A third ocean protection strategy that emerged during the 91st Congress was to designate areas where ocean dumping is prohibited in order to protect ocean wildlife and ecology. Ocean dumping, which was basically unregulated, had become a high priority issue for the Nixon administration and the Congress, along with other forms of pollution. In his environmental message of April 15, 1970, President Nixon directed the Council on Environmental Quality to prepare a study of the dumping issue.³⁸

While the study was being prepared, the House MMFC considered a variety of ocean dumping measures, some of which incorporated the sanctuary concept. In March 1970, Rep. John Murphy (D-NY), a member of the committee, introduced a bill to require the Secretary of the Interior to establish "marine sanctuaries" in areas "which he determines should be preserved and protected as necessary to a balanced marine ecology and in particular those waters and submerged lands areas necessary in connection with the mating and spawning of species of fish, shellfish, and marine animal and plant life."³⁹ Waste discharges of all kinds would be prohibited in the designated sanctuaries.⁴⁰

Later that year, Murphy introduced another bill to amend the Fish and Wildlife Coordination Act to require the Secretary of the Interior to conduct a two-year study to identify areas in navigable, coastal and offshore waters where wastes could be

“safely discharged.”⁴¹ Dumping would be prohibited outside the discharge areas. In determining which areas to designate as safe discharge sites, the Secretary was to “consider all ecological and environmental factors, including . . . the effect of such discharging on the marine and wildlife ecology.” Other members introduced measures to ban all dumping in the New York Bight and to establish national standards for the dumping of ocean wastes that might be harmful to wildlife or the ecology of coastal waters.⁴²

Hearings were held by the House Subcommittee on Fisheries and Wildlife Conservation, chaired by John Dingell, on July 27-28 and September 30, 1970 on Murphy’s safe discharge bill and other measures to protect ocean wildlife.⁴³ Although the subcommittee did not review sanctuary study bills, the hearings highlighted that there are places in the sea worth protecting for their ecological values. Concurrent with the hearings, Rep. Paul Rogers (D-FL), another member of the Merchant Marine and Fisheries Committee, introduced legislation to require the Secretary of the Interior to designate areas of waters and submerged lands where, because of ecological considerations, waste materials “cannot be safely discharged,” the mirror opposite of Murphy’s approach.⁴⁴

Council on Environmental Quality Report

The Council on Environmental Quality (CEQ) undertook, at President Nixon’s urging, a comprehensive report on the problem of ocean dumping and pollution. In his memoirs, Russell Train, CEQ’s first chairman, remembered the report as the first time the potential policy power of CEQ was deployed on behalf of a major international issue with the goal of achieving legislative success.

On October 7, 1970, President Nixon forwarded the CEQ’s report, *Ocean Dumping, A National Policy*, to Congress.⁴⁵ In his accompanying message, President Nixon wrote: “Pollution is now visible on the high seas—long believed beyond the reach of man’s harmful influence. In recent months, worldwide concern has been expressed about the dangers of dumping toxic wastes in the ocean.”⁴⁶ Nixon promised to submit legislation to the 92nd Congress “to ban the unregulated dumping of all materials in the oceans and to prevent or rigorously limit the dumping of harmful materials.”⁴⁷ This legislation was seen as complementary to other administration legislation submitted in November 1969 “to provide comprehensive management by the states of their coastal zone land and waters.”⁴⁸

The CEQ report identified 246 disposal sites in the ocean, of which 50% were in the Atlantic, 28% in the Pacific, and 22% in the Gulf of Mexico.⁴⁹ CEQ recommended that the U.S. Environmental Protection Agency (EPA) be given authority to set up a permit process for the transportation and dumping of wastes, ban the dumping of certain materials and designate safe dumping sites, and establish penalties for violators. The report did not discuss marine sanctuaries, but it did recommend that

EPA protect biologically valuable areas in the process of regulating dumping: “High priority should be given to protecting those portions of the marine environment which are biologically most active, namely the estuaries and the shallow near shore areas in which many marine organisms breed or spawn. These biologically critical areas should be delimited and protected.”⁵⁰

In discussing research needs, CEQ recommended that “marine research preserves should be established to protect representative marine ecosystems for research and to serve as ecological reference points-baselines by which man-induced changes may be evaluated.”⁵¹ This echoed the Stratton Commission’s call for the establishment of “representative coastal and estuarine sites . . . as natural preserves for conduct of studies necessary to establish a proper base from which the effects of man’s activities can be determined and ultimately regulated.”⁵²

Combination Bills

With so many ocean protection strategies on the table, it was only a matter of time until they began to be combined and blended. Shortly after the release of the CEQ report, Rep. Louis Frey (R-FL) introduced legislation to regulate ocean dumping, prohibit oil development, and establish a “system of marine sanctuaries.”⁵³ Frey’s bill declared that “many estuaries of the Nation are being subjected to severe ecological degradation through unregulated dumping,” and that portions of the tidelands and ocean waters “should be preserved as marine sanctuaries where *industry development and extraction of the nonliving resources of the seabed and subsoil thereof and dumping of any kind should be prohibited.*”⁵⁴ The Frey bill directed the Secretary of Commerce to “designate as marine sanctuaries those areas . . . which the Secretary determines should be preserved or restored for their recreation, conservation, ecologic, or esthetic values,” and to make initial designations within two years and periodically thereafter.⁵⁵

Frey explained his bill as follows:

Most dredge spoil is dumped relatively inshore, where it may contaminate valuable breeding grounds for shellfish and fish species generally. In view of this, it seems entirely logical to relate the problem of ocean-dumping to the broader problem of preserving certain eco-systems within the coastal zone areas . . . While a number of bills currently being considered . . . provide for the designation of safe areas where dumping may be conducted, it seems to me more reasonable to concentrate on determining which areas of our marine environment are most valuable and setting them aside as sanctuaries. This approach is somewhat analogous to the wilderness system, which attempts to preserve in their natural state the most valuable of our remaining untouched land areas.⁵⁶

As if to underscore Frey’s point, on December 2 a large quantity of oil sludge was dumped 50 miles off Florida’s Atlantic coast by the U.S. Navy, occasioning yet another congressional hearing, this one in the Senate.⁵⁷

⁵⁷*Oil Sludge Dumping Off the Florida Coast: Hearing Before the Subcommittee on Air and Water Pollution of the House Committee on Public Works*, 91st Cong. (1970).

At the close of the 91st Congress, multiple approaches for protecting the ocean lay on the table. The sanctuary study bills proposed by Brown and Keith to save ocean places from industrial development and manage them for compatible uses had not advanced. The Senate Committee on Commerce had shown little interest in sanctuary legislation. Its efforts were focused on coastal zone management legislation, which included a modest program to create estuarine sanctuaries where research would be conducted in support of coastal management needs.

Following the Santa Barbara oil spill, the drive to ban oil development along parts of California's coast had grown in intensity, but to the frustration of Senator Cranston and others, hearings had not resulted in action by either the Senate or House Interior committees.

Intensifying concern about ocean pollution generated yet another rationale for conserving ocean places: protecting ecologically important areas and their wildlife from waste dumping. It was probably inevitable that the various strategies to protect ocean places would be combined, as they were in Rep. Frey's bill.

Regardless of approach, the basic intent of sanctuary proponents was essentially the same: to preserve the natural values (and related compatible uses) of special marine places by protecting them from industrial development and pollution. In particular, the bills sought to protect cherished areas like George's Bank and Santa Barbara for their scenic, wildlife, fishery, ecological, scientific research, and recreational values. Keith, Brown, Frey, and others envisioned a marine sanctuary system analogous to that established for terrestrial wilderness areas by the Wilderness Act. Without a marine preservation system, proponents feared the eventual destruction of unique ocean resources as had occurred to America's forest and prairies.

However, the analogy between sanctuaries and wilderness areas was not a perfect one. Whereas the Wilderness Act generally prohibits commercial activities in wilderness areas, marine sanctuary study bills treated commercial fishing as a compatible use that should be allowed in sanctuaries. There was little, if any, recognition that overfishing was, or might become, a threat to sanctuary resources or could conflict with other uses.

The major obstacles to sanctuary legislation continued to be the DOI and the oil industry, both of whom opposed restrictions on offshore oil development. Although the Santa Barbara blowout and other oil spills had drawn attention to the dangers of offshore energy development, there was no consensus on remedies. A strong countervailing concern at the time was the need to develop more domestic energy supplies. Other factors contributing to the lack of action included the referral of sanctuary legislation to two different committees in each congressional body, always a recipe for delay; the sheer volume of marine studies and recommendations that had emerged at roughly the same time and that had to be digested and harmonized; and the flowering of other environmental issues that demanded congressional attention.

Although the Nixon Administration continued to oppose marine sanctuaries, many House members, including some on the House Merchant Marine and Fisheries Committee, were determined to act. As it turned out, the ocean-dumping crisis gave them the opportunity they needed. As the 91st Congress drew to a close, ocean-dumping legislation moved to center stage.

III. THE 1972 MARINE PROTECTION, RESEARCH AND SANCTUARIES ACT OF 1972

§ 23:14 Background

With the release of the CEQ report on ocean dumping, momentum for an ocean dumping law became unstoppable. On the first day of the 92nd Congress, 17 bills to

regulate ocean dumping were introduced in the House.¹ President Nixon's draft ocean dumping bill, an outgrowth of the CEQ report, was forwarded to Congress on February 8 and introduced in both houses.²

Meanwhile, sanctuary proponents continued to act on several fronts. Early in the session, Rep. Keith introduced his sanctuary study bill (unchanged from previous versions) and his Cape Cod sanctuary designation measure.³ Reps. Murphy and Rogers reintroduced bills to protect marine ecology from waste dumping.⁴ And Rep. Frey introduced a new version of his bill to regulate dumping and establish marine sanctuaries.⁵

In the Senate, Sen. Cranston continued his campaign to ban oil and gas development in the Santa Barbara Channel and other areas along the California coast. On January 27, 1971, he introduced legislation to terminate oil leases in the Santa Barbara Channel and to establish a permanent Federal Ecological Preserve.⁶ In April, he introduced a series of bills to establish "marine sanctuaries from leasing" in federal waters at six other areas along the California coast.⁷ All of Cranston's bills were referred to the Senate Interior Committee, which dutifully gave him a hearing, but took no action.⁸

§ 23:15 House Action

The House Merchant Marine and Fisheries Committee held hearings on ocean dumping bills in early April 1971.¹ Although the principal focus of the hearings was the regulation of ocean dumping, the Murphy, Rogers, and Frey bills were formally considered. Rep. Keith did not testify, but did ask a few questions about sanctuaries, as did other committee members.

The administration's witnesses urged passage of the President's ocean dumping bill, which aimed to put EPA in charge of issuing permits for the dumping of certain wastes. Russell Train, chairman of the CEQ, told the panel that the administration's bill gave the EPA Administrator authority to identify areas where dumping would

⁸Bills to Create Marine Sanctuaries from Leasing Pursuant to the Outer Continental Shelf Lands Act in Areas Off the Coast of California Adjacent to State-Owned Submerged Lands in Which Such State Has Suspended Leasing for Mineral Purposes: Hearings Before the Subcommittee on Minerals, Materials, and Fuels of the Senate Committee on Interior and Insular Affairs, 92d Cong. (1971).

[Section 23:15]

not be permitted, implying this achieved the same objective as sanctuaries.² He also noted that the sanctuary concept involved more than just dumping considerations, and urged that sanctuaries be considered in separate legislation.³ William Ruckelshaus, the EPA Administrator, testified that EPA was in complete accord that certain critical marine areas should be protected from dumping.⁴

The DOI did not raise concerns about sanctuaries in its submitted written views, but other agencies did.⁵ The State Department expressed concern about the designation of sanctuaries in international waters, and the Navy over conflicts sanctuaries might pose for military activities.⁶ In general, however, the administration raised no concerted defense against sanctuaries, a position that would change as sanctuary legislation progressed.

Shortly after the hearings ended, the Merchant Marine and Fisheries Committee commenced a series of executive sessions to develop a final ocean-dumping bill. It was during the course of these deliberations that a marine sanctuaries provision was added. A preview of the sanctuaries title came on June 17, when Rep. Alton Lennon (D-NC), chairman of the Oceanography Subcommittee, introduced a measure to establish a National Coastal and Estuarine Zone Management Program and a Marine Sanctuaries Program; Rep. Keith cosponsored the Lennon measure.⁷ The sanctuaries provision of Lennon bill's was almost identical to that included in Title III of the committee's ocean dumping bill, H.R. 9727, which was introduced a few days later on July 13 by Leonard Garmatz (D-MD), chairman of the House Merchant Marine and Fisheries Committee.⁸

The Garmatz bill, entitled The Marine Protection, Research and Sanctuaries Act, was a three-part measure that established a regulatory scheme for ocean dumping, a comprehensive research program to investigate the short and long term effects of pollution on the ocean, and a marine sanctuaries program.⁹ The committee viewed the three titles as complementary.¹⁰

The sanctuaries title (Title III) was an amalgam of old and new concepts. Title III provided the Secretary of Commerce with broad discretionary authority to designate in coastal, ocean and Great Lakes waters those marine sanctuaries he determined were necessary for the purposes of preserving and restoring an area's conservation, recreational, ecological, or esthetic values. The Secretary was given two years to make the first designations and was to make others periodically thereafter. In established sanctuaries, the Secretary had broad and complete power to regulate uses and ensure they were consistent with the sanctuary's purposes. The Sanctuaries Program was authorized for three years and given annual budget authority of up to \$10 million.

Title III was a decided shift away from earlier sanctuary concepts. The committee bill *did not mirror the Wilderness Act by establishing a marine wilderness preserve system*, as had been recommended by President Johnson's Science Advisory Committee. Perhaps more striking, *it lacked any prohibitions on industrial development, including oil development, in sanctuaries*, one of the principal goals of Keith,

Frey, and others.

The committee unanimously reported H.R. 9727 on July 17. House floor debate began September 8, and the bill passed the House by a vote of 300 to 4 on September 9. Members unhappy with the way the sanctuaries title treated offshore oil raised two significant challenges to the bill on the floor. One group, led by Reps. Norman Lent (R-NY) and Teague, objected to the absence of prohibitions on oil development, while the other, led by Interior Committee chairman, Wayne Aspinall (D-CO), and supported by the Nixon Administration, feared the bill would restrict offshore energy development, even though it contained no prohibitions on oil drilling.¹¹ Aspinall also claimed the bill infringed upon his committee's jurisdiction because it affected the OCS leasing program. A Lent-Teague amendment to expressly prohibit oil drilling in sanctuary study areas and designated sanctuaries was defeated.¹² Aspinall's attempt to delete the entire sanctuaries title also failed.¹³

§ 23:16 Action in Senate

The Senate Commerce Committee, which had shown little interest in marine sanctuaries legislation prior to the 92nd Congress, remained unengaged. The committee's top ocean priorities in the 92nd Congress were research, control of ocean pollution, and coastal zone management. In March and April 1971, the Senate Subcommittee on Oceans and Atmosphere, chaired by Sen. Ernest Hollings, held hearings on the administration's ocean dumping bill and a Hollings measure to foster oceanic research and development programs.¹ The Hollings bill included a provision to authorize grants to coastal states for acquisition, development, and operation of estuarine sanctuaries for research purposes as had been recommended by the Stratton Commission.² Marine sanctuaries were not considered at the hearing.

The House-passed ocean dumping bill was received in the Senate on September 10 and referred jointly to the Committees on Commerce and Public Works, both of which claimed jurisdiction over water pollution in the oceans.³ Commencing September 15, and continuing into October, the Senate Commerce Committee marked up its version of the bill and engaged in discussions with the Public Works Committee to harmonize the bill's content with other pollution laws.

The sanctuaries title was deleted at the outset of the Commerce Committee's mark-up process. The Commerce Committee's version of the ocean-dumping bill was reported with the concurrence of Public Works Committee on November 12.⁴

In its report on the bill, the Commerce Committee acknowledged the value of marine sanctuaries for certain purposes:

The Committee believes that the establishment of marine sanctuaries is appropriate where it is desirable to set aside areas of the seabed and the superjacent waters for scientific study, to preserve unique, rare, or characteristic features of the oceans, coastal, and other waters, and their total ecosystems. In this we agree with the Members of the House of Representatives. Particularly with respect to scientific investigation, marine sanctuaries would permit baseline ecological studies that would yield greater knowledge

of these preserved areas both in their natural state and in their altered state as natural and manmade phenomena effected change.⁵

However, the Committee explained it had deleted the sanctuaries title because “the principal purposes for which marine sanctuaries should be established would not be accomplished by the proposed [House] legislation.”⁶ The Committee rejected the bill because (1) the United States did not have authority under international law to establish sanctuaries beyond its territorial limits; (2) marine sanctuaries in international waters would be ineffective as the United States could not control the actions of foreign nationals on the high seas portion of a sanctuary; (3) new authority was not needed to regulate the exploitation of seabed resources because OCSLA already provided this authority; and (4) assertion of authority over portions of the high seas for sanctuaries undermined the nation’s self-interest in maintaining narrow geographical claims over the world’s oceans as a tenant of its foreign policy.⁷

The Senate’s ocean dumping bill passed on November 24 by a vote of 73 to 0, but not without controversy over its lack of a marine sanctuaries title.⁸ Sen. Nelson offered an amendment to restore the House sanctuary language⁹ and to invoke a moratorium on oil and gas leases off the east coast until the Secretary of the Interior made his first sanctuary designations.¹⁰ Nelson wished to avoid Santa Barbara-like disasters from harming the east coast.¹¹

Both the Nixon Administration and the Senate Commerce Committee opposed Nelson’s amendment to restore the sanctuaries title, using many of the same arguments Interior and other agencies had raised against the House bill.¹² Sen. Hollings reiterated the committee’s concerns about marine sanctuaries, particularly the extension of U.S. jurisdiction into international waters.¹³ That, he said, was the Nelson amendment’s “fatal flaw.”¹⁴

Hollings bolstered his opposition with another argument: The amendment was not needed because the Commerce Committee already had acted to establish *estuarine sanctuaries* when it approved legislation to create a Coastal Zone Management program.¹⁵ Estuarine sanctuaries complied with international law in that they were only to be established within the three-mile territorial limit of the United States. Estuarine sanctuaries were needed, said Hollings, to provide a “rational basis for intelligent management of coastal and estuarine areas.”¹⁶ The Commerce Committee, explained Hollings, envisioned “such sanctuaries as natural areas set aside primarily to provide scientists with the opportunity to make baseline ecological measurements . . . Such sanctuaries should not be chosen at random, but should reflect regional differentiation and a variety of ecosystems so as to cover all significant natural variations.”¹⁷ This view echoed the Stratton Commission and CEQ’s recommendations for a system of marine research reserves.

Sen. Gordon Allott (R-CO), the ranking minority member of the Interior Committee, supported the Commerce Committee and administration views that ample authority existed under the Outer Continental Shelf Lands Act to regulate minerals leasing on the Outer Continental Shelf.¹⁸ Furthermore, he argued that giving the Secretary of Commerce the authority to lock up offshore energy resources in sanctuaries, before the Interior Committee's pending national energy study was completed, said Allott, was premature.¹⁹

Nelson withdrew his amendment after considering the objections of the Commerce Committee and receiving assurances from the chairmen of the Commerce, Interior, and Public Works Committees that a joint committee hearing would be held on the subject the following year.²⁰ Shortly before the Congress adjourned, Nelson introduced his withdrawn amendment as a separate bill, but the promised hearings were never held.²¹ Nelson also introduced another bill that provided for a two-year study of the probable effects of new or additional mineral leasing and development in the OCS and Great Lakes on the "ecological, esthetics, recreation, resource, and scientific values of and related to such areas."²² Until the report was submitted, the bill would prevent minerals leases from being issued in the OCS.²³

Conference Committee

The Conference Committee named to resolve differences between the House and Senate ocean dumping bills immediately hit a snag that tied up action for almost a year. The issue in disagreement concerned which agency would regulate dredge spoil dumping, EPA or the U.S. Army Corps of Engineers.²⁴ It took until late 1972 to resolve the issue and issue the conference report.²⁵ The compromise bill that finally emerged included Title III as passed by the House with a few changes. Among other things, these included an expansion of the waters subject to sanctuary designation and changes in the enforcement provisions. The Senate and the House both approved the conference report on October 13th.²⁶ The MPRSA of 1972 was signed by President Nixon on October 23, 1972, despite the administration's unhappiness with the sanctuaries title.

§ 23:17 Provisions of the Sanctuary Title

The sanctuaries title that ultimately passed the Congress was a hybrid of various legislative concepts that preceded it and compromises forged in the committee's executive sessions. Title III did not fully implement the recommendation of President Johnson's Science Advisory Committee for a national marine wilderness preserve system modeled after the standards and principles of the Wilderness Act. For example, the Act did not formally establish a national sanctuary system or designate the first set of sanctuaries, as did the Wilderness Act for terrestrial wilderness areas.

Furthermore, the Act did not define what a marine sanctuary is, provide specific guidance on how the system was to be developed or how big it should be, or specify

²⁶118 Cong. Rec. 35842, 36045 (1972).

the uses that would be allowed or prohibited. Rather, Title III gave the Secretary of Commerce broad *discretionary authority* to preserve ocean places on a case-by-case basis if the Secretary determined sanctuary designations were “necessary for the purpose of preserving or restoring” marine areas for their “conservation, recreational, ecological, or esthetic values.” The Secretary was directed to make the first designations within two years and periodically thereafter, and to manage sanctuaries consistent with their designated purposes.

At least some members considered the Program experimental. Rep. Dingell, one of the bill’s floor managers, said that the Program may be extended after its three-year authorization period, “depending upon how effectively it has been carried out.”¹ The life of the Program was limited to two fiscal years after the fiscal year in which it was enacted, meaning the Program would require periodic reauthorization.² In contrast, the Wilderness Act had permanent authority.

§ 23:18 Provisions of the Sanctuary Title—Problem Addressed

The problem Title III attempted to address was fundamentally the same as that identified in the earliest sanctuary bills: the need to preserve places in the ocean with special values from industrial development. In its report on the bill, the Committee stated:

Title III deals with an issue which has been of great concern to the Committee for many years: the need to create a mechanism for protecting certain important areas of the coastal zone from intrusive activities by man. This need may stem from the desire to protect scenic resources, natural resources or living organisms; but it is not met by any legislation now on the books . . . The pressures for development of marine resources are already great and increasing. It is never easy to resist these pressures and yet all recognize that there are times when we may risk sacrificing long-term values for short-term gains. The marine sanctuaries authorized by this bill would provide the means whereby important areas may be set aside for protection and may thus be insulated from the various types of “development” which can destroy them.¹

Rep. Dingell referred to Title III as a “badly needed” tool “with which we may begin to repair some of the damage that has been done to the oceans in the past, and can protect important areas from further impairment.”² In short, preservation and restoration was professed to be the Act’s primary goal.

§ 23:19 Provisions of the Sanctuary Title—Purpose and Policy, Goals and Deadlines

Consistent with the Committee’s preservation intent, Title III authorized the Secretary of Commerce, after consulting with other federal agencies, to “designate as marine sanctuaries those areas . . . which he determines necessary for the purpose of *preserving or restoring such areas for their conservation, recreational, ecological or esthetic values.*”¹ Sanctuaries could be designated within ocean, coastal, and other waters “as far seaward as the outer edge of the Continental Shelf . . . other coastal waters where the tide ebbs and flows,” and the Great Lakes and their connecting

waters.²

No specific marine areas were identified for designation or inventory, as had occurred for wilderness areas under the Wilderness Act, and no size limits were specified. Although the Secretary could designate as many or as few sanctuaries as he or she saw fit, Congress clearly expected the Secretary to execute the Program with dispatch because it directed that the initial designations be made within two years and periodically thereafter. According to the Committee:

The reasons for designating a marine sanctuary may involve conservation of resources, protection of recreational interests, the preservation or restoration of ecological values, the protection of esthetic values, or a combination of any or all of them. It is particularly important therefore that the designation clearly states the purpose of the sanctuary and that the regulations in implementation be directed to the accomplishment of the stated purpose.³

The bill's preservation purpose was not as strongly reflected in the Act's policy and provisions as it could have been. For example, unlike earlier sanctuary bills, the Act did not expressly prohibit oil drilling, pollution discharges, or other development uses within sanctuary study areas or designated sanctuaries. Neither was there any language specifying the particular uses to be allowed in sanctuaries once established. Instead of precise guidance, the Act gave the Secretary broad discretionary authority to decide exactly what kind of preservation was to be afforded each area (*see* discussion on management in § 20:22). To a large degree, the Committee intended the Secretary to resolve existing or potential use conflicts through required consultations with federal agencies prior to a sanctuary's designation. "In any case where there is no way to reconcile competing uses, it is expected that the ultimate decision [to designate a sanctuary or not] will be made at a higher level in the Executive branch."⁴

More significantly, during House floor debate, committee members described the Act as giving dual or balanced emphasis to preservation and multiple use of sanctuaries, *including exploitative uses*, even though *the Act was silent on multiple use*.⁵ But if sanctuaries were to be multiple use areas, preservation and restoration could hardly be the Act's singular goal. Thus, from the start, the Act's preservation purpose was muddled by the House's interpretive guidance. Because of its long-term importance to the evolution of the Act, the preservation versus multiple use debate is dealt with extensively here.

§ 23:20 Provisions of the Sanctuary Title—Preservation vs. Multiple Use Focus

In explaining the bill and opposing the amendments offered by Lent and Aspinall, the House bill's floor managers and other committee members made extensive remarks about the bill's purpose and management provisions. The debate was confusing. Statements were made that were incomplete, ambiguous, internally contradictory, contradictory of other statements, and at times at odds with the plain meaning of the statute and committee report. The overall thrust of the argument put forth by the bill's managers was that although Title III intended to protect special places in the ocean to preserve long-term values, the Secretary was to pursue this goal with a balanced approach, meaning that both preservation and

²117 Cong. Rec., at 31132.

⁵*See, e.g.*, 117 Cong. Rec. 30853, 30855 (statement of Rep. Mosher), 20858 (statement of Rep. Keith).

development uses could occur within the same sanctuary if the Secretary decided they should.

Especially important are the statements made by the bill's floor managers: Reps. Dingell and Lennon on the Democratic side and Tom Pelly (R-WA) and Charles Mosher (R-OH) for the Republicans. Rep. Dingell spoke first. Citing the Santa Barbara spill, Dingell noted the human propensity to "sacrifice long-term values for short-term gain."¹ Dingell called Title III "an expeditious means of protecting important values . . . In Title III we do no more than provide the tools with which to preserve important assets for generations yet unborn."² Rep. Lennon, the chairman of the Oceanography Subcommittee, which helped shape the bill, said that Title III "provides a scheme whereby areas may be preserved or restored in order to insure their maximum overall potential, and would in effect provide for rational decisions on competing uses in the offshore waters."³

Rep. Mosher, the floor manager for the Republicans, addressed the multiple use issue head on. Mosher said that the purpose of Title III "is to insure the highest and best use of this national asset [the oceans]."⁴ Mosher assured his colleagues that he was not against using the sea's resources, living or mineral, but that "development must be conducted with an understanding and awareness of its consequences."⁵ He went on to say:

These various uses of the oceans, the water column, and the seabed can exist in harmony. They are not mutually exclusive nor [sic] incompatible. Experience with offshore platforms in the Gulf of Mexico has proven, for example, that a net increase in the fish population generally results.

The report of your committee makes it abundantly clear that the designation of a marine sanctuary is not intended to rule out multiple use of the sea surface, water column or seabed. Any proposed activity must, however, be consistent with the overall purpose of this title. An inconsistent use, in my opinion, would be one which negates the fundamental purpose for which a specific sanctuary may be established.

This title . . . is intended to insure that our coastal ocean waters are utilized to meet our total needs from the sea. Those needs include recreation, resource exploitation, the advancement of knowledge of the earth, and the preservation of unique areas. All are important.

This title is not designed to terminate the use of our coastal waters to meet any of these needs.⁶

Rep. Keith, who had sought to protect Georges Bank from oil development since 1967, explained that "the original marine sanctuaries concept [which he had championed] has been changed from one which would have called for a complete oil drilling moratorium to one which would permit drilling within the purposes of this title."⁷ Elaborating further on multiple use, Keith argued that preservation and development uses should be "balanced":

Certainly we do not intend, here, to punish consumers by denying them the necessary food and energy of the sea and seabed. Neither do we intend to be so responsive to the mineral interests that we adversely affect the essential protein resources of the sea.

[Section 23:20]

⁵117 Cong. Rec., at 30855.

⁶117 Cong. Rec., at 30855.

⁷117 Cong. Rec., at 30858.

I certainly believe in the dual usage concept for our coastal ocean waters. But I also believe such dual usage must be balanced. Neither usage should be permitted to destroy the other. In short, we need the oil and gas and we need the fish. Our bill recognizes this key fact. And it provides the proper safeguards to preserve that balanced basis.

I must admit that the word, "sanctuaries," carries a misleading connotation. It implies a restriction and a permanency not provided in the title itself.

Title III simply provides for an orderly review of the activities on our Continental Shelf. Its purpose is to assure the preservation of our coastal areas and fisheries, and at the same time assuring such industrial and commercial development as may be necessary in the national interest. .

It provides for multiple usage of the designated areas. It provides a balanced, even-handed means of prohibiting the resolution of one problem at the expense of the other. It guards against "ecology of the sake of ecology." It also guards against the cynical philosophy that the need for oil is so compelling that it justifies the destruction of the environment.⁸

In sum, Keith explained the Act as one providing for multiple uses within sanctuaries, including oil development, but with "proper safeguards," referring presumably to the Act's provision that requires the Secretary to regulate sanctuary uses and to certify that uses authorized under other laws are consistent with the purposes of the title and with individual sanctuary regulations.⁹

In responding to Rep. Aspinall's fears that Title III would lock up the oceans from oil and gas development, Rep. Pelly backed Mosher's and Keith's claims that the Act was not intended to be used to block oil development.

Let me reemphasize the fact that marine sanctuaries. . . are not intended to prevent legitimate uses of the sea. They are intended to protect unique areas of the ocean bordering our country. How many such marine sanctuaries should be established remains to be determined. It is likely that most of them will protect sections of our national seashores. A sanctuary is not meant to be a marine wilderness where man will not enter. Its designation will insure very simply a balance between uses.¹⁰

Pelly went on to argue that mere designation of a sanctuary did not prohibit current or prospective oil development. While oil and gas activities could conceivably be banned under the provision allowing the Secretary to regulate uses inconsistent with sanctuary purposes, Pelly did not envision that this would "frequently be the case."¹¹

Later in the debate, an amendment was offered by Reps. Lent and Teague to prohibit new oil and gas exploration and development activities in areas being studied for sanctuary status and all energy development in designated sanctuaries.¹² Lent argued that Title III was only a partial solution to coastal degradation because it did not specifically deal with offshore oil development, the biggest threat to the coastal areas and values the bill sought to protect. "If there is any activity that can be judged more totally incompatible with the concept of marine sanctuaries . . . it must be the offshore drilling of oil," argued Lent.¹³ In response, Pelly said:

Your committee considered this most carefully and rejected the concept [of proscribing oil development]. We are, as I have indicated, in favor of a balanced and rational use of the oceans, not an exclusive use for any one industry or group.

Offshore oil can be produced safely, and it is needed to meet our growing energy

requirements. It is not a sacred cow, however, and is subject to the National Environmental Policy Act.

Moratoriums are not the answer. We cannot bury our heads in the sand.¹⁴

Rep. Keith explained that although his constituents were adamantly opposed to further oil and gas activities off the Massachusetts coast, he could not support the Lent-Teague amendment, which was similar to one he had advanced in his own bills, because the President would veto the Act if it restricted oil development.¹⁵ Lennon also spoke against the Lent-Teague amendment, saying that the Secretary should not be constrained from deciding that oil drilling is “consistent with sanctuary designation.”¹⁶ Toward the end of the debate, Lennon submitted for the record a list of committee-prepared questions and answers to “clarify certain points on the bill.”¹⁷ These represent perhaps the most carefully crafted expression of the Merchant Marine Committee’s legislative intent:

1. Title III was included to extend “protections to specific areas which need preservation or restoration by providing a process through which rational choices as to competing uses of those areas may be made.”
2. The committee opposed prohibitions on oil and gas development in study areas because studies could take a long time and might not result in a designation; thus restriction on industrial development or oil exploration would be “undesirable.”
3. Oil development in sanctuaries should not be prohibited by the Act. The Secretary of Commerce should have the flexibility to certify oil development as consistent with the sanctuary’s purpose:

While in most cases oil exploitation activities would probably be inconsistent with the purpose of a sanctuary and, therefore, could not be certified under present language as consistent, there might be some instances where this would not necessarily be the case Therefore, to automatically forbid oil exploration in any sanctuary no matter whether it really violated the purposes of the sanctuary, would be inconsistent with the purposes of the Act and would remove from the Secretary the desirable flexibility now provided.¹⁸

In sum, during floor debate, members of the Merchant Marine and Fisheries Committee infused a sparsely drawn Act with added meaning beyond its plain meaning. Despite the statute’s clear preservation and restoration purpose, and the “safeguard” provision enabling the Secretary to prohibit uses inconsistent with these purposes, the Act was explained on the House floor as one intended to encourage or even actively promote multiple use of sanctuaries for both preservation and *resource exploitation purposes*.

§ 23:21 Provisions of the Sanctuary Title—Designation Process

In contrast to the Wilderness Act, which provides explicit guidance on the survey, identification, nomination, and designation by Congress of wilderness areas, the MPRSA delegated most of these details to the executive branch. The committee report stated that the Secretary may develop “preliminary information” on potential sanctuaries “in any manner he sees fit; however a scheme for processing preliminary information is considered necessary if the process is to be responsive to the

public interest and need, and the Secretary is expected to publish such a scheme.”¹

Whereas the Wilderness Act requires wilderness areas to be designated by Congress, the sanctuaries law gives that power to the Secretary. There is no discussion in the record of why Congress delegated the power to designate to the Secretary. However, creating a program whose implementation rested heavily with the executive branch put the Program’s fate in the hands of the power that opposed the Program, and was thus most likely to go slowly. Another factor may have been that the Merchant Marine and Fisheries Committee gave the designation authority to the executive branch because this followed the model of how national wildlife refuges were created.²

The Sanctuaries Act required the Secretary to consult with federal agencies and allow them to comment on proposed designations, and to hold public hearings to solicit the views of interested parties before making a designation.³ In the case of sanctuary proposals that encompass state territorial waters, the Secretary was to consult with state officials.⁴ Governors had the power to veto inclusion of any portion or all of state waters within a sanctuary within 60 days of its designation.⁵ For sanctuaries that included extraterritorial waters (waters outside three miles), the Secretary of State was directed to enter into negotiations with foreign governments to conclude protection agreements and “promote the purposes” for which the sanctuary was established.⁶

The sanctuary designation process would prove to be a problem once implementation got underway. Congress later would spend a good deal of time providing further guidance and clarifying its own role in the process.

§ 23:22 Provisions of the Sanctuary Title—Management and Protection Standards

The Act gave the Secretary broad regulatory power for the management and protection of designated sanctuaries:

[T]he Secretary . . . shall issue necessary and reasonable regulations to control any activities permitted within the designated marine sanctuary, and no permit, license, or other authorization issued pursuant to any other authority shall be valid unless the Secretary shall certify that the permitted activity is consistent with the purposes of this title and can be carried out within the regulations promulgated under this section.¹

In other words, under the plain meaning of the statute, the Secretary had clear authority to establish sanctuaries that preserved resources for specified preservation and restoration purposes, and regulate or ban uses that were inconsistent with the Act’s purposes.²

Although the Secretary of Commerce’s powers were broadly cast and clearly preservationist in intent, the Secretary’s potential to block development uses of the ocean, such as offshore oil development, helped generate opposition to the Act by

the Nixon Administration and members of Congress who supported the offshore oil development program. In the floor debate on multiple use, Merchant Marine Committee members frankly acknowledged the provision to certify uses as a “safeguard,” but simultaneously undermined its future use by advising executive branch implementers of the law to focus on creating sanctuaries where preservation and development uses were balanced; hence, no conflicts would theoretically exist and the provision would not need to be applied. Even so, the floor guidance was insufficient to save the Act from controversy. The safeguard provision would be one of the first provisions of the law to be changed.

§ 23:23 Provisions of the Sanctuary Title—Relation to Other Laws

Title III contained no specific provisions regarding its relationship to other federal laws. Despite the objection of the DOI that it had authority under the National Environmental Policy Act and OSCLA to protect the environmental values of the ocean that were to be protected under Title III, the committee clearly believed the sanctuaries title filled a gap in ocean protection. Noting that the Merchant Marine and Fisheries Committee had considered sanctuary bills for several years, Dingell said: “The Congress has been continually impressed with the fact that we have had no policy for the protection of these areas in the offshore lands which have significant ecological, environmental, and biological values.”¹

In terms of the Act’s effects on existing federal programs, the committee assumed that the required consultation among federal agencies and states would resolve any conflicts and provide coordination:

The consultation process is designed to coordinate the interests of various Federal departments and agencies, including the management of fisheries resources, the protection of national security and transportation interests, and the recognition of responsibility for the exploration and exploitation of mineral resources. It is expected that all interests will be considered, and that no sanctuary will be designated without complete coordination in this regard.²

In response to charges by the DOI and members of the Interior Committee that Title III would interfere with energy production under the OSCLA and lock up offshore oil deposits, Dingell disagreed, saying it “is not the intent of the Committee on Merchant Marine and Fisheries to halt drilling or other mineral exploration.”³ Several other House members made the same point during discussion of multiple use.⁴ Although the DOI and the Nixon Administration were unable to derail passage of the Act, the issue of the law’s relationship to the offshore leasing program would arise over and over again.

§ 23:24 Provisions of the Sanctuary Title—Conclusion

As enacted, the sanctuaries law only partially achieved the preservation intent of its original legislative champions. Reps. Keith, Brown, and others initially envisioned a system of marine wilderness preserves analogous to that of the National Wilderness Preservation System. Sanctuaries were proposed as a tool for preserving the environmental integrity of special marine areas and managing them for human uses deemed compatible with the natural environment, such as wildlife conservation and commercial and sport fishing. Industrial and commercial develop-

[Section 23:23]

³117 Cong. Rec. 31146.

