniel Simberloff, Issues in Science and Technology Online, Needed: A National Center for Biological Invasions (2001), at <http://www.nap.edu/issues/17.4/schmitz.htm> (last visited June 10, 2003).

Even if lawyers might find the building blocks they need in current law to defend current or proposed government actions, no ecologist or policymaker would think a set of laws so fractured and designed for other purposes provides a wise foundation for NIS law and policy. Nor should any lawyer be satisfied with a legal framework that is so difficult to describe, understand, and apply. And no one, legislator, lawyer, scientist, or citizen, should be satisfied with federal government's record thus far in preventing, identifying, or responding to invasive species.

APPENDIX 22A

Presidential Executive Orders on NIS

a. Executive Order 11987 (May 24, 1977) (Jimmy Carter) 42 Fed. Reg. 26969 (E.O. 11987 was replaced by E.O. 13112).

Exotic Organisms

By virtue of the authority vested in me by the Constitution and the statutes of the United States of America, and as President of the United States of America, in furtherance of the purposes and policies of the Lacey Act and the National Environmental Policy Act of 1969, it is hereby ordered as follows:

Section 1. As used in this Order:

- (a) “United States” means all of the several States, the District of Columbia, the Commonwealth of Puerto Rico, American Samoa, the Virgin Islands, Guam, and the Trust Territory of the Pacific Islands
- (b) “Introduction” means the release, escape, or establishment of an exotic species into a natural ecosystem
- (c) “Exotic species” means all species of plants and animals not naturally occurring, either presently or historically, in any ecosystem of the United States
- (d) “Native species” means all species of plants and animals naturally occurring, either presently or historically, in any ecosystem of the United States

Section 2.

- (a) Executive agencies shall, to the extent permitted by law, restrict the introduction of exotic species into natural ecosystems on lands and waters which they own, lease, or hold for purposes of administration; and, shall encourage the States, local governments, and private citizens to prevent the introduction of exotic species into natural ecosystems of the United States
- (b) Executive agencies, to the extent they have been authorized by statute to restrict the importation of exotic species, shall restrict the introduction of exotic species into any natural ecosystem of the United States
- (c) Executive agencies shall, to the extent permitted by law, restrict the use of Federal funds, programs, or authorities used to export native species for the purpose of introducing such species into ecosystems outside the United States where they do not naturally occur
- (d) This Order does not apply to the introduction of any exotic species, or the export of any native species, if the Secretary of Agriculture or the Secretary of the Interior finds that such introduction or exportation will not have an adverse effect on natural ecosystems

Section 3. The Secretary of the Interior, in consultation with the Secretary of Agriculture and the heads of other appropriate agencies, shall develop and implement, by rule or regulation, a system to standardize and simplify the requirements, procedures and other activities appropriate for implementing the provisions of this Order. The Secretary of the Interior shall ensure that such rules or regulations are in accord with the performance by other agencies of those functions vested by law, including this Order, in such agencies.

b. Executive Order 13112 (February 3, 1999) (William J. Clinton) 64 Fed. Reg. 6183

Invasive Species

By the authority vested in me as President by the Constitution and the laws of the United States of America, including the National Environmental Policy Act of 1969, Nonindigenous Aquatic Nuisance Prevention and Control Act of 1990, Lacey Act, Federal Plant Pest Act, Federal Noxious Weed Act of 1974, Endangered Species Act of 1973, and other pertinent statutes, to prevent the introduction of invasive species and provide for their control and to minimize the economic, ecological, and human health impacts that invasive species cause, it is ordered as follows:

Section 1. Definitions.

- (a) “Alien species” means, with respect to a particular ecosystem, any species, including its seeds, eggs, spores, or other biological material capable of propagating that species, that is not native to that ecosystem
- (b) “Control” means, as appropriate, eradicating, suppressing, reducing, or managing invasive species populations, preventing spread of invasive species from areas where they are present, and taking steps such as restoration of native species and habitats to reduce the effects of invasive species and to prevent further invasions
- (c) “Ecosystem” means the complex of a community of organisms and its environment
- (d) “Federal agency” means an executive department or agency, but does not include independent establishments as defined by 5 U.S.C. 104
- (e) “Introduction” means the intentional or unintentional escape, release, dissemination, or placement of a species into an ecosystem as a result of human activity
- (f) “Invasive species” means an alien species whose introduction does or is likely to cause economic or environmental harm or harm to human health
- (g) “Native species” means, with respect to a particular ecosystem, a species that, other than as a result of an introduction, historically occurred or currently occurs in that ecosystem
- (h) “Species” means a group of organisms all of which have a high degree of physical and genetic similarity, generally interbreed only among themselves, and show persistent differences from members of allied groups of organisms
- (i) “Stakeholders” means, but is not limited to, State, tribal, and local government agencies, academic institutions, the scientific community, nongovernmental entities including environmental, agricultural, and conservation organizations, trade groups, commercial interests, and private landowners
- (j) “United States” means the 50 States, the District of Columbia, Puerto Rico, Guam, and all possessions, territories, and the territorial sea of the United States

Sec. 2. Federal Agency Duties.

- (a) Each Federal agency whose actions may affect the status of invasive species shall, to the extent practicable and permitted by law
 - (1) identify such actions
 - (2) subject to the availability of appropriations, and within Administration budgetary limits, use relevant programs and authorities to
 - (i) prevent the introduction of invasive species
 - (ii) detect and respond rapidly to and control populations of such species in a cost-effective and environmentally sound manner
 - (iii) monitor invasive species populations accurately and reliably
 - (iv) provide for restoration of native species and habitat conditions in ecosystems that have been invaded
 - (v) conduct research on invasive species and develop technologies to

- prevent introduction and provide for environmentally sound control of invasive species; an
- (vi) promote public education on invasive species and the means to address them; an
- (3) not authorize, fund, or carry out actions that it believes are likely to cause or promote the introduction or spread of invasive species in the United States or elsewhere unless, pursuant to guidelines that it has prescribed, the agency has determined and made public its determination that the benefits of such actions clearly outweigh the potential harm caused by invasive species; and that all feasible and prudent measures to minimize risk of harm will be taken in conjunction with the actions
- (b) Federal agencies shall pursue the duties set forth in this section in consultation with the Invasive Species Council, consistent with the Invasive Species Management Plan and in cooperation with stakeholders, as appropriate, and, as approved by the Department of State, when Federal agencies are working with international organizations and foreign nations

Sec. 3. Invasive Species Council.

- (a) An Invasive Species Council (Council) is hereby established whose members shall include the Secretary of State, the Secretary of the Treasury, the Secretary of Defense, the Secretary of the Interior, the Secretary of Agriculture, the Secretary of Commerce, the Secretary of Transportation, and the Administrator of the Environmental Protection Agency. The Council shall be co-chaired by the Secretary of the Interior, the Secretary of Agriculture, and the Secretary of Commerce. The Council may invite additional Federal agency representatives to be members, including representatives from subcabinet bureaus or offices with significant responsibilities concerning invasive species, and may prescribe special procedures for their participation. The Secretary of the Interior shall, with concurrence of the co-chairs, appoint an Executive Director of the Council and shall provide the staff and administrative support for the Council
- (b) The Secretary of the Interior shall establish an advisory committee under the Federal Advisory Committee Act to provide information and advice for consideration by the Council, and shall, after consultation with other members of the Council, appoint members of the advisory committee representing stakeholders. Among other things, the advisory committee shall recommend plans and actions at local, tribal, State, regional, and ecosystem-based levels to achieve the goals and objectives of the Management Plan in section 5 of this order. The advisory committee shall act in cooperation with stakeholders and existing organizations addressing invasive species. The Department of the Interior shall provide the administrative and financial support for the advisory committee

Sec. 4. Duties of the Invasive Species Council.

The Invasive Species Council shall provide national leadership regarding invasive species, and shall:

- (a) oversee the implementation of this order and see that the Federal agency activities concerning invasive species are coordinated, complementary, cost-efficient, and effective, relying to the extent feasible and appropriate on existing organizations addressing invasive species, such as the Aquatic Nuisance Species Task Force, the Federal Interagency Committee for the Management of Noxious and Exotic Weeds, and the Committee on Environment and Natural Resources
- (b) encourage planning and action at local, tribal, State, regional, and ecosystem-based levels to achieve the goals and objectives of the Manage-

- ment Plan in section 5 of this order, in cooperation with stakeholders and existing organizations addressing invasive species
- (c) develop recommendations for international cooperation in addressing invasive species
 - (d) develop, in consultation with the Council on Environmental Quality, guidance to Federal agencies pursuant to the National Environmental Policy Act on prevention and control of invasive species, including the procurement, use, and maintenance of native species as they affect invasive species
 - (e) facilitate development of a coordinated network among Federal agencies to document, evaluate, and monitor impacts from invasive species on the economy, the environment, and human health
 - (f) facilitate establishment of a coordinated, up-to-date information-sharing system that utilizes, to the greatest extent practicable, the Internet; this system shall facilitate access to and exchange of information concerning invasive species, including, but not limited to, information on distribution and abundance of invasive species; life histories of such species and invasive characteristics; economic, environmental, and human health impacts; management techniques, and laws and programs for management, research, and public education; and
 - (g) prepare and issue a national Invasive Species Management Plan as set forth in section 5 of this order

Sec. 5. Invasive Species Management Plan.

- (a) Within 18 months after issuance of this order, the Council shall prepare and issue the first edition of a National Invasive Species Management Plan (Management Plan), which shall detail and recommend performance-oriented goals and objectives and specific measures of success for Federal agency efforts concerning invasive species. The Management Plan shall recommend specific objectives and measures for carrying out each of the Federal agency duties established in section 2(a) of this order and shall set forth steps to be taken by the Council to carry out the duties assigned to it under section 4 of this order. The Management Plan shall be developed through a public process and in consultation with Federal agencies and stakeholders
- (b) The first edition of the Management Plan shall include a review of existing and prospective approaches and authorities for preventing the introduction and spread of invasive species, including those for identifying pathways by which invasive species are introduced and for minimizing the risk of introductions via those pathways, and shall identify research needs and recommend measures to minimize the risk that introductions will occur. Such recommended measures shall provide for a science-based process to evaluate risks associated with introduction and spread of invasive species and a coordinated and systematic risk-based process to identify, monitor, and interdict pathways that may be involved in the introduction of invasive species. If recommended measures are not authorized by current law, the Council shall develop and recommend to the President through its co-chairs legislative proposals for necessary changes in authority
- (c) The Council shall update the Management Plan biennially and shall concurrently evaluate and report on success in achieving the goals and objectives set forth in the Management Plan. The Management Plan shall identify the personnel, other resources, and additional levels of coordination needed to achieve the Management Plan's identified goals and objectives, and the Council shall provide each edition of the Management Plan and each report on it to the Office of Management and Budget. Within 18 months after measures have been recommended by the Council in any edition of the

Management Plan, each Federal agency whose action is required to implement such measures shall either take the action recommended or shall provide the Council with an explanation of why the Action is not feasible. The Council shall assess the effectiveness of this order no less than once each 5 years after the order is issued and shall report to the Office of Management and Budget on whether the order should be revised

Sec. 6. Judicial Review and Administration.

- (a) This order is intended only to improve the internal management of the executive branch and is not intended to create any right, benefit, or trust responsibility, substantive or procedural, enforceable at law or equity by a party against the United States, its agencies, its officers, or any other person
- (b) Executive Order 11987 of May 24, 1977, is hereby revoked
- (c) The requirements of this order do not affect the obligations of Federal agencies under 16 U.S.C. 4713 with respect to ballast water programs
- (d) The requirements of section 2(a)(3) of this order shall not apply to any action of the Department of State or Department of Defense if the Secretary of State or the Secretary of Defense finds that exemption from such requirements is necessary for foreign policy or national security reasons

I. OVERVIEW AND BACKGROUND

§ 23:1 Executive Summary

Coastal and ocean degradation caused by pollution, industrial and commercial development, and ocean dumping became major environmental issues in the 1960s and early 1970s. Public awareness of ocean problems was heightened by oil spills, “dead seas” created by the dumping of dredge spoil and sewage sludge, and numerous scientific reports detailing the environmental decline of coastal areas. In response, the U.S. Congress considered and approved a number of remedial measures to protect coasts and estuaries, including federal assistance to states to develop coastal zone management plans, new water pollution and ocean dumping controls, and the creation of programs to establish estuarine and marine sanctuaries.

The Marine Protection, Research and Sanctuaries Act of 1972 (MPRSA)¹ authorized a trio of programs to protect and restore ocean ecosystems. The Act regulated the dumping of wastes in ocean waters, launched a study of the long-term impacts of humans on marine ecosystems, and created a Marine Sanctuaries Program for the “purpose of preserving or restoring . . . [marine] areas for their conservation, recreational, ecological, or esthetic values.”² Early proponents of marine sanctuaries envisioned a system of protected ocean areas analogous to those established for national parks and wilderness areas.

The concept of a marine wilderness preservation system was raised in 1966 in *Effective Use of the Sea*, a report prepared by President Lyndon Johnson’s Science Advisory Committee.³ The Advisory Committee recommended a permanent system of marine preserves similar in purpose and design to that established for terrestrial wilderness areas under the Wilderness Act. Like wilderness areas, marine preserves were to be areas managed for the purpose of maintaining the ocean’s natural characteristics and value, and human uses that were deemed compatible with this standard would be allowed.

[Section 23:1]

¹Marine Protection, Research, and Sanctuaries Act of 1972, Pub. L. No. 92-532 § Title III, 86 Stat. 1052 (1972).

²Marine Protection, Research, and Sanctuaries Act of 1972, Pub. L. No. 92-532 § 302.

³Panel on Oceanography, President’s Science Advisory Committee, *Effective Use of the Sea* (1966).

Unfortunately, the Sanctuaries Program did not follow the model of the National Wilderness Preserve System and proved to be highly unstable. For much of its history, the Sanctuaries Act has been a work in progress. A fundamental reason for the law's plasticity has been the ambiguity surrounding the Act's intent. Is the overriding purpose of the Act the preservation and protection of marine areas, or is it the creation of multiple use management areas in which preservation use has to contend with every other use, even exploitive ones like oil and gas extraction?

Congress failed to clearly and definitively answer this question at the outset, and in fact gave conflicting signals. The original law and accompanying legislative history were incongruous in that the law directed the Secretary of Commerce, acting through the National Oceanographic and Atmospheric Administration (NOAA), to establish sanctuaries for preservation and restoration purposes, but the House of Representatives' legislative history encouraged both preservation and extractive uses in sanctuaries. This ambiguity produced confusion and led to implementation difficulties, which in turn triggered periodic efforts by NOAA and Congress to clarify the Act's purposes and provisions.

Over time, Congress confirmed "multiple use" as a significant purpose of the Act and diminished the Act's preservation mission. Although amended numerous times over 30 years, the statute remains incongruous, calling for both preservation and multiple use. Although key areas of the oceans and Great Lakes have been protected in varying degrees in the 13 sanctuaries established since 1972, the Sanctuaries Program has yet to produce a comprehensive national network of marine conservation areas that restores and protects the full range of the nation's marine biodiversity, nor does it have a credible strategy to do so.

Early Sanctuary Bills

In 1967, several members of Congress, including Representatives Hastings Keith of Massachusetts and Phil Burton and George E. Brown, Jr., of California, introduced bills to direct the Secretary of the Interior to study the feasibility of a national system of marine sanctuaries patterned after the wilderness preservation system.⁴ A principal factor prompting this legislation was the desire to protect special marine places from harmful industrial development, especially oil and gas development. At the time, the hydrocarbon industry was rapidly expanding its operations offshore.

Sanctuary study bills received a hearing in 1968 by the House Merchant Marine and Fisheries Committee (House MMFC), but were opposed by the Department of the Interior (DOI) on grounds that existing law permitted Interior to manage the ocean for multiple uses, including environmental protection, and that sanctuaries might restrict offshore energy development. Nevertheless, several members of the House continued to promote study legislation in the next two congresses.

A second strategy for protecting ocean places was concurrently advanced by members of the California delegation who proposed to designate areas on the outer continental shelf (OCS) of California where oil drilling would be prohibited. In 1968, bills were introduced in the House and Senate to ban drilling in a section of waters near Santa Barbara. Following the massive oil spill from a ruptured well in the Santa Barbara Channel in 1969, Senator Alan Cranston became the most vocal advocate of prohibiting drilling at a number of places along the California coast. The DOI opposed these bills as well, claiming that new drilling guidelines and procedures implemented after the Santa Barbara accident would be sufficient to prevent future spills. The Senate and House Interior and Insular Affairs Committees, which had authority over the OCS minerals leasing program, were sympathetic to the DOI's

⁴See, e.g., H.R. 11584, 90th Cong. (1967); S. 2415, 90th Cong. (1967).

concerns and declined to set aside no-drilling areas.

A third approach for protecting ocean areas was spawned by concern about the impacts of waste dumping in the ocean, which at the time was virtually unregulated. Oil-covered beaches, closed shellfish beds and “dead seas” around ocean dumpsites prompted the introduction of bills in 1969 and 1970 to regulate ocean dumping comprehensively. A 1970 report of the newly formed Council on Environmental Quality called for comprehensive legislation to regulate ocean dumping, but was silent on the need for a marine sanctuary system.⁵ Given the DOI’s position on offshore oil development, this was not surprising.

Despite the Nixon Administration’s opposition to marine sanctuaries, the House Merchant Marine and Fisheries Committee was determined to act. As it turned out, the ocean dumping crisis gave the committee the opening it needed. As the 91st Congress drew to a close, momentum for an ocean dumping law had become unstoppable.

1972 Act

In June of 1972, the House Merchant Marine and Fisheries Committee unanimously reported an ocean dumping bill, the Marine Protection, Research and Sanctuaries Act, which contained titles on ocean dumping, marine research and sanctuaries. The sanctuaries title (Title III) was an amalgam of concepts from various bills pending before the committee and new ones forged in executive session. Although the sanctuary title proposed to preserve and restore ocean areas, *it did not mirror the Wilderness Act*, as had been recommended by the President’s Science Advisory Committee. Furthermore, *it lacked any prohibitions on industrial development, including energy development, within designated sanctuaries*, one of the principal goals originally sought by Rep. Keith and others.