⁴*See, e.g.*, 117 Cong. Rec. 31140.

ment that conflicted with the preservation purposes and desired uses of sanctuaries would be precluded.

But the analogy was not a perfect one. Whereas the Wilderness Act allowed recreational hunting and fishing in wilderness areas, sanctuary proponents saw no problem with allowing commercial fishing in sanctuaries even though it potentially posed a significant threat to sanctuary resources and might conflict with other uses. Preservation of fishery resources was one intended outcome of the Act, and the potential for conflict was simply never raised.

The Sanctuaries Act that passed in 1972 represented a significant modification of the original vision. Although drafted as a preservation and restoration measure, the House floor debate signaled that sanctuaries were to be multiple use areas in which all uses could be considered, even industrial ones, as part of the designation process. Furthermore, rather than establish a national sanctuary system outright with attendant guidance on how the system was to be built, Congress instead created a three-year program under which the Secretary of Commerce had discretion to designate as few or as many sanctuaries as he or she saw fit. In short, the Act gave enormous power to the executive branch to invent a place-based ocean conservation program underpinned by congressional guidance that was both ambiguous and sketchy.

What constitutes a marine sanctuary? What specific resources or places does the Act attempt to preserve? How would they be identified? What exactly does multiple use mean? Can any uses be excluded from a sanctuary? These and other questions would arise again and again as the law evolved over the next 30 years and as interest groups jostled with conservationists over virtually every major sanctuary proposal.

IV. THE RISE OF MULTIPLE USE, 1973-1986

§ 23:25 Background

Implementation of the National Marine Sanctuaries Act (NMSA), as Title III of the Marine Protection, Research and Sanctuaries Act came to be known, was slow to gain momentum. NOAA, the agency in the Commerce Department to which the Program was delegated, was scarcely two years old and still getting its sea legs when the Sanctuaries Act was passed. The Nixon administration's opposition to the Act was still warm, particularly at Interior. Equally problematic was the lack of clear and specific guidance from Congress on key points, such as designation priorities and which uses to allow in sanctuaries. The inherent difficulty of getting a new, unwanted program off the ground was compounded by a statute that emphasized preservation, but whose legislative history stressed multiple use of sanctuaries. In which direction was NOAA supposed to lean, and how far?

In its first program regulations, issued in 1974, NOAA signaled its intent to follow the House's lead and move the Program in the direction of multiple use sanctuaries. Initially, designations were few, as little money was spent to develop the Program. Once implementation began in earnest under the Carter Administration, controversies erupted over the scope, requirements and impact of the Program as NOAA attempted to designate areas such as Flower Garden Banks, Channel Islands, Georges Bank, and Farallon Islands.

Some observers and members of Congress became frustrated in general with the workability of the regulations. Oil and commercial fishing industries in particular developed a growing antipathy toward the Act because of its potential to infringe upon their activities. The oil industry sought to have oil development allowed in sanctuaries as an acceptable multiple use, and the fishing industry did not want sanctuaries to restrict their customary practices. From roughly 1977 to 1986, these

industries and their congressional allies led a counterattack against the Program that challenged the law's very existence. Barring repeal of the Act, the oil and fishing industries sought to limit the law's application by watering down its preservation purpose. In this they were largely successful. By 1984, NOAA and Congress had made a series of decisions that essentially refocused the Act's purpose from preserving and protecting places for their distinctive natural values to balancing preservation with other human uses. In short, multiple use sanctuaries became the defining paradigm of the Program.

§ 23:26 First Regulations, 1974

As a new agency cobbled together with units from other departments, NOAA had little experience managing ocean places for preservation purposes. In late 1973, NOAA hosted a national workshop to obtain advice on how to implement both the Marine Sanctuaries Program and the estuarine sanctuaries program, which had been authorized by the Coastal Zone Management Act (CZMA).¹ The workshop brought together members of state and federal agencies, conservation organizations, and industry/user groups. Participants generally felt that the marine sanctuary legislation provided less guidance and focus of purpose than the more narrow and specific estuarine sanctuary provisions of the CZMA. Among other things, the workshop explored the need for different kinds of marine sanctuaries, including a multiple use class; the desirability of frequent review of each sanctuary to determine if the purposes for which it was designated were still valid; and the need for regulated activities to be declared prior to designation so that cooperating states would understand what they were agreeing to.

Building off of the workshop's results, regulations for the Marine Sanctuaries Program were issued in June 1974.² The regulations established the policy and objectives of the Program, the kinds of areas that could be designated, a designation process, and procedures to enforce sanctuary regulations.

§ 23:27 First Regulations, 1974—Program Purpose and Multiple Use

The regulations reaffirmed the 1972 Act's clearly stated purpose of preserving or restoring certain areas for their conservation, recreational, ecological, or esthetic values.¹ The regulations identified five types of sanctuaries: habitat areas, species areas, research areas, recreational and esthetic areas, and areas with "unique or nearly one of a kind geological, oceanographic, or living resource feature[s]."² This provision appears to have originated in the 1973 workshop, which had suggested that NOAA create a range of sanctuary types.³

NOAA's regulations did not elaborate on the Act's restoration purpose. Under what circumstances and how would degraded marine areas be restored and to what condition? The failure to address restoration was a curious omission, given the fact that restoring coastal and ocean areas was a major theme of congressional discus-

sions of the period, as well as a specific purpose of the Act. NOAA never seriously addressed the restoration purpose before being repealed by Congress in 1984.

Instead of establishing a sanctuary category for multiple use, as had been discussed in the workshop, the 1974 regulations specified that “multiple use of marine sanctuaries . . . will be permitted [in all sanctuary types] to the extent the uses are compatible with the primary purposes of the sanctuary.”⁴ Multiple use was defined to mean

the contemporaneous utilization of an area or reserve for a variety of compatible purposes to the primary purpose so as to provide more than one benefit. The term implies the long-term, continued uses of such resources in such a fashion that one will not interfere with, diminish, or prevent other permitted uses.⁵

In responding to public comments about the multiple use provisions, NOAA explained:

The question of multiple use will need to be examined on a case by case basis. The legislative history of the Title clearly indicates that *multiple use of each area should be maximized consistent with the primary purpose*. Additionally, the statute clearly indicates, as a safeguard that “no permit, license, or other authorization issued pursuant to any other authority shall be valid unless the Secretary (Administrator) shall certify that the permitted activity is consistent with the purposes of this title and can be carried out within the regulations promulgated.”⁶

There are two points to be drawn. First, while several statements made on the House floor clearly pushed implementation in the direction of multiple use, nowhere does the record show that multiple use was to be *maximized consistent with the Act's stated purposes*. Rather, the maximization emphasis was NOAA's interpretation of how it was supposed to implement the Act. One of the early managers of the Sanctuaries Program, Robert Kifer, summarized his understanding of Congress' concept of sanctuaries as follows:

There are areas of the ocean that should be preserved for various purposes and once a purpose has been identified for a given sanctuary, the ensuing regulations should not reach beyond controlling those activities that will interfere or destroy the values of the primary purpose. *Thus, multiple compatible use should be encouraged.*⁷

Kifer's use of “encouraging” rather than “maximizing” multiple use is a subtle but significant difference of emphasis. Encouragement implies support or stimulation of compatible uses, whereas maximization connotes that the agency would permit uses to their fullest extent and assign them the “highest possible importance.”⁸ Even within NOAA, therefore, there can be seen disagreement about what the Act intended regarding multiple use. An alternative interpretation of the House debate record is that while multiple use *could* be allowed, it was not mandated or required to be “maximized,” and therefore was not intended to trump or diminish the Act's preservation and restoration purposes.

Second, NOAA acknowledged that multiple use was constrained by the so-called safeguard provision of the Act which specified that the Secretary had the power to regulate any activities in sanctuaries and that *all uses authorized under other authorities were considered invalid* unless the Secretary took reasoned action to certify them as “consistent” with the purposes of the Act and sanctuary regulations.

⁴39 Fed. Reg. 23254, 23255 (1974).

⁶39 Fed. Reg. 23254, 23255 (emphasis added).

⁷Robert R. Kifer, Comments: NOAA's Marine Sanctuary Program, 2 Coastal Zone Management J. 177, 178 (1975) (emphasis added).

⁸American Heritage Dictionary of the English Language (4th ed. 2000).

This default provision on other uses, when combined with the Secretary's broad regulatory authority over sanctuaries, gave the Secretary complete authority to decide sanctuary uses. As it turned out, the 1974 regulations represented the high-water mark of the Secretary's preservation and protection powers under the Act. Proposals to reduce these powers began appearing as early as 1978 (see below).

As David Tarnas notes, "The conflicts between the agency's multiple-use management approach and the program's goal of preservation" raised "an important controversial issue for the program," one that remains to this day.⁹ NOAA's regulations clearly reflected Congress' own ambiguity about the Program, but leaned toward embedding multiple use. NOAA now deemed the Act's preservation and restoration purposes "primary." Multiple uses were to be maximized consistent with the primary purposes, subject only to the Secretary's power to restrict inconsistent uses. In short, multiple use had been subtly upgraded to being a purpose of the Program, albeit a secondary one.

§ 23:28 First Regulations, 1974—Nomination and Designation Process

The 1972 Act directed Commerce to develop guidelines for designating sanctuaries, but was silent on the number and location of sanctuaries and other details. One of the few clues given about the scope of the Program was Rep. Pelly's remark that sanctuaries are "intended to protect unique areas of the ocean bordering our country," and that most sanctuaries would likely "protect sections of our national seashores."¹ The lack of definitive congressional guidelines for the Program proved to be a significant problem for NOAA, which struggled to invent a coherent and efficient designation process that could survive local pressure from economic interest groups.

NOAA established a loose system whereby any member of the public, as well as government officials, could make nominations.² Only the barest of information on an area was required, and there were no specific standards a nomination had to meet. A nomination was subject to preliminary review by interested agencies to determine *feasibility*, but again no criteria were provided. No mention was made of justifying the need for a designation or showing that it would achieve stated purposes. If a nomination were deemed feasible, a more in-depth study would be made. Among other things, the in-depth study was to include an analysis of "how the sanctuary will impact on the present and potential uses, and how these uses will impact on the primary purpose for which the sanctuary is being considered." If the study were favorable, a Draft Environmental Impact Statement and proposed regulations would be prepared, a public hearing held, and a consultation undertaken with other federal agencies before designation. Finally, the Secretary would designate the area with a clear statement of the sanctuary's purpose, and issue regulations and guidelines for its management. A "revision" of a sanctuary could only be made by the same procedure as the nomination.

The open-ended nature of the nomination process fueled early concern by industry that "overly large areas of the coastal waters" might become marine sanctuaries.³ In responding to this concern, NOAA stated: "It is not expected . . . that large areas of the oceans and coastal waters will be designated as marine sanctuaries, and all activity prohibited or drastically reduced. It is expected that sanctuaries will be only

large enough to permit accomplishment of the purposes specified in the Act.”⁴ Nevertheless, concern about the number and size of marine sanctuaries would soon intensify.

§ 23:29 Designation of U.S.S. Monitor and Key Largo National Marine Sanctuaries

With regulations in place, nominations began to trickle in. Two small sanctuaries were designated by the Ford Administration in 1975, an area one mile in diameter surrounding the wreck of the U.S.S. Monitor off North Carolina, on January 30, and about 75 square nautical miles of threatened coral reefs off Key Largo, Florida, on December 18. Neither of these sites had a major impact on ocean users; hence they drew no significant opposition.¹

The Monitor designation prohibited activities likely to damage the wreck, such as anchoring, salvage, diving, seabed drilling, trawling, or discharging of waste.² The regulations for the Key Largo sanctuary controlled or prohibited uses within the following categories: removal or destruction of natural features and marine life; dredging, filling, excavating and building activities; discharge of refuse and polluting substances; archaeological and historic substances; damage to markers and other signs; fishing; scuba diving and skin diving; operation of watercraft; photography; advertising or publicity; and explosives and dangerous weapons.³ Within the category of fishing, hook and line fishing and some trap fishing was allowed, while poisons, electric charges, and similar methods were prohibited. Additionally, the regulations stated that no more than 20% of the sanctuary would be completely closed to fishing or “set aside as control areas for research.”⁴

§ 23:30 President Carter’s Sanctuary Initiative

Although NOAA had begun review of a few additional sites, the Program was largely dormant until President Jimmy Carter took office. Congress had authorized appropriations of \$10 million per fiscal year for the Program, but the funds were neither requested by the Secretary of Commerce nor appropriated. After seven years of minimal funding from other NOAA sources, the Program finally received a line item appropriation of \$0.5 million in 1979.¹

Shortly after taking office, President Carter significantly raised the Program’s profile. In his 1977 Message to Congress on the Environment, Carter instructed the Secretary of Commerce “to identify possible sanctuaries in areas where development appears imminent, and to begin collecting the data necessary to designate them.”² He also directed the Secretary of the Interior to cooperate with the Secretary of Commerce’s effort in areas where offshore “leasing appears imminent.”³

During Carter’s tenure, the nation was faced with an energy shortage and dwindling commercial fish stocks. Both situations prompted increased congressional

concern for the needs of the oil and fishing industries. The 1973 oil embargo and the 1979 Iran hostage crisis and oil cut-off resulted in significant fuel shortages, which in turn led to a national push for self-sufficiency in oil production. The number of offshore oil and gas leases on the OCS more than doubled between 1972 and 1978.⁴ In 1978, Congress amended the Outer Continental Shelf Lands Act to authorize preparation and implement of a five-year plan for oil and gas leasing, putting the oil industry on a collision course with the fledgling Sanctuaries Program.⁵

The U.S. commercial fishing industry was in crisis due to obsolete technology and the overfishing of stocks. For example, “by 1975, all the major commercial species of the Bering Sea region were considered fully exploited or over-exploited, including the two most abundant species—Pollock and yellowfin sole—as well as King crab and shrimp.”⁶ New England catches also were in decline. The Magnuson Fishery Conservation and Management Act was passed in 1976 to address fish population declines caused in large part by fishing by foreign fishing fleets in U.S. waters. The goals of the Magnuson Act included the phase-out of foreign fishing, expansion of U.S. fleet capacity, and improved management of fish populations under the leadership of newly created regional fishery management councils composed of industry and government representatives. Although the Sanctuaries Act had originally had been advanced by Keith and others as a mechanism for protecting fisheries, fishing interests soon determined that the Act could be a double-edged sword capable of reducing their fishing, as well as protecting fishing grounds from harmful industrial development.

Meanwhile, several marine pollution events continued to highlight the need to protect ocean and estuarine areas. These included kepone contamination of Chesapeake Bay, dolphin die-offs along the New Jersey coast, and sewage washing up on Long Island beaches. There were also two oil tanker spills, one in the Gulf of Mexico and one off of France, which reconfirmed the threat offshore oil operations and tanker traffic posed to the marine environment.⁷

NOAA reorganized in 1977 and transferred the Sanctuaries Program from the Office of Coastal Zone Management to a newly created Office of Ocean Management, whose sole purpose was managing the Program.⁸ In the wake of President Carter’s message, NOAA issued a *Plan to Implement the President’s Mandate to Protect Ocean Areas from the Effects of Development*, solicited sanctuary recommendations, and issued draft site selection criteria by which the nominations would be judged.⁹ By February 1, 1978, 169 nominations had been received, including those for Monterey Bay, Channel Islands, and Point Reyes-Farallon Islands.¹⁰ Forty-five of the nominations were for sites in Alaska, none of which were smaller than 7,550 square nautical miles in size. An additional 100 nominations were submitted by various

Regional Fishery Management Councils, but were withdrawn because two Councils opposed the action.¹¹

§ 23:31 The 1978 Reauthorization

The gush of nominations and NOAA's renewed vigor in proposing candidate sanctuaries brought the Program under scrutiny from the public at large, ocean industries, and Congress. Depending on the area involved, commercial fishing interests or the oil industry viewed the Program as a serious threat and began agitating to limit its scope. Both the House and Senate conducted hearings in 1978 on the Program's reauthorization and reported amendments to the Act, which, though not enacted, set the stage for changes in NOAA's regulations in 1979 and congressional amendments in 1980. Among the issues considered during the 1978 hearings were: the role of public apathy in the dormancy of the Program, multiple use, the effects of designations on extractive industries, who should designate sanctuaries, and the consultative role of the Regional Fishery Management Councils.

§ 23:32 The 1978 Reauthorization—Public Involvement

Influencing the reauthorization debate was an article by two attorneys with the Center for Natural Areas summarizing the history of the Program and analyzing its strengths and weaknesses. The article gained currency on Capitol Hill and was reprinted in full in the Senate Commerce Committee's 1978 reauthorization hearing.¹ Attorneys Michael Blumm and Joel Blumstein concluded that one of the reasons for the Program's dormancy in its first five years was lack of significant public involvement, which in turn was in part due to a lack of clear prescribed standards for assessing whether nominated sites were worthy of designation.² They argued that the lack of standards meant that the public had been disinterested in submitting nominations and distrustful of the designation process.

Attempts by NOAA to regulate current and future uses of particular areas naturally generated both concern and interest among affected agencies and user groups. To deal with concerns that the designation process was flawed because other agencies and parties were not being consulted on the final draft of the designation document, from which they could ascertain its actual effects, the House and Senate reauthorization bills³ required the Secretary to identify in the designation document: the geographic area to be included, the characteristics of the area that give it special value, and the types of activities that would be subject to regulation.⁴ These provisions, explained a House committee report, will provide for the President, other Federal agencies, and the Governor of an effected [sic] State a specific indication of the purposes of a marine sanctuary and the nature of the regulations which will be adopted by the Secretary of Commerce, including all activities which necessarily will be regulated within the marine sanctuary, prior to the designation.⁵

§ 23:33 The 1978 Reauthorization—Multiple Use

¹¹S. Rep. No. 95-886, at 3 (1978).

⁴H.R. Rep. No. 95-1145, pt. 2 (1978).

⁵H.R. Rep. No. 95-1145, at 8.

Blumm and Blumstein applauded the June 1974 regulations' choice of the term "compatible use," opining that it "not only serves to carry out the congressional intent, as expressed in the legislative history of Title III, it also serves to mitigate the concerns of development interests and others for whom the term 'sanctuary' connotes the restriction of all uses."¹

Contrary to the Blumm and Blumstein conclusion that the multiple use debate was totally settled, Sen. Hollings, chairman of the Senate Committee on Commerce, Science, and Transportation, engaged Samuel Bleicher, the director of NOAA's Office of Ocean Management, in a strongly worded debate on the role of multiple-use. Bleicher testified that the goal of the office was:

to help assure that ocean resources are used for the maximum public benefit with minimum conflict among resource uses or environmental damage . . . Nor are marine sanctuaries pristine areas where human uses are severely restricted or excluded. This inference has often been drawn from the term "sanctuary," although the law itself contains no such limitations . . . Inevitably [there will be] multipleuse [sic] areas where even hard mining, and oil and gas development may be allowed in varying degrees.²

Hollings, who had been a member of the congressional conference committee that approved the House version of the 1972 Act, vehemently argued against comprehensive or multiple use activity in sanctuaries, going so far as to say, "we used the word 'sanctuary' and we did not intend it to mean multiple use, or oil and gas development. If we weren't going to protect the environment and its distinctive nature, there wasn't any need to have the sanctuaries."³ Nevertheless, no formal clarification of the Act's purposes or the role of multiple use management emerged from the Senate.

§ 23:34 The 1978 Reauthorization—Safeguard Provision

Also considered during the deliberations of 1978 was the Act's so-called safeguard provision, which enabled the Secretary to regulate uses in sanctuaries permitted under other authorities by treating these uses as *invalid* until the Secretary declared them consistent with sanctuary purposes. No congressional guidance was given in 1972 on the way this power was to be exercised. Did it, for example, mean that upon designation all uses had to cease until ruled on by the Secretary?

Both the House and Senate bills reversed the safeguard provision by providing that "all permits, licenses, and other authorizations issued pursuant to any other authority shall be *valid* unless such [designation] regulations otherwise provide."¹ While in theory the new language still allowed the Secretary to invalidate any permits he chose at the time he designated a sanctuary, the burden of proof had shifted. The Secretary would have to demonstrate why a permit or other authorization was invalid and should be disallowed, rather than which permits were consistent with the sanctuary's purpose and therefore valid.² The possibility was therefore greater that harmful uses could slip through the cracks and be allowed because the Secretary was under-funded, overworked, or had misjudged the impacts of uses. The

precautionary principle, based on taking no action unless it is determined the action would cause minimal or no harm, was therefore reversed.

The Senate Commerce Committee explained its action as follows:

one problem with the original title III is that in designating a sanctuary the Secretary of Commerce automatically and perhaps inadvertently may assume authority to regulate all activities within a sanctuary: all other statutes may be superseded within the designated site. While the committee believes the Secretary should have the authority necessary to regulate activities within a marine sanctuary, it also believes the Secretary should have discretion to select which activities to propose regulating under title III and which one [sic] to propose exempting from this regulation.³

This comment seems to highlight a two-fold Committee concern: that the Secretary had been given authority over all uses and would have to make decisions to return that authority to the pertinent agencies; and that the Secretary had been given power over numerous other authorities, which was viewed as excessive control over other programs. The proposed reversal of the safeguard provision was heavily influenced by concerns that sanctuaries might adversely affect commercial fishermen. Sen. Warren Magnuson (D-WA) went so far as to suggest eliminating altogether the Secretary's power over commercial fishing in sanctuaries.⁴ However, Sen. Ted Stevens (R-AK), who also sought to protect commercial fishing, acknowledged that there are places where fishermen should be "shut out," such as areas of tropical coral where boat anchors could cause damage, and that the Sanctuaries Program should therefore retain some power to regulate fishing.⁵ Under the new Senate proposal, the Secretary could only regulate activities that he declared he needed to regulate at the time a sanctuary was designated.

§ 23:35 The 1978 Reauthorization—Power to Designate

An issue addressed by the Senate, but not the House, was whether the Secretary of Commerce, as provided in the Act, or Congress should formally designate marine sanctuaries. There had been little recorded discussion of why Congress did not retain the designation power for itself when the Act was passed in 1972, as it did for national parks and terrestrial wilderness areas. As the potential scope and impact of the Program became known, some members of Congress became alarmed. Program Director Bleicher testified that he hoped the Marine Sanctuaries Program would designate five sanctuaries during 1978 and a total of 25 to 30 sanctuaries by 1983.¹ Many of these intended sanctuaries were in oil and gas rich areas, such as the Gulf of Mexico and off California and Alaska, or encompassed significant fishing grounds.

The Senate-reported bill would have required all designations larger than 1,000 square nautical miles to be authorized by Congress because large designations involve "major policy issues with wide-ranging environmental and economic implications."² Sen. Stevens was the proponent for this change, modeling the Senate's provision after the Wilderness Act, which requires Congress to designate

all wilderness areas.³ At a May 1978 hearing that preceded the reauthorization hearing, Stevens said he was “disturbed about the size” of many of the nominations, including the 17,000 square nautical miles on George’s Bank, 4,530 square nautical miles around the Channel Islands, and 5,588 square nautical miles off San Diego, all of which paled in comparison to Alaska nominations, which ranged from 7,550 to over 75,000 square nautical miles.⁴ Stevens feared that human uses, particularly commercial fishing, would be prohibited in the sanctuaries even when they were compatible with the purposes for which a sanctuary was designated.⁵ Sen. Harrison Schmitt (R-NM) noted that such large sanctuaries also could shut out oil development.⁶ Sen. Magnuson offered another solution to reign in the Secretary which, though not adopted, ultimately won out in the next Congress.⁷ Magnuson suggested that Congress do “what we have been doing on a lot of the bills, that the Secretary shall report to the Congress [on his intent to designate a sanctuary], and if either House doesn’t disapprove, within a 60 day period, it becomes effective.”⁸

§ 23:36 The 1978 Reauthorization—Consultation by the Regional Fishery Management Councils

A final provision of the Senate bill required NOAA to consult with the Regional Fisheries Management Councils concerning proposed designations.¹ The Councils, almost completely composed of government officials and fishermen, were charged under the Magnuson Fishery Management and Conservation Act with conserving and managing federal fisheries. Stevens raised an amendment to include consultation with the Councils after hearing that the Act “require[d] consultation with the Secretaries of Transportation, Interior and other agencies,” including the Secretary of Commerce.² There was no discussion of Stevens’ proposal, and the committee approved it without objection.

§ 23:37 The 1978 Reauthorization—Conclusion

The 1978 reauthorization bills failed to be enacted “for reasons beyond the control of either authorizing committee.”¹ Many of the ideas developed during hearings, however, remained influential. The problems and ideas raised during the 1978 discussion signaled congressional discontent with the direction of the Program. As the Program picked up interest and momentum, Congress began backpedaling from the preservation purposes they had approved in 1972. NOAA, sensing that the tide had turned, continued to do what it could through the regulatory process to deal with the issues raised in the reauthorization process and implement changes that tracked Congress’ desires.

§ 23:38 Flower Garden Banks Controversy

While the 1979 regulations were in the public comment phase, NOAA published

proposed regulations and a draft environmental impact statement for the Flower Garden Banks marine sanctuary, a 0.6 square nautical mile area of coral reefs about 100 miles off the coasts of Texas and Louisiana.¹ The NOAA proposal included a moratorium on new oil and gas development for five years within the sanctuary, an idea that was vigorously argued against by both industry and the Department of the Interior. In response, Rep. John Breaux (D-LA), a member of the House Merchant Marine and Fisheries Committee, introduced a bill to repeal the Marine Sanctuaries Program title of the MPRSA, citing NOAA's handling of Flower Garden Banks as an example of why the Act should be repealed.² NOAA's proposed oil and gas moratorium was seen by Breaux as "inconsistent with a well-conceived program for increased domestic hydrocarbon development."³ Breaux asserted that the Department of Commerce had failed to look at relevant, authoritative studies about the effects of oil exploration and development and had instead relied on personal communications and unpublished documents in reaching its decision.⁴ Breaux's opposition to the Flower Garden Banks sanctuary led to the stagnation of its designation, until it was removed in 1982 from the list of areas under consideration.

Breaux also criticized the Program because of what he saw as: its redundancy with other authorities "such as that provided by the Outer Continental Shelf Lands Act (OCSLA), the Clean Water Act, and the Fishery Conservation and Management Act (FCMA), among many others;" its failure to provide additional protections to those already available under other laws; its overly broad language that accomplished no goal other than duplicative effort and regulation; and the lack of congressional guidance to guide the Program in a clear direction.⁵ Although Breaux's bill to shut down the entire Program went nowhere, it signaled his role in coming years as one of the most vocal and influential opponents of the Program.

§ 23:39 1979 Regulations

NOAA finalized its new Program regulations in July 1979. The regulations were a significant departure both from the 1974 regulations and from the language and intent of the 1972 Act, in that they gave those with an economic stake in use of sanctuaries' resources significant leverage. As implemented by the 1979 regulations, the Act was no longer viewed as a preservation statute, but rather as a statute that *balanced preservation and human uses* in sanctuaries. Among other things, the regulations reformulated NOAA's approach to uses of sanctuaries; altered the way the Act's safeguard provision was applied; revised the site selection criteria proposed in 1977 to screen nominations; and created a List of Recommended Areas (LRA) from which to select candidate sanctuaries.¹

§ 23:40 1979 Regulations—Program Purposes and Multiple Use

The Program purposes set forth in the 1979 regulations were not all that different

[Section 23:38]

¹Flower Garden Banks Proposed Regulations, 44 Fed. Reg. 22081 (April 13, 1979).

²H.R. 5018, 96th Cong. (1979).

³125 Cong. Rec. 21665 (1979) (statement of Rep. Breaux).

⁴125 Cong. Rec. 21665 (1979).

⁵125 Cong. Rec. 21665 (1979). Despite these vehement objections to the entire program, Breaux was a cosponsor of H.R. 10661 in 1978 and H.R. 2519 in 1979 and voted for H.R. 6616, which contained identical language to H.R. 10661 and H.R. 2519, and whose language was substituted into the Senate bill (S. 1140), which eventually was enacted as the 1980 NMSA Amendments.

[Section 23:39]

¹Announcement of Initial List of Recommended Areas, 44 Fed. Reg. 62552 (Oct. 31, 1979).

from those in the 1974 regulations. NOAA stated that “protection of natural and biological resources” was the primary emphasis of the Program.¹ Although the definition of multiple use was dropped, the concept was very much alive in another guise:

Human activities will be allowed within a designated sanctuary to the extent that such activities are *compatible* with the purposes for which the sanctuary was established, based on an evaluation of whether the *individual or cumulative impacts of such activities may have a significant adverse effect* on the resource value of the sanctuary.²

This language was broad and vague enough to support an array of interpretations as it was applied, but clear enough that in order to exclude uses, NOAA would have to prove likely adverse effects. A big difference between the new compatibility standard and the 1974 definition was that the new standard only restricted uses that may have a “significant adverse” impact, whereas the 1974 multiple use definition called for “long-term, continued uses of . . . resources in such a fashion that one will not interfere with, diminish, or prevent other permitted uses.”³ Whereas the 1974 definition merely required NOAA to show *some level* of interference with, or diminution of, another use in order to disallow a proposed use, the 1979 standard required proof of a *significant, adverse* impact. Under this narrower definition, more uses could be allowed.

The issues of the Act’s redundancy and the appropriateness of oil and gas development within sanctuaries continued to simmer. Industry opposition to NOAA’s proposed blanket bans on oil and gas development at several candidate sites (including Channel Islands, Flower Garden Banks, and Georges Bank) in the late 1970s was so intense that a 1983 article by a NOAA employee in *Coastal Zone Management Journal* suggested that “the controversy provoked by the original proposal [to ban oil and gas in the Channel Islands sanctuary] may effectively ward against future regulatory proposals which impose a blanket prohibition on an individual activity.”⁴

Facilitation of multiple use in sanctuaries also was enhanced by NOAA’s interpretation of the Act’s provision concerning what uses the Secretary could regulate. The 1979 regulations adopted the language of the un-enacted 1978 House and Senate bills, which limited the Secretary’s power of regulation to those activities specifically included in the terms of the designation document.⁵ While this technically left intact the Secretary’s ability to regulate or prohibit any or all uses when a sanctuary was designated, it opened the door to the future erosion of the safeguard by requiring the Secretary to name up front all activities that he wished to regulate. A lack of foresight on the part of the Secretary as to what uses might need regulation or prohibition could lead to damaging delays in protection, because the 1979 regulations specified that the entire time-intensive designation process needed to be repeated in order to amend any of the sanctuary’s terms of designation.

NOAA explained that the new language “clearly provides that compatible activities may take place in a sanctuary . . . [NOAA] does not agree . . . that no human activities should be allowed. NOAA’s interpretation is supported by the legislative

history of the Act.”⁶ NOAA further explained that it saw the change as advantageous “in terms of providing clarity to potential users and, generally, of reduced bureaucracy, in not [restricting uses] unless necessary.”⁷

§ 23:41 1979 Regulations—Site Selection Criteria and the List of Recommended Areas

Another major change in the 1979 regulations was a new set of criteria and procedures for the nomination and designation of sanctuaries. In response to calls for clear standards and more public notification and input, NOAA created a List of Recommended Areas (LRA) to catalog nominated sites that had been selected by NOAA for potential further study.¹ As before, anyone could nominate an area for sanctuary status. NOAA would then screen the nomination and include it on the LRA only if it contained one or more of the following:

1. Important habitat;
2. A marine ecosystem of exceptional productivity;
3. An area of exceptional recreational opportunity relating to its distinctive marine characteristics;
4. Historic or cultural remains of widespread public interest; or
5. Distinctive or fragile ecological or geologic features of exceptional scientific research or educational value.²

The listing of a site on the LRA was a prerequisite to further consideration but not a guarantee it would be designated. While the factors for selecting valid nominations were based on resource protection and preservation, the process of naming areas as “active candidates” was far less singular in purpose. Active candidates were to be chosen based on a number of factors, including:

1. The significance of the site’s resources;
2. *The extent to which the means are available to conduct the required Public Workshop(s) within 6 months of selection as an Active Candidate;*
3. *Severity and imminence of existing or potential threats to the resources including cumulative effect of various human activities that individually may be insignificant;*
4. *The ability of existing regulatory mechanisms to protect the values of the site;*
5. The significance of the area to research opportunities;
6. The value of the area in complementing other areas of significance to public or private programs with similar objectives, such as the CZM programs;
7. The esthetic qualities of the area;
8. *The type and estimated economic value of the natural resources and human uses within the area which may be foregone as a result of marine sanctuary designation, taking into account the economic significance to the nation of such resources and uses and the probable impact on them of regulations designed to achieve the purposes of sanctuary designation; and*
9. The economic benefits to be derived from protecting or enhancing the resources within the sanctuary.³

These requirements undercut the Program’s preservation purpose in several ways.

Even if a site's resources were judged significant, NOAA could avoid responsibility for protecting the area by claiming lack of budget (factor 2) or determining that the area or its resources were able to be protected by other agencies (factor 4), as they did in 1981 with Georges Bank (*see* § 20:42) and subsequently with Norfolk Canyon, Ten Fathom Ledge/Big Rock, and Flower Garden Banks, among others. The 1979 regulations also threatened to turn the designation process into a cost-benefit analysis (factor 8) that explicitly allowed negative economic impacts of a designation potentially to trump the need for protection. While the Act gave broad discretion to the Secretary to determine whether to designate a sanctuary and how to do it, the Act itself made no mention of balancing economic use with preservation or prohibiting the designation of areas that would negatively impact economic uses or benefits. Both the legislative history and the VIMS workshop had raised the balancing concept in the context of multiple use. NOAA's 1979 regulations were the first to implement the concept.

§ 23:42 Controversy over the Act's Purpose and Scope

Concerns raised during the 1978 reauthorization debate about the Sanctuaries Program's purpose and scope continued to percolate. The first LRA was published in October 1979. Although NOAA had reduced the number of recommended sites to 69 from the more than 170 nominations, industry saw the LRA as a threatening blueprint for the Sanctuaries Program, and there was concern that some sites had been nominated solely to stop potential or planned oil and gas development.¹ Additionally, seven sites were identified as active candidates: Flower Garden Banks, Northern Channel Islands and Santa Barbara Island, Monterey Bay, Point Reyes/Farallon Islands, Looe Key, St. Thomas, and Gray's Reef.²

The very end of Carter's presidency saw publication of proposed rules for a 1,258 square nautical mile Channel Islands sanctuary,³ Point Reyes/Farallon Islands sanctuary (later renamed the Gulf of the Farallones),⁴ Looe Key sanctuary,⁵ and Gray's Reef sanctuary,⁶ and the proposed designation of a St. Thomas sanctuary.⁷ Fishing was regulated in Looe Key, where fish traps, spearguns, and poisons were banned and regulations were placed on lobster traps in one area of the sanctuary,⁸ and in Gray's Reef, which required sanctuary permits in order to trawl, use wire fish traps, or explosives.⁹ The proposed Channel Islands regulations prohibited exploration or development on *new* oil and gas leases, and those for the Farallones prohibited *all* oil and gas activity.¹⁰ NOAA's proposed moratorium on new oil and gas exploration in the proposed Flower Garden Banks site also remained

unresolved.¹¹

Between September 1980 and January 1981, when he left office, President Carter designated four sanctuaries: Channel Islands NMS (1,258 nm²) on September 22, 1980, Gulf of the Farallones NMS (948 nm²), Gray's Reef NMS (17 nm²), and Looe Key NMS (5.32 nm² which is now part of the Florida Keys NMS) all on January 16, 1981. Industry uproar led to the new Reagan Administration requiring a regulatory impact analysis before the oil ban provisions of the proposed regulations could become effective. Finally, in March 1982, the final regulations for both Channel Islands and Farallon Islands were issued with the oil and gas prohibitions intact.¹²

At about the same time, NOAA removed Georges Bank from active status. Georges Bank had been elevated to active candidacy a mere two months prior to it being removed. The Conservation Law Foundation and a number of fishing organizations, in response to the offering for the sale of an OCS lease on the Bank by the DOI, had nominated the 15,100 square nautical mile site. NOAA worked out a deal with DOI and EPA that "added a variety of environmental safeguards to protect the Bank."¹³ The safeguards, however, were far less than the protections that NOAA had been touting as necessary.¹⁴ The stated reason given by NOAA for removing the site from active status was that existing management programs were adequately protecting the site's resources. Thus, Georges Bank became the first casualty of the 1979 site selection criteria, particularly the site selection factor concerning the "ability of the existing regulatory framework to protect the resources" and the provision requiring consultation with other agencies.¹⁵ There also is some evidence that the site was removed from active candidacy because President Reagan had indicated that he would not approve the designation.¹⁶ Although temporarily sidetracked, Georges Bank would re-emerge as an active candidate a few years later.

The battles over Georges Bank, Channel Islands, Flower Garden Banks, and Farallon Islands demonstrate how controversial the issues of oil and gas development within marine sanctuaries were, the success of NOAA in influencing policies of other agencies, and the role of multiple use within sanctuaries. The battles also show how the new regulatory designation procedures could be used to excuse inaction by the agency under certain circumstances. Finally, these cases demonstrated the varied power of conservation coalitions. At Channel Islands and Farallon Islands, they defeated the oil industry, but could not keep oil development completely out of Flower Gardens.