The House MMFC bill provided the Secretary of Commerce with broad discretionary authority to designate marine sanctuaries in coastal, ocean, and Great Lakes waters for the purposes of preserving and restoring an area’s conservation, recreational, ecological, or esthetic values. The Secretary was given two years to make the first designations, and was to make others periodically thereafter. The Secretary also was given broad and complete power to regulate uses within sanctuaries and to ensure they were consistent with the sanctuary’s purposes; no uses were specifically prohibited. The Sanctuaries Program was authorized for three years and given annual budget authority of up to \$10 million.

The ocean dumping bill passed the House by a vote of 300 to 4 on September 9, 1971 with the sanctuaries title intact, despite continued opposition of the Nixon Administration. The Senate Commerce Committee was not supportive of marine sanctuaries and deleted the program from its version of the ocean dumping bill. Nevertheless, the House-Senate conference committee on the dumping bill ultimately agreed to accept the House sanctuary title, with only minor changes. President Richard Nixon signed the measure on October 23, 1972.

The Rise of Multiple Use

During floor debate on the 1972 law, House members of the Merchant Marine and Fisheries Committee went to great lengths to explain that the Act was not purely a preservation statute and that multiple use of sanctuaries was expected. Even extractive activities like oil and gas development were seen as potentially compatible with the statute’s preservation and restoration purposes. Taking the cue, NOAA moved the Program in the direction of multiple use in the first regulations issued in 1974.

⁵Message from the President of the United States Transmitting a Report of the Council on Environmental Quality on Ocean Dumping, H.R. Doc. No. 91-399 (1970).

Between 1972 and 1979, little money was spent to develop the Program. Two small, non-controversial national marine sanctuaries (NMSs) were designated in 1975, the USS Monitor, off North Carolina, and Key Largo, in Florida. Once implementation began in earnest under the Carter Administration, controversies erupted over the scope, requirements, and impact of the Program as NOAA attempted to designate larger areas such as Flower Garden Banks, Channel Islands, Georges Bank, and Farallon Islands. The Carter Administration was ultimately successful in the designation of four sanctuaries (Channel Islands, Gulf of the Farallones, Gray's Reef, and Looe Key).

Oil and commercial fishing industries in particular developed a growing antipathy toward the Act because of its potential to infringe upon their activities. The oil industry sought to have oil development routinely allowed in sanctuaries as an acceptable multiple use; the fishing industry sought to prevent sanctuaries from restricting their access to fishing grounds. From roughly 1977 to 1986, commercial fishing and oil interests and their congressional allies led a counterattack against the Program that challenged the sanctuaries law's very existence. Battles over individual sanctuary proposals fueled the broader attack against the Act. Barring repeal of the Act, the oil and fishing industries wanted to limit its application and water down its preservation purpose. In this they were largely successful. By 1984, NOAA and Congress had made a series of regulatory and legislative decisions that emphasized balancing preservation with other human uses of sanctuaries. In short, multiple use became the preferred management goal for sanctuaries. As applied by NOAA, the multiple use doctrine has made it extremely difficult to establish use-specific zones for such activities as preservation, recreational fishing, diving, etc.

Reemphasizing Preservation

The Sanctuaries Program suffered greatly during President Ronald Reagan's term.

Beset with the active opposition from the administration, the existing programs suffered. Staff positions went unfilled, and critics charged that management programs at existing sanctuaries languished. Funding levels stabilized at the beginning of the Reagan era but then actually declined during his second term. The levels of funding requested by the administration were even lower; Congress repeatedly allocated more money than the administration estimated was necessary. Most discouragingly for program advocates, NOAA designated no new sites other than Fagatele Bay, allowed the designation process for others to stagnate, and even removed Monterey Bay from the list of proposed sites.⁶

Meanwhile, a series of marine pollution events continued to highlight the broad need for marine protection. These included algal blooms, mass dolphin deaths, medical waste that washed up on the Atlantic Coast, and the crash of an ore carrier and a car carrier, which resulted in a spill of copper ore and bunker fuel oil adjacent to the Channel Islands NMS.

Of the 29 candidate sites NOAA had identified in 1983, only the tiny Fagatele Bay off American Samoa had been designated as of 1988. Congressional frustration over the lack of designations led to a new phase of the Program, in which Congress played an active role promoting new designations. The first congressional designation, Florida Keys NMS (1990), was followed by three designations in 1992: the Hawaiian Islands Humpback Whale Sanctuary, the Monterey Bay NMS, and the Stellwagen Bank NMS. Ironically, Congress had to bypass the Act in order to legislatively designate the Florida Keys and Monterey Bay sanctuaries, in which oil

⁶Dave Owen, *The Disappointing History of the National Marine Sanctuaries Act*, 11 N.Y.U. Env'tl. L.J. 711, 728 (2003).

extraction was prohibited. Congress also legislatively prohibited oil extraction at NOAA-designated sanctuaries: the Cordell Bank NMS (1989) and the Olympic Coast NMS (1992).

Congress amended the Act in 1988, 1992, 1996, and 2000 with the intent of strengthening the Act's preservation mission. However, because Congress failed to revise other provisions of the law that emphasize multiple use, the impact of these changes has been modest. More recently, with the 2000 Amendments, Congress authorized a temporary moratorium on designation of new sanctuaries until existing ones are better managed and studied. This has thrown a blanket of uncertainty over the system's growth.

Unfilled Mandate

Having precipitated numerous sanctuary designation battles, suffered stop-and-go implementation, and been the subject of repeated regulatory and legislative amendments over three decades, how effective has the Act been in achieving its preservation purpose?

The Sanctuaries Act has been used to set aside a number of key places, and to protect them from oil development and certain other harmful activities. Although sanctuaries are managed for multiple use, some preservation zones have been established in a limited number of sanctuaries (e.g., Florida Keys, Fagatele Bay, Channel Islands). Sanctuaries have also served as focal points for educating the public about marine conservation, and as platforms for further protection initiatives. Since about 2002 we have seen a greater emphasis on Underwater Cultural Heritage conservation by NOAA and the National Marine Sanctuaries Program through efforts to document and preserve shipwrecks and other historically significant items on the sea floor.

Nevertheless, there are still large swaths of the nation's oceans that have no sanctuaries. A look at a map will show blank spaces off many coastal states. No sanctuaries have been designated in the Caribbean or in the North Pacific. There are just three sanctuaries along the entire Atlantic seaboard, one in South Florida, and one in the Gulf of Mexico. On the west coast, California has four sanctuaries and Washington one, but Oregon and Alaska have none. Even Georges Bank, the area Rep. Keith set out to protect when he introduced sanctuary legislation in 1967, is missing from the system.

Lacking the singular preservation focus of the Wilderness Act, the Sanctuaries Act has proved to be an unreliable vehicle for inventorying, identifying, and preserving the full array of the nation's marine resources and special places in a comprehensive national system. After 48 years, the 14 sanctuaries comprise not even 0.4% of U.S. oceans. Moreover, some of these areas are inadequately protected from degrading or destructive uses such as overfishing, bottom habitat destruction and pollution.⁷

Conclusion

While it is technically possible that the Sanctuaries Act could be employed to designate sanctuaries that are preservationist in nature, in reality the Act's conflicting goals of preservation and multiple use, its discretionary and open-ended nature, its lack of clear definitions and protection standards, and its multiple intervention points for stakeholders, collectively burden the Program with enormous implementation difficulties and inefficiencies. At present, the Sanctuaries Act is so constrained by its own architecture that it stands little chance of creating the comprehensive

⁷See Table 23.1 for more information on the size of each sanctuary and the size of the entire system.

system of marine preservation areas envisioned by its earliest proponents, who hoped to create a system of marine wilderness preserves analogous to the National Wilderness Preservation System. Meanwhile, most of the nation's ocean waters have been left open to extractive and commercial uses of all kinds. As a result, progress toward protecting and preserving America's ocean resources and ecosystems has been nowhere near what was needed during the last 30 years to prevent the serious degradation and destruction of marine species and ecosystems.

In order to be effective in facilitating the establishment of a comprehensive national system of marine preservation areas, the Sanctuaries Act would have to undergo substantial amendment. Alternatively, Congress could provide separate authority for an exclusive system of marine preservation areas to encompass any area of ocean that meets the new system's preservation and protection criteria. This was precisely the approach taken by the Wilderness Act, which superimposed a wilderness-overlay on existing parks, refuges, forests, and public lands to identify qualified wilderness areas. Whichever approach is chosen, a bold, vigorous and systematic effort will be needed during the next 10 years to identify and preserve America's significant marine ecosystems and features before they are irretrievably degraded or lost.

As of 2015, there have been no amendments or updates of the National Marine Sanctuaries legislation to address its well-known flaws and rationalize its internally conflicting legislative history. In the meantime, in June 2014, following an extensively public and transparent design process for nominations, the National Marine Sanctuaries Program issued a federal ruling and began soliciting communities to nominate "their most treasured places in our marine and Great Lakes waters for consideration as national marine sanctuaries."

§ 23:2 Introduction

In 1971, in testimony before the Senate Subcommittee on Oceanography, Jacques Cousteau warned Congress that the world faced the destruction of the ocean from pollution, overfishing, extermination of species, and other causes. Cousteau called for immediate action on several fronts to reverse the situation. Cousteau was one of several well-known scientists that helped birth the environmental movement, but as the voice of the ocean, he was without peer. Cousteau's testimony made an indelible impression on many members of Congress and confirmed the need for ocean protection legislation already under consideration. Time after time his views would be mentioned in congressional speeches, testimony, reports, and debate.

The following year, the floodgates of environmental legislation opened. Congress passed a number of environmental laws, among them the MPRSA. The Act regulated the dumping of wastes in ocean waters, launched a study of the long-term impacts of humans on marine ecosystems, and created a Marine Sanctuaries Program for the "purpose of preserving or restoring . . . [marine] areas for their conservation, recreational, ecological, or esthetic values."¹

The original Sanctuaries Act and its accompanying legislative history were incongruous in that the law directed the Secretary of Commerce, acting through NOAA, to establish sanctuaries *for preservation and restoration purposes*, but the House of Representatives legislative history encouraged both preservation and extractive uses in sanctuaries. Later amendments codified multiple use as a major purpose of the Act, notwithstanding language citing "resource protection" as the Act's "primary objective." This ambiguity produced confusion and led to enormous

[Section 23:2]

¹Marine Protection, Research, and Sanctuaries Act § 302.

implementation difficulties, as ocean users, especially the oil and commercial fishing industries, battled conservationists over candidate sanctuaries, the terms of individual designations, and revisions to management plans.

Not surprisingly under these circumstances, the Sanctuaries Program has failed to achieve a comprehensive national network of marine preservation areas that restores and protects the full range of the nation's marine resources. While 13 valuable sanctuaries have been established in 30 years, they cover less than 0.4% of U.S. waters. It is well known that many significant marine areas and resources are missing from the sanctuary system.²

Meanwhile, the degradation of the ocean that Cousteau warned of and that Congress sought to prevent when it passed the Sanctuaries Act and other marine conservation laws is rapidly coming to pass. Although progress has been made on some fronts, such as bans on the dumping of toxic wastes in the ocean and better protection for marine mammals, other problems have worsened. Some examples:

- Only commercial fish species are assessed (by-catch and such generally are not), and of the U.S. fish populations that have been assessed 40% of are in trouble (24% are considered overfished or are being fished unsustainably, and an additional 16% are in a process of being rebuilt;
- Bottom trawls are pulverizing deep sea corals and sponges;
- Many thousands of farmed fish escape from their pens annually, competing with wild fish for food and interbreeding with wild stocks;
- Atmospheric CO₂ has risen by about 40% above pre-industrial levels, and the ocean has absorbed about 1/3 of human caused emissions of CO₂ annually, thereby making seawater more acidic; decreasing surface water pH by 0.1 units, equivalent to a 30% increase in ocean acidity;
- More than 175 alien marine species have invaded San Francisco Bay;
- In May 2013, a NOAA assessment finds 36 sunken vessels scattered across the U.S. seafloor could pose an oil pollution threat to the nation's coastal and marine resources;
- 100 million tons of plastic that already litter beaches, reefs, and bays before being broken down into toxic micro-debris consumed by fish and, eventually, humans;
- Due to climate change the ocean is becoming warmer and thus storms are more frequent and more intense;
- Cruise ships are dumping millions of gallons of sewage, ballast water, and other pollution into the ocean annually;
- Anoxic dead zones have been created in a number of coastal areas;
- Smalltooth sawfish were the first species listed as an endangered marine fish species; and
- Various species of seabirds, sea turtles, and marine mammals have severely depleted populations due to their being caught as bycatch in commercial fisheries.³

And yet, a healthy ocean is critical to our nation:

- \$700 billion of the annual U.S. Gross National Product originates in coastal areas
- Over 50% of the U.S. population lives within 50 miles of the coast

²See, e.g., Dave Owen, *The Disappointing History of the National Marine Sanctuaries Act*, 11 N.Y.U. Envtl. L.J. 711, 745-47 (2003).

● Nearly 80% of U.S. imports & export freight is transported through seaports. Although the Sanctuaries Act was passed with the intent of preserving places in the sea from destruction, the Act's multiple use provisions have made it difficult to create inviolate sanctuaries where no extraction of living or nonliving resources is allowed. Scientific thinking about conserving ocean ecosystems was in its infancy at the time the Sanctuaries Act was passed, but has evolved substantially since. Today, scientists around the world are calling for the establishment of networks of marine reserves—areas exempt from all extractive or harmful activities, including commercial and recreational fishing—as a necessary tool for conserving marine biodiversity, restoring and preserving the integrity of marine ecosystems, and maintaining sustainable fisheries.⁴ Increasingly, nations are heeding this advice.

Given the law's multiple use mandate, NOAA has moved cautiously to create fully protected marine reserves in sanctuaries. Prior to 1992, only small areas within a few uncontroversial sanctuaries were protected from all extractive uses. When it established the Florida Keys NMS in 1990, Congress directed NOAA to consider zoning of the sanctuary as a method for creating “no-take” reserves.⁵ Although NOAA's reserve initiative in the Keys drew vociferous opposition from some commercial and recreational fishing interests, agreement was eventually reached to establish 24 reserves covering less than 1% of the sanctuary. A more recent attempt by NOAA in partnership with the State of California to establish no-take reserves comprising 26% of the Channel Islands NMS is still in progress. Marine reserve initiatives at other sanctuaries have not been launched due to hostile political forces and lack of countervailing conservation advocacy.

About a decade ago, the Sanctuaries Act was again buffeted by the winds of change. As concern about the state of the world's oceans builds once again, two national commissions, one private and one governmental, have been launched to recommend corrective action. The Pew Oceans Commission, established by the Pew Charitable Trusts, issued its report in June 2003.⁶ Among other things, the report called for national legislation to create a system of fully protected marine reserves. The National Commission on Ocean Policy's report was released in April 2004. In the ensuing debate over the reports' recommendations, questions invariably will be asked about the role of marine reserves as an ocean conservation strategy. Questions also will be raised about the Sanctuaries Act. Should the United States establish a system of fully protected marine reserves? What kinds of uses of the reserves should be allowed? How can this be accomplished? Does the Sanctuaries Act provide sufficient authority for marine reserves or preventing conflicting uses? How could the Sanctuaries Act be changed or supplemented to meet current conservation needs?

Answering these questions requires an understanding of the history and evolution of the Sanctuaries Act. This understanding is not easily obtained. In its relatively short life of 32 years, the Act has been substantively amended six times, changing from a two-page law to one over 30 pages in length. Successive committee staffs have left an ever-growing body of legislative material to digest. Although many articles and reports have been written about the Sanctuaries Program, none have focused in detail on the Act's legislative history and evolution.

The purposes of this chapter are to provide a broad overview of the Sanctuaries Act's history and preservation provisions, and to hazard an explanation of how and why the Sanctuaries Act has fallen short as a preservation measure. We do not attempt an exhaustive explanation of every provision of the Act. Rather, our central

⁴*See, e.g.,* The Science of Marine Reserves, Ecological Applications (Feb. 2003).

⁵Pub. L. 101-605 § 7(a)(2) (1990).

⁶Pew Oceans Commission, *America's Living Oceans: Charting a Course for Sea Change* (2003).

focus is on the preservation intent of the law and how it has been advanced or hindered by events and successive amendments.

This chapter is based principally on written sources, which reveal the key stepping stones of the Act's evolution. Explanations of why particular regulations or legislative actions were taken are harder to come by. Written explanations were often vague, incomplete, or absent. Deciphering the motivation and intent of every person that ever "touched" the Act was not attempted. In cases where we were able to query some of the principals, faded memories were a problem.

Part II discusses the emergence of marine sanctuaries legislation in the late 1960s as a vehicle for preserving special marine areas and resources by protecting them from degradation and destruction from industrial uses. Part III traces how the early legislative concepts were blended and reshaped by the House Committee on Merchant Marine and Fisheries to produce the law enacted in 1972. Parts IV and V trace the law's evolution during the last 32 years and discuss the significance of these changes to the statute's preservation purpose. Part VI draws some conclusions about the value of the Sanctuaries Act today, and what it has achieved. Part VII sums up our findings.

II. EARLY SANCTUARY LEGISLATION

§ 23:3 Background

Throughout the 1960s and 1970s, there was growing public concern in the United States and the world about humanity's impact on the environment. Virtually every human effect came under examination, including extinction of species, air and water pollution, and ocean degradation. Fueled by media coverage of polluted water bodies, toxic threats to humans and the disruption of the natural ecology, public concern was galvanized in 1970 by Earth Day, the birthday of the modern environmental movement. In the United States, the executive and legislative branches responded by enacting a number of laws that ushered in a new era of environmental protection.

The flowering of environmental legislation in the 1970s was partly an outgrowth of earlier congressional concerns and partly the product of new knowledge and understanding. As early as the mid-1960s, congressional committees had acted on a number of fronts to develop new conservation and environmental protection policies. In the terrestrial domain, laws were enacted to conserve America's diminishing wildlife and outdoor recreation lands and wild areas. These included the Endangered Species Act, the Land and Water Conservation Fund Act, and the Wilderness Act.¹

In the marine realm, Congress was especially concerned about the degradation of America's estuaries from pollution, dredging, and shoreline development. Oil spills and the ocean dumping of dredge spoil and other wastes captured attention due to a number of well-publicized pollution incidents. Industrial development in coastal and offshore waters also became an issue as the oil industry sought to expand offshore, seabed-mining schemes were discussed, and deepwater ports proposed. In totality, pollution and coastal development were recognized as a significant threat to traditional uses of the ocean, such as fishing and recreation, as well as to the overall health of the marine environment.