§ 23:43 1980 Amendments

With the start of the 96th Congress, and as controversies over sanctuary proposals raged, Congress renewed its attempt to amend the Act. According to Rep. Gerry Studds (D-MA), the "agency has amended its regulations to implement the intended changes [of the failed 1978 bills] as much as possible under existing law, while the

Congress has not yet completed amending the law to require the new regulations.”¹ Studds’ goal was to reconcile the two. The 1978 House bill, as amended by Studds, was the basis for a Senate bill introduced by Sen. Cannon in late 1979 and for Studds’ new bill, introduced in early 1980. A final version of the two bills was enacted in August 1980.²

The 1980 Amendments complemented NOAA’s actions to facilitate multiple uses of sanctuaries and codified several of NOAA’s 1979 regulations. Among other things, the amendments altered the designation process to require that more and earlier information be given about the area under consideration, including the reason for designation, and the types of activities subject to regulation; required any changes to the terms of a designation to go through the lengthy designation process anew; reversed the safeguard provision, making all sanctuary uses authorized under other laws valid unless the Secretary enacted regulations to restrict or prohibit them; and gave Congress the power to formally disapprove of designations.³

§ 23:44 1980 Amendments—Terms of Designation

The 1980 Amendments required any revision of a sanctuary’s designation terms to follow the same process as a new designation. While there was no recorded discussion of the provision by Congress, it seems to address concerns about informing the public, other agencies, and state governors about what a sanctuary would mean to them.¹ Without this requirement, there was a lack of assurance to a party that designation negotiations and compromises would not be disregarded at the last instant by NOAA. The 1980 Amendments, therefore, ensured the continued participation of those consulted for the original designation proposal and helped to increase accountability and accurate expectations. However, by requiring changes to go through the entire process rather than a simplified, shortened version, the provision has been a significant deterrent to changing the terms of designation. The provision has increased public “buy-in” of the Sanctuaries Program, but has also created a disincentive for NOAA to promptly address changes in circumstances or knowledge, because of the expensive and time-consuming process required for any changes to a sanctuary’s designation terms.

§ 23:45 1980 Amendments—Multiple Use and the Safeguard Provision

As the authorizing committees had debated but failed to achieve in 1978, the 1980 Amendments reversed the “safeguard provision” over multiple use, giving other agencies a greater sense of security that their programs would not necessarily be affected by the Secretary of Commerce’s designation of sanctuaries. The provision now read:

The Secretary, after consultation with other interested Federal and State agencies, shall issue necessary and reasonable regulations to implement the terms of the designation and control the activities described in it, *except that all permits, licenses, and other authorizations issued pursuant to any other authority shall be valid unless such regula-*

tions otherwise provide.¹

The House Report on the bill from which the 1980 Amendments were derived emphasized the appropriateness of multiple use, as opposed to more restrictive management methods such as “total management,” and the need to inform people in advance of designation about which uses would be regulated.² The committee also expressed the intent that the Secretary, in carrying out the Program,

avoid duplicative regulatory authority and additional layers of bureaucracy where existing law and regulations provide sufficient protection . . . While current law requires the Secretary to assume authority for total management of marine sanctuaries, the amendment provides for more sophisticated techniques, including multiple-use management, dominant-use management, and partial management.³

Although the committee did not define the various management techniques mentioned, it seems to have meant that, whereas the safeguard provision of the 1972 Act had placed all authority on the Secretary unless he renounced it (total management), the revised safeguard provision allowed him to choose which uses to regulate without having to act to renounce those he wanted to ignore. There were intense interagency fights occurring during this time period, e.g., with regard to anchoring and oil development in the Flower Garden Banks and oil and gas development in Georges Bank. The reversal of the safeguard provision seems to have been viewed as a means of reducing secretarial involvement in other agencies’ decisionmaking, unless warranted by the needs of a particular sanctuary. By reducing the Secretary’s involvement, the committee seemed to view the new provision as reducing the layers of bureaucratic control over marine resources.

§ 23:46 1980 Amendments—Congressional Power of Disapproval

The debate over whether Congress should designate sanctuaries was addressed in 1980 when Congress gave itself the express power to formally object to a designation, as Senator Magnuson had suggested in 1978.¹ If Congress disagreed with a designation, it could pass a joint resolution of disapproval within 60 days of the designation’s publication in the *Federal Register*.² The resolution, however, was still subject to the approval of the President.³ This power went unused and was dropped from the Act in 1992. Apparently, by then, a resolution of disapproval was seen as redundant to Congress’ ability to disapprove or amend sanctuary designations and management plans through traditional legislative procedures.⁴

§ 23:47 1980 Amendments—Conclusion

Once NOAA got down to implementing the 1972 Act, the difficulty of protecting ocean places and regulating conflicting uses became apparent. NOAA proposals to prohibit new oil development in several sanctuaries generated intense controversies on the east, Gulf, and west coasts. Fishermen also quickly came to see the Act as a threat after numerous large areas were nominated. Instead of defending the Act’s

preservation mandate and clarifying the Program's scope and objectives, Congress facilitated multiple uses of sanctuaries and increased oversight of the Program to achieve greater acceptance by users, the public, the states and other agencies. This process of accommodation would continue until the late 1980s.

§ 23:48 1982-83 Further Program Revisions: The Program Development Plan

The 1979 regulations and the LRA, in combination with the 1980 Amendments, failed to quiet controversy. NOAA therefore undertook yet another overhaul of the designation process in an attempt to gain more support for the Program. In January of 1982, NOAA completed a Program Development Plan (PDP) for sanctuaries. "In many ways, the sanctuary program's PDP and emphasis on representative sites, for instance, reflected the most progressive thinking among marine protected area scientists at the time." The PDP, according to another observer, represented "a shift in emphasis from curtailment of activities within a sanctuary by regulation to promotion of sanctuary resources via comprehensive management. The concept of management has been broadened to include research activities, public access, and interpretive programs within sanctuary boundaries."¹ With small modifications, the process set up by the PDP is still in use today.

§ 23:49 1982-83 Further Program Revisions: The Program Development Plan—Program Goals

The PDP declared four goals, which "expand on the [Program's] mission by establishing specific designation purposes":

1. enhancement of resource protection through the implementation of a comprehensive, long-term multiple use management plan tailored to the specific resources;
2. promotion and coordination of research;
3. enhancement of public awareness, understanding, and wise use of the marine environment; and
4. provision for multiple compatible public and private uses of special marine areas.¹

While resource protection "is primary and will be the principle focus in each designated sanctuary," the other goals would not all be emphasized at every site, with a sanctuary perhaps only responding to one or two of the goals.²

§ 23:50 1982-83 Further Program Revisions: The Program Development Plan—Designation

In a further attempt to tighten the nomination process, the PDP replaced the

LRA with a Site Evaluation List (SEL).¹ Under the SEL process, NOAA assigned eight regional resource evaluation teams, one to each fishery management region, “to assist in the identification, evaluation, and recommendation of suitable sites for inclusion.”² After further review, the Secretary would determine which sites to add to the list and publish them in the *Federal Register*.³ Active candidates could only be drawn from the published list.⁴ New sites may be added only at periodic reviews or if new information comes to light about why a site should be included on the SEL.⁵

Each regional team was to recommend three to five sites per region from those nominated by the public or identified by the teams “which represent the most significant marine resource areas in the region.”⁶ More specifically, the teams were:

1. to identify significant marine and coastal ecological processes or features which are characteristic of the region;
2. to delineate discrete sites in which these major systems, processes, or features occur; and
3. to describe these areas in terms of resource and human-use value and potential user impacts.⁷

There is no mention of the teams considering either imminent threats to an area or an area’s importance to particular species or an entire ecosystem. The 1979 regulations had considered the value of a site’s resources, regardless of how representative it was to the biogeographical region of which the site was a part. The PDP, on the other hand, required areas to be identified based on the inclusion of regional characteristic features and processes. While important to ensure coverage of as many regional characteristics as possible in the Program, this meant that sites with resources already represented in other sanctuaries might be disregarded as duplicative.

Site identification criteria employed by the teams to make their recommendations included four categories: (1) natural resource values; (2) human-use values; (3) potential activity impacts; and (4) management concerns.⁸ In considering “management concerns” (criterion 4), the teams were required, “in cases where certain economic values are reduced or foregone,” to weigh the negative economic impact of designation “against the long-term benefits to society.”⁹ While it was consistent with the original preservation intent of the Act to consider the long-term benefits to be conveyed by a sanctuary designation, the PDP’s emphases on considering and weigh-

ing economic impacts, which were acknowledged to be difficult to quantify and estimate, was a far cry from the intent of the 1972 Act's preservation and restoration purposes. Additionally, "several factors . . . complicate the ability to make a concise determination between costs and benefits," including long-term time scales, a black and white "either/or" dichotomy that made it difficult to assess the benefits to some uses of restricting others, and the high potential for incorrect assumptions that led to incorrect economic conclusions.¹⁰

Sites on the SEL must undergo additional scrutiny during an active candidate stage prior to designation. The priority in which they are "selected as active candidates and evaluated by NOAA for possible sanctuary designation . . . involves not only the initial site evaluation [results], but also a balancing of relevant policy considerations including: ecological factors; immediacy of need; timing and practicality; and public comment."¹¹ The open-ended nature of selection, combined with a lack of deadlines, made the process highly susceptible to special interest influence and delay. It was entirely possible that a recommended site might never be studied.

As part of its "ecological factors" analysis to choose active candidates,

NOAA considers a site's contribution to the overall system of national marine sanctuaries. Consideration of representation ensures that the system not only includes sites which adequately represent the diverse coastal, marine and Great Lakes ecosystems in the United States, but also contains the "best" examples among representative sites. A consideration of diversity ensures that the system is illustrative of a variety of ecosystem types Although areas that duplicate existing sanctuaries may be given lower priorities than areas not yet represented, Ray (1975b) notes that "(r)edundancy of sites is important in the establishment of a reserve system and is essential from the genetic and ecological points of view . . . to circumvent loss from natural catastrophes or the inadvertent activities of man."¹²

Consideration of a site's *representativeness* marked the first time that this factor was included in the designation process.

The intent of the SEL was to "resolve weaknesses in the use of the existing LRA," which received recommendations that "are accompanied by limited information on the site and may or may not represent the 'best' candidate for sanctuary consideration."¹³ The SEL specified clear site identification and evaluation criteria, public participation in the pre-designation process, and identification of "significant marine and coastal ecological processes or features which are characteristic of the region."¹⁴

The theory behind the SEL was that it would include the sites with the most important resources, and those in most need of protection, and would provide scientific support for candidate sites. The restrictions on the number of sites that each team could suggest meant that some sites that perhaps should have been included had to be left off the list. Additionally, sites have repeatedly been dropped from the list for financial rather than ecological reasons. Despite intentions in 1989 to update

the list, no sites have been added to the SEL since its creation.¹⁵

The consultation requirements and the detailed list of factors to consider were drafted to ensure that positive and negative impacts of setting an area aside were considered prior to a designation. Required consideration of the factors also resulted in an administrative record to clarify what information NOAA used or why it disregarded or overrode other information while making its decision. These amendments were therefore partly intended to increase the transparency of designation decisionmaking and to ensure that impacts to communities or industries would be considered, though not necessarily directive. It was hoped that such consideration and delineation of basic qualifications would increase public trust in the Program by offering better explanations, e.g., for why oil and gas development were prohibited in some sanctuaries and not others. A hostile administration could also easily use the provisions to hold up designations. This is in fact what happened to the Program.

§ 23:51 Implementing the SEL

The changes in the designation process created by the PDP were formalized in new regulations that were made final in May 1983, two months after the first proposed SEL was published in the *Federal Register* and just as Congress was gearing up for another round of amendments to the NMSA.¹ The regulations formalized the new program goals and the SEL process, including the economic requirements, but dropped reference to weighing impacts of designation against the long-term benefits. The failure to formalize this weighting provision meant that the emphasis on cost-benefit analysis was reduced from what it might have been. This was a minor boost for the preservation purpose of the Act.

While the old designation process had not been popular, the new process garnered vehement opposition in Alaska, particularly from commercial fishermen, when it was learned the evaluation team was thinking of recommending 10 of the 18 sites that had been nominated for the SEL in Alaska, far more than the three to five sites other teams had recommended.² Further exacerbating tensions was the fact that in 1980, 104 million acres of federal land had been set aside for parks, wilderness, and other conservation uses under the Alaska National Interest Lands Conservation Act. The prospect of a perceived “federal takeover” of large areas of ocean waters, too, was enough to make fishermen fight any nominations.³

The fact that the ocean waters past three miles from shore already were federally “owned” was no consolation to fishermen accustomed to enjoying unrestricted access to valuable free resources. The fear that national marine sanctuaries would mean the end of commercial fishing in designated areas had been fed by a mistake on the part of the company hired by NOAA to conduct the regional review: notice to the public asking for nominations and other input to assist the team went out in the middle of fishing season when most fishermen were far out to sea.⁴ Alarm also was expressed by Sen. Stevens⁵ about “the uncanny similarity between the proposed marine sanctuary sites and the [sites on the] five-year OCS lease schedule. . . . It’s

⁴Eugene H. Buck & George H. Siehl, Congressional Research Service, National Marine Sanctuary Program: Regional Site Selection 25-26 (1983).

⁵What is left out of Sen. Stevens’ analysis was that the push for sites in areas up for federal OCS

apparent that the contract review group felt that only areas with strong oil and gas potential were worth consideration as marine sanctuaries.”⁶ On October 29, 1982, in response to pressure from members of Congress from Alaska, NOAA decided to exclude all Alaskan sites from the SEL development process.⁷ The effect of that decision has been, in essence, to exempt Alaska from the Marine Sanctuaries Program on a semi-permanent basis.

Monterey Bay was removed from consideration as an active candidate on December 20, 1983. The area had been nominated by the state of California in 1977 and had been the subject of public meetings and agency studies for six years. NOAA “acknowledge[d] that the Monterey site does have outstanding marine resources” but removed it from further consideration for three reasons: (1) “two other national marine sanctuaries in California (Channel Islands and Point Reyes-Farallon Islands) which protect similar marine resources and the Program’s policy established in 1980 to consider a diverse array of similar marine resources,” (2) “the proposed area’s relatively large size and the surveillance and enforcement burdens this would impose on NOAA,” and (3) “the wealth of existing marine conservation programs already in place in the [proposed] sanctuary area.”⁸ NOAA took the position that this rejection of the Monterey site meant that it would not be *reconsidered* until all other sites on the SEL had been considered.⁹

§ 23:52 1983-84: Renewed Congressional Attacks

Continued controversy over the Program’s scope and site designation terms at places like Flower Garden Banks provided the backdrop for a further dilution of the Act’s preservation purpose in the 1984 reauthorization process. As a result of the receptivity of some Congressmen to the fears of the oil and gas and fishery industries, the opponents of the Program had significantly more power than they had wielded during previous reauthorizations. This was all the more true because Rep. Breaux, who had previously introduced bills to abolish the NMSA, had become chairman in 1979 of the House Subcommittee on Fisheries and Wildlife Conservation and the Environment, which shared jurisdiction over sanctuaries with the Oceanography Subcommittee.

That the Act was in for more change was foreshadowed by the introduction in early 1983 by Rep. Don Young (R-AK) of a bill to delete Title III of the MPRSA in its entirety.¹ Young stated that the Sanctuaries Program was “showing signs of turning into a monster,” and focused on the potential of the NMSA to “disrupt all

leasing came from the Alaskan state government liaison to the resource evaluation team. “Officials of the State of Alaska’s Department of Fish and Game who served as liaison with NOAA/SPD may not have foreseen what would occur if they were intent on determining how the NMSP might be helpful in gaining additional leverage for the State over Federal OCS oil and gas development.” Eugene H. Buck & George H. Siehl, Congressional Research Service, National Marine Sanctuary Program: Regional Site Selection 28 (1983).

⁸Removal of Monterey Bay from Active Candidate Status, 48 Fed. Reg. 56252 (Dec. 20, 1983).

⁹132 Cong. Rec. 31136 (1986) (POM-856 from Legislature of CA).

[Section 23:52]

¹H.R. 1229, 98th Cong. (1983).

maritime activities in the [Exclusive Economic Zone] EEZ.”² He also said that, contrary to the congressional intent of the original bill for “a small system of marine sanctuaries,” numerous areas around the country had been proposed, including 18 sites in Alaska that “would have nearly surrounded Alaska’s coast,” and that “designation of significant numbers of marine sanctuaries, as proposed in the past, could seriously disrupt the continued development of the U.S. fishing industry.”³

The arguments raised by Reps. Breaux and Young could be summarized as: (1) existing laws can provide sufficient protection for the marine environment, therefore the Act is redundant; and (2) the law is so broad and lacking in clear standards and legislative history that it runs the risk of becoming a behemoth, withdrawing large parts of marine territory from oil and gas development or commercial fishing.

§ 23:53 1983-84: Renewed Congressional Attacks—The Charge of Redundancy

Breaux, as Chairman of the House Subcommittee on Fisheries and Wildlife Conservation and the Environment, had commissioned the U.S. Government Accounting Office (GAO) in 1979 to investigate the Act’s redundancy.¹ Ironically, the results of the GAO report were completely contrary to the arguments that Breaux, Young, and others had voiced.

The GAO report, issued in March 1981, concluded that the NMSA

fills “gaps” in Federal regulatory authority affecting the protection of marine resources; that is, it can offer benefits not available under other Federal laws [including the Outer Continental Shelf Lands Act, the Antiquities Act, the Magnuson-Stevens Fishery Conservation and Management Act, the Clean Water Act, the Endangered Species Act, and the Marine Mammal Protection Act]. These include:

- Protecting shipwrecks, marine artifacts, and underwater historical landmarks beyond the territorial sea.
- Protecting coral and coral resources from damage or disturbance (such as might be caused by recreational vessels anchoring on coral reefs).
- Protecting marine life or habitat not protected under wildlife protection laws but [which], because of their unique characteristics or locations, may be deemed worthy of special treatment.
- Protecting ocean waters beyond the territorial sea from the dumping of common trash and other substances not regulated under other laws.²

In addition to providing protection not afforded by other laws, the GAO cited the importance of the NMSA to “comprehensive area management” and in providing for “evaluation of overall impact from all activities in a particular area.”³ U.S. Court of Appeals for the First Circuit reached a similar conclusion, in a decision involving the proposed Georges Bank sanctuary:

While under the Marine Sanctuaries Act the land use options of the Secretary of Commerce are much the same as those of the Secretary of the Interior under the Outer

³U.S. GAO, Marine Sanctuaries Program Offers Environmental Protection and Benefits Other Laws Do Not 7 (1981).

Continental Shelf Lands Act, the management objectives are different. It is thus possible that different environmental hazards would result depending on which program was invoked. Under the latter Act, the emphasis is upon exploitation of oil, gas and other minerals, with, to be sure, all necessary protective controls. Under the Sanctuaries Act, the prime management objectives are conservation, recreation, or ecological or esthetic values. 16 U.S.C. 1432. Drilling and mining may be allowed, but the primary emphasis remains upon the other objects. The marked differences in priorities could lead to different administrative decisions as to whether particular parcels are suitable for oil and gas operations.⁴

The differences between the Outer Continental Shelf Lands Act and the Sanctuaries Act highlighted by the court are applicable between NMSA and other laws that tend to focus on a particular resource or use.

Title III authorizes the only Federal program to comprehensively manage and protect marine areas as units . . . Only under title III may an area of the ocean or other coastal waters be set aside for preservation and the activities in the area be limited to those that are consistent with and compatible to the basic preservation purpose.⁵

§ 23:54 1983-84: Renewed Congressional Attacks—Scope of the Program

The second argument for the abolition of the NMSA, that it risks becoming an unwieldy “monster,” was driven by reactions to the LRA and the SEL, which some saw as blueprints for prohibiting uses of vast areas of the ocean.¹ Representative Young, in introducing his bill to repeal the Act, referred to the danger evidenced by

a private contractor working for [NOAA who] proposed establishing 18 marine sanctuaries off Alaska that would have nearly surrounded Alaska’s coast. Although the Alaska proposal was dropped temporarily, NOAA is continuing to work on numerous sanctuaries throughout the rest of the country. Obviously, instead of looking at discrete areas that might merit some protection, NOAA is interested in creating a huge new Federal enclave, complete with attendant bureaucracy.²

That fear has never become a reality. In the over 30 years of the Program, only 13 sanctuaries have been designated, covering about 0.4% of the U.S. Exclusive Economic Zone, and the restrictions on uses in these sanctuaries are, on the whole, minimal.

§ 23:55 1984 Amendments

Regardless of the questionable validity of the arguments to abolish the Program, Breaux’s new position of power and a Reagan administration that would later be described by many, including Reps. Leon Panetta (D-CA) and Hertel (D-MI), as unsupportive of or hostile to the Program, led to more amendments.¹ Representative Young’s repeal effort did not carry the day, but did influence the ultimate result. The House Committee on Merchant Marine and Fisheries had to resolve divergent

Hertel), 97 (reprinting in full the Marine Sanctuaries Review Team report) (1991).

bills introduced by Young, Breaux, and Norman D'Amours (D-NH).² The Senate bill, which was modeled after the D'Amours bill, was introduced by Sen. Robert Packwood (R-OR) and the bill was ultimately enacted in October 1984.³

The 1984 Amendments to the MPRSA significantly rewrote the law, changing it from an Act focused on preservation and restoration into one arguably equally interested in weighing “resource protection” with human uses.⁴ The continued backslide with regard to the Act’s preservation purpose was due in part to significant concessions won by commercial fishermen and the oil and gas industry: NOAA was limited by the amendments in its ability to regulate these industries’ activities. Among the most significant changes, the amendments altered the Program’s purpose from preservation and restoration to five newly stated purposes; abolished the “safeguard provision” over multiple use by removing the Secretary’s power to prohibit uses previously authorized under other laws; made the SEL the required designation process, with four standards that must be met and nine factors that must be considered prior to designation; required earlier and more thorough notification to the public and Congress of impending designations; gave the Regional Fishery Management Councils the power of drafting fishery regulations for sanctuaries; and enhanced enforcement authorities.

In addition, Congress again considered giving itself the power to designate sanctuaries, but ultimately rejected the idea. Given the intensity of dislike for the NMSA by some of Congress’ leaders, the fact that the Act was not further eroded or terminated can only be credited to the hard work of many Members of Congress and the advocacy of the Center for Environmental Education and Defenders of Wildlife.⁵ Passage of the amendments appears to have been facilitated by language that was ambiguous enough to be considered a gain both by those who supported the Sanctuaries Program’s attempt to protect natural marine resources and by those who were pushing for minimally-restricted or outright appeal of industrial, commercial, and recreational uses of the sanctuaries. Arguably the Program’s supporters could not have done better during these most difficult of years for the Act and should be credited with keeping the Program functioning. Nevertheless, the 1984 Amendments weakened several key areas of the NMSA.

§ 23:56 1984 Amendments—Program Purposes

The 1984 Amendments mimicked the Program’s purposes and policies as stated in the “goals” section of NOAA’s 1983 regulations. The new purposes and policies were:

- to identify areas of the marine environment of special national significance due to their resource or human-use values;
- to provide authority for comprehensive and coordinated conservation and management of these marine areas that will complement existing regulatory authorities;
- to support, promote, and coordinate scientific research on, and monitoring of, the resources of these marine areas;
- to enhance public awareness, understanding, appreciation, and wise use of the marine environment; and
- *to facilitate, to the extent compatible with the primary objective of resource protection, all public and private uses of the resources of these marine areas*

⁴1984 NMSA Amendments.

⁵Telephone Interview with Michael L. Weber, National Marine Sanctuaries Program History (Mar. 11, 2004).

*not prohibited pursuant to other authorities.*¹

All but the first of the new purposes were influenced by NOAA regulations, and the final new purpose was lifted verbatim from Breaux's bill.²

Taken together, the new purposes are very weak: none specify that the primary purpose of the Program is to preserve special marine areas. Preservation is left out entirely, replaced by the fifth purpose's "primary objective of resource protection."³ While the preservation goal was sidelined, multiple use was raised to the forefront with the clear mandate to facilitate all public and private compatible uses.

§ 23:57 1984 Amendments—Abolishment of the Safeguard Provision over Multiple Use

The reauthorization hearings and committee reports gave extensive treatment to the role of multiple use in the Sanctuaries Program. The result was that the 1984 Amendments abolished the safeguard provision over multiple use. Whereas the 1980 Amendments had reversed the safeguard, meaning that all previous authorizations were valid unless the Secretary chose to regulate or prohibit them, the 1984 Amendments no longer allowed the Secretary to prohibit previously authorized uses at all.¹ While the Secretary could *regulate* such uses even if not mentioned in the designation terms, he *could no longer completely protect a sanctuary* from a particular use even if the use was known to be generally detrimental to achieving the purposes for which a sanctuary was designated, unless the designation terms gave him control over the use. The provision provided some assurance to oil and gas leaseholders and fishing permit holders that they would be able to pursue their extractive industries unmolested.

President Carter's designation of the Channel Islands sanctuary, with a prohibition on new oil activity, and the Gulf of the Farallones sanctuary, which prohibited all oil activity, was a loss for the oil and gas industry, which had been defeated by local alliances of conservation groups and fishing interests.² When President Reagan took office in January 1982, he appointed a new head of the agency in which the Sanctuaries Program resided, choosing Peter Tweedt, an official from the DOI's offshore oil drilling office in southern California. At one point, Tweedt confessed to conservationists that his mission was to terminate the Sanctuaries Program.³ Industry now felt comfortable making such statements as the following one it gave in a Senate hearing:

Our association believes it is a splendid idea to preserve the conservational, recreational, ecological, and aesthetic values for which the act was intended. In fact, the evolution of our society, I think, requires consideration of these values. At the same time, we believe it is an equally splendid idea to seek to find new accumulations of oil and gas . . . as a means of sustaining our economy . . . and further, to guarantee our national security . . . we believe we can operate in the marine environment safely without damage to

environmental values.⁴

In view of fierce pressure against the Act, conservation groups sought to keep the Sanctuaries Program alive and to maintain to the extent feasible its preservation objective. Conservationists also had to oppose efforts that would have completely turned the Program into an ocean area multiple use program, as the testimony of Michael Weber, representing the Center for Environmental Education, shows:

Regarding the multiple-use of sanctuary areas, the oil and gas industry, for instance, has consistently maintained that the program has impeded its ability to explore and develop petroleum reserves on the outer continental shelf. Yet what I said to these subcommittees two years ago still holds true. Oil drilling prohibitions resulting from national marine sanctuary designation affect less than one-tenth of one percent of the outer continental shelf. The industry has been very successful in having its concerns addressed in this program. They successfully halted consideration of sanctuary nominations for the Georges Bank, Flower Garden Banks and the Beaufort Sea. In concert with the Department of the Interior, they also succeeded in suspending the oil drilling prohibitions at the two California sanctuaries in a legally questionable manner (CRS) and subjected these prohibitions to a lengthy and expensive regulatory impact analysis. Therefore, we submit that there is very little, if any, actual effect upon the offshore oil and gas industry from the marine sanctuaries program.

The fishing community has also expressed concerns that the designation of a marine sanctuary will preclude them from important fishing areas. Currently only the Looe Key sanctuary regulates commercial fishing to any extent . . . To our knowledge, this prohibition . . . has not proved to be burdensome . . . Similar concerns were expressed by California fishermen when the proposal for two California sanctuaries first surfaced. As they have gained greater experience with the program, these fishermen have become supporters of the program and have recognized it as a means of providing protection of habitat critical to commercial fisheries.⁵

In discussing the purpose of the Sanctuaries Program, House and Senate floor and committee debates fairly consistently stated that the primary goal of sanctuaries is conservation and management of resources to be achieved by *controlling the allowed mix of uses*, despite little congressional consensus or clear direction regarding what uses were compatible. Representative John McKernan (R-ME) agreed with Rep. Breaux that “[w]e have not created another wilderness area system in which man’s activities are to be uniformly excluded. Instead, man’s activities are to be permitted, and in some cases, encouraged in marine sanctuaries to the extent that such activities do not detract from the integrity of the sanctuary.”⁶ Other members of Congress argued that the overriding objective is resource protection and that management should be conducted through multiple use.⁷

Representative Young said that the idea that nothing in the NMSA guarantees the continuation of commercial fishing in a sanctuary—a position expressed by the Secretary—would be seriously disruptive to the continued development of the U.S. fishing industry if, as proposed in the past, significant numbers of sanctuaries were designated.⁸ Representative Barbara Boxer (D-CA) noted that only a miniscule fraction of the OCS had been designated and that she continued to support the “historical emphasis on resource protection by excluding disruptive activities such as oil

and gas development.”⁹ Senator Packwood opined that the interests of a particular user group must never come above conservation of special areas, and that the Secretary must only listen to, but in no way give assurances to, user groups.¹⁰

In addition to Young and Stevens, the fishing community, outraged over the attempted implementation of the SEL in Alaska, also had a champion in Rep. McKernan. McKernan joined the fight over the Program when fishermen in his state became angered by NOAA’s consideration of the Frenchman’s Bay area. “The downeast fishermen believe that a marine sanctuary means another layer of fisheries management. I am convinced that their beliefs are justified because of some loose language that is contained within Title 3.”¹¹ It was this “loose language” and the avoidance of “disrupting on-going programs” with which the 1984 Amendments sought to deal.¹²

In line with its emphasis on multiple use of sanctuaries, Congress wanted to make sure that existing leases, permits, licenses, rights of subsistence use, and rights of access were respected “in recognition of the variety of uses within marine areas.”¹³ As of the 1984 Amendments, the Secretary had the authority to regulate uses authorized by other authorities prior to the date of a sanctuary’s designation, but could not prohibit them.¹⁴ The impact of the provision was to grandfather in certain uses even if they conflicted with resource protection. Again, the focus of the 1984 Amendments was on facilitating uses rather than preserving natural resources and ecosystems.

§ 23:58 1984 Amendments—Changes to the Designation Process

The 1984 Amendments substantially broadened the Act’s guidance on the designation process. The SEL designation process was codified with minor changes in the 1984 Amendments and is the process followed today. Congress added four standards that the Secretary must apply to proceed with the designation process, nine factors to consider, and explained that the required consultations with “interested parties” meant that the Regional Fishery Management Councils must be included.¹ The factors and consultations, like NEPA analyses, only require consideration of the listed elements or stated views/concerns of those consulted with, and do not mandate a particular conclusion.

In order to proceed with a designation, the Secretary was required to determine that “the designation will fulfill the purposes and policies” of the Act by finding that:

- “the area is of special national significance due to its resource or human-use values”;
- “existing State and Federal authorities are inadequate to ensure coordinated and comprehensive conservation and management of the area, including resource protection, scientific research, and public education”;
- “designation of the area as a national marine sanctuary will facilitate the objectives” in (3); and
- “the area is of a size and nature that will permit comprehensive and

[Section 23:58]

¹1984 NMSA Amendments § 303.

coordinated conservation and management.”²

The nine factors required by the amendments to be considered by the Secretary in determining if a site met the above standards were:

- the area’s natural resource and ecological qualities, including its contribution to biological productivity, maintenance of ecologically or commercially important or threatened species or species assemblages, and the biogeographic representation of the site;
- the area’s historical, cultural, archaeological, or paleontological significance;
- the present and potential uses of the area that depend on maintenance of the area’s resources, including commercial and recreational fishing, subsistence uses, other commercial and recreational activities, and research and education;
- the present and potential activities that may adversely affect the factors identified in subparagraphs [(1), (2), and (3)];
- the existing state and federal regulatory and management authorities applicable to the area and the adequacy of those authorities to fulfill the purposes and policies of this title;
- the manageability of the area, including such factors as its size, its ability to be identified as a discrete ecological unit with definable boundaries, its accessibility, and its suitability for monitoring and enforcement activities;
- the public benefits to be derived from sanctuary status, with emphasis on the benefits of long-term protection of nationally significant resources, vital habitats, and resources which generate tourism;
- the negative impacts produced by management restrictions on income-generating activities such as living and nonliving resources development; and
- the socioeconomic effects of sanctuary designation.³

As Senator Packwood noted, citing the Senate report on the bill, “the factors . . . are not themselves standards which must be met, but are only guidelines for the Secretary’s consideration.”⁴ The factors were intended to be considered in combination to help in determining whether the standards are met, and whether the Secretary could therefore make the determination that the designation would accomplish the program’s goals. While these standards and factors provided more guidance than had previously existed on what types of areas Congress considered appropriate for designation, their layered structure, additional undefined terms, and many focuses further entangled the designation process.

§ 23:59 1984 Amendments—Resource Assessment Report

As part of the designation process, the Secretary was required to submit to relevant House and Senate Committees draft regulations and an Environmental Impact Statement, including a Resource Assessment Report “documenting present and potential uses of the area, including commercial and recreational fishing, research and education, minerals and energy development, subsistence uses, and other commercial or recreational uses.”¹ This description of the new reporting requirement was the first time that Congress mentioned energy activities in the Act. While the description did not say that present or potential uses were appropriate in marine sanctuaries, this provision furthered the weighing of resource protection versus

resource extraction by ensuring that an area's use for oil and gas were considered prior to designation.

§ 23:60 1984 Amendments—Size of Sanctuaries

The debate on the appropriate size of a sanctuary, which had waged for years, finally received some direction in the 1984 Amendments. NOAA's Program Development Plan stated, and Reps. Young and Breaux agreed, that the upper size limit should approximate that of the 1,258 square nautical mile Channel Islands NMS.¹ The 1984 Amendments, however, left out such explicit language and merely required designations to be "discrete," and that the Secretary consider the "manageability of the area."² Representative Young in particular was concerned about size limits because one site that had been considered for the SEL was an almost 81,000 square nautical miles area in the Bering Straits. The Senate Committee on Resources "viewed [this] as an unrealistic size for effective conservation and management."³

Representative Walter Jones (D-NC), chairman of the Merchant Marine and Fisheries Committee,⁴ tried to bring reality back into the discussion by emphasizing that "while the broad mandate has led to certain misunderstandings, it has not led, as some have suggested, to widespread misuse. In the program's 10-year history, only six sites have been designated, encompassing 1.5 million acres, or 0.15% of the entire Outer Continental Shelf."⁵ Representative Jones also reminded his colleagues that "[w]hile an area may be too large for comprehensive management, it is also possible that an area may be too small, and therefore, insufficient to control activities affecting sanctuary resources."⁶ According to Jones, "discrete" did not refer to size. Instead, Jones argued that the plain meaning of the word, "constituting a separate entity or individually distinct," was intended. He also stated that the term referred to "ecological considerations and to the stated preference that the sanctuary constitute an ecological unit with clearly definable boundaries."⁷ The Act itself remained silent on what was meant by the term.

§ 23:61 1984 Amendments—Consultations Prior to Designation

The 1984 Amendments clarified that consultations with agencies and other "interested parties" must occur *prior* to a decision to designate. Additionally, the amendments expanded the consultation requirement to include House and Senate committees of jurisdiction and appropriate State and local government entities, Regional Fishery Management Councils, and other interested persons.¹ The 1984 Amendments further involved the Secretary of the Interior in drafting the resource assessment section of the resource assessment report, garnering input on "any commercial or recreational resource uses in the area under consideration that are

subject to the primary jurisdiction of the Department of the Interior.”² In reality, these consultations have meant that the designation process has been held up in negotiations as powerful agencies such as EPA and DOI try to convince NOAA to do their bidding.

§ 23:62 1984 Amendments—Regional Fishery Management Council Drafting of Fishery Regulations

In a move to mollify the concerns of the fishing industry over the impacts of sanctuaries on their freedom to fish where they pleased, the 1984 Amendments required that the Regional Fishery Management Councils have the opportunity to prepare draft fishing regulations for the sanctuaries.¹ The industry had sought to exempt fishing entirely from regulation within sanctuaries but were held in check by conservation groups and their Hill allies.² The regulations “shall be accepted and issued as proposed regulations by the Secretary unless the Secretary finds that the Council’s action fails to fulfill the purposes and policies of this title and the goals and objectives of the proposed designation.”³ The Councils’ role had been raised in Sen. Stevens’ concerns about the 1978 Senate bill.⁴ The heated Alaskan emotions resulting from the SEL debacle apparently led to the return of this provision, which had failed to gain traction during the 1980 Amendments. The fishing industry was the only user group to receive such preferred consultative treatment.

§ 23:63 1984 Amendments—Enhancement of Enforcement Authority and Capability

The 1984 Amendments expanded the enforcement authorities of the Secretary.¹ The amendments allowed the Secretary to make agreements with other federal departments, agencies, and instrumentalities to assist in enforcement of marine sanctuary regulations, on a reimbursable basis. The amendments also established set civil penalties of up to \$50,000 for violating regulations and allowed vessels used in the violation to be held *in rem*, and sold to help pay any penalty assessed. These provisions replaced the Act’s previously vague enforcement authorizations, enhanced the capacity of the Secretary to ensure that law enforcement vessels were enforcing the regulations, and provided a strong financial incentive not to violate the regulations.

§ 23:64 1984 Amendments—Congressional Designation

The one significant provision of Breaux’s bill that was not enacted by the 1984 Amendments would have required Congress, rather than the President, to designate sites based on the Secretary’s recommendations.¹ The reasons given for congressional designation were that all terrestrial special areas are designated by Congress,

Congress would be better able to ensure public participation by holding hearings, and the administration had been stepping away from Congress' intent by looking at potential sites that were too numerous and too large.² Reps. Boxer and D'Amours were the only people to give any recorded response to this provision of the bill. They expressed concern about politicizing the process with greater involvement of Congress, lengthening the designation process by an additional few years, and not adding any new power, given that Congress already had a veto power.³ In any event, the power of designation remained with NOAA.

§ 23:65 1984 Amendments—Conclusion

Program supporters in Congress and the conservation community were successful in preventing the Program's demise with the 1984 Amendments, which were the last push by the Program's critics to abolish it. In summary, the 1984 Amendments focused on expanding the input and consideration of industrial and commercial uses of sanctuaries, while diminishing the preservation purpose to one of "resource protection," and completely dropping reference to restoration. The purpose/policy to facilitate all compatible uses, the abolishment of the safeguard provision by restricting the Secretary's power to prohibit activities, and the required study of the socio-economic impacts that a designation would cause, all led to a further dilution of the preservation goal.¹ The focus of the Program was now linked to a cost-benefit analysis focused on human use and benefit rather than to a precautionary approach of preservation of important areas for their environmental values and characteristics.

§ 23:66 Program Results from 1984-1986

In keeping with the Reagan Administration's desire to scuttle the Program, NOAA's designation efforts were slow and often redundant. The only sanctuary designated during Reagan's eight years was the tiny Fagatele Bay off American Samoa in 1986.¹ The final regulations for the sanctuary prohibited several types of recreational fishing methods and all commercial fishing.²

While there was action taken to study sites such as Ten Fathom Ledge/Big Rock, North Carolina, and Norfolk Canyon, Virginia, results were minimal. In 1986, Norfolk Canyon, which had been studied for designation for years, joined Flower Garden Banks in the Gulf of Mexico (first considered for designation in April 1979) and Cordell Bank, California (declared an active candidate on June 30, 1983) as an active candidate, where it languished until finally withdrawn in 1997 due to financial constraints on the Program.³ Ten Fathom Ledge/Big Rock was studied for active candidacy in 1985, but in 1986 was put back on the SEL waiting list due to a lack of staff time and resources to deal with it.⁴

⁴51 Fed. Reg. 7097 (Feb. 28, 1986).