The threat of coastal and ocean degradation helped precipitate several pieces of study legislation. The Clean Water Restoration Act of 1966, whose purpose was to

[Section 23:3]

¹Endangered Species Act of 1973, 16 U.S.C.A. § 1533 to 1544 (1973); Land and Water Conservation Fund Act of 1965, 16 U.S.C.A. §§ 4601-4 to 4601-11 (1964, as amended); Wilderness Act of 1964, 16 U.S.C.A. § 1121 (note), 1131-36 (1964).

improve the nation's water pollution control program, mandated a study of estuarine pollution and executive branch recommendations for an "effective national estuarine management program."² As the estuarine pollution study was being conducted, the House Subcommittee on Fisheries and Wildlife Conservation, chaired by John Dingell (D-MI), considered the need for a national system of estuaries similar to those that protected other national resources like parks and refuges. In 1968, Congress passed the Estuary Protection Act, which required the Secretary of the Interior to study and inventory the nation's estuaries and to submit recommendations "on the feasibility and desirability of establishing a nationwide system of estuarine areas, the terms . . . to govern such system, and the designation and acquisition of any specific estuarine areas of national significance which he believes should be acquired by the United States."³

A parallel congressional interest of the time was oceanographic research. Commencing in the 1950s, a small group of scientists and policy makers in Congress and the executive branch began working to strengthen the nation's oceanographic research program, inspired at least in part by the astounding popularity of Rachel Carson's *The Sea Around Us* more than a decade before. Spurred by defense concerns, national pride, and recognition that the ocean was a relatively unexplored and untapped resource of immense potential, the oceanographic community engaged in a decade-long debate about how to improve oceanographic research. The major focus of debate was exploration and exploitation of ocean resources, not environmental conservation. However, as public concern about the environment grew, the oceanographic issue expanded to incorporate coastal conservation as a major theme.

The oceanography debate culminated in the enactment of The Marine Resources and Engineering Development Act of 1966.⁴ The Act declared a new policy "to develop, encourage, and maintain a coordinated, comprehensive, and long-range national program in marine science."⁵ The Act established a Commission on Marine Sciences, Engineering and Resources (also referred to as the Stratton Commission after its chairman, Julius Stratton) to conduct a study and recommend a plan for a "national oceanographic program that will meet the present and future national needs."⁶ The Act created a temporary National Council on Marine Resources and Engineering Development to advise and assist the President in day-to-day marine policy and program coordination.⁷ In its 1969 report, the Stratton Commission recommended establishment of a new ocean agency, which was fulfilled with the creation of NOAA in 1970, and creation of a national coastal zone management program, which was realized with passage of the Coastal Zone Management Act of 1972.⁸

§ 23:4 The Sanctuary Idea

A variety of studies and reports, one of which played a seminal role in the development of marine sanctuary legislation, punctuated the long-running oceanography debate. Contemporaneous with congressional consideration of the Marine Resources and Engineering Development Act, the President's Science Advisory Committee formed a Panel on Oceanography to prepare an assessment of marine science and

⁸Commission on Marine Science, Engineering and Resources, *Our Nation and the Sea: A Plan for National Action* (1969); Coastal Zone Management Act of 1972, 16 U.S.C.A. §§ 1451 et seq. (1972).

technology needs. The Panel's report, *Effective Use of the Sea*, was released in June 1966 by President Johnson.¹ The report called for establishment of a national ocean program, the objective of which was "effective use of the sea by man for all purposes currently considered for the terrestrial environment: commerce; industry; recreation and settlement; as well as knowledge and understanding."²

Although much of the Advisory Committee's report focused on exploring, developing, and understanding the oceans, the Committee presciently recognized the growing threat of what it called "environmental modification," and particularly the need to preserve the near-shore environment:

Continuing population growth combined with increased dependence on the sea for food and recreation means that modification of marine environments will not only continue, but will drastically increase . . . We are far from understanding most short-range and all long-range biological consequences of environmental modification.

These considerations suggest that we now need to preserve the quality of as much of the unmodified or useful marine environment as we can and to restore the quality of as much of the damaged environment as possible. Delay will only increase the cost in money, time, manpower, resources and missed opportunities.³

The most pervasive inadvertent modification, the Panel concluded, is pollution in all its forms. We have learned from our experience with river and lake pollution, said the Panel, that we "should not make similar mistakes as we inhabit and exploit the oceans."⁴

The report identified habitat destruction as a major issue: "Habitat destruction by improper fishing techniques have [sic] affected our biological resources."⁵ It also recognized the serious problems caused by channel dredging, shoreline modification and the filling in of marshes. "These modifications are occurring in estuaries which are important natural resources for recreation and food production. These areas are nursery grounds for many marine organisms. How severely these and other environmental alterations affect the biota is unknown."⁶

In sum, the Panel on Oceanography identified two issues that would grow in importance in following years and have yet to be adequately resolved: the protection and restoration of estuaries and coastal waters to preserve their natural values, and control of water pollution. The Panel recommended five broad "courses of action" by the federal government, two of which were relevant to subsequent marine sanctuary legislation:

1. Establish a system of marine wilderness preserves as an extension to marine environments of the basic principle established in the Wilderness Act of 1964 . . . that "it is the policy of the Congress to secure for the American people of present and future generations the benefits of an enduring resource of wilderness." In the present context, specific reasons for such preserves include:

- (a) Provision of ecological baselines against which to compare modified areas.
 - (b) Preservation of major types of unmodified habitats for research and education in marine sciences.
 - (c) Provision of continuing opportunities for marine wilderness recreation.
2. Undertake large-scale efforts to maintain and restore the quality of marine environments. Goals of these efforts should include increasing food production and recreational opportunities and furthering research and education in marine sciences. A multiple-use concept should be evolved for marine environments analogous to that used for many Federal land areas . . . It should be emphasized that this concept includes the recognition that for some areas, such as wilderness, only one use is possible.⁷

In referencing the Wilderness Act, the Panel explicitly endorsed the preservation of marine areas and resources in their natural condition as a legitimate goal. The Wilderness Act, enacted in 1964, established a National Wilderness Preservation System to be composed of federally-owned areas designated by Congress as “wilderness.”⁸ Wilderness areas are “administered for the use and enjoyment of the American people in such manner as will leave them unimpaired for future use and enjoyment as wilderness.”⁹ The Act defines a wilderness area as a place

where the earth and its community of life are untrammelled by man, where man is a visitor who does not remain. An area of wilderness is further defined to mean . . . an area of undeveloped Federal land retaining its primeval character and influence, without permanent improvements or human habitation, which is protected and managed so as to preserve its natural conditions . . .¹⁰

The Wilderness Act prohibits commercial uses of wilderness, but some pre-existing commercial uses may be allowed to continue in certain areas.¹¹ Recreational uses of wilderness deemed compatible with maintaining its primeval character are allowed, including recreational hunting and fishing.¹² Since about 2012, there has been an increasing focus on the potential the Act has for designation of “wilderness” in the ocean. If such designation were to happen, would the National Marine Sanctuary Program manage it?

The President’s Science Advisory Committee clearly viewed marine wilderness as a distinct type of ocean use within a broader multiple use framework. Although the report was silent on how the recommended marine multiple use management system should work, the concepts of marine wilderness preserve and multiple use management would play significant roles in shaping the debate on marine sanctuaries legislation.

§ 23:5 Sanctuaries Legislation in the 90th Congress, 1967-1968—Overview

Concurrent with congressional activity on estuaries and marine science issues, several members of the House introduced bills in 1967 to establish marine sanctuaries as a means of protecting their states’ coastal and ocean resources from oil and gas development activities on the Outer Continental Shelf. In July, Representatives Phil Burton (D-CA) and George Brown, Jr. (D-CA) proposed identical bills to autho-

size a feasibility study of a Santa Barbara Channel marine sanctuary to be completed within two years. Their legislation established a moratorium on *all* “industrial development” in the Channel until the study was completed.¹

The citizens of Santa Barbara long had been concerned about the effects on Santa Barbara County’s scenic beauty and tourism economy of offshore oil drilling in the Channel. The State of California had banned minerals extraction in State waters off Santa Barbara in 1955 by creating a so-called oil sanctuary where drilling is forbidden.² The federal government began selling mineral leases in federal waters in the Channel in 1967. In recognition of the coast’s environmental values, the federal government established a no-drilling buffer zone that extended two miles seaward from the Santa Barbara oil sanctuary, but proceeded to offer leases outside the zone. By early 1968, 72 federal leases had been sold for in excess of \$600 million.³ The Burton-Brown bills were solidly responsive to constituents’ preference for protection, and were clearly an attempt to forestall oil development in federal waters off Santa Barbara until such protections could be made primary.

A few days after the Burton and Brown bills were filed, Rep. Hastings Keith (R-MA) introduced a bill to authorize a study of the desirability and feasibility of establishing a national system of marine sanctuaries, including a study of Georges Bank in New England as a candidate site.⁴ The Keith bill provided for a moratorium on new minerals exploration and development on the Outer Continental Shelf in all study areas, and called for voluntary agreements between governmental bodies to prevent “industrial development” while studies were being conducted.⁵ Keith became interested in protecting Georges Bank after a seismic explosion detonated in the course of oil exploration caused a large fish kill in September 1966.⁶ Keith represented the coastal area of Cape Cod and was particularly concerned about protecting the Georges Bank fishery from energy development. As a member of the House Merchant Marine and Fisheries Committee, he was well positioned to play an active role in shaping sanctuaries legislation.

Eight more sanctuary study bills were introduced in 1967 by House members from the east and west coasts.⁷ Some of the bills were identical to the Keith and Burton-Brown measures. Others differed slightly, specifying different areas for sanctuary study, such as Plum Island, New Hampshire, and Point Lobos and Pfeiffer-Big Sur, Monterey County, California. In the Senate, Sen. Edward Brooke (R-MA) introduced a measure identical to Keith’s.⁸

The eleven House bills were referred to the House Committee on Merchant Marine and Fisheries, which became the driving force for marine sanctuaries legislation. The Oceanography Subcommittee, chaired by Rep. Alton Lennon (D-NC), held three

days of hearings on the study bills in April 1968.⁹ Reps. Keith, Brown, and 10 other members of Congress testified in support of sanctuary legislation, as did nonprofit conservation organizations, the Massachusetts fishing industry, the state of Massachusetts, and several scientific organizations.

Although the DOI and other executive agencies said they favored the objectives of the bills, they opposed enactment on several grounds.¹⁰ Interior's most telling objection to the bill, and one that would continue to dog sanctuary legislation, was opposition to restrictions on offshore energy development. The DOI said the moratorium on offshore minerals extraction in sanctuary study areas would deny the government revenue from oil and gas lease sales and the public an energy supply.¹¹ Furthermore, DOI claimed the bill was not needed because it already had general authority under existing wildlife laws to conduct resource studies like those called for by the sanctuaries bills, and that under the Outer Continental Shelf Lands Act, it had the authority to achieve multiple-use management of the Outer Continental Shelf.¹²

Because of the administration's opposition to sanctuary legislation, and the desire of the chairman of the Oceanography Subcommittee to get the views of the Stratton Commission and the National Council on Marine Resources, Lennon's subcommittee took no further action in 1968. In the Senate, there was no action on Sen. Brooke's bill.

§ 23:6 Sanctuaries Legislation in the 90th Congress, 1967-1968—Detailed Provisions of Early Bills

The Problem

The intent of Rep. Keith and other sanctuary bill sponsors was to preserve portions of the tidelands and ocean waters for their natural values and to protect these areas from incompatible commercial and industrial uses, particularly oil development. In the statement accompanying his 1967 legislation, Keith said the purpose of his bill was to "save distinctive offshore areas of the United States," and that as "exploitation of the ocean's riches progresses, it is essential to give some enduring protection to sections of the offshore marine environment in a natural or near-natural condition."¹ Over the next several years, Keith would repeatedly refer to the need to protect valuable fisheries from the effects of oil and gas development. For example, at the 1968 House hearings, Keith noted that oil drilling "could have a tremendously disruptive effect on the ecology and the present resource use of a vast stretch of ocean."²

Similarly, Rep. Brown testified:

We recognize that the quality of our ocean environment can be seriously impaired by unplanned industrial development offshore, and the pollution it creates. It follows that we must dedicate a system of ocean sanctuaries that can preserve a [broad] variety of marine plant and animal communities.³

Representative Burt Talcott (R-CA), who had introduced one of the study bills, said:

²House Hearing 1968, at 43.

³House Hearing 1968, at 73.

“We must set aside some of our abundant marine areas before they are wasted or exploited.”⁴ In short, marine sanctuaries were needed as an antidote to unrestrained coastal development.

Policy Response

To secure the protection they sought for local places, sanctuary sponsors envisioned a national system of sanctuaries set aside for uses they considered compatible with preservation of the natural environment. The Burton-Brown bill directed the Secretary to discuss the applicability of the Santa Barbara sanctuary feasibility study “to other areas along the coastal waters of the United States with similar values and the feasible and desirable means of creating a marine wilderness system as an extension to marine environments of the basic principles established in the Wilderness Act,” language that directly reflected the recommendation of President Johnson’s Science Advisory Committee.⁵

Keith’s bill declared that

it is the policy of the Congress, through a system of marine sanctuaries, to preserve, protect, encourage balanced use, and where possible, restore, and make accessible for the benefit of all the people, selected parts of the Nation’s natural tidelands, outer continental shelf, seaward areas, and land and waters of the Great Lakes, which are valuable for sport and commercial fishing, wildlife conservation, outdoor recreation, and scenic beauty.⁶

In his bill introduction statement, Rep. Keith referred to the system as a “national system of marine wilderness preserves.”⁷ But instead of establishing a national marine wilderness preserve system outright (as the Wilderness Act did for terrestrial areas), and immediately designating as marine sanctuaries certain areas such as Georges Bank, Keith sought the Secretary of the Interior’s opinion on the most desirable and feasible means of establishing a national sanctuary system.⁸ In sum, both the Keith and Burton-Brown study bills represented a preliminary step toward the creation of a marine analog to the wilderness system, and the lineage of their bills may be traced directly to the President’s Science Advisory Committee’s recommendation.

Management of Sanctuaries

Given the study approach taken by the sponsors, it is not surprising that none of the bills specified exactly how sanctuary areas were to be established and managed to preserve desired values. These details were to be studied and decided later. However, to preserve future options, the Keith bill mandated a moratorium on new minerals exploration and development activities in sanctuary study areas until the Secretary submitted the report.⁹ A similar development moratorium was specified in the Burton-Brown bill, but it applied only to the Santa Barbara area.¹⁰

Under the philosophy of the time, it was assumed that the ocean should be managed for multiple uses. Because there was no overarching legal authority or central agency to regulate or zone competing uses within the ocean, it was recognized by sanctuary bill sponsors that industrial and commercial uses would continue to

degrade and destroy natural values and resources with impunity and increasing frequency unless action was taken.

None of the sanctuary bills of the 90th Congress explicitly mentioned multiple use as a *purpose* of sanctuaries. The Keith and Burton-Brown bills directly specified or indirectly implied that in identifying sanctuaries for potential designation, the Secretary should consider the values and alternative uses of an area before deciding which sites should be designated.¹¹ Keith's bill declared it the policy of Congress to "preserve, protect, encourage balanced use, and where possible, restore and make accessible" sanctuaries that are "valuable for *sport and commercial fishing, wildlife conservation, outdoor recreation, and scenic beauty*."¹² The Burton-Brown bill sought to protect similar values in the Santa Barbara Channel.¹³ There was no mention in either bill of industrial or commercial uses being allowed in sanctuaries, except for commercial fishing. Furthermore, the idea that commercial fishing might sooner or later pose a threat to sanctuary resources or conflict with uses like wildlife conservation was not considered.

Keith explained he was not interested in blocking industrial development everywhere in the ocean, noting that "industrial and commercial development can go hand in hand with fishing, recreational, conservation, and scientific uses of the seas-if we are wise enough to see that these uses are made compatible with each other."¹⁴ In other words, Keith was for rational planned use of the ocean that would avoid some of the mistakes of development on land. Given his expressed desire to protect areas of the ocean from "damage or destruction by industrial exploitation," Keith seemed to mean that oil development could occur in some areas of the ocean, while other areas (our national sanctuaries) would be protected from oil.¹⁵

At the House hearing, Keith characterized his bill as a balanced approach to resource management. The bill

seeks to encourage balanced, compatible uses of our offshore waters-first by identifying alternative uses, and then by ensuring compatibility among these competing values and resources

The study called for in the bill would determine the likely impact of new industrial activities on the other natural resources and values of certain marine environments. It would determine whether some kind of "ocean zoning" is necessary to make these various uses compatible, and whether certain portions of our offshore environments should be sanctuary areas, closed to new industrial activities . . .¹⁶

However, other statements made by Keith could be interpreted to support multiple use sanctuaries. Noting that his bill did not define the term marine sanctuary, Keith testified:

A marine sanctuary area would be an ocean area which is especially distinctive for its commercial fishing uses, and for its scenic, recreation, and wildlife conservation values. In such an area, the Secretary of the Interior would be authorized to *restrict, prohibit, or prescribe the conditions under which industrials [sic] activities could be carried on, including the mining of gas or oil deposits*.¹⁷

The idea that mineral extraction *might occur* in sanctuaries was inconsistent with the overall thrust of Keith's introductory statement and with his bill, which was

silent on the issue. Furthermore, Keith's proposed definition never was included in any of his subsequent bills, and he continued to argue for the protection of the Georges Bank fishery from oil development. Why he offered the definition is not known; it may have been an attempt to dampen DOI opposition by giving agency officials broader discretion to manage a sanctuary, all the while assuming that there was little chance that oil development would be found compatible with valuable fisheries. Alternatively, it may reflect Keith's thinking at that moment. Regardless of Keith's reasons, the idea that sanctuaries *might include industrial activities within their borders* was on the table. Eventually, it would weigh heavily in the shaping of the 1972 law.