If there had ever been any doubt about congressional intent on multiple use under the Sanctuaries Act, it was laid to rest during the 15-year period following enactment. Working in tandem, Congress and NOAA changed the direction of the Program by adding new goals and purposes that muddled the new primary purpose of protection, without providing clear requirements on how to assure that protection was actually achieved. The focus on multiple use, discussed by Congress prior to passage in 1972 but first included in implementation by NOAA in the 1974 regulations, enhanced the confusion over the Program's direction. The Act was significantly weakened, but kept from total abolishment, in 1984, when the safeguard over multiple use was all but destroyed by removing the power of the Secretary to terminate existing rights; by granting the fishery management councils unprecedented power through the ability to draft fishing regulations for sanctuaries; by the inclusion of a purpose requiring facilitation of compatible public and private uses; and by the consideration of economic impacts in the decision about whether to designate an area.

Additionally, the provision requiring any changes to the original terms of designation to go through the entire consultation and public input process has acted as a serious deterrent to addressing new problems in the sanctuaries. After the 1984 Amendments, the terms of designation were required to list all uses that might be regulated within the sanctuary. The combination of these two provisions means that sanctuaries are virtually unable to manage uses that the Secretary had not foreseen would be a problem at the time of designation. For example, commercial fishing was often exempted from sanctuary regulation. As more information has become available about the destruction done to seafloor habitats by fishing methods such as bottom trawling, sanctuaries are unable to protect their resources because they are unable to regulate fishing. An attempt to change the terms of designation to allow such regulation would be very time and money consuming, in a program already tight on both. The result has been a reluctance to change the terms of designation once they have been finalized.

As noted in the CRS Report:

The National Marine Sanctuary Program has undergone a complex evolution of both Congressional intent (evidenced in the original Act and subsequent reauthorization and amendment) and Administrative conduct (evidenced in the variety of statements of goals, purposes, mission, and philosophy of this program). Confusion between Congress and the Administration over the operation of the NMSP often is spawned by this complexity. There even appears to be some Administrative confusion over what goals and/or purposes best serve to guide this program.¹

V. REEMPHASIS ON PRESERVATION, 1987-2000

§ 23:68 Background

President Reagan's terms of office, according to David Owen,

may have been the program's nadir. Beset with the active opposition from the administration, the existing programs suffered. Staff positions went unfilled, and critics charged that management programs at existing sanctuaries languished. Funding levels stabilized at the beginning of the Reagan era but then actually declined during his second term. The levels of funding requested by the administration were even lower; Congress repeatedly allocated more money than the administration estimated was necessary. Most discouragingly for program advocates, NOAA designated no new sites other than Fagatele Bay, allowed the designation process for others to stagnate, and

[Section 23:67]

¹Eugene H. Buck & George H. Siehl, Congressional Research Service, National Marine Sanctuary Program: Regional Site Selection 34 (1983).

even removed Monterey Bay from the list of proposed sites.¹

Meanwhile, a series of marine pollution events continued to highlight the need for marine protection. These included algal blooms, mass dolphin deaths, medical waste that washed up on the Atlantic Coast, and the crash of an ore carrier and a car carrier, which resulted in a spill of copper ore and bunker fuel oil adjacent to the Channel Islands NMS.

Of the 29 sites placed on the SEL in 1983, the *only* site that had been designated by 1988 was the tiny Fagatele Bay, a record that Congress called “unacceptable.”² Congressional frustration over the lack of designations led to a new phase of the Program, one in which Congress played an active role in deciding which sites would be designated and under what conditions. Congress even resorted to bypassing the process it had created in order to designate four sanctuaries between 1990 and 1992. Congress amended the Act in 1988, 1992, 1996, and 2000 with the ostensible objective of strengthening the Act’s preservation mission. However, in so doing, it failed to revise the law’s multiple use objectives; thus the impact of the changes has been minimal. Furthermore, with the 2000 Amendments, Congress authorized a temporary moratorium on designation of new sanctuaries until existing ones are better managed and studied, throwing a blanket of uncertainty over the Program.

§ 23:69 The 1988 Amendments

The 1988 reauthorization process clearly reflected the frustration of Congress with the inaction of the Reagan Administration. While the 1988 Amendments did not go so far as to remove any of the troublesome provisions of earlier amendments, they reflected Congress’ renascent interest in the preservation mission of the Program, and gave it a needed jump start.¹ In addition to a number of changes to the management and enforcement provisions of the Act, the 1988 Amendments required the administration to designate four sites and issue prospectuses and studies on six more according to a set timetable.²

A number of bills dealing with various aspects of the Marine Sanctuaries Program were introduced in 1986 and 1987 in both House and Senate. In September 1986 and again in January 1987, Rep. Panetta introduced bills to designate Monterey Bay as a national marine sanctuary.³ In his introductory statement in 1986, Panetta said that the “decision [in 1983] to remove the bay from the list of active candidate sites was at best arbitrary, and at worst misguided. The reasons given by NOAA at the time bore little relationship to the facts involved.”⁴ Panetta listed and rebutted each argument that NOAA had advanced in 1983 as to why Monterey Bay was not suitable for designation: “It should be noted that nowhere in the Marine Sanctuaries Act is it contemplated that geographical distribution would be decisive in determining protection or that a coastline as extensive and varies as California’s

would be limited to the number of potential sanctuaries.”⁵ Panetta also argued that the two existing sanctuaries in California did *not* protect similar resources, as NOAA had claimed; that the exact size would not be determined until designation but would “certainly be smaller than the Channel Islands Sanctuary;” and that the resources of Monterey Bay faced increasing threats from coastal pollution.⁶ Panetta’s bill marked the first time in years that Congress expressed an interest in using its powers to designate areas on its own, bypassing the designation process it had fought so hard to perfect.

In addition to Panetta’s bills, there was a concerted effort by the California state legislature and congressional representatives to restrict oil and gas development off the northern California coast. Concerns about oil development off of California and Massachusetts had helped stimulate the passage of the original Act, yet protections from oil development had only been achieved in the Channel Islands and Gulf of the Farallones sanctuaries; Georges Bank was still entirely unprotected. In 1985, Sen. Cranston introduced legislation to impose an oil and gas leasing moratorium along parts of the California and Massachusetts coast.⁷

In September 1986, the California legislature laid before the U.S. Senate a petition that the northern California coast be “set aside as a marine sanctuary, where extraction of fossil fuels, minerals, and other nonrenewable materials, and the dumping or burning of toxic wastes, are forbidden and the protection of the marine environment and the needs of the commercial and sports fisheries are assured forever.”⁸ Rep. Robert Lagomarsino (R-CA) followed up on this proposal in early 1987 by introducing a bill, to “disallow the Secretary of the Interior from issuing oil and gas leases with respect to a geographical area located in the Pacific Ocean off the coastline of the State of California,” and in late 1987 with the Santa Barbara Channel Protection Act.⁹ The Santa Barbara Channel Protection Act would have established an “environmental protection zone” in which the Secretary of Transportation would establish standards for all vessels, including oil tankers, passing through the area. The bill would also have amended the NMSA to incorporate language similar to that proposed by Rep. Studds in a 1987 bill “to authorize the Secretary of Commerce to recover damages for the injury to or destruction of national marine sanctuary resources” and earmark the recovered damages for sanctuary protection programs.¹⁰ The impetus for the damages provision had been the 1984 groundings of the *Wellwood* in the Key Largo NMS and the *Puerto Rican* very near the Gulf of the Farallones NMS.¹¹ In both cases, legal settlements of \$22 million and \$1.7 million respectively were unavailable to reimburse the Sanctuaries Program for its extensive restoration or response costs, because the monies were required to go into the general Treasury coffers.¹²

Legislation sponsored by Rep. Mike Lowry (D-WA) and Sen. Hollings formed the basis for the Program’s reauthorization in 1988.¹³ The resulting amendments set a time-deadline for NOAA review of candidate sites, created a permit program to regulate special uses of sanctuaries, and mandated designation of four sites and

prospectuses or studies of six more areas.¹⁴

Members of the House and Senate voiced extreme criticism of the administration's management of the Program.

Testimony . . . has demonstrated that program implementation has been unacceptably slow. . . . only one new site covering 163 acres has been designated. Other sites are languishing within NOAA, with no clear indication when critical decisions will be made. . . . A glance at NOAA's Site Evaluation List (SEL) provides further evidence of programmatic atrophy. Of the 29 sites placed on the SEL in 1983, NOAA has not completed consideration of a single site. . . . The Committee considers the Administration's record of considering and designating new sites over the past four years unacceptable. . . . there has been an evident lack of administrative will.¹⁵

My friend from Washington [Rep. Lowry] deserves high praise for recognizing the need to override the intransigence of the NOAA officials who have for too long sought to tear down and destroy the program they were charged with nurturing.¹⁶

I believe this legislation is necessary to provide a renewed sense of direction to our National Marine Sanctuaries Program, particularly with respect to the long-term goal of establishing consistent authority in the conservation and protection of our nationally significant marine resources.¹⁷

§ 23:70 The 1988 Amendments—30-Month Deadline

In an attempt to speed up the seemingly interminable studies of candidate sites, Congress required the Secretary either to issue a notice of designation for a proposed site within 30 months of publishing the notice declaring the site an active candidate, or to publish a notice in the *Federal Register* explaining why no designation notice has been issued.¹ This requirement to act was spurred by the plight of sites such as Cordell bank, Monterey Bay, Georges Bank, and the many others that had been floating in and out of active candidacy for years, often with no notice given as to why they were not designated.

§ 23:71 The 1988 Amendments—Special Use Permits

While multiple use compatible with resource protection had been declared as a purpose of the Act in 1984, “nonetheless, questions of when, to what extent, and under what conditions, public and private uses of sanctuary resources are appropriate have presented a continually difficult issue for sanctuary managers.”¹ The 1988 Amendments established a system of special use permits to regulate access to and use of sanctuary resources. The need for these permits was raised by the increased interest in commercial use of sanctuaries (e.g., recreational diving, whale watching, boat tours) and the failure of NOAA to issue final regulations implementing the 1984 Amendments. Existing regulations only authorized permits for research, education, and salvage activities and left the agency with no clear means of controlling new concessions and other uses not contemplated at the time of designation.²

§ 23:72 The 1988 Amendments—Mandated Designations

Perhaps the most significant provisions of the 1988 Amendments, in terms of the precedent they set, were provisions requiring the Secretary to issue notices of designation, submit prospectuses, and conduct studies of particular sites. The amendments required designation by set dates for Cordell Bank, Flower Garden Banks, Monterey Bay, and the Western Washington Outer Coast.¹ The Secretary also was required to submit a prospectus to Congress on Stellwagen Bank and the Northern Puget Sound, and to conduct studies on the appropriateness for designation of the American Shoal, Sombrero Key, and Alligator Reef within the Florida Keys, and Santa Monica Bay, CA.² Finally, a provision was inserted to require the Secretary to complete a report jointly with the Secretary of Transportation on safety in the Channel Islands NMS, including proposals to prevent and respond to future oil pollution incidents in or affecting the sanctuary.³ “While I feel that it is unfortunate that we, in Congress, must legislate these designations, it is the only way I know that we can move the program along,” said Sen. Hollings.⁴

The California sites had been considered for years, and were highlighted for action in part on Sen. Pete Wilson’s (R-CA) suggestion.⁵ Wilson had identified the three sites as “some of the most critical and important marine habitat off all of California.”⁶ Two of the three had also had long, fruitless experiences mired in the designation process. Monterey Bay, “despite strong public and State governmental support . . . was suspended [as an active candidate] by NOAA in December 1983, without any opportunity for public comment.”⁷ Cordell Bank had been nominated in 1981, made an active candidate in 1983, and been formally proposed for designation in 1987. During the year between its proposal and the enactment of the 1988 Amendments, however, no further action had been taken on the site’s designation. According to Sen. Cranston, the requirement for study of Santa Monica Bay was made due to its extreme popularity as a recreation site and its need for preservation.⁸ “The intent of Congress has been made clear—sensitive marine habitat such as can be found off the coast of California should be protected as a marine sanctuary. If the administration won’t take the initiative, then this responsibility falls to Congress.”⁹

The other sites mentioned by the amendments had all experienced similar inaction. Flower Garden Banks had not been reconsidered as an active candidate since 1983, despite the fact that the Gulf of Mexico Fishery Management Council and the State Department had reversed their earlier objections to designation.¹⁰ Stellwagen Bank, the Washington Outer Coast and Northern Puget Sound had languished on the SEL since 1983, with no sign of action being taken by NOAA.¹¹ It was hoped that the 1988 Amendments would counter the “programmatic atrophy” of

the 1980s.¹²

The House Merchant Marine and Fisheries Committee concluded among other things that the lack of designations had resulted because “the President has not recommended and Congress has not provided adequate funding to support the necessary research, surveys and staffing levels” and “there has been an evident lack of administrative will within NOAA to complete the designation process.”¹³ So, in addition to mandating more sites for study, Congress increased funding authorizations and required that annual budget submissions be divided into Program functions, so that Congress would have a better handle on whether requests were for designation, management or enforcement.¹⁴

§ 23:73 Meeting Designation Deadlines

Regardless of its new deadlines, the Reagan Administration failed to meet the congressional mandate and continued to drag its feet on several of the sites. In May 1989, five months after the deadline set by the 1988 Amendments, President George H.W. Bush designated Cordell Bank, where oil development was a major issue.¹ Despite the House MMFC having heard testimony in 1988 that urged it “to establish a ban on oil and gas development within Cordell Bank, the Committee initially deferred this issue to NOAA.”² The terms of designation, however, only prohibited oil and gas leasing within 13.7 square nautical miles of the 300 square nautical mile sanctuary.³ The draft environmental impact statement had inexplicably not even considered banning oil and gas development within the entire sanctuary. The final environmental impact statement (FEIS) had found that “hydrocarbon exploration, development, and production activities could threaten Sanctuary resources (impacts from seismic exploration, oil discharges from accidental spills including well blow-outs, and on-site discharges of drill cuttings and drilling muds),” but opined that it was not necessary to ban oil and gas in the entire sanctuary at that time.⁴

In response to the FEIS, public comments and a letter from the EPA were submitted “stating that, based on information in the FEIS, a Sanctuary-wide ban on hydrocarbon development appeared to be the environmentally preferable alternative.”⁵ Pressure from conservation organizations and the public and EPA’s contradiction of NOAA’s findings led NOAA to issue a proposed rule to ban oil and gas activities within the rest of the sanctuary, at the same time that it designated the sanctuary with a limited ban.⁶

Congress, unhappy with the additional delays and uncertainty in achieving a complete ban on hydrocarbon development, stepped in again and by statute prohibited exploration, development, or production of oil, natural gas, or minerals in the entire Cordell Bank NMS.⁷ As the Committee on Merchant Marine and Fisheries said in its report on the issue,

In a nation which leads the world in energy consumption and relies on imported oil for

nearly on-half of its supplies, and off the coast of a State that is a leading energy consumer, such decisions cannot be made lightly. However, in the case of Cordell Bank, the Committee has decided it is prudent to “Just Say No.” . . . The Committee believes that leaving the question of oil and gas regulation open-ended sends ambiguous signals to the oil and gas industry.⁸

Of the other required designations, Flower Garden Banks was to have been designated by NOAA by March 31, 1989, yet designation did not occur by NOAA until December 5, 1991.⁹ The moratorium on oil and gas that had been proposed in 1979 was nowhere to be seen in the final designation, which allowed leasing and exploration to continue in some areas of the sanctuary. Monterey Bay was to have been designated by December 31, 1989, but did not see protection until Congress gave up on NOAA and designated it in 1992.¹⁰ The Western Washington Outer Coast, which was to have been designated no later than June 30, 1990, was not designated until 1994 as the Olympic Coast NMS.¹¹ Congress’ attempts to guide the administration proved to be a dismal failure, with NOAA ignoring specific timetables.

§ 23:74 Florida Keys NMS Designation by Congress

The years leading up to the Florida Keys designation had shown the need for urgent action to stem vessel groundings, of which there had been three significant and recent ones, and declines in water quality. Bills to designate the Keys were introduced in November 1989 by Reps. Dante Fascell (D-FL) and Jones, and by Sen. Bob Graham (D-FL) in March 1990.¹ According to Sen. Graham, there was “broad support for this legislation from both commercial users, recreational users, and environmentalists.”² After discussion and amendment, these bills led the way to another Fascell-sponsored measure, which was enacted less than a month later, on November 16, 1990.³

Among its extensive area, the sanctuary incorporated the already existent Key Largo and Looe Key sanctuaries, along with Alligator and Sombrero Reefs, and American Shoal, which Congress had told NOAA to study for designation back in 1988.⁴ The law also:

- codified a Coast Guard “area to be avoided,” directing commercial vessels around rather than over the reef;
- prohibited all mineral and hydrocarbon leasing, exploration, development, and production;
- ordered the Secretary of Commerce to prepare a comprehensive management plan within 30 months, in consultation with appropriate federal, state, and local government authorities, and with the Advisory Council established by the Act;
- established an Advisory Council to assist the Secretary in the development and implementation of the Sanctuary’s comprehensive management plan,

³Florida Keys National Marine Sanctuary and Protection Act, Pub. L. 101-605, 104 Stat. 3089 (1990) [hereinafter Florida Keys National Marine Sanctuary Act].

⁴1988 NMSA Amendments § 206.

- including conclusions on zoning; and
- required the Administrator of the EPA and the Governor of Florida to develop a comprehensive water quality protection program in consultation with the Secretary of Commerce.⁵

The goals of the comprehensive management plan were to:

1. facilitate all public and private uses of the Sanctuary consistent with the primary objective of Sanctuary resource protection;
2. consider temporal and geographic zoning, to ensure protection of Sanctuary resources;
3. incorporate regulations necessary to enforce the elements of the comprehensive water quality program;
4. identify needs for research and establish a long-term ecological monitoring program;
5. identify alternative sources of funding needed to fully implement the plan's provisions and supplement appropriations;
6. ensure coordination and cooperation between Sanctuary managers and other Federal, State, and local authorities with jurisdiction within or adjacent to the Sanctuary; and
7. promote education, among users of the Sanctuary, about coral reef conservation and navigational safety.⁶

The emphasis on the protection of sanctuary resources and the provisions on zoning and long-term ecological monitoring served to focus sanctuary management on preservation rather than multiple uses. As the Wilderness Society said in their letter of support to Sen. Graham, "This legislation charts a course toward real protection for the Florida Keys coral reef resource . . . your legislation may well become a model for future marine designations elsewhere in the United States."⁷ Although Congress had included several innovative provisions, such as the water quality protection program, the Advisory Council, and the concept of zoning, these provisions were specific to the Florida Keys sanctuary. It remained to be seen whether Congress would apply them to the entire Program.⁸

§ 23:75 The 1992 Amendments

By 1992, public support for the Sanctuaries Program had increased. This was in part because of campaigns by conservation groups to highlight the sanctuaries as part of the solution to preventing a repeat of the recent events such as the devastating *Exxon Valdez* oil spill, freighter groundings in the Florida Keys, and two major oil spills off the Olympic Coast.¹ Additionally, biodiversity conservation was a topic of increasing international attention. Stellwagen Bank was threatened by proposals

Booth Gardner of Washington to Secretary of

for a floating casino, sand and gravel mining, and an EPA proposal for a disposal site only 12 miles west of the proposed sanctuary borders.²

Also generating interest were two reports on the Program released prior to the start of the 1992 reauthorization process; both called for substantial change and lauded the Program as necessary and effective at protection.³ The report by G. Carleton Ray and M.G. McCormick-Ray, *A Future for Marine Sanctuaries*, provided fodder for further discussions on the program's scope and goals. The Rays found that the Program suffered from a "lack of sufficient leadership, support, personnel, expertise, and influence, to carry out even its existing statutory mission. That is, the Congress has placed demands on the Program greater than the institution designated to carry them out."⁴ The report also suggested that an emphasis be placed on defining and creating a "'nationally significant' sanctuary system."⁵

On the heels of the Rays' report, NOAA's Assistant Administrator formed the Marine Sanctuaries Review Team to make recommendations on ways to improve the Program. The Review Team issued its report in February 1991.

In general, the panel has concluded that this program affords this Administration a rare opportunity to take important and bold steps to protect and enhance these important parts of our heritage, and in the process, to create a model for the rest of the world of how to respond to this challenge . . .

In the past, NOAA's administration of the Marine Sanctuaries Program has lacked leadership, focus, resources and visibility, and the program has suffered for it. It has generally been treated as the runt of the NOAA litter, receiving only occasional pats on the head as executive and legislative attention was focused on its larger and better endowed siblings.⁶

The Review Team suggested a \$30 million budget, shortening the designation process, creating a clear vision statement, securing representation of all 12 marine biogeographical provinces, implementing comprehensive and coordinated inter-agency management by zoning and other methods, and creating user fees similar to the National Park Service's "Golden Eagle Passport" to help support the Program.⁷ The report rejected calls to change the name of the Program, arguing that no clear and compelling reason existed, and that such a change would cause additional public confusion.⁸

With substantial guidance and interest, the authorizing committees substantially re-wrote the Act. Reps. Hertel and Studds and Sen. John Kerry (D-MA) each introduced sanctuary bills that were relatively similar.⁹ The final language of the public law drew from all of them, but predominantly from the House bills.¹⁰ Among other changes, the 1992 Amendments:

- Added four new program purposes to the five that already existed;
- Allowed for designations to be made when existing state and Federal authorities needed to be *supplemented*, not just when they are *inadequate*;

Commerce, Dec. 31, 1991, re: formal comments on the DEIS for the Olympic Coast NMS) (1992) [hereinafter House Hearing of 1992]; S. Rep. No. 102-411, at 2 (1992) (on S. 2788).

¹⁰1992 NMSA Amendments.

- Required a site's contribution to "maintenance of critical habitat of endangered species" to be one of the factors considered in the study process;
- Required interagency cooperation on activities either within or outside sanctuaries that "are likely to destroy, cause the loss of, or injure any sanctuary resource";
- Required management plan reviews for each sanctuary every five years;
- Granted NOAA authority to create Sanctuary Advisory Councils (SACs) to assist in the management of the sanctuaries, based on the success of the Florida Keys Council; and
- Designated the Hawaiian Islands Humpback Whale, Monterey Bay, and Stellwagen Bank National Marine Sanctuaries.¹¹

The overall direction of the 1992 Amendments can be characterized as a move towards preservation, but again, Congress failed to remove multiple use and other conflicting provisions.

§ 23:76 The 1992 Amendments—Program Purposes

Reflecting a diversity of views in Congress on the purpose of the Program, the amendments revised the 1984 purposes and added four more purposes in an attempt to clarify the intent of the Act.¹ Congress stated that the purpose of the Program is to identify *and designate* areas of special *national significance* (rather than just identifying special areas).² While the purposes of enhancing public awareness and the facilitation of all public and private uses were left intact and unchanged, the four new purposes were:

1. "develop and implement coordinated plans for protection and management of these areas" with appropriate agencies, governments, organizations, and other interests "concerned with the continuing health and resilience of these marine areas";
2. "create models of, and incentives for, ways to conserve and manage these areas";
3. "cooperate with global programs encouraging conservation of marine resources"; and
4. "maintain, restore, and enhance living resources by providing places for species that depend upon these marine areas to survive and propagate."³

The second of the new purposes was a lofty goal that conceivably could allow the Sanctuaries Program to become a guiding light for management of protected marine areas. The inclusion of a provision that authorized the Secretary to create Sanctuary Advisory Councils patterned after the success of the Florida Keys Council is an example of the beneficial way the Program can be used to test innovative management techniques.

The fourth purpose emphasized protection of species' habitats because "protection of these special areas can contribute to maintaining a natural assemblage of living resources for future generations," and because the areas may possess qualities, which give them international significance in addition to national significance.⁴ This provision opened the door (again) to wildlife sanctuaries. NOAA itself had envisioned

wildlife-oriented sanctuaries in its 1974 regulations, but this concept had disappeared in the interim.

§ 23:77 The 1992 Amendments—Expansion of Consulted Parties and NOAA Influence on Other Agencies’ Actions

To ensure implementation of coordinated plans, the amendments included several new consultation requirements. The involvement of the Secretary of Interior in the drafting of the resource assessment report during the consideration for designation was broadened, to include consultation with the Secretaries of Defense and Energy and the Administrator of EPA on “any past, present, or proposed future disposal or discharge of materials in the vicinity of the proposed sanctuary.”¹ The requirement to allow the federal Regional Fishery Management Councils to draft fishing regulations was also broadened, requiring cooperation with other appropriate fishery management authorities such as state and local managers.²

The amendments also made *any Federal agency action* subject to consultation with the Secretary of Commerce, *even if it occurs outside of a sanctuary*, if the action is likely to “destroy, cause the loss of, or injure any sanctuary resource.”³ As part of this consultation, the acting agency must provide the Secretary of Commerce with a written statement describing the action and its potential effects on sanctuary resources and must consider the Secretary of Commerce’s recommended alternatives. If the acting agency decides not to adhere to the Secretary’s recommendations, it must provide a written statement giving reasons for acting otherwise.⁴

The House report added further clarity to the consultation provision, specifying that the term “agency action” is intended to be broadly applied to direct actions, and licenses, permits, and other authorizations issued by federal agencies to third parties. The committee intended “that agency actions encompass all actions that are reasonably likely to affect sanctuary resources while those resources are within sanctuary boundaries, including the cumulative and secondary effects of such actions.”⁵

The committee noted that some sanctuary “resources, such as fish, move in and out of a sanctuary, and thus, may be physically injured or destroyed by lawful activities outside the boundaries of that sanctuary. The [c]ommittee intends that “the prohibition on damaging sanctuary resources” apply to: (1) activities inside sanctuary boundaries affecting sanctuary resources that occur within the boundaries of a sanctuary; and (2) activities outside sanctuary boundaries that affect sanctuary resources while those resources are within the sanctuary.”⁶ Rep. Young explained that “we are not attempting to prohibit activities such as commercial fishing that occur outside of a sanctuary, even though those same fish may be found in the sanctuary.”⁷ While only a power of consultation and not a mandate that any particular action be taken, the review provision was the first time that sanctuaries were given any influence over activities outside their borders.

The 1992 Amendments about interagency consultation and review of agency actions reflected a growing interest in protecting sanctuary resources. Interagency

cooperation was raised at this point in time in part because Rep. Studds, who was chairman of the Subcommittee on Fisheries and Wildlife Conservation and the Environment, was personally engaged in the debate over designating Stellwagen Bank. NOAA had been able to wield little power in fighting a proposed sewage outfall that would discharge only 12 miles west of the proposed Stellwagen Bank sanctuary boundary, or in blocking a potential sand and gravel mining operation within the proposed sanctuary. Another problem was the disposal near Stellwagen Bank of contaminated dredge spoils from the Boston harbor area.⁸ Led by Studds, Congress cited Stellwagen as an example of why NOAA needed a clarified role and more influence in other agencies' actions that might affect sanctuaries.⁹

§ 23:78 The 1992 Amendments—Multiple Use

The Marine Sanctuaries Review Team argued that multiple use, while raised during early NMSA debate, was never adequately explained, “nor were the ambiguities in the concept ever discussed, still less resolved.”¹ Instead of applying an ill-defined multiple use approach, the report suggested using zones to separate areas of strict preservation from areas where various uses can be accommodated.² Ray and Ray argued, similarly, that the sanctuaries can be a model for greater ocean management by providing “replenishment areas” for fisheries, where no fishing is allowed.³

Congressional views on what uses should be allowed in sanctuaries seem to depend primarily on the particular issues affecting a representative's local sanctuary rather than on a coherent national vision for the entire sanctuary system. For example, Rep. Studds was one of the most vocal, frustrated by what he saw as delay tactics to prevent designation of Stellwagen and protect certain private user interests. He was outraged that sand and gravel mining would even be considered in Stellwagen Bank, as habitat protection was part of the very reason for establishing the sanctuary.⁴ Reps. Panetta, Fascell, and Hertel were also frustrated by the administration's delays and its consideration of oil and gas activities in Monterey Bay.⁵ Representative Panetta went so far as to say that he thought oil and gas drilling and sanctuaries were “diametrically opposed to each other.”⁶

The general sense from statements by Congressmen during this time is that there are some uses that are unacceptable in sanctuaries because they risk damaging the resources that were at the heart of designations. While this would be the logical meaning of the Act's purpose of facilitating all *compatible* uses, NOAA had routinely considered allowing potentially damaging uses in sanctuaries during the designation process, e.g., the consideration of sand and gravel mining in Stellwagen and of oil and gas development in Monterey Bay. Despite the numerous pro-protection statements made on the House and Senate floor and in committee reports and hearings, no changes were made to guide NOAA in what uses to allow in sanctuaries. Multiple use remained undefined in the Act and the purpose of facilitating compatible uses remained unchanged. So, too, did the provision allowing Regional Fishery

Management Councils to propose draft fishing regulations in sanctuaries.

§ 23:79 The 1992 Amendments—Management Plan Reviews

Without recorded discussion, Congress included a provision to require sanctuary management plans to be reviewed every five years:

Not more than five years after the date of designation of any national marine sanctuary, and thereafter at intervals not exceeding five years, the Secretary shall evaluate the substantive progress toward implementing the management plan and goals for the sanctuary, especially the effectiveness of site-specific management techniques, and shall revise the management plan and regulations as necessary to fulfill the purposes and policies of this title.¹

The importance of this provision is that it mandates occasional review and updates, but some have questioned the frequency of the reviews:

The requirement for management plan reviews provides flexibility to account for new scientific understandings and management. But, the five year review cycle called for in the Sanctuaries Act means that protections within Sanctuaries are not necessarily long-lasting. In contrast, the Wilderness Act allows for review but does not require it. Similarly, Congress has required that the management plans for National Forests undergo review only once every 10 to 15 years. This builds in a degree of stability to the management plan. It allows enough time for ecosystems to begin showing some response to protections before such protections are reviewed.²

In addition, if a review determines that large changes need to occur, such as to regulate fishing when such power had not been reserved in the designation terms, then the entire process of public review, agency consultation, and development of an environmental impact statement has to be gone through again to implement the change. This suggests that the real problem may be with the Act's provision requiring changes to the designation terms to undergo lengthy review, rather than with the five-year review. However, requiring a review every five years is probably unrealistic given that the time it takes to conduct a review is so lengthy.

§ 23:80 The 1992 Amendments—Sanctuary Advisory Councils

The 1992 Amendments made Sanctuary Advisory Councils optional for all sanctuaries.¹ The SACs were intended to “provide assistance to the Secretary regarding the designation and management of national marine sanctuaries.”² In designating the Florida Keys NMS, Congress had mandated the Secretary to create such a council with 15 members from various interest and conservation groups, to assist in development and implementation of the sanctuary's management plan.³ The 1992 Amendments, however, gave the Secretary complete discretion as to how many members came from which agency or interest group, with no requirement for representation for a particular group.⁴ Additionally, the Councils were removed from the purview of the Federal Advisory Committee Act (FACA) in the hopes of streamlin-

ing their appointment, which had been time-consuming in the Florida Keys.⁵ While exempting the councils from FACA, provisions for “good government,” such as a requirement for public participation, were included in the Sanctuaries Act.⁶

§ 23:81 The 1992 Amendments—Funding for the Program

The reports and testimony before Congress of both the NOAA Marine Sanctuaries Review Team and the Rays highlighted the tremendous problem of the Program’s inadequate funding.¹ As time went on, it became all too apparent that designation and management costs were far greater than those anticipated in 1984. It wasn’t until 1994 that the Program’s authorizations for appropriations again topped \$10 million.² By then, however, there were 12 sanctuaries requiring management, education, and enforcement. The Program was estimated to need over \$30 million just to deal with current sanctuaries, let alone take on the expense of new designations.³ These budgetary constraints had meant that places deemed to be valid “special places” had gone unprotected because of the Program’s budget woes. The removal from active candidacy of Norfolk Canyon in 1997, Ten Fathom/Big Rock in 1986, and Monterey Bay in 1983 were all attributed by NOAA to a lack of adequate funding.⁴

By 1992, Congress was ready to adequately fund the Program. The solution proposed by Sen. Stevens and incorporated into the 1992 Amendments was to increase authorizations and to require the Program’s budget requests to be broken down by category, so that Congress could better track where the money was going.⁵ Whereas Congress had authorized \$5.95 million for the Program in fiscal year (FY) 1992 (down \$60,000 from the previous year), the amendments authorized \$8 million for FY 1993, \$12.5 million for FY 1994, \$15 million for FY 1995, and \$20 million for FY 1996.⁶

§ 23:82 The 1992 Amendments—Additional Provisions of the Amendments

The 1992 Amendments also addressed enforcement and alternate funding sources for the Program.¹ Liability for damage to sanctuaries was declared to be without a cap limiting it to a certain amount.² Liability also was expanded to include interest on response costs and damages and to allow vessels to be seized to help pay any fines levied against an offender.³ To assist with funding the program, Congress created a two-year pilot project to enhance funding for designation and management by creating an official NMS symbol and selling the rights to the symbol to sponsors.⁴ The section on cooperative agreements was also expanded to include more types of

agreements with additional parties, broadening the ability of the Program to receive outside support.⁵

§ 23:83 The 1992 Amendments—New Sanctuaries Designated by Congress in 1992

Perhaps the most important provisions of the 1992 Amendments were those legislatively designating Monterey Bay NMS, the Hawaiian Islands Humpback Whale Sanctuary, and Stellwagen Bank NMS.¹ With these congressional designations and NOAA's designation of Flower Garden Banks by NOAA in January 1992 (in response to a congressional mandate), the area under the control of the Program was *doubled* in size. The new sanctuaries represented resources not previously included in the Program, including humpback and other whales and a submarine canyon, but added only one previously unrepresented biogeographic region.²

As Rep. Hertel noted, Congress intervened in these designations because they were interested in “finalizing the lengthy and tedious designation process where the merits of specific sites are clear and where these sites require immediate management consideration.”³ Before Congress stepped in, the administration had been mired in debate over whether to allow sand and gravel mining in Stellwagen Bank, whether to designate Monterey Bay or once again remove it from active candidacy, and whether to side with NOAA or the Department of Defense on allowing the continued use of the Hawaiian Islands for military training.

Congress protected Stellwagen Bank and Monterey Bay by excluding some of the most pernicious threats. Rep. Studds found that the fact that the DOI

would even consider the possibility of sand and gravel mining in a highly productive marine ecosystem is nothing short of ludicrous. Stellwagen Bank is sand and gravel—mine it, and you destroy the very reason for establishing this sanctuary in the first place . . . This ridiculous debate must be stopped here and now. Government by special interest does not fly in the Commonwealth of Massachusetts—government by the people does.⁴

Congress, distrusting the administration's resolution of mining in Stellwagen Bank, therefore legislatively prohibited sand and gravel mining in the sanctuary, and gave NOAA consultation rights in other agency decisions that *may* (as opposed to the stricter standard of “likely to” provided in the new requirement for interagency consultation) affect sanctuary resources.⁵ Congress also protected Monterey Bay from oil and gas extraction, and mandated cooperative work towards safer vessel transportation in the sanctuary.⁶ However, neither the Monterey Bay nor Stellwagen Bank congressional designations required regulation of commercial fishing, testimony to the power of local fishing constituencies. Thus, it was left up to NOAA to decide whether to regulate fishing in the Monterey Bay designation document and the Stellwagen Bank management plan. In the final designation document for

Monterey Bay, NOAA explicitly chose not to regulate fishing, using this logic:

Fishing is not being regulated as part of the Sanctuary regime and is not included in the Designation Document as an activity subject to future regulation. Fisheries management will remain under the existing jurisdiction of the State of California, NMFS and PFMC. Sanctuary prohibitions that may indirectly affect fishing activities have been written to explicitly exempt aquaculture, kelp harvesting and traditional fishing activities.

Existing fishery management agencies are primarily concerned with the regulation and management of fish stocks for a healthy fishery. In contrast, the sanctuary program has a different and broader mandate under the MPRSA to protect all sanctuary resources on an ecosystem wide basis. Thus, while fishery agencies may be concerned about certain fishing efforts and techniques in relation to fish stock abundance and distribution the Sanctuary program is also concerned about the potential incidental impacts of specific fishery technique on all sanctuary resources including benthic habitats or marine mammals as well as the role the target species plays in the health of the ecosystem. In the case of the Monterey Bay area fish resources are already extensively managed by existing authorities.⁷

NOAA came to a different conclusion about the Program's role in regulating fishing at Stellwagen Bank. Stellwagen Bank's designation document included activities (e.g., discharge of any matter within the sanctuary, operation of any vessel within the sanctuary, and altering the sanctuary's seafloor) within the "scope of regulation" which could be used to restrict fishing.⁸

In its consideration of the Stellwagen Bank proposal, NOAA has identified threats to the Bank environment against which there currently is either insufficient protection or no protection. For example, while NMFS and the New England Fishery Management Council attempt to address concerns of overfishing, the Sanctuary program can play an important supplementary role of protecting habitat and systems upon which fish species rely, without interfering with other regulatory regimes. A primary intent of a national marine sanctuary designation is to fill such existing regulatory gaps, and to enhance the existing regulatory authorities of other agencies. . . .

NOAA/NOS has determined that while the regulatory structure for management of fisheries is adequate, current implementation of that structure is not fully attaining the objectives mandated under MFCMA. The NEFMC and NMFS are currently responding to a Court order to revise the FMP's for groundfish species, so as to design a rebuilding program for those stocks. NOAA/NOS believes this is an appropriate mechanism to address the current problems related to groundfish stocks. In addition, Congress is developing legislation to address this problem. Therefore, NOAA/NOS is neither regulating fishing nor listing fishing as an activity subject to Sanctuary regulation. NOAA/NOS intends to work closely with the NEFMC and NMFS to establish, via the Sanctuary, a broad forum representing multiple sources of possible assistance to the NEFMC and NMFS in the attainment of mutual objectives; and will also work with those entities on the impacts of fishing upon other Sanctuary resources and other Sanctuary users.⁹

The final *management plan* for Stellwagen Bank excluded traditional fishing from regulation.¹⁰ By leaving fishing subject to regulation in the *designation document*, however, NOAA allowed for regulation of fishing to occur merely by amendment of the management plan.