Relation to Other Laws-Consultation

The argument advanced by the DOI that its existing legal authorities for management of wildlife and the Outer Continental Shelf were sufficient to protect the marine environment obviously was not convincing to representatives who already had determined that new preservation authority was needed. The DOI claimed that it could protect marine ecology and develop oil using a multiple use approach to resource management, and that the Outer Continental Shelf Lands Act enabled it to do both.¹⁸ At the hearing on the sanctuary bills, Keith specifically noted that existing laws had been considered in the development of his legislation, and that his bill filled a gap.¹⁹ Although sanctuary bill sponsors did not believe Interior would protect special places from oil development, they did recognize the importance of consulting with Interior, other agencies and the public on the design of the sanctuaries program, and included consultation and public hearings provisions in their bills.²⁰

§ 23:7 Sanctuaries Legislation in the 90th Congress, 1967-1968—An Alternative Ocean Protection Strategy

While the Oceanography Subcommittee was considering sanctuary proposals, several members of Congress from California proposed to protect marine areas from oil development on a site-by-site basis. In April 1968, Sen. Thomas Kuchel (R-CA) and Rep. Charles Teague (R-CA) introduced identical measures to prohibit mineral exploration and development in the federal no-leasing buffer zone that lay adjacent to the state's Santa Barbara oil sanctuary.¹ In the statement accompanying his bill, Kuchel said his purpose was to make the administratively-established federal buffer zone "semi-permanent," to protect the scenic values of the coast from the unsightly oil-drilling structures.² (Curiously, Kuchel made no mention of the potential for oil pollution from oil wells located outside the buffer zone.) The fact that California legislators saw fit to introduce bills to ban oil development in federal waters off Santa Barbara was further evidence of the lack of confidence in the DOI's ability to protect the environment under existing laws.

The Kuchel and Teague bills were referred to the Interior and Insular Affairs Committees of the Senate and House, which had jurisdiction over the Outer Continental Shelf minerals program. No hearings were held on either bill in 1968. Similar oil development prohibition bills would be introduced in subsequent congresses, but ultimately, this line of attack reached a dead end because neither

the House nor Senate Interior Committees were willing to close portions of the Outer Continental Shelf to mineral leasing.

§ 23:8 Sanctuaries Legislation in the 90th Congress, 1967-1968— Conclusion/Significance

At the close of the 90th Congress, two strategies had been proposed to protect special marine places from development. One was to have the Secretary of the Interior study the feasibility of a national system of sanctuaries and identify for further consideration by Congress any places that merited protection. The other was to ban oil development on the Outer Continental Shelf on a site-by-site basis. The intent of the Keith and Burton-Brown study bills was to eventually establish a marine analog to the National Wilderness Preservation System, as had been recommended by President Johnson's Science Advisory Committee. Perhaps because they were treading on new and unfamiliar territory, the sponsors moved cautiously, seeking a study of the feasibility and desirability of their idea, rather than establishing a permanent national system outright as Congress did under the Wilderness Act.

By creating sanctuaries, the sponsors sought to prevent industrial development from harming resources and conflicting with uses of the sea they deemed acceptable. The uses the sponsors wished to protect included sport and commercial fishing, wildlife conservation, recreation, maintenance of scenic beauty, and ecological research. For the most part, these uses were the same kinds of uses allowed in terrestrial wilderness areas, the exception being commercial fishing. Importantly, sanctuary proponents did not view commercial fishing as a threat to the other values they sought to protect.

In contrast, the intent of Kuchel and Teague was more limited in scope. They sought only to protect Santa Barbara from the negative effects of offshore oil development by restricting new oil activity. Both strategies, however, posed a direct challenge to the offshore oil development program, and as such, drew strong opposition from the oil industry, congressional committees with authority over OCS leasing, and the DOI, which managed the offshore minerals program. Until this opposition could be dealt with, there would be no marine sanctuaries bill.

§ 23:9 Legislation in the 91st Congress, 1969-1970—Overview

Interest in ocean protection and marine sanctuaries legislation grew substantially in the 91st Congress as a large oil spill off Santa Barbara and other pollution incidents heightened the need for action. Also, three reports on coastal and marine management were issued during this period, and ocean dumping became a major issue. At least 21 bills dealing with marine sanctuaries to some degree were introduced in the 91st Congress, 18 in the House and three in the Senate. As more legislators took up the issue, so too did the number of approaches and combinations of approaches for protecting ocean places. In addition to sanctuary study bills, measures were introduced to ban oil development in *all* federal waters off Santa Barbara and other places along the California coast, and to establish areas in the ocean where ocean dumping would be prohibited for the protection of marine ecology.

§ 23:10 Legislation in the 91st Congress, 1969-1970—Impetus for Action— Santa Barbara Oil Spill

On January 28, 1969, an oil well on a federal lease site in the Santa Barbara Channel ruptured, eventually spilling 3.3 million gallons of oil, and polluting miles of California shoreline. It took months to bring the leak under control. The event received heavy media coverage and brought home the vulnerability of the U.S.

coastline to massive oil spills such as had occurred in 1967 when the oil tanker *Torrey Canyon* ran aground on England's southern coast. In addition to supervising the Santa Barbara cleanup, the DOI revised its well operation guidelines in an attempt to prevent future spills. On March 3, 1969, Secretary of the Interior Walter Hickel converted the 21,000-acre federal no-lease buffer zone in the Channel into a permanent Santa Barbara Ecological Preserve.¹ Hickel withdrew from leasing another 34,000 acres in the Channel as an additional buffer zone between the coast and federal lease sites.²

Nevertheless, the Santa Barbara spill's impact continued to reverberate in Congress as an event not to be repeated. Subsequent oil spills in San Francisco Bay, Long Island Sound, the Gulf of Mexico, and elsewhere reinforced the peril of oil. In 1968 alone, the U.S. Coast Guard reported 714 cases of oil pollution, and the Federal Water Pollution Control Administration identified 180 significant oil spills.³

In addition to oil pollution, degradation of the ocean from the unregulated dumping of sewage, dredge spoils, and toxic and radioactive wastes gained major attention during the late 1960s and 1970s. At the time, the ocean served as a cost-free dumping zone for government and industry. In story after story, the media catalogued a host of pollution incidents and impacts, such as the "dead sea" off New York and New Jersey created by waste dumping, mercury contamination in fish and related poisoning of humans, the closure of ocean beaches and shellfish beds because of bacterial contamination, diseased estuaries, thermal pollution of Biscayne Bay, and the dumping of nerve gas and oil wastes off Florida. "The oceans are in danger of dying," Jacques Cousteau told *Time* magazine.⁴ The following year, Cousteau testified before the Senate that "we are facing the destruction of the ocean by pollution and by other causes."⁵

§ 23:11 Legislation in the 91st Congress, 1969-1970—Coastal Management Reports

The startling and graphic nature of environmental catastrophes during the period underscored the conclusions of several reports that Congress had commissioned on marine sciences and resources. In January 1969, the Stratton Commission released *Our Nation and the Sea*.¹ The report focused on the "wise and orderly use" of the ocean, but also recognized growing environmental problems. The Commission recommended the consolidation of federal ocean activities in a new agency, NOAA, whose mission would be to coordinate and implement a national oceans program.² The report also recommended creation of a new system for protecting and managing the coastal zone with states having lead responsibility.³ "The guiding principles" for coastal zone management, said the report, "should include the concept of fostering

the widest possible variety of beneficial uses so as to maximize net social return.”⁴

There was no mention of marine sanctuaries in the Stratton Commission’s report, but as part of the new coastal management system, the Commission recommended that the DOI, through the two estuary studies then in progress, “identify areas to be set aside as sanctuaries to provide natural laboratories for ecological investigations.”⁵ Spurring this recommendation was recognition of the “diminishing number of relatively unaltered areas where natural processes can be observed.”⁶ Thus, the Commission envisioned estuarine sanctuaries as research sites “for conduct of studies necessary to establish a proper base from which the effects of man’s activities can be determined and ultimately predicted.”⁷

In November 1969, the DOI submitted *The National Estuarine Pollution Study* to Congress.⁸ The report concluded that the nation’s estuaries were being degraded and destroyed because of institutional failures and society’s inability to recognize the non-commercial values of estuaries such as fish and wildlife habitat, recreation, and esthetics.⁹ The DOI recommended new legislation to promulgate a national policy and program to deal with the situation, again with States in the lead.¹⁰ Interior recommended

achievement of the best use of the values of the estuarine and coastal zones through a balance between: (a) multi-purpose development; (b) conservation; and (c) preservation over the short and long-range. Priority consideration should be given to those resources and uses which are estuarine-dependent.¹¹

Noting the failure of governments to achieve “a proper balance” between development and preservation and conservation of estuary resources, the DOI concluded that

[t]he principal goal of the national program is the use of the estuarine and coastal zone for as many beneficial purposes as possible, and where some uses are precluded, to achieve that mix of uses which society . . . deems most beneficial.¹²

The report also called for

maximum multiple use of the estuarine resource. The primary objective of technical management is to achieve the best combination of uses to serve the needs of society while protecting, preserving, and enhancing the biophysical environment for the continuing benefit of present and future generations.¹³

Although the report highlighted the need to “reduce to an acceptable minimum the

adverse effect of man's use of the estuaries and coastal areas" and cited the need to "accept preservation" as one means to that end, there was no mention of either estuarine or marine sanctuaries as desirable preservation tools.¹⁴ Nor did the report identify particular estuaries that should be set aside for research purposes as the Stratton Commission had recommended.

The DOI's second report, the *National Estuary Study* was released in January 1970.¹⁵ Prepared by the U.S. Fish and Wildlife Service, the report recommended that the DOI "should initiate a program designed expressly to provide for the protection and restoration of the natural values of estuaries . . . We should proceed now to halt and reverse the grim trend of estuary degradation."¹⁶ The "principal thrust of the report" was to "focus attention on the urgent need to preserve and restore" the natural values of estuaries. The report endorsed the DOI's earlier conclusion that states should be primarily responsible for establishing coastal zone management programs, but did not make specific recommendations for federal actions to help States establish protective programs for estuarine resources.¹⁷

In response to its statutory mandate to provide Congress with recommendations on a national estuary system, possibly to include federally acquired sites, the DOI dodged, saying that it needed more time to develop suggestions.¹⁸ It also declined to identify "significant" estuaries, arguing instead that all estuaries were important for one or more reasons and deserved better management and protection.¹⁹ Interior did not identify estuarine sanctuaries for research purposes, nor did it address the concept of marine sanctuaries in its summary volume of the report.

Collectively, the three studies served to justify the need for a new system of coastal management in which states would be the lead actors. All three reports recommended a policy of balanced multiple use of the coastal zone, but recognized that establishment of preservation areas was part of the multiple use approach. Congress responded by passing the Coastal Zone Management Act of 1972, authorizing federal assistance to states for managing their coasts.²⁰ However, the House Merchant Marine and Fisheries Committee did not see state coastal zone management plans as sufficient in themselves to preserve ocean places. Thus, despite the Nixon Administration's lack of interest, consideration of marine sanctuaries legislation continued on a parallel track with the Coastal Zone Management Act.

90th Congress, the spill might have been prevented.¹ Also reintroduced was Brown's bill to study a sanctuary in the Santa Barbara Channel, and a Talcott measure to study other coastal areas in California for possible designation.²

The national focus on oil spills prompted a tactical maneuver by Rep. Keith. On February 20, 1969, a few days before the House Merchant Marine and Fisheries Committee (House MMFC) was to conduct hearings on oil pollution, Keith introduced a bill to control oil pollution from vessels, which included his sanctuary study proposal as a separate title.³ At the hearings, Keith again noted that the Santa Barbara spill might have been prevented had the Santa Barbara area been studied and set aside "for a higher purpose than oil exploration and the operation of oil wells."⁴ Keith emphasized the need to protect the Georges Bank fishery, already depleted by Russian fishing, from further harm by oil pollution.⁵ He also made clear that his study bill called for cessation of new oil activities in sanctuary study areas, but left it up to Congress to decide which areas to protect permanently and how to protect them. In response to Secretary Hickel's decision to create a no-drilling ecological reserve off Santa Barbara, Keith suggested to the Secretary that other coastlines of the country comparable to Santa Barbara's in value also might deserve sanctuary status to protect established uses such as fisheries and recreation.⁶

Keith's idea of attaching the sanctuary study to oil pollution control legislation went nowhere. Furthermore, no House hearings were held on any sanctuary study bills during the 91st Congress. A major reason for the lack of action was the continuing opposition by the Interior Department and the oil industry. The DOI counseled delay on the bills until various reports on marine and estuary issues were received, including a study on ocean dumping that the Nixon administration had initiated.⁷

Undeterred, Keith came up with yet another proposal. In October 1970, during the waning months of the 91st Congress, Keith introduced a bill to congressionally designate a Cape Cod National Marine Sanctuary in waters adjacent to the Cape Cod National Seashore.⁸ Keith's bill came down solidly against oil development. It prohibited mineral extraction and the erection of any structure within the sanctuary.⁹ It also prohibited "any . . . activity which would seriously alter or endanger the ecology or the appearance of the ocean, or of the land beneath the water."¹⁰ The bill allowed commercial fishing and sport and recreational activities within the sanctuary "as long as they are carried on in accordance with sound conservation practices" as determined by the Secretary of the Interior.¹¹ No hearings occurred on the bill.

Sanctuary study legislation drew little interest in the Senate. Senator Brooke had again introduced the Keith measure early in the session.¹² In June 1969, Sen. Muskie (D-ME), chairman of the Subcommittee on Air and Water Pollution, after being contacted by Keith, introduced a modified version of the Keith bill.¹³ Muskie's bill, The Marine Resources Preservation Act, called for the study of sites as potential "marine preserves."¹⁴ The Muskie bill differed from Keith's in that it did not prohibit oil exploration and development in study areas, but did *prohibit minerals exploration and development in preserves subsequently designated by Congress*.¹⁵

In the spring of 1970, the Senate Subcommittee on Oceanography, chaired by Sen. Ernest Hollings (D-SC), held hearings on several coastal zone management bills and the Muskie bill.¹⁶ However, the hearings focused on the creation of a grant program for states to better manage their coastal zones, as recommended by the Stratton Commission, and paid scant attention to the Muskie legislation. Senator Brooke's sanctuary study bill, which had been referred to the Senate Commerce Committee, was not considered at the hearing.

Sanctuaries from Oil Drilling

With the need for action heightened by the Santa Barbara oil spill, members of the California delegation continued to refine their strategy of protecting ocean places by prohibiting oil and gas development on the Outer Continental Shelf. Senator Alan Cranston (D-CA), who replaced Kuchel, became the lead champion for stopping federal oil and gas leasing along the California coast. One month after the Santa Barbara spill, Cranston introduced legislation to terminate drilling for oil and gas on all federally leased areas in the Santa Barbara Channel, and to suspend drilling on all other leased areas off California pending completion of a study "to determine methods of drilling for, producing, and transporting oil . . . which will remove the threat of pollution and other damage to the environment and the ecological community."¹⁷ Sen. George Murphy (R-CA) and Rep. Teague also introduced lease prohibition bills.¹⁸

On May 19, 1969, the Senate Subcommittee on Minerals initiated what would turn into a series of hearings on the Cranston bill and similar legislation.¹⁹ Calling the Santa Barbara blowout an example of a general and growing threat of pollution, Cranston said he sought to preserve the unique beauty of the Santa Barbara coastline and to prevent further repetitions of the Santa Barbara disaster by banning further offshore oil development.²⁰ Besides, he noted, if a national emergency arose in the future, the Channel's oil could be tapped, hopefully with greatly improved technology.²¹

Like the sanctuary bills, Cranston's measure was opposed by the DOI as

“unnecessary.”²² Secretary Hickel already had created a permanent ecological preserve and a new buffer zone of some 34,000 acres and was taking steps to prevent future incidents.²³ Interior officials also expressed concerns about compensation costs for terminated leases and the loss of an energy supply at a time of shortage.²⁴ Testifying for the administration, Assistant Secretary of the Interior Hollis Dole noted that the DOI had an obligation to develop the mineral resources of the nation and to consider “environmental factors. . . The balance of national needs guides all of our decisions,” testified Dole.²⁵

In October 1969, Cranston took another tack, introducing the California Marine Sanctuaries Act.²⁶ The measure, cosponsored by Sens. Murphy, Muskie, and Gaylord Nelson (D-WI), declared it the policy of Congress to preserve, protect, and restore portions of the California shoreline and coastal waters.²⁷ The bill directed the Secretary of the Interior to suspend further minerals leasing in federal waters adjacent to any area of state territorial waters where California had by law prohibited exploration and extraction of oil, gas or any other mineral.²⁸ Reps. Teague, Talcott, Burton, Charles Gubser (R-CA), and Paul “Pete” McCloskey (R-CA) introduced identical companion measures in the House.²⁹

In his statement accompanying the bill, Cranston argued that federal law should be at least as stringent as local laws designed to protect the environment, “for without federal conformity, State laws may be useless. . .”³⁰ As California already had set aside seven so-called oil sanctuaries in state waters in which oil drilling was prohibited, he argued, the federal government should respect these actions and not undercut them by leasing the Outer Continental Shelf areas contiguous to the state sanctuaries.³¹ Federal leasing could still occur along other portions of the California coastline.

Yet Sen. Muskie offered another approach for protecting Santa Barbara. In February 1970, Muskie introduced legislation to terminate oil production in the Santa Barbara Channel, establish an ecological reserve for “scientific, recreational, fish and wildlife conservation and other similar uses,” and to withdraw all other Outer Continental Shelf lands in the Channel from minerals production, holding them in reserve until Congress decided otherwise.³²

The Senate Subcommittee on Minerals held more hearings on the various Santa Barbara protection bills on March 13 and 14, 1970 in Santa Barbara, and again on July 21 and 22 in Washington, D.C.³³ Sen. Frank Moss (D-UT), the subcommittee chairman, playing, he said, the Devil’s Advocate, expressed three concerns about

stopping oil production off California: (1) the dilemma of balancing demands on natural resources with environmental preservation, and more specifically the nation's need for energy supplies; (2) loss of revenue to the federal Treasury; and (3) the large number of existing laws that control offshore oil and gas exploration and whether additional place-specific authority was really needed.³⁴ By and large, witnesses from the state, local governments, environmental organizations, and private citizens supported the Cranston measures.

By the July hearing, the Nixon Administration had developed a compromise proposal. Introduced by Sen. Murphy, the bill established a national energy reserve of approximately 198,000 acres in the federal portion of the OCS and terminated 20 existing leases. Drilling in the reserve could only be authorized by the President.³⁵ The Union Oil Company, one of the lease-holders and operator of the ruptured well, opposed all bills.³⁶ Ultimately, no action was taken on Cranston's or Murphy's bills by the Senate. As Sen. Moss had hinted, the Senate Interior Committee was simply not willing to prohibit offshore oil development and pay compensation for terminated leases.

In the House, hearings were held in September 1970 on the administration's bill and on related measures, including a Teague bill.³⁷ But the House Interior Committee was no more inclined to act than the Senate committee, and the measures died.

Ocean Dumping Bills