Sen. Daniel Inouye (D-HA) introduced a bill that would have stepped into the inter-agency turf wars between NOAA and the Department of Defense (DOD). The bill would have allowed DOD to continue ongoing activities *as long as* actions were taken to minimize any impact on the whales and would have allowed new DOD

activities *only* if there was no potential for significant adverse impact on humpback whales and their habitat *or* if the Secretary of Commerce exempted such new activities based on consideration of the national interest and the purposes of the sanctuary.¹¹ However, Congress did not adopt the Inouye language, designating the sanctuary but leaving the development of a comprehensive management plan up to the Secretary of Commerce.¹²

What is most clear from the congressional designations of 1992 is that Congress felt that NOAA had failed to properly interpret and implement the Act. All three of the designated sanctuaries were chosen at large sizes, and two were protected from some industrial uses. In designating the largest of the size alternatives for Monterey Bay NMS, Congress essentially disregarded the size issue.¹³ At 4,023 square nautical miles, Monterey Bay was significantly larger than the 1,258 square nautical mile Channel Islands designation, which some in Congress had previously proposed as an upper size limit.

Also evident was the influence of new scientific conclusions on protection of the oceans, and the power of public support for the Program. Rep. Neil Abercrombie (D-HI) received over 5,200 constituent comments in support of the Humpback Whale Sanctuary, and public awareness of the devastation caused by oil spills and freighter groundings led to the change in congressional attitude.¹⁴ The Ray and Ray report had concluded that sanctuary size should “reflect ecosystem properties and the degree of human threat” and that there can be no criteria for an “ultimate size” for the program but that the program must be left flexible or it will be “self-limiting.”¹⁵ Increased public support and scientific backing contributed to the newfound congressional *disinterest* in size limits. Congress was focused on protecting areas from oil spills, freighter groundings, and other threats that had shown how destructive they could be.

§ 23:84 The 1992 Amendments—Natural Diversity

As the amendments to and discussions of the bills leading up to the 1992 Amendments demonstrate, the importance of natural diversity was considered and ultimately rejected for inclusion in the final 1992 Amendments. Rep. Studds’ bill, as introduced, would have added “natural diversity” to the NMSA in the findings, twice in the purposes and policies, and in the factors to be considered for sanctuary designation.¹ All uses of the term were toned down before the bill was passed by the House, and further trimmed by the time it was incorporated into Hertel’s bill. In the end, Studds’ proposed finding was watered down to: “protection of these special areas can contribute to maintaining a *natural assemblage* of living resources for future generations.”² Despite alleged agreement in the committee, all other references to diversity or biogeographic representation were deleted in the final amendments.³

§ 23:85 The 1992 Amendments—Conclusion

In the 1992 Amendments, Congress sought to guide NOAA towards preservation by introducing more terms and more purposes connected with biodiversity and ecosystem health. However, by adding yet more purposes and duties and by leaving in the language about facilitation of all compatible public and private uses, the end result was an Act of greater complexity and diffuse mandates. The fact that Congress found it necessary to designate several sanctuaries and restrict uses that NOAA was unwilling to, was an indicator that the Act was bogged down by contradiction and its multitude of mandates.

§ 23:86 1994: The Designation of the Olympic Coast NMS

The debate over preservation versus multiple use continued with the considerations of the Northwest Straits and the addition of Stetson Bank to the Flower Garden Banks NMS. On May 11, 1994, NOAA designated the Olympic Coast NMS off of Washington State and abutting Olympic National Park.¹ NOAA had placed the site, also known as the Western Washington Outer Coast, on the SEL in 1983.² In 1988, Congress mandated that the sanctuary be designated by June 30, 1990.³ NOAA began public hearings in April 1989. Meanwhile, in 1992, Congress passed the Oceans Act, one provision of which prohibited oil and gas development once the western Washington site was designated.⁴ While the record is silent on the oil and gas prohibition, it is most likely that Congress did not trust NOAA to arrive at a prohibition on its own. When finally designated in 1994 as the Olympic Coast NMS, NOAA's regulations prohibited numerous activities, including hydrocarbon or mineral exploration or development; some types of discharging (but deposit of dredge spoils related to harbor maintenance was allowed); altering the seabed (though damage by uses such as traditional fishing methods was exempted); and airplane over flights below specified altitudes.⁵ In accordance with the 1984 Amendments, existing activities were allowed to continue if permits allowing them were issued prior to the date of the sanctuary's designation.

§ 23:87 The 1996 Amendments

In 1996, the Act was amended again. The changes to the Act's provisions were minor,¹ but the amendments also expanded two sanctuaries and prohibited designation of a third unless Congress expressly allowed it. The amendments expanded the Flower Garden Banks NMS to include Stetson Bank and allowed for expansion of the Hawaiian Islands Humpback Whale Sanctuary to include Kahoolawe Island. Designation of a Northwest Straits (Puget Sound) NMS was prohibited unless

biogeographic region be represented by the national program, a full array of representative ecosystems should be a long-term goal." H.R. Rep. No. 102-565 at 37.

[Section 23:87]

¹The amendments also made permanent the pilot study of the NMS official symbol effective way to increase funding, exempted Sanctuary Advisory Council meetings from the requirement to publish notice in the Federal Register to "streamline the public notification process," and required the Secretary to submit a long-range, comprehensive plan for management, stabilization, preservation, and recovery of artifacts and materials of the U.S.S. Monitor. Pub. L. 104-283, 110 Stat. 3363 (1996) [hereinafter 1996 NMSA Amendments]; H.R. Rep. No. 104-717 at 9 (1996) (on H.R. 3487).

Congress passed a law specifically allowing the area to become a sanctuary.² Rep. Solomon Ortiz (D-TX), Rep. Abercrombie, Rep. Metcalf, and Sen. Patty Murray (D-WA) supported these changes in their respective states in response to constituent desires.

The provision prohibiting a Northwest Straits sanctuary was the result of failure of the local jurisdictions in the Puget Sound area to buy in to the sanctuary process during the eight years that the area had been under consideration as an active candidate. Unlike most of the other marine sanctuaries, the Northwest Straits site is located predominately in state waters. Without local support, the governor might exercise his power under the Act to veto the portion in state waters, thus negating the purpose of designation. The sense in the community and the local government was that local people and institutions were capable of managing the area, and that a sanctuary would only add an extra layer of tension and federal bureaucracy without providing additional benefits. As Brian Calvert, Port Commissioner for the Friday Harbor Port District in San Juan County, testified,

[a]ctive citizens working with local and state governments are the best and more efficient way of managing this resource. The further decisions, rule making and management gets from the place being managed, the less effective it will be and the less involvement you will find from people like me . . . The Federal Government is too blunt an instrument to manage the many sensitive issues needed to maintain water quality, the unique quality of human life, the quality of our economy, the quality of marine habitat and the myriad of other issues which require balance and consideration.³

Sen. Murray echoed these sentiments:

I was concerned that the creation of a NOAA-controlled advisory committee would undermine the very intent of bringing local community members together to consider the resource protection needs of the Northwest Straits in an objective and open forum. Many members of the local communities have serious concerns about the performance of NOAA over the last several years with regard to the proposed sanctuary.⁴

Apparently, just four years after enacting a Sanctuary Advisory Council provision, Congress was beginning to have second thoughts. The SACs had been created to address the very type of concerns expressed by San Juan residents, Sen. Murray and Rep. Metcalf. However, the idea of creating a SAC to assist NOAA with designation and management was now seen as counter-productive, at least in the Northwest Straits, because of public distrust in federal (NOAA) oversight of their local waters. By the amendment, Congress once again was declaring that the NMSA was ineffective at achieving its purpose. As the Northwest Straits decision shows, the presence or absence of local public support can sway a decision about a candidate site.

During House debate on the 1996 Amendments, Rep. Jim Saxton (R-NJ) iterated the Program's purpose as protecting resources "while ensuring the continuation of all compatible public and private uses," and drew a comparison to national parks.⁵ Rep. Sam Farr (D-CA) expanded this, saying that sanctuaries "are not just about conserving resources. They are also about protecting coastal economies, such as our billion dollar tourism industry."⁶ This economic emphasis was echoed a week after Farr's statement by Jeffrey R. Benoit, the Director of the Office of Ocean & Coastal

Resource Management, who testified that the accommodation of multiple uses in sanctuaries encourages recreational use and fosters economic growth and success.⁷ These statements reflect what appears to be another shift in thinking about the Marine Sanctuaries Program: whereas the 1992 Amendments had focused on designating areas that Congress deemed worthy for resource protection, by 1996 a swing back towards the multiple use sensibilities of the 1980s had begun.

§ 23:88 The 2000 Amendments

In 1997, the National Research Council concluded in a report, *Striking a Balance: Improving Stewardship of Marine Areas*, that there is need for a comprehensive regulatory or management framework for current or future activities in federal and state waters or on or under the seabed of the United States.¹ Public polls showed significant awareness of the worsening conditions of our coasts, particularly with respect to pollution and overfishing.² The 1998 International Year of the Ocean heightened this public awareness, capped off by a White House organized National Ocean Conference in Monterey, California, which was attended by President William Clinton, Vice President Albert Gore, several cabinet members and members of Congress, and more than 500 ocean experts.³ Shortly thereafter, President Clinton issued an executive memorandum which included prohibitions on oil and gas exploration or development in any of our National Marine Sanctuaries.⁴

I . . . withdraw from disposition by leasing for a time period without specific expiration those areas of the Outer Continental Shelf currently designated Marine Sanctuaries under the Marine Protection, Research, and Sanctuaries Act . . . Nothing in this withdrawal affects the rights under existing leases in these areas. Each of these withdrawals is subject to revocation by the President in the interest of national security.⁵

In one brief act, Clinton accomplished what Congress and NOAA had been haggling over for more than 25 years. The memorandum did not, however, cover existing leases in the Channel Islands or Flower Garden Banks sanctuaries or those in close proximity to sanctuaries that could have impacts on sanctuary resources.

In 2000, President Clinton issued an executive order to establish a Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve.⁶ NOAA designated the Thunder Bay NMS, primarily known for its historic shipwrecks, in 2000 as the thirteenth sanctuary.⁷

The 2000 Amendments to the Act, led predominately by Rep. Saxton and Sens. John McCain (R-AZ) and Olympia Snowe (R-ME), included significant changes to all aspects of the Act.⁸ Rep. Farr noted that public interest in the oceans remained an important political force, with several polls showing that “more than half of Americans have observed that the conditions of our coasts are worsening, especially

due to pollution and overfishing, and they want us, Members of Congress, to do something about it.”⁹ The 2000 Amendments were Congress’ answer.

Specifically, the 2000 Amendments:

- added a finding on the benefits of sanctuaries to scientific, cultural, and archaeological resources;
- added a ninth purpose “to maintain the natural biological communities in the national marine sanctuaries, and to protect, and where appropriate, restore and enhance natural habitats, populations, and ecological processes”;
- formally established a “system” to encompass all sanctuaries;
- added three new factors to be considered in making new designations: biodiversity, ecological importance, and archaeological, cultural, and historical importance;
- clarified and streamlined designation procedures;
- prohibited new designations unless the Program is determined to have met financial goals;
- enhanced enforcement provisions;
- placed emphasis on the need for long-term monitoring (as opposed to just monitoring) and wise and sustainable use of marine resources; and
- made permanent the trial Marine Sanctuaries Program logo from the 1996 amendments.¹⁰

The amendments also made two exceptions to the new provision that limited designations for financial reasons, authorizing designation of Thunder Bay and the Northwestern Hawaiian Islands sanctuaries.¹¹ Finally, the amendments required the Secretary to establish a Dr. Nancy Foster Scholarship Program to “award graduate education scholarships in oceanography, marine biology or maritime archeology.”¹²

§ 23:89 The 2000 Amendments—Sanctuaries as a System

In 1991, NOAA’s Marine Sanctuaries Review Team had set a vision that

by the year 2000, the National Marine Sanctuaries Program will manage a comprehensive and integrated system of the nation’s most significant marine areas, managed on the basis of ecologically sound, well-researched principles of resource protection and sustainable use and will focus as well on improving public understanding of the nation’s marine heritage and in extending sound marine resource management principles to areas beyond sanctuary boundaries.¹

Twenty-eight years after the Sanctuaries Program was created, Congress declared that the marine sanctuaries constituted components of a system. The Findings stated that management of sanctuaries, as a National Marine Sanctuary System will:

- (A) improve the conservation, understanding, management, and wise and sustainable use of marine resources;
- (B) enhance public awareness, understanding, and appreciation of the marine environment; and
- (C) maintain for future generations the habitat, and ecological services, of the

natural assemblage of living resources that inhabit these areas.²

The new focus on the “system” of national marine sanctuaries has thus far been in name only. “System” implies clear definitions of what a marine sanctuary is, and clear, uniform guidelines about how sanctuaries are supposed to be selected and managed. However, the National Marine Sanctuaries System remains a group of disparately managed parts rather than a cohesive program with a unified vision. Nevertheless, the system concept is important because it heightens the value of individual sanctuaries and points toward a desired future state.

§ 23:90 The 2000 Amendments—Re-emphasis on the Program’s Primary Mandate

Drawing on the 1992 consideration of “natural diversity,” the 2000 Amendments added a new purpose “to maintain the natural biological communities in the national marine sanctuaries, and to protect, and where appropriate, *restore* and enhance natural habitats, populations, and ecological processes,” partially redirecting the Act to its original roots of preservation and restoration.¹ The 2000 Amendments also added more factors to those the Secretary must consider in making future designations. These include: the area’s scientific and monitoring value, the feasibility of employing innovative management approaches, and the value of the area as an addition to the system.² NOAA claimed the provisions “clarify that resource protection includes maintaining the entire ecosystem, including the structure of natural biodiversity and species assemblages and ecological processes.”³ The impact of this reemphasis, however, was severely tempered by the failure to simplify the Program’s purposes or to reduce the emphasis on facilitation of compatible uses. In fact, individual Members of Congress and committee reports all made comments that appear to strengthen the place of multiple use in the Program, rather than to diminish it.⁴

The Senate Committee on Commerce Science and Technology emphasized that the primary purpose is resource protection “while” facilitating all multiple uses, and said that “as a general rule, activities like drilling, mining, dredging, commercial fishing, sport fishing, boating, scuba diving, and marine tourism are generally allowed where practicable.”⁵ In other words, while the primary purpose of a sanctuary is protection, no use is out right prohibited and all may be allowed if they are “practicable” or “compatible.” Sens. McCain and Snowe declared that they saw the strength of the Program to be its emphasis on a “responsible balance” between conservation and compatible multiple uses.⁶ It is unclear why a responsible balance between conservation and compatible multiple uses would be needed if the multiple uses are actually compatible with conservation. These comments highlight one of the greatest weaknesses of the Act: the lack of any definition of what constitutes a

“compatible” activity such as that found in the Refuge Administration Act.⁷

The 2000 Amendments also reflected a division between Congress and the administration. Whereas President Clinton had banned all new oil and gas development in marine sanctuaries as of 1998, congressional statements made during the 2000 reauthorization and amendment process made it clear that many in Congress still felt that use of sanctuaries for oil and gas may be appropriate in some cases.⁸ The 2000 Amendments would have been the appropriate place to finally enact a clear legislated prohibition on oil and gas development in marine sanctuaries, given President Clinton’s stance and the various moratoria then in effect on OCS leasing in significant portions of U.S. coastal waters. Instead, Congress ignored the issue.

§ 23:91 The 2000 Amendments—Funding Constraints on New Sanctuaries

On Earth Day 1999, Rep. Farr said:

We have created national marine sanctuaries, which are essentially national parks in the ocean. We have 12 of those, yet with less than 1% of the funding that we give to our national parks. We have 378 national parks, 155 national forests, but only 12 national marine sanctuaries.¹

Addressing the lack of funding, Congress that year nearly doubled the Program’s budget from roughly \$14 million in FY 1996 to \$26 million in FY 2000, still falling short of the \$30 million identified as necessary in 1991 by the NOAA Review Team and Ray’s reports. Ironically, Rep. Farr said this only a year and a half prior to the 2000 Amendments that essentially banned new sanctuaries for financial reasons.

The 2000 Amendments prevented the designation of new sanctuaries by the Secretary unless he finds that:

- (A) the addition of a new sanctuary will not have a negative impact on the System; and
- (B) sufficient resources were available in the fiscal year in which the finding is made to—
 - i. effectively implement sanctuary management plans for each sanctuary in the System; and
 - ii. complete site characterization studies and inventory known sanctuary resources, including cultural resources, for each sanctuary in the System within 10 years after the date that the finding is made if the resources available for those activities are maintained at the same level for each fiscal year in that 10 year period.²

Although the 2000 Amendments were portrayed as a conservation-minded advance for the NMSA, the moratorium was not desired by most conservation groups involved in the process or by NOAA.³ The moratorium was opposed by the conservation community because it implements a standard that is nearly impossible to meet. The provisions of the moratorium require the Secretary to undertake new burdens, without any new funding, in a program that already stretches its appropriations further than any other resource preservation program.

²2000 NMSA Amendments § 6(f).

³Telephone Interview with Amy Mathews-Amos, National Marine Sanctuaries Act History (Oct. 20, 2003).

The Review Team in its 1991 report had raised the concept of focusing the Program on improving management of existing sanctuaries, rather than continuing to designate additional sanctuaries. By 2000, the idea had gained wide support on the authorizing committees, and was confirmed by a National Academy of Public Administration (NAPA) report, which concluded that

[t]his is probably not the right time to create more sanctuaries. Perhaps if Congress were to increase the budget and the clout of the program dramatically, the program could handle additional sites, but no one is talking about such a step now. Eventually, the program could grow to include more sites. There are only a few small sites along the Atlantic Coast and in the Gulf of Mexico now, and none in Alaska. However, at this point, the program cannot afford to spend its resources on a long, expensive process to add more sites.⁴

Sen. McCain voiced his approval for the restriction by arguing that “by prioritizing our actions over the next few years on making the existing sanctuaries fully operational with education and research programs, a full complement of staff, active public outreach programs, and enforcement we will strengthen the system and help it to reach its full potential.”⁵

Rep. Saxton stated similar sentiments: the “biggest hurdle is inadequate funding for basic management and outreach activities.”⁶ Rep. Saxton contended that NOAA’s concerns about the moratorium were addressed by the provisions that allow new designations if they will not negatively impact management of existing sanctuaries or interfere with the sanctuary resource surveys.⁷

§ 23:92 The 2000 Amendments—Conclusion

The addition of a new purpose of restoring and maintaining natural ecosystems and processes and several other preservation-oriented provisions in the 2000 Amendments was important in highlighting the Act’s preservation goal, but in reality was not much of an advance because of the remaining and numerous non-resource factors and standards that promote multiple use. In addition, the moratorium on growth, other than the approved Northwestern Hawaiian Islands sanctuary, means that the sanctuaries-creation process, imperfect though it is, ground to a halt until Congress chose to restart it, or NOAA as a dedicated administration found a different path.

There have been no legislative changes, amendments, etc. to the National Marine Sanctuaries Act since 2000.

§ 23:93 Steps of National Importance Since the 2000 amendments (2006-2014)

The following are some of the items of national importance to the sanctuary system overall that have taken place since the 2000 amendments, and the last update of this chapter (these were quoted or partly adapted from the NMSA Web site).

2006

The Antiquities Act gives the President authority to protect natural and cultural objects through designation of a national monument. Although this authority has

⁴Center for the Economy and the Environment, Protecting Our National Marine Sanctuaries 34 (2000).

⁵145 Cong. Rec., at S10636.

⁶145 Cong. Rec., at H8413.

⁷145 Cong. Rec., at H8413.

been largely used to protect terrestrial resources, President George W. Bush used it to designate the Papahānaumokuākea Marine National Monument (Presidential Proclamation 8031) on June 15, 2006 (originally called the Northwestern Hawaiian Islands Marine National Monument), making it the largest single conservation area in the history of the country at the time. While Papahānaumokuākea is not a U.S. national marine sanctuary, it is jointly administered by the NMSP (in conjunction with the U.S. Fish and Wildlife Service and the State of Hawaii).

More than three million Americans learn about sanctuaries for the first time from Jean-Michel Cousteau's six-part high definition television Ocean Adventures series on PBS.

2007

On July 29, 2007 NOAA expands the state marine reserves and one of the limited take marine conservation areas in the Channel Islands National Marine Sanctuary to include federal waters out to six nautical miles, making the reserve network the largest network of marine reserves in the continental United States.

A collaborative effort by Stellwagen Bank National Marine Sanctuary staff and partners leads the International Maritime Organization to redirect the Boston shipping lanes to protect endangered whales off the coast of Massachusetts. The shift cuts the risk of vessel collisions with critically endangered right whales by an estimated 58% and all other baleen whales by 81%.

2008

Revised management plans are completed for Monterey Bay, Cordell Bank and Gulf of the Farallones national marine sanctuaries. Changes include the expansion of the Monterey Bay sanctuary to include Davidson Seamount, one of the largest underwater mountains in the U.S.

The fragile marine ecosystems of Papahānaumokuākea Marine National Monument are designated a "Particularly Sensitive Sea Area" (PSSA) in April by the International Maritime Organization. PSSA designation is intended to protect ecologically and culturally significant marine resources from damage by ships while helping keep mariners safe.

2009

On Jan. 6, 2009, President George W. Bush designates Rose Atoll in American Samoa as a marine national monument. The Pacific Islands Region and Fagatele Bay National Marine Sanctuary begin work to develop management strategies for the new monument.

Sanctuary advisory council members across the National Marine Sanctuary System create a national working group and draft an agreement addressing the issue of ocean acidification and the threat it poses to sanctuary resources.

2010

On June 17, 2010, Stellwagen Bank National Marine Sanctuary achieves a major milestone with the release of its final management plan, which will guide the sanctuary's resource protection and conservation efforts over the next five years.

2011

On Nov. 1, 2011, NOAA released the final management plan and environmental assessment for the Olympic Coast National Marine Sanctuary in Washington State.

2012

A new rule prohibiting killing, injuring, touching or disturbing whale sharks and rays is part of the final management plan, regulations and environmental assess-

ment for NOAA's Flower Garden Banks National Marine Sanctuary, was released in April, 2012.

In October 2012, NOAA completed the expansion of Fagatele Bay National Marine Sanctuary by adding five additional discrete geographical areas to the sanctuary, including Rose Atoll. The sanctuary's name was changed to the National Marine Sanctuary of American Samoa, and the multi-year public process also resulted in revised sanctuary regulations and sanctuary management plan. The final management plan will guide sanctuary management over the next five to ten years. The sanctuary's new management plan represents a needed revision of the original 1984 management plan under which the sanctuary used to operate.

2013

In February 2013, NOAA released the final management plan and environmental assessment for Monitor National Marine Sanctuary, based on several years of scientific assessment and public involvement. The plan outlines how the sanctuary will operate over the next five to 10 years. Specifically, it provides a framework for the sanctuary to refine its education and outreach programs; continue restoration and conservation of USS Monitor artifacts; consider possible expansion of the sanctuary's boundaries; and work with the state of North Carolina to strengthen local economies in coastal communities through maritime heritage tourism.

2014

In 2014, the Office of National Marine Sanctuaries released a proposal to expand the boundaries of Gulf of the Farallones (GFNMS) and Cordell Bank (CBNMS) national marine sanctuaries, 2 of 14 sites managed by NOAA, located off north-central California. California Senator Barbara Boxer and former U.S. Rep. Lynn Woolsey, whose district included areas near the sanctuaries, both had introduced legislation several times in Congress between 2004 and 2011 to expand the sanctuaries' boundaries.

In June, President Obama signed a proclamation to increase the size and protections for the existing Pacific Remote Islands Marine National Monument, to six times its current size. This designation may lead to a new national marine sanctuaries.

§ 23:94 An increasing emphasis on history and Underwater Cultural Heritage

NOAA's Maritime Heritage Program was created in 2002, as an initiative of the National Marine Sanctuaries Program. The program focuses on maritime heritage resources within the 14 designated National Marine Sanctuaries and also fosters maritime heritage appreciation throughout the entire nation. The program must comply with the Federal Archaeological Program, which is the collection of laws and regulations that pertain to the protection of historical and archaeological properties on federal and federally managed areas. As we have already noted, the NMSA authorizes the Secretary of Commerce to ". . . designate and manage areas of the marine environment with special national significance due to their conservation, recreational, ecological, historical, scientific, cultural, archaeological, educational or esthetic qualities as National Marine Sanctuaries."

The National Historic Preservation Act, which directs all federal agencies to develop programs to protect historical and archaeological resources, governs this activity.

- NHPA Section 106 requires agencies to consider the potential impacts of their actions, which includes the review of permit applications for projects that may allow the disturbance of the seabed, where archaeological remains may lie.

- NHPA Section 110 requires agencies to actively search for archaeological resources and to assess them for their significance and eligibility for inclusion in the National Register of Historic Places.

Some highlights from this effort to focus on history and heritage listed by the NMSP Web site include:

- In 2008, the Monitor National Marine Sanctuary staff coordinate a scientific expedition in July to investigate three sunken German U-boats off the coast of North Carolina in an area known as the “Graveyard of the Atlantic.” The research mission is the first part of a multi-year project to document several historic shipwrecks lost during World War II’s Battle of the Atlantic.
- Sanctuary marine archaeologists on an expedition in Papahānaumokuākea Marine National Monument locate the remains of the historic 19th-century British whaling ship *Gledstanes* and another unidentified vessel.
- In 2009, continuing the Graveyard of the Atlantic research effort, sanctuary researchers locate and identify the final resting place of the YP-389, a U.S. Navy patrol boat sunk by a German submarine during World War II approximately 20 miles off the coast of Cape Hatteras, N.C.
- In 2010, the whaling shipwreck *Two Brothers* is identified at Papahānaumokuākea Marine National Monument. The *Two Brothers* was a whaler lost in 1823 under the command of Captain George Pollard.
- On Jan. 31, 2011, the wreck of a mid-20th century fishing vessel, representative of a distinctive regional fishing technique, has been listed on the National Register of Historic Places, the nation’s official list of cultural resources worthy of preservation. The *Edna G.* shipwreck site rests within NOAA’s Stellwagen Bank National Marine Sanctuary.
- NOAA’s Office of National Marine Sanctuaries’ Maritime Heritage Program and the University of Hawaii’s Marine Option Program have completed a survey of sunken World War II-era aircraft and shipwrecks along Maui’s southern coast. The two-week survey continues a longstanding collaboration between NOAA and the University of Hawaii in providing students with hands-on training in maritime archaeology surveying techniques.
- On May 20th, 2013, NOAA presented the U.S. Coast Guard a national report that finds 36 sunken vessels scattered across the U.S. seafloor could pose an oil pollution threat to the nation’s coastal and marine resources. Of those, 17 were recommended for further assessment and potential removal of both fuel oil and oil cargo. The sunken vessels are a legacy of more than a century of U.S. commerce and warfare.

§ 23:95 A New Nomination Process

In June 2014, President Obama launched a series of executive actions to increase protections for the ocean, including the establishment of a pathway to new marine sanctuaries. On June 13, 2014, National Oceanic and Atmospheric Administration issued a rule making that “re-establishes the process by which communities may submit applications to have NOAA consider nominations of areas of the marine and Great Lakes environments as national marine sanctuaries.”¹ In response to widespread interest from the public, NOAA launched this new, locally driven sanctuary nomination process, which was developed with input from more than 18,000 public comments. NOAA then invites communities across the nation to “nominate their most treasured places in our marine and Great Lakes waters for consideration as

[Section 23:95]

¹79 Fed. Reg. 33851 (June 12, 2014).

national marine sanctuaries.”²

1. Community Builds a Nomination

Every nomination starts at the community level.

A group of people who care passionately about protecting an area of our nation’s marine or Great Lakes waters comes together to develop a nomination. This consists of gathering key information about the special place they wish to nominate and developing broad community support for the nomination.

2. Community Submits Nomination to NOAA

3. NOAA’s Initial Review

In our initial review, we will look at whether or not the nomination contains enough of the information we need. If the proposal does not meet the basic requirements, NOAA may decline it or send it back to the community for additional information.

4. Taking a Closer Look

A nomination that meets the minimum requirements will move on to the next round of review, where NOAA will take a closer look at all the different factors that make the nominated place a potential candidate for sanctuary designation. Throughout this process, NOAA will work with the community to answer any questions that arise, and NOAA may bring in external reviewers as needed.

5. Nomination Is Accepted

When a nomination successfully passes the review phase, NOAA will notify the community that all the requirements have been met and the nomination has been accepted.

6. Nominated Area Added to Inventory

As mentioned above, NOAA will place successful nominations in an inventory of areas it could consider for potential designation as a national marine sanctuary. NOAA [then] may consider an area added to the inventory for future designation as a national marine sanctuary.

VI. THE UNFILLED PRESERVATION MANDATE

§ 23:96 Background

The NMSA has experienced a complex and turbulent evolution. Having precipitated numerous sanctuary designation battles, suffered stop and go implementation, and been the subject of repeated regulatory and legislative amendments over three decades, how effective has the Act been in achieving its preservation purpose?

Some observers have rightly extolled the successes and potential of the Sanctuaries Program under difficult circumstances.¹ Dave Owen notes the Program has

functioned as a popular and effective limit on oil and gas drilling, particularly along the California coast. It has been similarly effective in protecting other limited areas from selected threats; Stellwagen Bank is intact, unmined and without floating casinos, and the reefs in the Florida Keys are better protected from shipping traffic. All of this protection, moreover, grew out of an uncommon level of bipartisan support and cooperation. The program also offers states a source of pride and communities a potentially defining connection to their surrounding environment. Finally, it has provided a platform for the potential development of future protection schemes.²

Although existing sanctuaries encompass a variety of qualities that make them nationally or internationally significant, they fail to add up to a complete marine preservation system. Moreover, given past experience with the Act’s conflicting and

²Id.

[Section 23:96]

¹Center for the Economy and the Environment, *Protecting Our National Marine Sanctuaries* 34 (2000).

²Dave Owen, *The Disappointing History of the National Marine Sanctuaries Act*, 11 N.Y.U. Env’tl. L.J. 711, 746 (2003).

numerous mandates, there is little likelihood that a sanctuary system that preserves the full array of the nation's unique and representative marine features and resources will be realized under the current law.

§ 23:97 Limited Scope of the Sanctuary System

The scientific consensus is very strong: many of the ocean ecosystems of the U.S. are in dire and worsening condition. At the same time, public support for ocean protection is growing. Is the Sanctuaries Program capable of preserving and restoring ocean ecosystems in timely fashion?

In the 43 years since the Act's passage, 14 sanctuaries have been established that cover approximately 150,000 square nautical miles, as noted in Table 23.1. This area equals nearly 0.4 percent of the nation's EEZ. The sanctuaries range in size from less than one square nautical mile (snm) (Monitor) to 137,792 snm (Papahānaumokuākea Marine National Monument). Most sanctuaries are relatively small, with eight under 1,000 snm. Five sanctuaries are between 1,000 and 4,100 snm in size. The authorized addition of a Northwest Hawaiian Islands Sanctuary of more than 99,500 square nautical miles will increase the size of the current system by seven-fold. But even with this addition, the System would encompass only 3.38% of the U.S. oceans.

Congress has never specified what constitutes an ideal sanctuary system, only that the Act intends to protect special areas that possess national significance. Although NOAA's regional survey teams identified a number of candidate sites in the early 1980s, NOAA has never undertaken a rigorous survey of U.S. ocean waters, similar to the comprehensive wilderness inventories and studies mandated by the Wilderness Act, to determine what marine resource types and areas are adequately protected and which ones merit protection.

§ 23:98 Limited Scope of the Sanctuary System—Resources Missing

Many desirable resources and areas are missing from the system. There are large swaths of the nation's oceans that have no sanctuaries. A look at a map will show blank spaces off many coastal States. No sanctuaries have been designated in the Caribbean or in the North Pacific. There are just three sanctuaries along the entire Atlantic seaboard, one in South Florida, and one in the Gulf of Mexico. On the West Coast, California has four sanctuaries, and Washington one, but Oregon and Alaska have none. Ironically, even Georges Bank, the area Rep. Keith set out to protect when he introduced sanctuary legislation in 1967, is missing from the system. Furthermore, only half of the 12 marine biotic regions identified by Ray and Ray are represented in existing sanctuaries, as noted in Table 23.2.

Another example of the system's incompleteness is its inadequate coverage of both endangered and commercially valuable species. In its 1974 regulations, NOAA identified preserving genetic resources, including spawning and nursery grounds and migratory pathways, as one purpose of a sanctuary designation and NOAA reconfirmed this in 1988.¹ Congress agreed with NOAA, and in 1992 added as a purpose of the Act: "to maintain, restore, and enhance living resources by providing places for species that depend upon these marine areas to survive and propagate."² In the 2000 Amendments, Congress declared that one of the purposes of the Act is "to maintain the natural biological communities in the national marine sanctuaries,

[Section 23:98]

¹39 Fed. Reg. 23254, 23255 (§ 922.10(a)); Marine Sanctuary Program Final Regulations, 53 Fed. Reg. 43802 (Oct. 28, 1988) (§ 922.1(c)(1)).

²2000 NMSA Amendments § 2101(b).

and to protect, and where appropriate, restore and enhance natural habitats, populations, and ecological processes.”³ The Act further specifies that among the factors to be considered in creating a sanctuary are “maintenance of ecologically or commercially important or threatened species or species assemblages, maintenance of critical habitat of endangered species, and the biogeographic representation of the site.”⁴

There are currently 21 domestic marine species listed as endangered and 13 as threatened, as listed in Table 23.3. There has been no comprehensive assessment by NOAA of what or how many endangered marine species and critical habitats are encompassed in sanctuaries, or what additional sanctuaries are needed to help conserve these species. Regarding commercial species, although the Act has been used to protect ocean areas from oil development and pollution, it has not been used to protect fisheries stocks from overfishing or uniformly applied to protect sanctuary bottom habitats from destruction by commercial fishermen. For example, bottom trawling, the most environmentally destructive method of commercial fishing,⁵ is allowed in Stellwagen Bank and Monterey Bay sanctuaries, but banned in other sanctuaries.

§ 23:99 Limited Scope of the Sanctuary System—What Does Protection Mean?

The Turnstone Group notes that no sanctuary has been set aside as a “fully protected area.”¹ As defined by the Turnstone Group, a fully protected area means an area designated based on its “importance to ecosystem structure, function or process or their esthetic or other values,” and in which all extractive or potentially disruptive activities are prohibited, resource protection is the singular goal, and protection is permanent.² Fully protected zones or sub-areas have been created in two sanctuaries (Florida Keys, Fagatele Bay) and proposed in a third (Channel Islands).³ All or large portions of the northwest Hawaiian Islands also will qualify as fully protected zones when the designation process is complete.⁴ While it is conceivable the Act could be used to establish sanctuaries whose sole purpose is full protection, the Act has never been used this way.

The Act’s purpose of facilitating all uses means that resource conflicts within sanctuaries are common. Generally, it is against the law to “destroy, cause the loss of, or injure any sanctuary resource managed under law or regulations.”⁵ However, the prohibition on destruction of managed resources applies only to resources identified in individual sanctuary designation documents as the subject of protection. In addition, the designation document, as implemented by the management plan, determines which uses or activities shall be subject to regulations. Uses not listed

⁵National Marine Sanctuaries Act § 1436(1).

are not subject to regulation, and thus can only be addressed post a loss, injury or destruction. For example, NOAA's management plan for Stellwagen expressly excludes fishing as subject to the regulation that prohibits altering the sanctuary seabed,⁶ despite research that NAPA says "has documented how bottom-trawling has leveled the seabed at Stellwagen and stripped vegetation."⁷

The Hawaiian Islands Humpback Whale Sanctuary, established primarily for research and education about humpback whales, does not regulate fishing in the sanctuary, even though "overfishing of bottom fish . . . and live capture of reef fish for the pet trade have depleted stocks sharply."⁸ Flower Garden Banks, a relatively small sanctuary set in an oil producing area, prohibits oil and gas development in some areas of the sanctuary but not others.⁹

According to the Turnstone Group,

Even when a sanctuary does prohibit activities in general, there are often exceptions for specific and often significant exceptions.

Some of these exceptions are minor but others substantially weaken protection. For instance, most sanctuaries prohibit discharge or deposit of materials in sanctuary waters, but include exceptions for minor activities such as discharge of deck washdown water. However, Monterey Bay and Gulf of the Farallones . . . include exceptions for disposing of dredge material and the Farallones provides an exception for the discharge of sewage. The Flower Garden Banks prohibits the use of explosives but then gives an exception to the use of explosives for oil and gas exploration.¹⁰

While one may determine what resources are being protected at each sanctuary by consulting the designation document or the current *Code of Federal Regulations*, it is more difficult to determine the status and trend of any particular resource because NOAA has not developed baseline information or effective monitoring programs.¹¹ Today, few sanctuaries can report with much specificity how their resources are faring based on objective measures.

§ 23:100 Limited Scope of the Sanctuary System—Oil Development and Commercial Fishing

Two of the biggest threats to sanctuary resources, oil development and commercial fishing, have proved flashpoints in sanctuary designations throughout the Act's history. As things have turned out, new oil development has been prohibited in the sanctuaries system, at least for the moment. Although there were assertions when the Act passed and afterwards that oil development could be a compatible use of a sanctuary, a number of sanctuaries specifically prohibited new oil and gas development at the time they were designated by NOAA (e.g., Channel Islands, Gulf of the Farallones) or by Congress (e.g., Monterey Bay, Cordell Bank). In fact, it was the desire of local citizens to exclude oil from their shores that impelled the creation of sanctuaries such as Monterey Bay and Channel Islands.

More recently, President Clinton issued an executive memorandum to the Secre-

tary of the Interior in 1998 that extended until June 30, 2012 the prohibition on the granting of new oil and gas leases in all sanctuaries, but the issue of oil development is by no means settled.¹ The Clinton memorandum can be rescinded by a succeeding president. Congress can also intervene, as it did in 2003, when a provision was included in the energy bill to allow exploration for oil throughout the entire Outer Continental Shelf, including in marine sanctuaries.² The measure was passed by the Senate, but rejected by the House due to heavy opposition by members of Congress from coastal states. Energy development on the OCS remains an issue of public debate as it has from the time the Sanctuaries Act was passed.

Since 1972, commercial overfishing has caused severe population declines of many commercial fish species. Depleted populations include New England cod, snapper-grouper reef fish in the South Atlantic and Gulf of Mexico, various species of rockfish and the nearly extinct white abalone along the Pacific Coast, and rock lobster in Hawaii. According to NOAA, 86 populations in the U.S. are classified as overfished.³ Populations of depleted stocks are found in many sanctuaries, but most sanctuaries do not prevent or regulate the taking of fish commercially or recreationally except in a few closed areas. Furthermore, seven sanctuaries allow fishing by bottom trawl in all or a portion of their waters. Bottom trawling is known to cause extensive damage to structurally complex seafloor habitats, thereby reducing habitat complexity and “potentially altering the productivity of fish communities that depend on seafloor habitats for food and refuge.”⁴ Clearly, commercial fishing has had and continues to have significant negative impacts on sanctuary environments, as well as detracting other uses such as recreational fishing and diving.

Sanctuary staff of the National Ocean Service, the NOAA bureau with responsibility for management of the Sanctuaries Program, candidly admit, “We don’t do fish,” meaning that they leave commercial and recreational fisheries management in federal waters to their sister bureau, the National Marine Fisheries Service (NMFS), and the Regional Fishery Management Councils.⁵ This attitude is derived from the Act’s provision requiring the Secretary to give the appropriate Council “the opportunity to prepare draft regulations for fishing within the Exclusive Economic Zone as the Council may deem necessary to implement the proposed designation.”⁶ The draft regulations must be guided by the national standards that implement the Magnuson-Stevens Act, the law under which federal fisheries are managed primarily for exploitation.⁷ The Secretary must accept Council recommendations unless the Council action “fails to fulfill the purpose and policies . . . [of the Act] and the goals and objectives of the proposed designation.”⁸ If the Secretary rejects the Council-proposed regulations or the Council fails to submit regulations or to submit them in

⁸National Marine Sanctuaries Act § 1434(a)(5).

a timely manner, the Secretary must prepare the regulations.⁹ Although the Sanctuaries Act technically gives the Secretary the power to object to a Council recommendation that would harm sanctuary resources, the Act, notes the Turnstone Group,

puts the burden on the Secretary to show why the regulations from Councils (that are generally less protective and more interested in resource exploitation) are incompatible with the goals and objectives of a sanctuaries designation. Given the multiple-use standard in the Sanctuaries Act, this finding is a difficult one to make. To our knowledge, this provision has never been used [by the Secretary] to protect Sanctuary resources from the effects of fishing.¹⁰

In addition, secretarial action to protect fish in sanctuaries is constrained by the Secretary's conflicting responsibilities. The National Ocean Service manages sanctuaries, and the NMFS manages fisheries, and both bureaus are within the Department of Commerce. According to the Turnstone Group, conflicts between the two bureaus typically "get resolved in favor of . . . [the fisheries service] at low levels before ever reaching the level of the Secretary."¹¹

Reluctance on the Secretary's part to challenge Council-drafted fishery rules for sanctuaries has been further reinforced by Congress's own failure to address head-on the negative impacts of fishing on sanctuaries. For example, the legislative designations of Monterey Bay and Stellwagen Bank were silent on commercial fisheries regulation, leaving it to NOAA to decide whether to include these activities in the list of what would be regulated or prohibited.¹² As a result, neither sanctuary has played a significant role in stopping the drastic decline of certain fish populations in their respective regions. These declines of fish populations and structural habitat impacted by some commercial fishing gears have also affected recreational fishing opportunities.

Clearly the Sanctuaries Act has been interpreted to give deference to the Fishery Management Councils regarding how to best manage commercial and recreational fishing in sanctuaries. This deference is at odds with the law's purpose of providing for "comprehensive and coordinated conservation and management" of special ocean areas.¹³ How can sanctuaries management be comprehensive if sanctuary managers do not have controlling authority over fish or fish habitat within a sanctuary?

§ 23:101 Limited Scope of the Sanctuary System—Moratorium on New Sanctuaries

While the Sanctuaries Program has clearly failed to identify, inventory, and protect the full array of marine resources and places meriting preservation, efforts to designate additional sanctuaries had come to a halt by the mid-1990's, by which time NOAA had inactivated the SEL on the ground that it was to be revised.¹ Before the revisions occurred, new designations were foreclosed by the moratorium

[Section 23:101]

¹Marine Sanctuary Program Regulations, 60 Fed. Reg. 66875 (Dec. 27, 1995).

mandated by Congress in the 2000 Amendments.² The lifting of the moratorium is contingent upon the Secretary publishing a “finding” that the “addition of a new sanctuary will not have a negative impact on the System,” and that the Commerce Department’s budget has sufficient resources in the year of any new designation to inventory known sanctuary resources and complete site characterization studies for all sanctuaries within 10 years, if current funding levels are maintained.³

The moratorium is a signal that additions to the sanctuary system are not a high priority for the Program’s congressional authorizing committees until such time as NOAA proposes an adequate plan and budget for managing existing sanctuaries, and Congress itself provides the appropriations. While the moratorium has had one positive consequence—forcing NOAA to develop a management program for congressional review—it throws a pall of uncertainty over the Program because there is no set date for the moratorium’s expiration. It is hard to imagine a similar no-growth injunction being placed on the national park or wildlife refuge systems.

The moratorium will be tested once the new nomination process is allowed to work. Once one or more nominations overcome the various tests and hurdles and reviews, the Secretary will still have to find that adding new sanctuaries will not have a negative impact on the extant system; something that is hard to imagine in this area of declining resources.

§ 23:102 Structural Flaws of the Sanctuaries Act—Lack of Preservation Focus

The Turnstone Group calls the NMSA a paradox because “it provides authority for meaningful protection on the one hand, and then substantially undermines it with the other. The effect on the water is few real protections in marine sanctuaries.”¹ Among other things,

- the Act “makes it difficult to prohibit activities”;
- fisheries management [in sanctuaries] is essentially controlled by the NMFS;
- the Act’s multiple use mandate “makes it difficult to implement regulations that are contentious or that significantly impact politically well-connected user groups”;
- the requirement to review sanctuary management plans every five years undermines long-term protection; and
- the Act’s multiple use mandate and exhaustive consultation requirements make it “fundamentally different” from laws governing other protected systems like parks and wilderness areas which have an overarching conservation frame work.²

While we agree the law is riddled with incongruities, in our view, the fundamental flaw of the Sanctuaries Act is its *lack of a singular focus on preservation*. This conclusion is all the more obvious when the Sanctuaries Act is compared to the Wilderness Act, which was enacted just eight years earlier.

The Wilderness Act provides a valuable comparison for the Sanctuaries Program for two reasons. First, the singular objective of the Wilderness Act is preservation of “untrammeled” wilderness. Second, while implementation of the Wilderness Act has

²2000 NMSA Amendments § 6(f).

not been trouble-free by any means, it has produced very successful outcomes.

**§ 23:103 Structural Flaws of the Sanctuaries Act—Lack of Preservation
Focus—Wilderness Act Model**

In his short history of the Wilderness Act, Douglas Scott identifies the features of that Act that have made it such an effective conservation tool.¹ The Wilderness Act:

- “established a clear unambiguous national policy to preserve wilderness, recognizing wilderness itself as a resource of value”;
- provided a specific definition of wilderness which could be applied practically in the field;
- established a permanent wilderness preservation system, described its extent and designated the first 9.1 million acres of wilderness (equivalent to 10,740 sqm of water);
- “set out a single, consistent management directive” that applied to all wilderness areas which, among other things, clearly specified allowed and prohibited uses;
- “mandated a clearly specified wilderness review process,” which included an inventory of all federal roadless areas 5,000 acres and larger, and required the executive branch to recommend all suitable wilderness areas to Congress within 10 years;
- “asserted the exclusive power of the Congress to designate wilderness areas” and to maintain them as wilderness until Congress decided otherwise; and
- “constituted the best, most practical mechanism to actually preserve wilderness *in perpetuity*.”²

In short, the Wilderness Act established a comprehensive, well-defined program with the *singular purpose of conserving America’s remaining wilderness in perpetuity*. The Wilderness Act has led to the designation of wilderness in 46 states.³ While there have been many political battles over whether particular areas were suitable for or should be designated as wilderness, once designated, wilderness areas must be managed in accordance with uniform preservation standards prescribed in the law. Furthermore, once established, wilderness areas are not subject to change in boundaries or degrees of protection, except by further act of Congress.

In contrast, the Sanctuaries Act has produced just 14 sanctuaries, which constitute less than 0.4% of U.S. waters. Although amended many times since 1972, the Sanctuaries Act still lacks a singular focus on preservation and a rigorous process to achieve it. Moreover, the Secretary of Commerce is not required to establish any particular sanctuary or number of sanctuaries or even to comprehensively inventory the nation’s waters for candidate areas. The Sanctuaries Act’s conflicting goals of preservation and multiple use, its discretionary and open ended nature, its lack of clear definitions and protection standards, and the multiple intervention points it provides for stakeholders and Congress have burdened the Program with enormous implementation difficulties and inefficiencies. The Act’s results speak for themselves.

**§ 23:104 Structural Flaws of the Sanctuaries Act—Lack of Preservation
Focus—Preservation and Multiple Use**

[Section 23:103]

²Douglas W. Scott, Campaign for America’s Wilderness, A Wilderness-Forever Future: A Short History of the National Wilderness Preservation System 15 (2001).

³See Table 23.1.

Several observers have argued that the primary or central mission of the NMSA has always been protection or preservation, and that NOAA has simply failed to aggressively pursue this mission.¹ We believe the reality is more complex. While it is true that preservation (or protection) always has been a purpose of the Act, it is not the Act's *singular purpose*. More than anything, it is the multiple use provision (and related provisions) that has prevented the development of a marine sanctuary system that lives up to its name.

Even though the Act states that “protection” is the primary objective, by also mandating the facilitation of all public and private uses, the legislation

gives standing to resource users who can challenge the Secretary's decision to prohibit certain activities, and creates the expectation among resource users that their use will be facilitated. The Secretary must then defend his or her regulatory decisions by demonstrating that such activities are not “compatible” with resource protection. This fact raises the bar for determining whether an activity should be allowed and fundamentally changes the question the Secretary must answer before regulating an activity. Instead of the precautionary question “might this activity harm the resource?” the test is more complex. The Secretary must in effect, answer the question “Does this activity harm the resource enough in comparison to the benefits people get from that activity to justify regulating it?”²

David Tarnas found the pursuit of multiple use in sanctuaries “unworkable” because both the meaning of the term and its practical application are unclear.³ If preservation is the primary purpose of sanctuaries, at what point do multiple uses compromise resource protection? Furthermore, says Tarnas, according to some observers, application of multiple use management is “ineffective.” What ocean users “call multiple use appears to amount to a policy of non-exclusion of their favored uses.”⁴

Multiple use management would only make sense, says Tarnas, if it were applied comprehensively to the entire ocean to “balance the whole range of marine uses.”⁵

Conflicting activities could be separated, complementary activities allowed together. Designated areas would have different levels of use restrictions to achieve different purposes. For example, a marine protected area, being part of a larger interactive marine ecosystem, would restrict those consumptive uses that conflict with the primary purpose of resource protection.⁶

The Marine Sanctuaries Program, observes Tarnas, has “assumed the task of trying to provide both the overall multiple-use management of large ocean areas, and the specialized protective management of smaller areas. Doing both has been difficult

[Section 23:104]

and has possibly weakened the program.”⁷

Tarnas concludes:

Sanctuaries fit into an overall multiple-use strategy for the larger marine ecosystem as one type of specialized marine management. Sanctuaries are marine protected areas with varying levels of protection not afforded by multiple use management. Thus, sanctuaries would operate most effectively within the context of a larger national ocean resource management policy using this multiple use approach. Yet this country has no comprehensive or integrated national ocean policy.⁸

Tarnas’ observations ring true. If most of the ocean is generally open to all uses, then the most direct and effective way to *preserve* ocean places is to set some of them aside for the singular purpose of preservation just as national parks and wilderness areas have been created on land. Only truly compatible uses of sanctuaries, such as education, science, and low-impact recreation would be allowed. A comprehensive ocean zoning policy, if we had one, would divide the ocean into a number of a number of different use zones, including preservation zones. This was the strategy recommended by President Johnson’s Science Advisory Committee in its 1966 call for a marine wilderness preservation system.

VII. CONCLUSION

§ 23:105 Generally

Lacking as it does the singular preservation focus of the Wilderness Act, the Sanctuaries Act has proved to be an unreliable vehicle for the timely preservation of the full array of the nation’s marine resources and special places in a comprehensive national system.

That the Sanctuaries Act is ineffective as a reliable preservation statute is reflected in the Act’s implementation history. Because of its incongruous and conflicting mandates, lack of strategic implementation guidelines, and failure to prohibit incompatible uses, or define uniform protection standards, the Act proved baffling to NOAA and a continuing frustration to its authorizing committees. Furthermore, the Act’s frequent reinvention by Congress and NOAA, though well-intentioned, has not really gotten at the root of the Act’s problems.

With the purposes and uses of each sanctuary up for grabs during the designation process, highly contentious and lengthy battles have been waged between conservationists and user groups over a number of candidate sites. Indeed, this contention is almost guaranteed by the Act’s elaborate designation process.

When NOAA became bogged down in designation battles in the 1980s, a protection-leaning Congress first was forced to mandate deadlines for NOAA to designate certain sanctuaries, then had to bypass a dysfunctional process to designate Florida Keys, the Hawaiian Islands Humpback Whale, Monterey Bay, and Stellwagen Bank marine sanctuaries. In addition, when Congress found itself unhappy with NOAA’s protection strategies for certain candidate sanctuaries, it intervened legislatively to prohibit new oil and gas leases at Cordell Bank and Olympic Coast, included an oil development ban in its legislative designation of Monterey Bay, and prohibited sand and gravel mining (but not oil development) at Stellwagen.

At other times, Congress has been more charitable towards certain user groups or

⁷David A. Tarnas, *The U.S. National Marine Sanctuary Program: An Analysis of the Program’s Implementation and Current Issues*, 16 *Coastal Management* 275, 280 (1988).

⁸David A. Tarnas, *The U.S. National Marine Sanctuary Program: An Analysis of the Program’s Implementation and Current Issues*, 16 *Coastal Management* 275, 294 (1988).

local constituencies. For example, Congress specifically prohibited the designation of a Northwest Straits sanctuary by NOAA because local users feared that federal oversight would result in greater use restrictions without a corresponding increase in protection to the area's resources. Congress also created sanctuaries (e.g., Monterey Bay) in which commercial fishing activities were not subject to regulation under the terms of the legislative designation, despite growing recognition that fish stocks in those areas were in decline.

The Act is now so constrained by its own architecture that that it stands little chance of ever producing the comprehensive system of marine preservation areas envisioned by early visionaries, who hoped to create a system of marine wilderness preserves analogous to the terrestrial wilderness system. The blueprint of a permanent marine sanctuary system with the singular purpose of preservation was rejected in favor of a law that required preservation to be balanced with other uses within a sanctuary. As a result, progress toward protecting America's ocean resources has been nowhere near that needed to achieve the national network of marine conservation areas scientists say are needed to protect and restore ocean life.

In order to be capable of establishing a system of marine preservation areas that only allows uses that are truly compatible with preservation, the Sanctuaries Act would have to undergo substantial amendment. Alternatively, Congress could authorize a separate system whose components could include any areas of the ocean, including presently managed or protected areas, which met the new law's preservation and protection criteria. This was precisely the approach taken by the Wilderness Act, which provided a wilderness-overlay on existing parks, refuges, forests, and public lands, and allowed compatible uses as defined by the law. Whichever approach is taken, a bold, vigorous and systematic effort will be needed to identify, protect and preserve the full array of marine habitats and features during the next 10 years before they are irretrievably degraded or lost. Current trends do not bode well for conservation.

§ 23:106 Our governance for coastal and ocean protection is seriously outdated and increasingly ineffective

The NMSA calls for the protection of nationally significant marine areas, but it does not clearly define the types of resources that are supposed to be protected. The sanctuary system covers a very small portion of U.S. waters, does not include a representative sample of biogeographical examples, nor has it been used to ensure Underwater Cultural Heritage is identified, included, and then monitored and protected. And, there is no coherent strategy for doing so despite the genuine support of NOAA administrators for a scientifically representative and biologically significant system of protected sanctuaries in U.S. waters.

Too some extent, the Act's flaws derive from its lukewarm beginning—almost an afterthought title of a broader, more universally supported legislative solution to human causes of ocean pollution. Its champions were neither united in their message nor able to frame the vision for the implementation of a marine sanctuary system. The Act's undefined multiple use mandate, discussed extensively in this chapter, has severely compromised its preservation purpose, because it allows extant users to hold out for exemptions for their extraction. So too has the authority of state governments to block creation of nationally significant sanctuaries that lie wholly or partly within state territorial waters. As a result, the nomination process has been too political and is at best producing lowest common denominator protections. And, was so dysfunctional that Congress had to bypass it. When something is that dysfunctional we have some serious flaws to address.

And, we have little or no data on whether ecosystems, species or habitats have

benefited from the NMSA. The management and protection of fish populations and fish habitat in sanctuaries has been ceded to NMFS and its regional fishery management councils, which until very recently were not doing a good job of following scientific recommendations for rebuilding fish stocks. The Sanctuary Program is not being used effectively or consistently to complement NOAA's Protected Resources Program for the conservation of marine mammals and endangered species. And, while most sanctuaries prohibit oil and gas development, the record otherwise in terms of real protections is abysmal. Most of the sanctuaries do not address recreational fishing, noise pollution, aquaculture, seabed mining or motorized recreation.

The new nominating process, is designed to minimize the kinds of local and regional political squabbles that have hindered NOAA's efforts to properly manage nominations, only to have a locally-driven, nationally supported first effort squashed by its congressional delegation in response to special user interests. The new process is transparent with nominations and all correspondence between NOAA and the nominators published on the NMS office Web site. Even the projects rejected at the first sufficiency review are encouraged to revise and resubmit, signaling a dedication to expanding and improving our system of sanctuaries.

The NMSA deserves better administration, an express authority to create fully protected marine reserves, flexibility in management and monitoring (particularly in the face of climate change) and more appropriations to make this all possible. For the health of the nation, food security, and preservation of our national heritage, we need to foster the rapid development of a national system of MPAs that include marine reserves, and right now the NMSA is not designed to accomplish this.

Table 23.1

Sanctuary Information

I. INTRODUCTION

§ 24:1 In general

“Climate change” refers to changes in the climate system that are attributed directly or indirectly to human activity, alter the composition of the global atmosphere, and are in addition to natural climate variability observed over comparable time periods.¹ The United Nations has called climate change “the defining issue of our time” and urged global action to mitigate this threat.²

Government at all levels are addressing climate change through mitigation, adaptation, and, perhaps in the near future, geoengineering. Climate change *mitigation* involves reducing emissions of greenhouse gases (GHGs) or enhancing the sinks that remove these gases from the atmosphere, whereas climate change *adaptation* (see §§ 24:13 to 24:32) is the process of adjusting to climate effects already set to occur, and *geoengineering* envisions deliberate invention in environmental systems to directly counteract greenhouse gas emissions and solar radiation.

This chapter describes the legal tools available to, and leveraged by, all levels of government to both mitigate and adapt to climate change. Climate change law in the United States remains decentralized, and it is uncertain at this point whether a comprehensive and coordinated federal effort is forthcoming. Consequently, this chapter analyzes the legal tools available to, and used by, federal, state, tribal, and local governments. A discussion of climate change risk and disclosure recognize that climate change’s impacts are just as much economic as they are environmental. Finally, this chapter reviews litigation as a driver—whether attempted or successful—of climate change policy by actors both public and private.

II. SCIENTIFIC BASIS OF AND CONSENSUS ON CLIMATE CHANGE

§ 24:2 The Science behind climate change

Greenhouse gases trap heat in the atmosphere, and anthropogenic (human-caused) emissions of long-lived greenhouse gases since the onset of the Industrial

[Section 24:1]

¹United Nations Framework Convention on Climate Change (1992), <https://unfccc.int/resource/docs/convkp/conveng.pdf>.

²United Nations, *Climate Change* (2020), <https://www.un.org/en/sections/issues-depth/climate-change/>.

Revolution have driven global warming.¹ Most significant is carbon dioxide (CO₂), which accounts for approximately 66% of the total radiative forcing (a standardized measure of the warming effect) from long-lived greenhouse gases. CO₂ increases are primarily due to combustion of fossil fuels (coal, oil, gas), with smaller sources including cement production, deforestation, and other land use changes. Methane has contributed 17% of this radiative forcing, with approximately 40% of methane emitted by natural sources (such as wetlands and termites) and 60% by anthropogenic sources (such as cattle farming, rice agriculture, fossil fuel production, landfills, and biomass burning). Nitrous oxide accounts for 6% of this radiative forcing and comes from both natural sources (about 60%, including soils and oceans) and anthropogenic sources (about 40%, including agriculture, biomass burning, and various industrial processes).²

Most of the remaining radiative forcing from long-lived greenhouse gases comes from past emissions of chlorofluorocarbons (CFCs), which have been largely phased out following the 1987 adoption of the Montreal Protocol (see *infra*) and thus are not subject to separate international reporting requirements for greenhouse gases.³ The other major greenhouse gases are all synthetic, fluorinated gases: hydrofluorocarbons (HFCs, used mainly as refrigerants), perfluorocarbons (PFCs, byproducts of aluminum production and used in semiconductor manufacturing), sulfur hexafluoride (used in semiconductor manufacturing, magnesium processing, and electrical transmission equipment), and nitrogen trifluoride (used in the electronics industry).⁴ While these gases are much less abundant than CO₂, methane, and nitrous oxide, they warrant concern because they remain in the atmosphere for long durations and produce more radiative forcing per unit of mass than CO₂—this ratio, shown below in Table 1, is known as “global warming potential.”⁵

Greenhouse Gas	Lifetime in Atmosphere (years)	Global Warming Potential (relative to CO ₂)		% of 2010 Global Greenhouse Gas Emissions (based on CO ₂ equivalents)
		20 Years	100 Years	
Carbon dioxide (CO ₂)	Variable	1	1	76%
Methane (CH ₄)	12.4	84	28	16%
Nitrous oxide (N ₂ O)	121	264	265	6%
Hydrofluorocarbons (HFCs)*				2%

[Section 24:2]

¹Water vapor is the largest contributor to the natural greenhouse effect. However, water vapor is not typically categorized as a greenhouse gas for the purposes of analyzing climate change, as its atmospheric concentration is controlled mostly by air temperature, rather than anthropogenic emissions.

§ 24:3 Scientific consensus on climate change threats

The threats posed by anthropogenic climate change have been widely recognized internationally since 1988, when the United Nations and the World Meteorological Organization created the Intergovernmental Panel on Climate Change (IPCC).¹ In the 1990s, the U.S. government recognized the IPCC as the preeminent international body established to provide objective scientific and technical assessments on climate change.²

In 2014, the IPCC completed its Fifth Assessment Report (IPCC FAR), the largest peer-reviewed scientific evaluation of climate change ever undertaken.³ The IPCC FAR concluded that “[w]arming of the climate system is unequivocal,” with significant changes including atmospheric and ocean warming, decreased snow and ice, and rising sea levels.⁴ With respect to the causes of these phenomena, the IPCC found that “[h]uman influence on the climate system is clear,” particularly “from the increasing greenhouse gas concentrations in the atmosphere.”⁵

In October 2018, the IPCC published a special report to compare the impacts of global warming of 1.5°C and 2°C and to assess emissions reduction pathways to limit warming.⁶ The report projected “robust differences” between the three scenarios of present-day warming (approximately 1.0°C above pre-industrial levels), reaching warming of 1.5°C, and reaching warming of 2°C, including differences in mean temperatures, heat extremes, heavy precipitation, and probability of drought and precipitation deficits.⁷ Moreover, the report projected that 2°C of global warming, as compared to 1.5°C, would yield an additional 0.1 meters in sea level rise; intensify ocean acidification; double the land area at risk of species loss due to shifts from one ecosystem to another; and increase the number of people exposed to climate-related risks and susceptible to poverty by up to several hundred million by 2050.⁸ The IPCC indicated that pathways limiting global warming to 1.5°C (and avoiding the

more devastating impacts of 2°C) would require “deep emissions reductions in all sectors,” including “rapid and far-reaching transitions in energy, land, urban and infrastructure (including transport and buildings), and industrial systems” that would be “unprecedented in terms of scale.”⁹

The U.S. government has similarly studied climate change threats. In November 2018, the U.S. Global Change Research Program released the Fourth National Climate Assessment, which was developed in accordance with the requirements of the Global Change Research Act of 1990.¹⁰ The Fourth Assessment detailed climate change impacts on water quality and quantity; on public health, particularly in vulnerable communities (due to impacts on extreme weather and climate-related events, air quality, and the transmission of disease through insects and pests, food, and water); on indigenous peoples; on ecosystems; on agriculture and food systems; on infrastructure; on oceans and coasts; and on tourism and recreation.¹¹

III. CLIMATE CHANGE MITIGATION

§ 24:4 In general

This section provides background on core concepts of climate change mitigation, followed by sections that summarize: the primary components of achieving deep emissions reductions; relevant international agreements; U.S. federal, state, and local initiatives; and litigation related to climate change mitigation.

Greenhouse gas emissions are attributable to several different sectors. Roughly three-quarters of global emissions come from the energy system: electricity, heat production, and other fuel consumption in the major end-use sectors of industry, transportation, and buildings.¹ Reducing these emissions sources involves reducing overall energy demand (through efficiency and conservation efforts), decarbonizing energy sources (i.e., reducing the greenhouse gas emissions intensity of energy supply), and switching to low-carbon energy carriers (i.e., enabling end uses to run on cleanly-generated electricity, hydrogen, or biofuels instead of fossil fuels). Nearly one-quarter of global emissions come from the agriculture, forestry, and other land use (AFOLU) sector, after netting out the greenhouse emissions that are removed by natural sinks.² Mitigation options for this sector include reducing deforestation, improving management of cropland and grazing land, and reducing demand for energy-intensive foods.³ Figure 1 shows a sectoral breakdown of U.S. greenhouse gas emissions, with the electric power industry categorized separately (rather than attributing the emissions from electricity generation to the relevant end-use sectors), the building sector denoted as “commercial & residential,” and forestry and other land use excluded, as this sector is a net sink in the United States.

⁴UNITED STATES ENVIRONMENTAL PROTECTION AGENCY, *Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2018* (2020), <https://www.epa.gov/ghgemissions/sources-greenhouse-gas-emissions>.

At the international level (see § 24:6), climate change mitigation efforts have included multilateral agreements on greenhouse gas reporting and emissions reduction targets; financing mechanisms to fund green investments; creation of offset markets; trade measures; technology cooperation; and coordination on public policies and industry standards.

At the national and subnational levels (see Sections 24:6 to 24:11), a variety of policy approaches are available to implement mitigation efforts.⁵ Regulatory approaches set specific rules or limits for industries to comply with—for example, maximum levels of emissions from certain sources, or standards requiring certain pollution abatement technologies or low-carbon product inputs. Economic approaches, also known as market-based mechanisms, rely on private sector responses to economic incentives. These mechanisms include taxes or other required payments for greenhouse gas emissions; emissions trading systems (“cap-and-trade” or “cap-and-invest”) that limit overall amounts of certain emissions and issue a corresponding amount of tradeable permits; offset markets that let polluters (on a voluntary or mandatory basis) purchase credits generated by emissions reductions elsewhere; and subsidies that make public funds available to private actors who undertake certain activities, such as generating renewable energy or providing ecosystem services. Another policy category is direct public investment—government provision of goods and services such as R&D, green infrastructure, public transportation, and public lands management. Governments can also implement information policies, such as greenhouse gas reporting requirements or eco-labelling, to improve planning efforts and drive behavior changes by consumers and corporations. Federal and state examples of each policy category are shown below in Table 2.

§ 24:5 Components of climate change mitigation

Achieving deep reductions in greenhouse gas (GHG) emissions involves action on the following major areas: energy efficiency and conservation measures to reduce overall energy demand; replacement of fossil fuel sources with low- or zero-carbon sources to meet the remaining energy demand; switching to low-carbon energy carriers, mainly through electrification of end uses; and sustainable practices to reduce emissions from agriculture, forestry, and other land uses. In addition to reducing emission sources, another component of mitigation is enhancing the “sinks” that remove greenhouse gases from the atmosphere, including through biological or technological carbon sequestration. Finally, while often categorized as separate from mitigation, geoengineering (large-scale technical interventions in the climate system to alleviate the impacts of climate change) includes carbon dioxide removal—a set of techniques that overlap conceptually with mitigation efforts to enhance carbon sinks.

A. Energy efficiency and conservation

Given the importance of the transportation sector in emissions, more stringent vehicle fuel economy standards are a critical way to reduce greenhouse gas emissions. So are increased use of energy-saving technologies, such as hybrid vehicles, and less use of heavy and energy inefficient vehicles, such as sport utility vehicles (SUVs). Also frequently discussed, but requiring more decentralized effort over a much longer period of time, is changing land use patterns to reduce vehicle miles traveled by passenger vehicles and to increase trips by mass transit, bicycles and walking.

In the residential and commercial sectors, much effort is now being directed toward construction of buildings that minimize the use of energy in heating, cooling, lighting, and other operations. Energy efficiency is also being pursued in home appliances and office equipment. Likewise, increased efficiency of many industrial operations has the potential to yield major reductions in greenhouse gas emissions.

B. Decarbonizing energy sources

Lower-carbon alternatives to coal and oil are becoming increasingly widespread and cost effective. Ongoing fuel switching from coal to gas, which is roughly half as carbon intensive, has averted GHG emissions from electricity generation in several countries, most significantly China and the United States.¹ Another method of reducing emissions from fossil fuels is to pair them with emerging carbon capture and storage technologies (discussed *infra*, Subsection E) in electricity generation

[Section 24:5]

¹IEA, GLOBAL ENERGY & CO₂ STATUS REPORT (2019), <https://www.iea.org/reports/global-energy-co2-status-report-2019>.

and industrial processes.² However, even if such technologies further mature, significant decreases in fossil fuel usage and increases in renewable energy will still be necessary to limit warming in line with global climate goals. IPCC pathways for limiting warming to 1.5°C with no or limited overshoot rely on renewables providing 52-67% of primary energy overall and 70-85% of electricity by 2050.³

Renewable energy sources are naturally replenishing and include solar (photovoltaic cells that generate electricity and thermal systems that heat water or air); wind (onshore and offshore turbines that generate electricity); hydropower (dams, run-of-river systems, pumped storage facilities, and tidal or wave power systems that generate electricity); geothermal (steam plants that generate electricity and heat pumps or district heating systems that cool and heat buildings); and biomass (use of nonfossilized plant materials to generate electricity, heat buildings, or serve as transportation fuels).⁴ In 2019, renewables (predominantly hydropower, followed by wind and solar) accounted for 27% of global electricity generation.⁵

Nuclear energy (power plants using nuclear fission to generate electricity),⁶ while not a renewable energy source due to finite amounts of the uranium used as fuel, is a zero-emission energy source.⁷ In 2019, nuclear power accounted for 10% of global electricity generation.⁸ Nuclear power's share of the energy sector could increase in the near future. More funding is anticipated under the December 2020 COVID-19 stimulus package. The Congressional Budget Office calculated \$369 million in estimated budget authority specifically targeted for nuclear power technologies from 2021 to 2030, aimed at stimulating next-generation operations.⁹ Other observers estimate that total allocation to nuclear technologies in the bill amounts to \$6.6 billion.¹⁰ While existing nuclear technologies or new reactor types could play a role in further decarbonizing electricity generation, nuclear plants raise concerns including risks of accidents, security threats, and radioactive waste management.¹¹

C. Electrification and other low-carbon energy carriers

¹¹IPCC, SPECIAL REPORT ON GLOBAL WARMING OF 1.5°C, at 325 (2018), https://www.ipcc.ch/site/assets/uploads/sites/2/2019/06/SR15_Full_Report_Low_Res.pdf.

Increases in clean energy sources, such as electricity generated from renewables, are not by themselves sufficient to decarbonize the energy system. Another key mitigation strategy is converting end uses that currently run on fossil fuels to instead utilize clean electricity, or another low-carbon energy carrier (e.g., hydrogen or liquid biofuels in some vehicles; hydrogen or bioenergy in some industrial processes).¹² In the buildings sector, existing technologies can electrify space heating and cooling, water heating, and cooking, though cost remains a barrier. In the transportation sector, battery electric vehicles, plug-in hybrid electric vehicles, or hydrogen fuel cell vehicles could replace vehicles fueled by gasoline or diesel. While another replacement option is to use biofuels in existing combustion engines, some biofuels have high indirect emissions from land use change.¹³ For industry, shifts toward electricity, heat, hydrogen, and bioenergy are a significant component of the sector's likely decarbonization pathways.¹⁴

D. Reducing emissions from agriculture, forestry, and other land uses

The agriculture, forestry, and other land use (AFOLU) sector produced approximately 23% of net anthropogenic greenhouse gas emissions from 2007 to 2016.¹⁵ Mitigation options include ecosystem conservation and land restoration; reduced deforestation and degradation; more sustainable forest management; more sustainable crop and livestock management; dietary changes away from energy-intensive foods; and reduction of food loss and waste.¹⁶ In pursuing these options, policymakers face both a challenge and an opportunity to harmonize climate change mitigation with other sustainable development goals such as food security, clean water and sanitation, improved health and wellbeing, and poverty eradication.¹⁷

E. Carbon sequestration

Carbon sequestration falls into two categories—biological sequestration and carbon capture and storage (CCS). Biological sequestration uses the natural function of plants to take up carbon dioxide through photosynthesis. A portion of the carbon is then stored in plant biomass and in soil organic matter. The amount of carbon dioxide stored in natural systems can be increased through forest conservation and management, reforestation, agricultural practices that increase levels of soil organic matter, and conserving or creating certain kinds of wetlands. However, stored carbon can be released back into the atmosphere as a result of fires, decomposition, and land use changes.

CCS uses engineered systems to capture carbon dioxide before it is emitted into the atmosphere, and then injects it into reservoirs for long-term storage. Carbon capture technologies are also being developed for other industries, such as cement manufacture, oil refining, ammonia production, and iron and steel manufacture. Once the carbon dioxide is captured, it can be transported to underground geologic formations; this may have the side benefit of enhancing oil and gas recovery from certain formations.

¹⁷*Id.* at 21.

A. *United Nations framework Convention on Climate Change*

The United Nations Framework Convention on Climate Change (UNFCCC) was opened for signature at the United Nations Conference on Environment and Development in Rio de Janeiro in 1992. The UNFCCC was ratified by the United States Senate in 1992, came into force in 1994, and has 197 parties as of 2020.¹ The UNFCCC's main objective is "stabilization of greenhouse gas concentrations in the atmosphere at a level that would prevent dangerous interference with the climate system," and it embraces the principle that developed and developing countries have "common but differentiated responsibilities and respective capabilities" to address climate change. The UNFCCC governing body is the Conference of the Parties (COP), composed of representatives of ratifying countries who meet annually to assess progress on implementation and negotiate additional agreements.

B. *Kyoto Protocol*

At the 1997 COP meeting in Kyoto, Japan, the parties negotiated an agreement to operationalize the UNFCCC goals by setting binding emission reduction targets for 37 developed countries.² While the United States actively participated in these negotiations, with Vice President Al Gore playing a central role, the United States never ratified the Kyoto Protocol, which has 192 parties as of 2020. During the period 2008–2012, the Kyoto Protocol targets for developed countries were set as designated percentage reductions from a 1990 baseline of each country's emissions. Different countries were to meet different percentages; the figure for the U.S. was to be 7% below 1990 emissions. Overall, the Kyoto Protocol aimed to reduce emissions about 30% below what would have occurred under "business as usual." The Kyoto Protocol also established the "Clean Development Mechanism" (CDM), allowing developed countries to offset their own emissions by paying for certified emissions reduction projects in developing countries.³ While emissions from countries covered by Kyoto Protocol targets did fall, the success of these commitments was limited by the exclusion of many major economies, including China and India.

C. *Copenhagen Accord*

Ahead of the 2009 COP meeting in Copenhagen, Denmark, negotiators had aimed to secure a legally binding agreement to succeed the Kyoto Protocol. However, the end result was the three-page, non-binding Copenhagen Accord negotiated by the leaders of the U.S., China, India, Brazil, and South Africa.⁴ While falling short of expectations, the Copenhagen Accord did provide a foundation for the 2015 Paris Agreement by establishing a framework for countries to submit their domestic mitigation targets and policies, to be subject to monitoring, reporting, and verification procedures. Developed countries also committed to collective financing levels "approaching" \$30 billion for the period 2010–2012, and longer-term assistance of \$100 billion annually by 2020 to help developing countries with emissions mitigation, adaptation, and reduction in deforestation.

D. *Paris Agreement*

In 2015, the COP successfully adopted the first legally binding agreement with universal commitments for all parties to undertake climate change mitigation

efforts.⁵ The Paris Agreement was the result of extensive negotiations, including a joint announcement in November 2014 by the United States and China of their greenhouse gas emissions reduction targets.⁶ The overarching goal adopted in the Paris Agreement is to hold the increase in the global average temperature to “well below 2°C above pre-industrial levels,” with parties also agreeing “to pursue efforts to limit the temperature increase to 1.5°C”—a priority urged by many island and other vulnerable nations. To meet these goals, parties aim to reach a global peak in greenhouse gas emissions “as soon as possible,” recognizing that developing countries would take longer to reach their peaks, and achieve a balance between anthropogenic greenhouse gas emissions and removals by sinks (climate neutrality) “in the second half of this century.”

The main implementation mechanism is for countries to prepare, communicate, and maintain “nationally determined contributions” (NDCs), essentially climate action plans. In addition to domestic climate actions, the Paris Agreement allows for market mechanisms by which countries can use “internationally transferred mitigation outcomes” toward achievement of their NDCs. While specific rules for these offset markets are still being negotiated as of the time of this writing, they could eventually extend eligibility to projects under existing international frameworks such as REDD+ (Reducing Emissions from Deforestation and Forest Degradation), which provides results-based payments to developing countries for sustainable forest management.⁷

The NDCs are to be updated every five years, with requirements starting in 2024 for public reporting on actions taken and international review of implementation progress. Parties will collectively assess progress towards achieving the long-term goals in “global stocktakes” every five years, beginning at the Conference of Parties in 2023. The global stocktakes are intended to result in commitments by the parties to update and enhance their climate actions. However, there is no mechanism to ensure that the commitments are adequate, or to take enforcement action or impose sanctions if they are not met. As assessed by the IPCC in 2018, existing NDCs under the Paris Agreement would not limit global warming to 1.5°C, even if supplemented by post-2030 emissions reductions.⁸

The Paris Agreement also addresses climate adaptation, providing that parties should submit and periodically update “an adaptation communication” that sets forth priorities, implementation and support needs, and plans and actions.⁹ The Agreement states that “[c]ontinuous and enhanced international support shall be provided to developing country Parties” for adaptation programs. More generally, developed countries “shall provide financial resources” to assist developing countries in their mitigation and adaptation efforts, with other parties encouraged to provide such support voluntarily. Every two years, developed countries must provide information about their support of developing countries and efforts in mobilizing climate finance—for example, through contributions to the Green Climate Fund established by the UNFCCC in 2010.¹⁰ However, no requirements were imposed on specific countries to make contributions of any particular magnitude.

In the United States, the Paris Agreement was not initially sent to the Senate for

¹⁰GREEN CLIMATE FUND, *Overview*, <https://www.greenclimate.fund/about>.

ratification, given that President Obama had several sources of authority to unilaterally enter it as an executive agreement rather than a treaty.¹¹ First, the core obligations of the Paris Agreement are procedural (submitting NDCs) rather than substantive (no binding emission reduction targets), allowing the President to execute the agreement based on independent foreign affairs powers. Second, the Paris Agreement elaborated on planning and reporting obligations already contained in the UNFCCC, which the Senate did ratify in 1992. Third, the Paris Agreement's goals and commitments had existing Congressional support from statutes like the Global Climate Protection Act of 1987, which declared a U.S. policy of working toward multilateral agreements on climate change.

The United States' NDC set a 2025 target of reducing greenhouse gas emissions (below 2005 levels) by 26-28%, on top of its Copenhagen Accord target of 17% reduction in 2020.¹² Estimates for 2019 showed U.S. emissions at only 12% below 2005 levels, leaving the U.S. behind on progress toward these targets.¹³

On June 1, 2017, President Donald J. Trump announced his intention to withdraw the U.S. from the Paris Agreement. In his announcement, Trump stated that “as of today, the United States will cease all implementation” of the Paris Agreement, including the NDC and contributions to the Green Climate Fund, to which the United States had contributed only \$1 billion of an initial \$3 billion pledge.¹⁴

The Paris Agreement entered into force on November 4, 2016, and allows parties to file a notice of intent to withdraw no sooner than three years afterward, with such withdrawal becoming effective one year later. The Trump administration filed its official intent to withdraw on November 4, 2019, with formal withdrawal becoming effective on November 4, 2020.¹⁵ President-elect Joseph Biden, as of the time of this writing, has indicated that he will reverse this decision.

E. Kigali Amendments to the Montreal Protocol

Predating the UNFCCC, in 1987 the United Nations adopted the Montreal Protocol on Substances That Deplete the Ozone Layer, a landmark agreement to phase out the use of ozone-depleting substances including chlorofluorocarbons (CFCs) and hydrochlorofluorocarbons (HCFCs).¹⁶ Given their coverage in the Montreal Protocol, CFCs and HCFCs are excluded from UNFCCC emissions reporting, despite technically being greenhouse gases. As CFCs and HCFCs have been phased out, the use of hydrofluorocarbons (HFCs)—potent greenhouse gases covered by UNFCCC mechanisms—has increased as a substitute for use in air conditioners, refrigerators, and aerosols. To avoid business-as-usual projections of significant emissions from increased HFC use, the parties to the Montreal Protocol adopted the Kigali Amendment in 2016, with a timeline for reducing HFC use by 80-85% by the

late 2040s.¹⁷ The December 2020 COVID-19 stimulus package brought the U.S. in line with the Kigali Agreement, authorizing a 15-year phase down of HFCs to 15% of the 2011-2013 annual levels by 2036.¹⁸

§ 24:7 Federal efforts to reduce greenhouse gas emissions

A. Mitigation effects of federal environmental laws

While the United States lacks comprehensive federal legislation on greenhouse gas emissions, some foundational environmental laws have indirectly promoted mitigation. For example, federal land management by the Department of the Interior and the U.S. Forest Service can help preserve and enhance carbon sinks, and Clean Water Act permitting requirements that deter certain wetland conversion can avert releases of stored carbon. Some environmentalists have attempted to use the Endangered Species Act to require mitigation efforts to prevent climate change impacts on sensitive habitats.¹

B. Clean Air Act

As the bedrock federal law for regulating air pollution, the Clean Air Act has played a central role in evolving policy debates over federal regulation of greenhouse gas emissions. Longstanding Clean Air Act regulations on conventional pollutants can also reduce greenhouse gas emissions from some sources (e.g., by requiring industries to engage in efficiency improvements or switches to cleaner fuels). The 1990 Clean Air Act Amendments also contributed to climate change mitigation by requiring the phaseout of ozone-depleting substances, which are also potent greenhouse gases, in accordance with the Montreal Protocol (see *supra*).

Following years of litigation (see *infra*, *Massachusetts v. EPA*), in 2009 EPA issued an “endangerment finding” under Clean Air Act Section 202(a) that greenhouse gases endanger public health and the environment for current and future generations, providing a legal hook for regulating greenhouse gases under the Clean Air Act.² As discussed below, EPA has taken regulatory action on greenhouse gas emissions from stationary sources (with the Obama Administration’s Clean Power Plan since replaced by the Trump Administration’s Affordable Clean Energy Rule) and mobile sources (with the Obama Administration’s vehicle emission standards since replaced by the Trump Administration’s Safer Affordable Fuel-Efficient Vehicles Rule).

C. Federal Efforts to reduce GHG emissions from power plants

Clean Air Act Section 111, the New Source Performance Standards (NSPS) program, requires EPA to (1) identify categories of stationary sources that contribute significantly to air pollution which may reasonably be anticipated to endanger public health or welfare; and (2) establish technology-based standards at the level of “best system of emission reduction . . . adequately demonstrated” (BSER, which can account for cost and other factors) for new and modified sources in those

categories. Fossil-fuel fired electric generating units have long been subject to NSPS for conventional pollutants. For non-conventional pollutants (i.e., not NAAQS pollutants or Section 112 hazardous air pollutants), EPA also establishes BSER guidelines for existing sources, with Section 111(d) requiring states to receive EPA approval for implementation or become subject to an EPA federal implementation plan.

In October 2015, EPA published a final rule establishing standards under Section 111 for greenhouse gas emissions from new, modified, and reconstructed fossil fuel-fired electric utility generating units (power plants).³ This rule has remained in effect throughout the Trump Administration, though in 2018 EPA did propose a revision that would identify the BSER for new coal-fired power plants to be the most efficient demonstrated steam cycle in combination with the best operating practices, rather than requiring partial carbon capture and storage.⁴

Also in October 2015, EPA also published a final rule under Section 111(d) for existing power plants, known as the Clean Power Plan.⁵ EPA estimated that the emissions reductions required by the rule would reduce carbon pollution by 32% below 2005 levels. In February 2016, the Supreme Court granted applications for an emergency stay of the rule, and thus it never went into effect.⁶

The Clean Power Plan included three elements: (1) CO₂ emission performance rates representing BSER for two subcategories of existing fossil fuel-fired power plants (called electric generating units or EGUs)—fossil fuel-fired electric utility steam generating units and stationary combustion turbines; (2) state-specific goals for emission reduction using a rate-based (tons of CO₂ per megawatt hour) or mass-based (total tons of CO₂) approach; and (3) guidelines for the development, submission, and implementation of state plans to comply by 2030, with interim goals phasing in between 2022 and 2029.

States could base their Section 111(d) plans on an “emissions standards” approach, in which states would apply requirements to each covered power plant for achieving the subcategory-specific CO₂ emission performance rates or the state-specific rate-based or mass-based CO₂ emission goal, with those source-specific requirements applying as federally enforceable emission standards. Alternatively, states could use a “state measures” approach, in which a state would implement a combination of policies to achieve the state’s mass-based emissions goal, with source-specific emissions standards only applying as a backstop.

In March 2017, President Trump issued an executive order entitled “Promoting Energy Independence and Economic Growth” which directed EPA to review the Clean Power Plan.⁷ In July 2019, EPA published its final rule repealing the Clean Power Plan and finalizing the Affordable Clean Energy (ACE) Rule.⁸ EPA concluded that the Clean Power Plan “departed from the EPA’s traditional understanding of its authority under section 111 of the CAA and promulgated a rule in excess of its statutory authority” by setting a BSER that “could only be achieved by a shift in the

energy generation mix at the grid level” rather than through application of equipment and practices at the facility level.

The ACE Rule determines that the BSER for power plants is based on heat rate improvement (HRI) measures that can be applied to a designated facility.⁹ The ACE Rule includes a table listing the most impactful HRI technologies, equipment upgrades, and best operating and maintenance practices. States are required to establish rate-based standards of performance for existing sources in their state based on application of the BSER, with an emphasis on states having discretion in determining these standards.

D. Federal efforts to reduce GHG emissions from vehicles

Federal regulations to reduce greenhouse gas emissions from motor vehicles fall into three primary categories: renewable fuel standards (to reduce the petroleum content of vehicle fuels), fuel economy standards (to increase the fuel efficiency of vehicles), and tailpipe emission standards (to directly limit the emissions from vehicles).

1. Renewable Fuel Standard

The federal Renewable Fuel Standard (RFS) was established by the Energy Policy Act of 2005 and expanded by the Energy Independence and Security Act of 2007, which amended Clean Air Act Section 211(o) to require that the U.S. supply of transportation fuel contain specified amounts of renewable fuel.¹⁰ Section 211(o) sets an annual schedule, starting with a requirement for 4 billion gallons of renewable fuel in 2006 and escalating to 36 billion gallons in 2022, after which EPA determines the amount, based on considerations including “the impact of the production and use of renewable fuels on the environment, including on air quality, climate change, conversion of wetlands, ecosystems, wildlife habitat, water quality, and water supply.”¹¹ To achieve these volume targets, the RFS imposes obligations on refiners or importers of gasoline and diesel fuel to meet a specified renewable volume obligation through a combination of blending renewable fuels into their own transportation fuels and/or purchasing credits generated by producers of renewable fuels.¹²

2. Corporate Average Fuel Economy (CAFE) standards

Federal fuel economy standards were first established by the 1975 Energy Policy and Conservation Act, requiring the National Highway Traffic Safety Administration (NHTSA) to set minimum corporate average fuel economy (CAFE) standards for vehicle fleets.¹³ The 2007 Energy Independence and Security Act required increased CAFE standards beginning in 2011 to achieve a combined fuel economy fleet average of at least 35 miles per gallon (mpg) by model year 2020.¹⁴

3. Greenhouse Gas Emission Standards

Following EPA’s 2009 “endangerment finding” for greenhouse gases under the Clean Air Act, EPA developed standards to regulate greenhouse gas emissions from various vehicle types in concert with NHTSA updates to the CAFE standards. Joint

¹⁴Energy Independence and Security Act of 2007, Pub. L. No. 110-140, 121 Stat. 1492 (Dec. 19, 2007).

rules were possible in part because fuel economy under the CAFE standards is determined by test procedures that use the amount of CO₂ emitted from the tailpipe to determine fuel consumption per mile. A final joint rule from EPA and NHTSA on light-duty vehicle GHG emission standards and CAFE standards took effect in July 2010, requiring achievement of a combined average emissions level of 250 grams of CO₂ per mile in model year 2016 vehicles, which could be achieved either by reaching average fuel economy of 35.5 mpg, or by reaching fuel economy of at least 34.1 mpg and undertaking other emissions reduction measures.¹⁵ An October 2012 joint rule applied to light-duty vehicles for model years 2017 to 2025, requiring an average of only 163 grams CO₂ per mile by 2025, corresponding to fuel efficiency improving to 54.5 mpg.¹⁶ The agencies also issued joint standards for medium- and heavy-duty trucks, with a September 2011 rule setting standards for model years 2014 to 2018 and an October 2016 rule for model years 2019 to 2027.¹⁷

In January 2017, EPA completed its midterm evaluation of the light-duty vehicle rule, concluding that the standards currently in place for model years 2022-2025 were appropriate and that it would be practical and feasible for automakers to meet the standards at reasonable cost.¹⁸ Following the change in presidential administrations, in April 2018 EPA published notice of its Final Determination for the Mid-Term Evaluation, determining that the current standards were “based on outdated information, and that more recent information suggests that the current standards may be too stringent.”¹⁹ EPA then adopted the Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule in two parts. First, a September 2019 regulation withdrew the waiver previously allowing California to implement stricter vehicle emission limits (see *infra*) and clarified the scope of federal preemption of state efforts to limit or prohibit tailpipe greenhouse gas emissions.²⁰ Second, an April 2020 regulation lowered the greenhouse gas emissions and CAFE standards for passenger vehicles and light trucks for model years 2021 to 2026.²¹ The standards will increase in stringency at 1.5% per year from model year 2020 levels over model years 2021 to 2026. The agencies concluded that although the final standards were estimated to result in 1.9 to 2.0 additional billion barrels of fuel consumed and from 867 to 923 additional million metric tons of CO₂ compared to the standards established in 2012, the final standards’ “overall benefits” would outweigh the additional costs.

E. Product Energy Efficiency Standards

The Department of Energy sets minimum energy efficiency standards for approximately 60 product categories, covering both consumer appliances (e.g., refrigerators, water heaters, light bulbs, kitchen ranges and ovens) and industrial equipment (e.g., electric motors, commercial clothes washers).²² This DOE Appliance and Equipment Standards Program was initially authorized by the Energy Policy and Conservation Act of 1975, with amendments from subsequent laws including

the Energy Policy Act of 1992 and the Energy Policy Act of 2005.²³ Manufacturers of covered products must submit certifications of energy performance before marketing each model. As of 2016, these standards were expected to achieve annual CO₂ savings of 345 million tons by 2020—equivalent to the emissions from nearly 75 million cars.²⁴

F. Greenhouse Gas Reporting Program

Within the Fiscal Year 2008 Consolidated Appropriations Act, Congress directed EPA to promulgate a rule requiring reporting of greenhouse gas emissions from large sources across all sectors of the economy.²⁵ The final rule, which took effect in 2010, identifies 41 categories of reports, with entities generally required to submit annual reports if either (1) greenhouse gas emissions from covered sources exceed 25,000 metric tons of carbon dioxide equivalent (CO₂e) per year; (2) supply of certain products would result in over 25,000 metric tons CO₂e of greenhouse gas emissions if those products were released, combusted, or oxidized; or (3) the facility receives 25,000 metric tons or more of CO₂ for underground injection.²⁶ With approximately 7,600 facilities and 1,000 greenhouse gas suppliers subject to reporting requirements, EPA estimates that the program covers 85 to 90% of U.S. greenhouse gas emissions.²⁷

G. EPA voluntary programs

Beyond the mandatory Greenhouse Gas Reporting Program and Clean Air Act regulations (see *infra*), EPA also administers several voluntary programs to promote energy efficiency, green transportation, and renewable energy generation.

EPA's "ENERGY STAR" program provides a government certification of energy efficiency, with far greater applicability (75 product categories, commercial buildings, residential homes, and industrial plants) than DOE's mandatory standards.²⁸ EPA established the program in 1992, under the authority of Clean Air Act Section 103(g), which directs EPA to "develop, evaluate, and demonstrate nonregulatory strategies and technologies for air pollution prevention . . . with opportunities for participation by [stakeholders] . . . including SO_x, NO_x . . . CO₂ . . . including end-use efficiency, and fuel-switching to cleaner fuels."²⁹ The Energy Policy Act of 2005 subsequently directed EPA and DOE to "promote ENERGY STAR compliant technologies" and regularly update the label's criteria.³⁰ Moreover, several laws require the federal government to use ENERGY STAR when procuring certain appliances and leasing buildings.³¹ Since 1992, ENERGY STAR and its partners have achieved over 3.5 billion metric tons of greenhouse gas reductions, equivalent to an-

nual emissions from 750 million cars.³²

The Combined Heat and Power (CHP) Partnership works to advance the use of CHP at the facility, district energy, or utility resource level. CHP systems have higher fuel use efficiencies than separate heat and power systems, as CHP generates electricity and captures the heat (that would otherwise be wasted) to provide thermal energy for space heating, cooling, domestic hot water, or industrial processes.³³ Other energy-saving programs are AgStar, which promotes the use of biogas recovery systems to reduce methane emissions from livestock waste, and the Landfill Methane Outreach Program, which encourages the recovery and beneficial use of landfill gas.³⁴

In the transportation sector, the SmartWay Transport Partnership is a public-private collaboration between EPA and the freight transportation industry, launched in 2004 to help freight companies measure, benchmark, and improve efficiency across the supply chain through fuel-saving technologies.³⁵ EPA's Green Vehicle Guide provides information on more efficient, less polluting vehicle types and fuels.³⁶

EPA's renewable energy programs include the Green Power Partnership, which encourages organizations to make voluntary purchases of green power and thereby incentivize development of renewable electricity sources, and the RE-Powering America's Land Initiative, which promotes renewable energy development that is responsive to community priorities on current and formerly contaminated lands, landfills, and mine sites.³⁷

EPA also partners with state, local, and tribal governments to provide outreach support, data, technical assistance, and analytical tools on strategies for energy efficiency and renewable energy.³⁸ In partnership with DOE, EPA facilitates the State and Local Energy Efficiency Action Network, which convenes policymakers, business leaders, non-government organizations, and other stakeholders to advance recommendations for energy efficiency programs and policies.³⁹

H. Grant programs and tax credits

The Department of Energy's Weatherization Assistance Program funds energy efficiency improvements for low-income households.⁴⁰ Grants are awarded to states, which then contract with local governments and service providers that weatherize homes. The program began in 1976, as authorized by Title IV of the Energy Conservation and Production Act, and was intended to save energy and reduce household

costs in an era of high heating fuel prices.⁴¹ While not designed as a climate change mitigation policy, the Weatherization Assistance Program currently reduces CO₂ emissions by an estimated 3.5 million metric tons each year—an amount equivalent to the emissions from over 740,000 cars.⁴² Most recently, the December 2020 COVID relief package reauthorized the Weatherization Assistance Program at \$1.7 billion, and extended credits, up to \$2,000, for new energy efficient homes through the end of 2021.⁴³

The 1992 Energy Policy Act created the renewable electricity production tax credit (PTC), a per-kilowatt-hour credit for electricity generated by qualified renewable resources.⁴⁴ While wind and closed-loop biomass were initially the only eligible resources, Congress has since renewed the PTC (Section 45 of the Internal Revenue Code) several times and added and removed various resources.⁴⁵ The federal investment tax credit (ITC) was created by the Energy Act of 1978, which provided a temporary 10% tax credit for certain businesses using energy resources other than oil or gas. The ITC (Section 48 of the Internal Revenue Code) has similarly undergone several renewals and modifications. Solar and geothermal energy both have a permanent ITC of 10% (of the cost of acquiring or constructing eligible energy property), and various Congressional extensions have increased that percentage for certain years and included other resources, such as wind and fuel cells.⁴⁶ The December 2020 COVID-19 relief package extended the PTC and ITC for onshore wind projects at 60% for projects that start construction by the end of 2021,⁴⁷ and established a new ITC for offshore wind at 30% for projects that start construction by 2025.⁴⁸ ITCs for solar projects were extended for 2 years at 26% for projects through the end of 2022; qualified projects starting construction in 2023 would be eligible for a 22% credit.⁴⁹

The Energy Policy Act of 2005 also created the Section 179D Commercial Buildings Energy-Efficiency Tax Deduction, available to owners of new or existing buildings who make efficiency improvements to lighting, building insulation, or HVAC or hot water systems that produce certain levels of energy savings.⁵⁰

The American Recovery and Reinvestment Act (ARRA), enacted in 2009 as a stimulus response to the Great Recession, was the largest-ever federal investment in clean energy, providing more than \$90 billion in direct funding and tax incentives. A tax credit for investments in clean energy manufacturing provided \$2.3 billion for renewable energy generation, energy storage, advanced transmission, energy conservation, renewable fuel refining or blending, plug-in vehicles, and carbon capture and storage. ARRA also initiated the Section 1603 Payments-In-Lieu-Of-Tax-Credits program, providing \$25 billion to support installation of wind, solar, geothermal, and biomass projects, and extended the production tax credit for wind, geothermal, and hydroelectric generation. The Department of Energy's Loan Programs Office received \$16.1 billion for loans to projects including wind farms, utility-scale solar installations, and thermal energy storage systems. With \$5 billion in additional funding for the Weatherization Assistance Program, ARRA also provided for weatherization of more than one million homes. Other investment areas included electric grid modernization, advanced vehicle and fuel technologies, and carbon capture and sequestration.⁵¹

ARRA provided the initial \$400 million budget to the Advanced Research Projects Agency—Energy (ARPA-E), housed within the Department of Energy, which had been established in 2007 by the America COMPETES Act.⁵² From 2009 to 2018, ARPA-E provided approximately \$1.8 billion in R&D funding for more than 660 potentially transformational energy technology projects, including new efficiency solutions, battery storage technologies, and advanced biofuels.⁵³ The Congressional Budget Office estimated \$4 million in outlays for carbon management programs from 2021 to 2025 from the December 2020 COVID-19 stimulus package.⁵⁴ Other observers estimated the package provided \$6 billion for carbon capture and storage technologies and \$1.08 billion for energy storage technologies.⁵⁵

J. Sustainability in federal agency operations

The Energy Independence and Security Act of 2007 (EISA) requires federal agencies to designate energy managers and complete energy efficiency evaluations for certain facilities; source at least 30% of hot water demand from solar hot water heating, if life-cycle cost-effective, in new or renovated federal buildings; in any new or renovated agency buildings from FY 2010 onward, use designs that reduce fossil fuel-generated energy consumption by 55% compared to an FY 2003 baseline (and

for new buildings or major renovations after FY 2030, a reduction of 100%).⁵⁶

In October 2009, President Barack Obama signed Executive Order 13514, which set sustainability goals for federal agencies and focused on improvements in environmental, energy, and economic performance. The Order required federal agencies to set a 2020 greenhouse gas emissions reduction target within 90 days; increase energy efficiency; reduce fleet petroleum consumption; conserve water; reduce waste; support sustainable communities; and leverage federal purchasing power to promote environmentally-responsible products and technologies.⁵⁷ In March 2015, President Obama announced that federal greenhouse gas emissions had been reduced by 17% below the 2008 baseline and issued Executive Order 13693, aimed at furthering progress and achieving 40% reduction by 2025.⁵⁸ The U.S. Council on Environmental Quality (CEQ) released in 2010, and updated in 2012, guidance establishing government-wide requirements for calculating and reporting greenhouse gas emissions resulting from federal agency operations.⁵⁹

In May 2018, President Trump revoked the Obama-era orders on federal sustainability and issued Executive Order 13834, “Efficient Federal Operations,” which did away with specific targets and timetables for emissions reductions.⁶⁰ In April 2019, CEQ issued implementing instructions for this Order.⁶¹ CEQ also issued updated sustainable buildings guidance for federal agencies in December 2020.⁶²

K. Other reversals of Obama administration initiatives

In addition to the rollbacks discuss above (of the Clean Power Plan, CAFE standards and vehicle GHG emission standards, and sustainability targets for federal agency operations), the Trump Administration has reversed several other climate change initiatives established during the Obama Administration through executive orders and agency actions.

In March 2017, President Donald Trump issued Executive Order 13783, which described a national interest in promoting “clean and safe development of our Nation’s vast energy resources, while at the same time avoiding regulatory burdens that unnecessarily encumber energy production, constrain economic growth, and prevent job creation.”⁶³ The Order directed agencies to review existing regulations, orders, and other agency actions “that potentially burden the development or use of domestically produced energy resources, with particular attention to oil, natural gas, coal, and nuclear energy resources” and to recommend and implement actions

to alleviate or eliminate agency actions that burden domestic energy production. President Trump's Executive Order 13783 specifically revoked certain climate change-related executive orders, presidential memoranda, guidance, and reports issued during the Obama administration. It also directed agencies to identify other existing agency actions that arose from these revoked documents and to take action to suspend, revise, or rescind those agency actions.⁶⁴

In October 2020, the House Committee on Energy and Commerce issued a report stating that the Trump Administration had taken steps to roll back nearly 100 environmental protections.⁶⁵ Summarized below are three examples relating to climate change mitigation efforts.

1. NEPA guidance on climate change

The National Environmental Policy Act (NEPA) requires federal agencies to assess the environmental impacts of “proposals for legislation and other major Federal actions significantly affecting the quality of the human environment.”⁶⁶ President Trump's Executive Order 13783 directed the Council on Environmental Quality (CEQ), which issues NEPA regulations and guidance, to rescind its 2016 “Final Guidance for Federal Departments and Agencies on Consideration of Greenhouse Gas Emissions and the Effects of Climate Change in National Environmental Policy Act Reviews.” CEQ had issued this final guidance after years of public input and issuance of draft guidance in 2010 and revised draft guidance in 2014.⁶⁷ The final guidance specified that NEPA reviews should consider both (1) “the potential effects of a proposed action on climate change as indicated by assessing GHG emissions (e.g., to include, where applicable, carbon sequestration)” and (2) “the effects of climate change on a proposed action and its environmental impacts.”⁶⁸

Following the Trump Administration's 2017 withdrawal of the 2016 final guidance, CEQ published new draft guidance in June 2019.⁶⁹ This draft guidance focuses on consideration of climate effects from a project—with regard to how climate change could impact the project itself, it states that agencies should consider “whether the proposed action would be affected by foreseeable changes to the affected environment under a reasonable scenario,” but need not “undertake new research or analysis of potential changes to the affected environment in the proposed

⁶⁴This included guidance issued by CEQ in March 2011 to help federal agencies develop climate change adaptation plans and Executive Order 13653, which created the Council on Climate Preparedness and Resilience as well as a State, Local, and Tribal Leaders Task Force on Climate Preparedness and Resilience. See Federal Agency Climate Change Adaptation Planning, Implementing Instructions (Mar. 4, 2011); Exec. Order No. 13,653, 78 Fed. Reg. 66,819 (Nov. 6, 2013). See *infra* §§ 24:13 to 24:32 for more on climate change adaptation.

⁶⁹84 Fed. Reg. 30097 (June 26, 2019), <https://www.govinfo.gov/content/pkg/FR-2019-06-26/pdf/2019-13576.pdf>.

action area.”⁷⁰ It indicates that projections of a proposed action’s direct and reasonably foreseeable indirect greenhouse gas emissions may serve as a proxy for assessing potential climate effects.⁷¹ However, the draft guidance cautions that “but for” causation is not a sufficiently close causal relationship for emissions to be considered an indirect effect. CEQ describes the threshold for quantification of greenhouse gas emissions as “when the amount of those emissions is substantial enough to warrant quantification, and when it is practicable to quantify them using available data and GHG quantification tools.”⁷² The draft guidance also recommends that agencies should explain any determination to use only qualitative analysis when quantitative tools, methods, or data are not reasonably available.

CEQ also found that NEPA and its implementing regulations do not require agencies to monetize costs and benefits of a proposed action, meaning agencies need not use monetized Social Cost of Carbon estimates (see *infra*). The guidance further stated that some effects—such as employment or socioeconomic effects—are more “capable of monetization or quantification.”⁷³ The guidance indicated that monetization of some effects “does not require that all effects, including potential effects of GHG emissions, be monetized or quantified”—but that any decision to monetize some effects and not others should be explained.⁷⁴

2. Social cost of carbon

Beginning in 2009, an Interagency Working Group on Social Cost of Carbon devised a consistent methodology for incorporating the social cost of carbon into the agency rulemaking process. Executive Order 12866, issued in 1993, requires analysis of the costs and benefits of significant regulatory actions, and this analysis can play a significant role in the outcome of agency decisions.⁷⁵ To enable consideration of the benefits of reducing (or the costs of increasing) CO₂ emissions, the working group issued a “Technical Support Document: Social Cost of Carbon for Regulatory Impact Analysis Under Executive Order 12866” in 2010, with revisions in 2013, 2015, and 2016. The Social Cost of Carbon (SCC) provided was an estimate of “the monetized damages associated with an incremental increase in carbon emissions in a given year.”⁷⁶ The SCC takes into account, among other things, changes in net agricultural productivity, human health, property damages from increased flood risk, and the value of ecosystem services due to climate change. The 2013 revision also incorporated sea level rise damages, updated adaptation assumptions, and a revised treatment of potentially abrupt shifts in climate damages.

The working group provided four different SCC values, all based on averages from several “integrated assessment models” of the interplay between human activities and environmental impacts. The first three SCC values all use different discount rates, which convert future damages into present-day value, based on the assumption that effects further in the future have a lower present-day value (whereas a discount rate of zero would treat present and future damages equally). A common justification for discount rates is the time value of money: spending \$1 million today

⁷⁴*Id.*

⁷⁵Exec. Order No. 12866, <https://www.archives.gov/files/federal-register/executive-orders/pdf/12866.pdf>.

⁷⁶Interagency Working Group on Social Cost of Greenhouse Gases, Technical Support Document: Technical Update of the Social Cost of Carbon for Regulatory Impact Analysis Under Executive Order 12866 (Aug. 2016), https://www.epa.gov/sites/production/files/2016-12/documents/sc_co2_tsd_august_2016.pdf.

to avoid \$1 million in present damages means breaking even, whereas spending that money to avoid future damages may not, because that same money could have instead been invested and compounded over time. A common criticism is that high discount rates may preference current generations over future generations. The choice of discount rate is significant. In the 2016 revision, the SCC estimates for the year 2020 (per metric ton of CO₂, in 2007 dollars) were \$12 at a 5% discount rate, \$42 at a 3% discount rate, and \$62 at a 2.5% discount rate.⁷⁷ The working group also provided a fourth, significantly higher SCC estimate (\$123 in 2020) “to represent the potential for lower-probability, but higher-impact outcomes from climate change,” using the “95th percentile of the frequency distribution of [SCC] estimates based on a 3% discount rate.”⁷⁸

In 2014, a federal district court stated that federal agencies should use the SCC to assess climate change impacts in NEPA documents,⁷⁹ and in 2016, the Seventh Circuit upheld energy efficiency standards published by the Department of Energy that analyzed environmental benefits based on the social cost of carbon.⁸⁰

President Trump’s Executive Order 13783 disbanded the working group and declared its technical support documents to “be withdrawn as no longer representative of governmental policy.”⁸¹ The Order instead directed agencies, when monetizing the value of changes in greenhouse gas emissions resulting from regulations, to ensure consistency with a 2003 guidance document, OMB Circular A-4, including with respect to consideration of domestic versus international impacts and discount rates. A June 2020 analysis from the U.S. Government Accountability Office found that because agencies began considering only domestic rather than global climate change damages, the SCC at the 3% discount rate became about 7 times lower than prior estimates, falling to just \$7 for 2020 emissions.⁸² Agency officials, including in the regulatory impact analysis for the 2019 Affordable Clean Energy Rule (see *infra*), also used higher discount rates of 3% and 7%, instead of the previous rates of 2.5%, 3%, and 7%.

3. Methane reduction strategy

In March 2014, the Obama administration released a “Strategy to Reduce Methane Emissions.”⁸³ The plan targeted key sources of methane: landfills, coal mines, agriculture, and oil and gas. Components of the strategy included regulatory measures as well as voluntary or incentive programs and collaborations with industry. With respect to landfills, EPA amended air emissions standards for new landfills and issued guidelines for emissions from existing landfills.⁸⁴ The revised NSPS and emissions guidelines for landfills became effective on October 28, 2016,

⁸⁴Emission Guidelines and Compliance Times for Municipal Solid Waste Landfills, 81 Fed. Reg. 59276 (Aug. 29, 2016) (final rule); Standards of Performance for Municipal Solid Waste Landfills, 81 Fed. Reg. 59332 (Aug. 29, 2016) (final rule); Standards of Performance for Municipal Solid Waste Landfills, 79 Fed. Reg. 41795 (July 17, 2014) (proposed rule); Emission Guidelines and Compliance Times for Municipal Solid Waste Landfills, 79 Fed. Reg. 41771 (July 17, 2014) (advanced notice of proposed rulemaking).

but on May 31, 2017, EPA published notice that it was administratively staying the revised regulations for 90 days (until August 29, 2017) pending reconsideration.⁸⁵ In May 2017, EPA also announced it would reconsider certain provisions of the landfill regulations. In October 2018, EPA proposed to extend the compliance timeframe for the guidelines.⁸⁶ The proposal would change the due date for state plans for implementing the landfill guidelines from July 30, 2017 to August 29, 2019.

With respect to coal mines, the Bureau of Land Management (BLM) issued an advance notice of proposed rulemaking regarding the development of a program for the capture and sale or disposal of waste mine methane on leased federal lands,⁸⁷ but never developed a final rule. In January 2016, Secretary of the Interior Sally Jewell announced a moratorium on federal coal leasing pending the preparation of a programmatic environmental impact statement (PEIS) to analyze leasing and management reforms of the federal coal program.⁸⁸ The Secretary of the Interior directed that the PEIS should address the effect of the coal leasing program on greenhouse gas emissions. President Trump's Executive Order 13783 ordered the Secretary of the Interior to lift the moratorium. On March 29, 2017, Secretary of the Interior Ryan Zinke ordered the termination of the moratorium and also of the programmatic review of the coal leasing program.⁸⁹ In 2019, a federal court in Montana ruled that the lifting of the moratorium constituted a "major federal action" that triggered National Environmental Policy Act review requirements.⁹⁰

With respect to the oil and gas industry, the Obama administration in January 2015 outlined steps it would take to reduce methane and ozone-forming pollution from this sector, including commencement of a rulemaking process to set methane and volatile organic compound emissions standards for new and modified oil and gas production sources and natural gas processing and transmission sources. EPA published final standards in June 2016.⁹¹ President Trump's Executive Order 13783 ordered EPA to review and, if appropriate, suspend, revise, or rescind the standards. After publishing an announcement that it was reviewing the standards on April 4, 2017, EPA published a notice stating that it was staying for three months certain rule requirements for which it had granted reconsideration. On June 16, 2017, EPA proposed a two-year stay of the NSPS requirements pending its reconsideration of those requirements.⁹² The D.C. Circuit vacated the three-month administrative stay, finding that EPA lacked authority to issue it.⁹³ In October 2018, EPA proposed amendments to the NSPS that would change fugitive emissions requirements, well site pneumatic pump standards, the requirements for certification of closed vent systems by a professional engineer, and alternative means of emissions limitations,

among other provisions.⁹⁴

EPA also intended to develop new guidelines for reducing emissions of methane and ozone-forming pollutants from existing oil and gas systems that do not meet ozone standards. In November 2016, EPA sent information collection requests to owners and operators of oil and gas facilities requesting information about equipment, including information on sources of methane emissions and emissions control devices or practices. On March 7, 2017, EPA provided notice that it was withdrawing the request.⁹⁵

Other initiatives undertaken by EPA during the Obama administration regarding methane emissions from the oil and gas sector included requiring all segments of the oil and gas industry to participate in the Greenhouse Gas Reporting Program (see *supra*). Other federal agencies taking action to reduce methane emissions included BLM, which updated operational standards regarding venting, flaring, and leaks of natural gas from oil and gas wells on public lands⁹⁶ (a regulation that President Trump's Executive Order 13783 required BLM to review and for which BLM announced it was postponing certain compliance dates in a June 15, 2017 notice).⁹⁷ A California federal court ruled that BLM could not postpone the compliance dates without complying with the notice-and-comment procedures of the Administrative Procedure Act.⁹⁸ In December 2017, BLM temporarily suspended certain requirements in the rule based on concerns regarding BLM's authority to issue the regulation and regarding the cost, complexity, and feasibility of complying with the regulation's requirements.⁹⁹ This suspension was enjoined by a California federal court in February 2018,¹⁰⁰ but in April 2018 a Wyoming federal court stayed key "phase-in" provisions of the rule that BLM had proposed to change in a February 2018 proposed rule.¹⁰¹ In September 2018, BLM rescinded several provisions of the 2016 rule, including those governing leak detection and repair, and substantially revised provisions addressing venting and flaring to include requirements similar to those in place before the 2016 rule.¹⁰²

§ 24:8 Regional efforts to reduce greenhouse gas emissions

A. Regional Greenhouse Gas Initiative

RGGI was the first mandatory, market-based CO₂ emissions reduction program in the United States. As of January 2021, its members are Connecticut, Delaware, Maine, Maryland, Massachusetts, New Hampshire, New Jersey, New York, Rhode Island, Vermont, and Virginia. RGGI has initially regulated carbon dioxide emissions from fossil-fuel-fired power plants that have a capacity of at least 25 MW, though other sources and gases may be targeted in the future. To meet emission reduction targets, the RGGI states established a regional cap-and-trade system, with each state implementing a CO₂ Budget Trading Program based on the RGGI

¹⁰¹Wyoming v. U.S. Department of the Interior, No. 2:16-cv-00285 (D. Wyo. Apr. 4, 2018). See 83 Fed. Reg. 7924 (Feb. 22, 2018).

¹⁰²83 Fed. Reg. 49184 (Sept. 28, 2018). See also 83 Fed. Reg. 7924 (Feb. 22, 2018) (proposed rule).

Model Rule. RGGI states have set an annual cap on emissions, starting with 2009, and issued a corresponding number of allowances. Regulated power plants must purchase allowances (from periodic RGGI auctions, on the secondary trading market, or the offset market for emission reduction projects within the region) to cover their CO₂ emissions.¹

When setting the first emissions caps, RGGI's aim was to stabilize covered emissions at 2009 levels through 2013, then later require gradual reductions from 2014 to 2018. Actual emissions during the initial the 2009-2013 period ended up being lower than the cap, and clearing prices for allowances stayed low (ranging from \$1.86 to \$3.51). Accordingly, the RGGI states adopted an updated 2013 model rule that reduced the 2014 cap by 45%, from 165 million to 91 million tons, and set it to decline 2.5% each year from 2015 to 2020. The 2017 model rule provides that the cap (approximately 75 million tons in 2021) will decrease by 2.275 million tons each year through 2030 (to less than 55 million tons). Between 2012 and 2018, CO₂ emissions from electricity generation decreased by 20% in RGGI states. RGGI auction proceeds through 2019 were \$3.2 billion, which states dedicated in large part to support energy efficiency, renewable energy, and other climate change mitigation efforts.²

In May 2011, New Jersey Governor Chris Christie declared that the state would withdraw from RGGI in May 2011, and formal repeal took place in August 2015.³ In 2018, New Jersey Governor Phil Murphy, issued an executive order directing agency rulemaking to ensure New Jersey's return to full participation in RGGI.⁴ In June 2019, the New Jersey Department of Environmental Protection adopted two rules to allow New Jersey to rejoin RGGI (effective January 1, 2020), a Carbon Dioxide Budget Trading rule (establishing the mechanism for the trading program)⁵ and a Global Warming Solutions Fund rule (addressing the framework for spending the proceeds from the auctions).⁶

Virginia joined RGGI as of January 2021, following the Virginia Department of Environmental Quality's adoption of the final Virginia Carbon Rule in June 2020.⁷ In October 2019, Pennsylvania Governor Tom Wolf issued an executive order directing the Pennsylvania Department of Environmental Protection to develop regulations on carbon dioxide emissions from fossil fuel-fired power plants that would enable the State to join RGGI.⁸ The Department published a proposed rulemaking in November 2020, open for public comment through January 14, 2021.⁹

B. Western Climate Initiative

From 2007 to 2012, several western U.S. states (including Arizona, California,

Montana, New Mexico, Oregon, Utah, and Washington) and Canadian provinces (including British Columbia, Ontario, and Quebec) worked to implement a Western Climate Initiative (WCI) that would involve a regional target for emissions reduction, a market-based mechanism to achieve it, and a joint registry for tracking regional emissions. Almost all the western states later abandoned their plans for WCI participation, leaving only California, which later re-established a regional link with Quebec and briefly with Ontario.

California approved its Cap-and-Trade Program regulations in 2011 (see *infra*). Unlike RGGI, which only covers the power sector, California's Cap-and-Trade Program also covers large industrial sources and distributors of transportation fuels, gas, and other petroleum products. Similar to the RGGI mechanism, CARB sets an annual emissions cap and issues a corresponding number of "allowance" certificates which authorize the holder to emit a fixed amount of GHGs. As the cap declines each year, the number of allowances decreases, and covered entities are required to find ways to reduce emissions at their own facilities and/or purchase offset credits.

California may link its Cap-and-Trade Program with programs operating in other states, provinces, and countries so that covered entities may use allowances and offsets issued by those other jurisdictions to fulfill AB 32 compliance obligations, discussed later in § 24:9. Under legislation enacted in 2012, such linkages require the California Governor to make certain findings, including that the linked program's requirements for offsets are equivalent to or stricter than California's, that California is able to enforce AB 32 against regulated entities, that the linked jurisdiction will enforce requirements that are equivalent to or stricter than AB 32, and that the linkage will not impose any significant liability on California for any failure of the linkage.¹⁰ In April 2013, California Governor Jerry Brown made the findings required to link California's Cap-and-Trade Program with that of Quebec.¹¹ CARB subsequently adopted regulations to implement the linkage with Quebec, effective January 1, 2014.¹² In 2019, the United States filed a lawsuit challenging the constitutionality of this linkage. In March 2020, the court dismissed the lawsuit, stating that the agreement linking the cap-and-trade programs did not violate either the Treaty Clause or the Compact Clause of the U.S. Constitution.¹³

The Quebec and California programs also briefly linked with Ontario from January 1 to July 3, 2018, when Ontario revoked its own cap-and-trade regulation.¹⁴

C. Transportation and Climate Initiative

In December 2009, the governors of 11 northeastern states—which included the 10 states that were then part of RGGI plus Pennsylvania—signed a Memorandum of Understanding committing their states to further reduce greenhouse gas emissions from fuels, including transportation fuels, and, potentially, fuel oil used for heating. This group, along with the District of Columbia, became known as the

¹⁴California Air Resources Board, *Program Linkage*, <https://ww2.arb.ca.gov/our-work/programs/cap-and-trade-program/program-linkage>.

Transportation and Climate Initiative (TCI).¹⁵ The states committed to assess the feasibility of a range of reduction goals by early 2011, including a 10% cut in fuel carbon intensity and development of a framework for a regional low-carbon fuel standard to ensure sustainable use of renewable fuels.

The group intended ultimately to develop a model rule for enforcing the standard, which individual states could adopt through administrative or legislative means. In June 2010, the states signed another agreement to collaborate on developing policies and programs to reduce GHG emissions through transportation improvements and efficiencies. In September 2018, Virginia joined TCI. In October 2019, the TCI jurisdictions released a framework for a program that would cap emissions from combustion of the fossil component of gasoline and on-road diesel in the region.¹⁶ The cap would cover emissions from fuel destined for final sale or consumption in a TCI jurisdiction, upon removal from a storage facility (i.e., a “terminal rack”) in the TCI jurisdiction, or, for fuel removed from a facility in another jurisdiction, upon delivery into the TCI jurisdiction. Fuel suppliers—the regulated entities—would be required to hold allowances to cover reported emissions. In December 2020, Massachusetts, Connecticut, Rhode Island and the District of Columbia announced in a memorandum of understanding that they would move forward with implementing the program,¹⁷ with the eight remaining states agreeing to continue studying the program in a statement of support.¹⁸

§ 24:9 State efforts to reduce greenhouse gas emissions

In the absence of any comprehensive federal laws to control greenhouse gas emissions, states have played a leading role on climate change mitigation in the United States. Notable examples include economy-wide emissions reduction targets, clean electricity targets, and Energy Efficiency Resource Standards.

A. *Economy-wide emissions reduction targets*

At least 25 states and the District of Columbia have pledged to reduce their overall emissions by specific amounts before specific dates, with these economy-wide targets often complementing sector-specific targets. Beyond differing reduction amounts and timelines, these targets also differ in terms of bindingness—some targets are set by binding legislation, while others are only expressed by executive orders or non-binding legislative goals. As of December 2020, State legislatures have enacted economy-wide mandates for emissions reduction in California,¹ Colorado,² Connecticut,³ Hawaii,⁴ Maine,⁵ Maryland,⁶ Massachusetts,⁷ Minnesota,⁸ New

of December 2020. While many pledges are for reductions by 2030 and 2050, in the short-term nearly all of these states are aiming to reduce emissions 26-28% below 2005 levels by 2025—a goal that corresponds to the Obama Administration’s commitment under the Paris Agreement and has since been taken up by states through the United States Climate Alliance.²⁶

1. California

a. **AB 32: Global Warming Solutions Act**

In September 2006, California passed Assembly Bill 32, otherwise known as the Global Warming Solutions Act.²⁷ AB 32 created the first enforceable state-wide program in the U.S. to cap all greenhouse gas emissions from major industries. It requires that greenhouse gas emissions be cut to 1990 levels by 2020 and 80% below that threshold by 2050. The California Air Resources Board (CARB) is the state agency responsible for monitoring and regulating GHG emission sources. In December 2007, CARB approved a regulation requiring annual reporting of GHG emissions from large sources.²⁸

CARB’s 2008 Climate Change Scoping Plan recommended a cap-and-trade program with regional linkages through the Western Climate Initiative (see *supra*). In 2011, CARB approved regulations for such a program, estimated to cover 85% of the state’s greenhouse gas emissions.²⁹ CARB’s rules apply to businesses in the state with reported or verified annual emissions exceeding 25,000 metric tons of carbon dioxide equivalents (CO₂e). During the initial 2012–2015 period, the program covered emissions from large industrial sources and “first deliverers” of electricity, which include electricity generators located within California as well as entities that import electricity from out-of-state sources into California. Beginning in 2015, fuel distributors (e.g., of gas and petroleum products) with annual emissions exceeding the threshold were included in the program. In 2017, California enacted a law that extended the cap-and-trade program through 2030.³⁰

California’s emissions cap declined approximately 2% per year from 2012 to 2014 and approximately 3% per year from 2015-2020 and is set to decline 5% per year from 2021-2030. Covered entities can use offset credits to meet up to 8% of their compliance obligation for emissions through 2020, 4% for 2021-2025, and 6% for 2026-2030, and from 2021 onward no more than half of an entity’s offsets can be sourced from projects without direct, in-state environmental benefits.³¹ From 2012 to 2019, allowance auctions generated \$12.5 billion in revenue, which are placed in the state’s Greenhouse Gas Reduction Fund and invested in other programs to reduce emissions.³²

In 2016, California enacted a law that codified a greenhouse gas emissions reduc-

achieve net-zero GHG emissions by 2045).

tion target of 40% below 1990 levels by 2030.³³ In November 2017, CARB released its 2017 Climate Change Scoping Plan, which sets forth the State’s strategy for achieving the emissions targets and retains a large role for both the Cap-and-Trade Program and the Low Carbon Fuel Standard (discussed below).³⁴

b. Vehicle emissions

California is also a leader on reducing greenhouse gas emissions from vehicles. While the Clean Air Act generally preempts states from setting vehicle emissions standards, Section 209—in recognition of the fact that California had standards pre-dating Clean Air Act passage—allows EPA to grant a waiver to California standards that are “at least as protective of public health and welfare as applicable Federal standards” and necessary “to meet compelling and extraordinary conditions.”³⁵ In December 2005, California sought a waiver from the EPA to adopt standards regulating tailpipe emissions of CO₂ and other greenhouse gases. EPA denied this request in 2008, generating litigation until 2009, when EPA issued its own endangerment finding for greenhouse gases and subsequently granted California’s waiver request.³⁶ Since then, California has adopted the Advanced Clean Cars program, which establishes tailpipe GHG emission limits through a low-emission vehicle (LEV) regulation and requires manufacturers to produce an increasing amount of zero-emission vehicles (ZEVs) such as electric vehicles.³⁷ Section 177 of the Clean Air Act allows other states to adopt emissions standards that are “identical to the California standards for which a waiver has been granted,” without the need to obtain any separate EPA waiver.³⁸ As of August 2019, 14 states had adopted California’s LEV greenhouse gas emission regulations and ZEV regulations.³⁹ In June 2020, CARB adopted the Advanced Clean Truck Rule, requiring manufacturers of medium- and heavy-duty vehicles to sell zero-emission trucks as an increasing percentage of their annual California sales, beginning in 2024 and reaching 40-75% (varying based on truck class) by 2035.⁴⁰

c. Low-carbon fuel standard

In April 2009, CARB approved a regulation adopting a low-carbon fuel standard (LCFS), designed to cut the average “carbon intensity” of transportation fuels by 10% over 10 years.⁴¹ The regulation established a policy for calculating the life-cycle emissions of all vehicle fuels, specifically measuring the level of GHG emissions associated with the production, distribution, and consumption of gasoline, diesel fuels and their alternatives. Fuel providers, refiners, importers, and blenders are required to demonstrate that the mix of fuels they supply meets the declining “carbon intensity” standard each year through a market-based reporting system based on

the amount of fuel sold in the state.

While the LCFS has faced litigation challenges, it has been upheld by the Ninth Circuit twice and remains in place. In December 2011, a district court temporarily enjoined enforcement of the standard, holding (*inter alia*) that because the standard assigns more favorable carbon intensity values to corn-derived ethanol in California than to ethanol derived out-of-state, it impermissibly discriminates against out-of-state entities and thus violates the dormant Commerce Clause.⁴² However, in September 2013, the Ninth Circuit reversed its decision, instead holding that the LCFS did not impermissibly discriminate and did not violate the dormant Commerce Clause.⁴³ The court noted that, while California is generally exempt from the Clean Air Act's provision on fuel standards preemption, it declined to answer whether the federal Renewable Fuel Standard (see *supra*) established by Clean Air Act Section 211(o) could preempt the LCFS.⁴⁴ Litigation continued, and in 2019 the Ninth Circuit again rejected a Commerce Clause challenge.⁴⁵

2. Massachusetts

In 2008, Massachusetts enacted the Global Warming Solutions Act, which mandates emissions reductions of up to 25% below 1990 levels by 2020 and 80% by 2050.⁴⁶ In July 2009, Massachusetts released final reporting rules and baseline figures under which the state will be able to measure its progress in reducing GHG emissions.⁴⁷ In January 2011, the state released a plan designed to achieve a reduction of statewide GHG emissions by 25% below 1990 levels by 2020 through expansion of existing programs, along with new initiatives in building standards, electricity generation, and transportation.⁴⁸ In 2016, the Massachusetts Supreme Judicial Court ordered the Massachusetts Department of Environmental Protection (MassDEP) to take additional measures to implement the Global Warming Solutions Act. The court held that the Act required MassDEP to impose volumetric limits on aggregate greenhouse gas emissions from certain types of sources and that these limits were required to decline on an annual basis.⁴⁹ On September 16, 2016, Governor Charles D. Baker issued an executive order providing direction for the state's efforts to mitigate greenhouse gas emissions and to build resilience and adapt to climate change.⁵⁰ The order also required MassDEP to publish final regulations to meet the 2020 statewide emissions limit mandated by the Global Warming Solutions Act by August 2017.

3. New York

In July 2019, New York enacted the Climate Leadership and Community Protection Act (CLCPA).⁵¹ The CLCPA requires the New York State Department of Environmental Conservation (DEC) to promulgate regulations to achieve statewide

⁵⁰Exec. Order No. 569.

⁵¹L. 2019, ch. 106 (primarily codified at N.Y. Env'tl. Conserv. Law art. 75, N.Y. Pub. Serv. Law § 66-p).

greenhouse gas emissions limits of 60% of 1990 emissions by 2030 and 15% of 1990 emissions by 2050, as well as to advance the goal of net-zero emissions by 2050.⁵² CLCPA sets criteria for alternative compliance mechanisms for sources to achieve net-zero emissions, authorizing DEC to provide for use of such mechanisms to account for up to 15% of statewide emissions if the approved offset projects do not place a “disproportionate burden” of environmental impacts on disadvantaged communities. CLCPA extends this requirement of not disproportionately burdening disadvantaged communities to all state agencies in making certain environmental decisions. Moreover, CLCPA requires that disadvantaged communities receive at least 35% (with 40% as a goal) of the overall benefits of spending on clean energy and energy efficiency. The CLCPA further requires the New York State Public Service Commission (PSC) to establish a renewable energy program to require at least 70% of statewide electric generation in 2030 to come from renewable sources and to achieve zero emissions in the electric sector by 2040. The PSC must also establish programs to require 9 gigawatts (GW) of offshore wind generation by 2035, 6 GW of photovoltaic generation by 2025, and 3 GW of statewide energy storage capacity by 2030.

CLCPA established a new Climate Action Council, as well as an Environmental Justice Advisory Group and Climate Justice Working Group, to develop a Scoping Plan with recommendations for attaining the emissions limits. DEC, in consultation with the New York State Energy Research and Development Authority, has also issued guidance establishing a Social Cost of Carbon (see *supra*) for use by State agencies, setting a central value (at a 2% discount rate) of \$125 per ton of CO₂ for 2020.⁵³

B. Clean electricity targets

Many states have adopted policies to limit emissions from the electric power sector, often in parallel or as a precursor to economy-wide targets. One common policy is a Renewable Portfolio Standard (RPS) requiring a certain percentage of electricity sold by certain years to be generated by renewable resources—with variation in which resources are eligible, which utilities or other suppliers are covered, and which types of offsets are possible. As of December 2020, 30 states, three territories, and the District of Columbia have adopted an RPS, and seven states and one territory have set voluntary renewable targets for the power sector.⁵⁴

Going beyond partial RPS requirements, several states have adopted legislation setting binding targets for 100% zero-carbon electricity. These states include New York⁵⁵ (by 2040); and California,⁵⁶ Hawaii,⁵⁷ New Mexico,⁵⁸ Virginia,⁵⁹ and Washington⁶⁰ (by 2045). For example, in March 2019, New Mexico enacted a law requiring

that “zero carbon resources” supply 100% of all retail sales of electricity by 2045.⁶¹ The law also provided for the closure of a coal-fired power plant in the state. In May 2019, Washington enacted the Clean Energy Transformation Act, which sets milestones for reducing electric utilities greenhouse gas emissions. By 2025, utilities must eliminate coal-fired electricity; by 2030, utilities must be greenhouse gas neutral; and by 2045, all electricity must be 100% renewable or non-emitting.

Other states have adopted non-binding goals for 100% clean electricity, including legislation in Colorado,⁶² Maine⁶³ and Nevada⁶⁴ and executive orders in Connecticut,⁶⁵ Rhode Island,⁶⁶ and Wisconsin.⁶⁷

C. *Energy efficiency resource standards*

At least 26 states have adopted an Energy Efficiency Resource Standard (EERS) to require electric utilities to meet energy savings targets, with 10 of these states extending similar requirements to gas utilities.⁶⁸ Covered utilities must implement energy efficiency programs (such as weatherization, efficient appliance rebates, incentives for demand reduction) for their customers in order to achieve the savings targets. Examples of particularly robust EERS policies include Massachusetts (2.7% annual electricity savings), Arizona (2.5%), Rhode Island (2.5%), Vermont (2.4%), and Maine (2.3%), and New York’s requirement of 3% annual electricity savings by 2025 will become one of the country’s most stringent EERS policies.⁶⁹

§ 24:10 Tribal efforts

Many Native American tribes are uniquely vulnerable to the effects of climate change because their culture and way of life is largely dependent on the natural environment. In addition, many areas near or on tribal lands have become targets for nuclear waste dumps, abandoned mines, and contaminated waterways, which increase the negative health impacts on tribal members. Tribal efforts to reduce greenhouse gas emissions and to increase the use of renewable sources of energy on their lands are discussed in more detail in §§ 24:36 to 24:40.

§ 24:11 Local efforts

Local governments are also taking action to reduce greenhouse gas emissions, with more than 200 cities and counties having committed to (or already achieved) a

⁶⁹Natural Resources Defense Council, *Race to 100% Clean* (Dec. 2, 2020), <https://www.nrdc.org/resources/race-100-clean>.

transition to 100% clean energy.¹ Several local policies have focused on sectors like buildings, where municipalities have clear jurisdiction to regulate. Some representative examples are highlighted below.

A. *Portland, Oregon*

Portland has adopted a climate action plan to reduce CO₂ emissions by 40% by 2030 and 80% by 2050, compared with 1990 levels. The plan outlines several sector-specific initiatives to achieve this goal. With respect to buildings, the city will strive to achieve zero GHG emissions in all new residential and commercial buildings, recover 90% of all solid waste generated, improve the energy efficiency of freight movement within the city, expand the urban forestry to cover one third of the city, and to establish a tax credit for businesses that install green roofs and solar panels.²

B. *New York, New York*

New York City has adopted several policies to improve efficiency and reduce emissions in the buildings sector.³ In December 2009, the New York City Council enacted an energy-efficiency legislative package for government, commercial, and residential buildings in New York City called the Greener, Greater Buildings Plan. Among the most significant new provisions is Local Law 87, which requires large buildings (those over 50,000 square feet, which accounts for half of the building square footage in the city) to conduct periodic energy audits and retro-commissioning (ensuring correct equipment installation and performance) measures. The enacted law removed a provision from an earlier bill that would have also required retrofitting (installation of new technology) measures based on the results of large building audits. Unlike private buildings, city-owned buildings larger than 10,000 square feet must still retrofit with “all reasonable capital improvements” within a year of filing an audit report if the work would generate an energy cost-savings payback within seven years. Local Law 84 requires buildings over 50,000 square feet to benchmark their energy use and water consumption through EPA’s Portfolio Manager energy program. Local Law 85 established the New York City Energy Conservation Construction Code for building renovations that, among other things, removed an exemption from the State Energy Code for renovations that include less than 50% of a building’s subsystems. Local Law 88 requires large commercial buildings to carry out lighting upgrades by 2025.

In April 2019, New York City enacted the multi-bill Climate Mobilization Act, including Local Law 97, which requires a 40-percent reduction in carbon emissions from nearly 50,000 public and private sector buildings by 2024, bringing such reductions to 2005 levels by 2030.⁴ However, the Real Estate Board of New York has been fierce in its opposition to this bill, and it remains to be seen whether it will be implemented as currently conceived by the City Council.

C. *San Diego, California*

In December 2015, San Diego adopted a Climate Action Plan (CAP) with targets to reduce city-wide greenhouse gas emissions, below 2010 levels, 24% by 2020, 41%

by 2030, and 51% by 2035, in order to help achieve California’s goal of 80% reduction by 2050.⁵ The CAP identified implementation actions for five key areas: energy and water efficient buildings; clean and renewable energy; bicycling, walking, transit, and land use; zero waste (gas & waste management); and climate resiliency. As of 2019, all 17 actions identified in the CAP were in progress or completed, and greenhouse gas emissions had already decreased by 24% below the 2010 baseline. Sector-specific achievements included a 2.5% reduction in municipal energy usage and 15% reduction in residential energy usage since 2010; plans for a community choice energy program to achieve 100% renewable electricity by 2035; deployment of 64 electric vehicle charging stations; elimination of parking requirements for new multi-family developments within a half-mile of a public transit stop; improvements or additions of 42 miles of bike lanes; diversion of 65% of waste from landfills; and planting of 1,089 trees.⁶

§ 24:12 Litigation

Numerous lawsuits have been filed to address global climate change.¹ They fall into two broad categories: administrative law claims and civil claims. Some representative cases in each category are included below. A more comprehensive discussion of these and other cases is included in §§ 24:47 to 24:52.

A. Administrative Law Claims: *Massachusetts v. EPA*

In 1999, the International Center for Technology Assessment (ICTA) petitioned the Environmental Protection Agency (EPA) to regulate certain greenhouse gas (GHG) emissions from new motor vehicles. This petition wound its way through the EPA process and was denied in 2003. The denial was challenged by the ICTA, 12 states, and others. The U.S. Court of Appeals for the District of Columbia upheld the denial in a split decision.²

On April 2, 2007, the U.S. Supreme Court issued a 5-4 decision reversing the D.C. Circuit.³ The majority decision was authored by Justice Stevens and joined by Justices Kennedy, Souter, Ginsburg and Breyer. The majority found that “[t]he harms associated with climate change are serious and well recognized,” and that EPA did not “dispute the existence of a causal connection between man-made greenhouse gas emissions and global warming.”⁴ Addressing the plaintiffs’ standing, the Court declared that “[o]nly one of the petitioners needs to have standing to permit us to consider the petition for review,” and that a sovereign state, Massachusetts, was among the plaintiffs.⁵ Petitioners’ uncontested affidavits showed that “the rise in sea levels associated with global warming has already harmed and will continue to harm Massachusetts. The risk of catastrophic harm, through remote, is neverthe-

³*Massachusetts v. E.P.A.*, 549 U.S. 497, 127 S. Ct. 1438, 167 L. Ed. 2d 248, 63 Env’t. Rep. Cas. (BNA) 2057 (2007).

⁴127 S. Ct. at 1455.

⁵127 S. Ct. at 1453–1454.

less real.”⁶ Though an EPA decision to regulate greenhouse gas emissions from new motor vehicles might have only a small benefit to the Massachusetts coastline, that is enough to confer standing. The Court found that EPA’s argument against standing “rests on the erroneous assumption that a small incremental step, because it is incremental, can never be attacked in a federal judicial forum.”⁷

The Court then turned to the merits. The Court said that it had “little trouble concluding” that the Clean Air Act authorizes EPA to regulate greenhouse gas emissions from new motor vehicles in the event that it forms a judgment that such emissions contribute to climate change. The Clean Air Act has a “sweeping definition” of “air pollutant” that “embraces all airborne compounds of whatever stripe.”⁸ According to the Court, “[r]ather than relying on statutory text, EPA invokes postenactment congressional actions and deliberations it views as tantamount to a congressional command to refrain from regulating greenhouse gas emissions.”⁹ The Court also rejected EPA’s conclusion that even if it does have statutory authority to regulate greenhouse gases, it would be unwise to do so, finding that this “rests on reasoning divorced from the statutory text.”¹⁰ The Court found that “[u]nder the clear terms of the Clean Air Act, EPA can avoid taking further action only if it determines that greenhouse gases do not contribute to climate change or if it provides some reasonable explanation as to why it cannot or will not exercise its discretion to determine whether they do.”¹¹ The Court declared that “EPA has offered no reasoned explanation for its refusal to decide whether greenhouse gases cause or contribute to climate change,” and therefore its action was “arbitrary, capricious, . . . or otherwise not in accordance with law.”¹² The Court explicitly did not reach the question of whether on remand EPA must make an endangerment finding, or whether policy concerns can inform EPA’s actions in the event that it makes such a finding.¹³

Two dissenting opinions were filed—one by Chief Justice Roberts on standing, and one by Justice Scalia on the merits. Chief Justice Roberts expressed alarm that the majority opinion was opening up standing too broadly. He said there was no basis for giving special solicitude to states as plaintiffs.¹⁴ He declared that there was no evidence that Massachusetts was really losing coastal land as a result of climate change, or that such loss was caused by EPA’s failure to regulate greenhouse gases from motor vehicles, or that any injury it suffered would be redressed by a victory in this case.¹⁵ Justice Scalia found no requirement in the Clean Air Act that the Administrator of EPA make a judgment about whether to regulate greenhouse gases, as opposed to deferring any decision.¹⁶ He also found that EPA had looked at the science and reasonably concluded that there is too much scientific uncertainty to regulate greenhouse gases.¹⁷ Moreover, he disagreed with the majority’s reading of the term “air pollutant” in the Clean Air Act, and said that EPA’s judgment that

greenhouse gases do not qualify should receive deference.¹⁸

B. Civil Claims

Several lawsuits have been brought claiming that GHG emissions are a public nuisance or otherwise actionable at common law. As of the time of this writing, such cases have been unsuccessful.

1. Nuisance: *Connecticut v. American Electric Power*

In *Connecticut v. American Electric Power Co.*,¹⁹ eight states²⁰ and the City of New York sued the five biggest power companies in the United States, claiming their emissions were a nuisance by contributing to global warming. The District Court for the Southern District of New York dismissed their suit, finding it raised a political question that could not be answered by the courts. The court noted that Congress had recognized that carbon dioxide emissions caused global warming and that global warming would have severe adverse impacts.²¹ However, as Congress had refused to impose limits on carbon dioxide emissions, as sought by the plaintiffs, the court found it was without authority to resolve the political question. In September 2009, the Second Circuit reversed the district court, holding that while the plaintiffs' claims had political implications, the claims remained justiciable in the federal courts and the states, the city, and the land trusts all had standing to pursue those claims.²² The court acknowledged that the political implications of any decision involving possible limits on CO₂ emissions are important in the context of climate change, but held that not every case with political overtones is nonjusticiable and that it was error to equate a political question with a political case. While acknowledging that the EPA or Congress could still issue regulations or adopt legislation that pre-empted the field, neither had done so, and the court therefore found that the plaintiffs' claims were not displaced by other federal laws or regulations. On December 6, 2010, the U.S. Supreme Court granted certiorari.²³

On June 20, 2011, the Court issued a decision,²⁴ unanimously holding that the Clean Air Act displaces federal common law nuisance claims brought to reduce greenhouse gas emissions. This decision reverses the holding of the Second Circuit that states and private parties may pursue a public nuisance action under federal common law to limit power plants' greenhouse gas emissions. The opinion, written by Justice Ruth Bader Ginsburg, notes that the eight-member court (Justice Sonia M. Sotomayor was on the Second Circuit panel, though she was elevated before the decision was issued, and she recused herself) divided 4-4 on whether plaintiffs in this case had standing to bring suit, and thus whether the federal court had jurisdiction, affirming the decision below on this point. Because the Second Circuit found

²⁴131 S. Ct. 2527, 180 L. Ed. 2d 435 (2011).

in favor of jurisdiction, the Supreme Court proceeded to consider plaintiffs' federal common law claims. Referencing *Massachusetts v. EPA*,²⁵ the Supreme Court held that the Clean Air Act addresses carbon dioxide from defendants' plants and thus displaces the federal common law of nuisance. The Court remanded the case, declining to rule on plaintiffs' state law tort claims.

2. Class Action: *Comer v. Nationwide Mutual Insurance Co.*

In *Comer v. Nationwide Mutual Insurance Co.*,²⁶ 14 victims of Hurricane Katrina sought class certifications in a lawsuit against numerous insurance companies that issued policies insuring affected properties, mortgage lenders that allegedly failed to maintain adequate insurance coverage on these properties, and chemical manufacturers and oil companies that allegedly caused damage to affected properties by contributing to climate change. In a 2006 decision, the court refused to certify the insurance company and mortgage lender classes based on the difficulty and impracticality of resolving "individual questions of damage, coverage, policy provisions, mortgage obligations, and other relevant particulars" through the class action framework.²⁷ The court also declined to determine whether a class action was the appropriate vehicle for resolving plaintiffs' claims against the chemical manufacturer and oil company defendants but granted plaintiffs leave to file an amended complaint to clarify their claims against these defendants. The court addressed the seemingly insurmountable difficulties of basing a class action, or any lawsuit, on damages resulting from a defendant's contribution to global warming, concluding that although plaintiffs were free to pursue their lawsuit, the court foresaw "daunting evidentiary problems" in proving their allegations by a preponderance of the evidence.²⁸ In August 2007, the district court dismissed the suit, finding that the issues raised were political questions more appropriate for the legislative and executive branches and that plaintiffs did not have standing.²⁹

In October 2009, the Fifth Circuit reversed, finding that the plaintiffs had standing to assert their nuisance, trespass, and negligence claims.³⁰ The circuit court held that for purposes of Article III standing, an indirect causal relationship will suffice so long as there is a fairly traceable connection between the alleged injury and the conduct of the defendant, and that the traceability need not be as close as the proximate causation needed to succeed on the merits of a tort claim. The court further held that the plaintiffs' claims did not present nonjusticiable political questions because they did not present any specific question that is exclusively committed by law to the discretion of the legislative or executive branch. However, the Fifth Circuit did uphold the dismissal of the plaintiffs' claims for unjust enrichment, fraudulent misrepresentation and civil conspiracy, finding that the plaintiffs lacked standing on these claims given that they essentially alleged a massive fraud on the political system resulting from the failure of environmental regulators to impose proper costs on the defendants, and that this type of generalized grievance was best left to the legislative and executive branches.

In February 2010, the Fifth Circuit granted *en banc* review and vacated the 2009

decision.³¹ In a subsequent decision in May 2010, the Fifth Circuit held that it could not give the lawsuit *en banc* review because it no longer had a quorum to do so, but it left standing the order vacating the panel decision.³² This action means that the district court's dismissal of the lawsuit stands. The court said plaintiffs may now seek review from the U.S. Supreme Court. Three judges vigorously dissented. On January 10, 2011, the Supreme Court rejected without comment plaintiffs' request for a writ of mandamus.³³

Plaintiffs filed a new lawsuit against energy and chemical company defendants alleging public and private nuisance, trespass, and negligence claims.³⁴ In March 2012, the district court dismissed the claims on the grounds that they were barred by *res judicata* and collateral estoppel.³⁵ The court further held that the plaintiffs did not have standing because their alleged injuries were not fairly traceable to the defendants' conduct.³⁶ The court also ruled that the claims presented a nonjusticiable political question, that the claims were displaced by the Clean Air Act, that they were barred by the statute of limitations, and that the complaint failed to state a plausible claim for relief.³⁷

In May 2013, the Fifth Circuit affirmed the district court's dismissal on *res judicata* grounds.³⁸ The Fifth Circuit rejected plaintiffs' arguments that the district court's 2007 judgment was not final or on the merits, noting that at no point in the protracted appeals process had the district court's 2007 judgment been disturbed.³⁹ The Fifth Circuit also refused plaintiffs' request for an equitable exception to *res judicata*, invoking the "well-known rule that a federal court may not abrogate principles of *res judicata* out of equitable concerns."⁴⁰ The Fifth Circuit also held that the 2007 judgment was on the merits since *res judicata* principles apply to jurisdictional determinations.⁴¹

3. Public Trust Doctrine: *Juliana v. United States*

In 2015, 21 individual plaintiffs, all age 19 or younger, filed a lawsuit in the federal district court for the District of Oregon against the United States, the president, and various federal officials and agencies. The plaintiffs asked the court to compel the defendants to take action to reduce carbon dioxide emissions so that atmospheric CO₂ concentrations would be no greater than 350 parts per million by 2100. The plaintiffs alleged that the "nation's climate system" was critical to their rights to life, liberty, and property, and that the defendants had violated their

substantive due process rights by allowing fossil fuel production, consumption, and combustion at “dangerous levels.” The plaintiffs also asserted an equal protection claim based on the government’s denial to them of fundamental rights afforded to prior and present generations. They further asserted violations of rights secured by the Ninth Amendment, which the plaintiffs said protects “the right to be sustained by our country’s vital natural systems, including our climate system.” The plaintiffs additionally alleged that defendants failed to fulfill their obligations under the public trust doctrine.⁴²

In 2016, the district court denied motions to dismiss the public trust and due process claims against the United States and federal officials and agencies.⁴³ The court held that the action did not raise a nonjusticiable political question because it asked the court to determine whether defendants had violated the plaintiffs’ constitutional rights, a question “squarely within the purview of the judiciary.” The court also concluded that the plaintiffs had adequately alleged standing to sue. In determining that the plaintiffs had adequately alleged a due process claim, the court said that the plaintiffs had asserted a fundamental right “to a climate system capable of sustaining human life” and that the plaintiffs’ allegations regarding the defendants’ role in creating the climate crisis, the defendants’ knowledge of the consequences of their actions, and the defendants’ deliberate indifference in failing to act to prevent the harm were sufficient to state a “danger-creation” due process claim. In finding that the plaintiffs had adequately stated a public trust claim, the court said that it was not necessary to determine whether the atmosphere was a public trust asset because the plaintiffs had also alleged the claim in connection with the territorial sea, to which the Supreme Court had said “[t]ime and again” that the public trust doctrine applies. The court also rejected the arguments that the public trust doctrine does not apply to the federal government and that federal environmental statutes displaced public trust claims.

In October 2018, the district court denied almost all aspects of the government’s pending dispositive motions.⁴⁴ The court declined to rule for the defendants on the primary claims advanced by the plaintiffs: the “state-created danger” due process claim and the public trust claim. The court dismissed President Trump from the action (but without prejudice) and also granted summary judgment to the defendants on the plaintiffs’ Ninth Amendment claim and on an equal protection claim based on “posterity” being a suspect classification. The district court said, however, that an equal protection claim based on alleged interference with a right to a climate system capable of sustaining human life would be aided by further development of a factual record. The district court rejected the government’s arguments that the case was required to be heard under the Administrative Procedure Act; that separation of powers principles foreclosed the plaintiffs’ claims; that plaintiffs lacked standing; and that there is no right to a climate system capable of sustaining human life.

In January 2020, the Ninth Circuit, in a split decision, ruled that the plaintiffs did not have Article III standing.⁴⁵ The Ninth Circuit rejected the government’s argument that the plaintiffs’ constitutional claims had to be brought pursuant to the Administrative Procedure Act and agreed with the district court that the plaintiffs met the injury and causation requirements for Article III standing because at least some plaintiffs had alleged concrete and particularized injuries caused by fossil fuel carbon emissions that were increased by federal subsidies and leases. The

⁴⁵Juliana v. United States, 947 F.3d 1159 (9th Cir. 2020).

Ninth Circuit found, however, that the plaintiffs had not established the redressability requirement for standing. The court said it was “skeptical” that even the first prong of redressability—that the relief sought be substantially likely to redress the plaintiffs’ injuries—was satisfied, noting that the plaintiffs conceded “that their requested relief will not alone solve global climate change.” The Ninth Circuit further concluded that even if the first prong was satisfied, the plaintiffs did not “surmount the remaining hurdle” of establishing that the relief they sought was within the power of Article III courts. The majority wrote that “[t]here is much to recommend the adoption of a comprehensive scheme to decrease fossil fuel emissions and combat climate change, both as a policy matter in general and a matter of national survival in particular,” but said it was beyond judicial power “to order, design, supervise, or implement the plaintiffs’ requested remedial plan.” The majority said it “reluctantly” concluded that “the plaintiffs’ case must be made to the political branches or to the electorate at large” and “[t]hat the other branches may have abdicated their responsibility to remediate the problem does not confer on Article III courts, no matter how well-intentioned, the ability to step into their shoes.” The dissenting judge would have held that the plaintiffs had standing and that they had asserted claims under the Constitution and presented sufficient evidence to proceed to a trial. The dissent contended that “a federal court need not manage all of the delicate foreign relations and regulatory minutiae implicated by climate change to offer real relief, and the mere fact that this suit cannot alone halt climate change does not mean that it presents no claim suitable for judicial resolution.”

IV. ADAPTATION—INTRODUCTION

§ 24:13 In general

This section of the chapter focuses on climate “adaptation,” defined in the 2018 National Climate Assessment as actions taken at the individual, local, regional, and national levels to reduce risks from current and future climate conditions.¹ This concept of adaptation shares overlapping characteristics with “resilience,” another frequently used term that also has many definitions.² In the context of climate change, resilience generally refers to a set of qualities that aid disaster recovery and facilitate continuity—in both government and the community—in the face of climate change impacts. Resilience and the ability to adapt are often positively related, since an increase in the capacity to adapt may also increase resilience and vice versa.³ Given the parallel correlation of these two concepts, the terms for “adaptation” and “resilience” will be used interchangeably in this section.

This section is organized into three sub-sections divided according to how different levels of government in the United States—federal, state, and local—are adapting to climate change. Federal, state, and local governments merit separate attention and analysis because, despite some overlap, each level of government has a

different legal authority and jurisdiction to address the climate crisis. This section first outlines federal laws, agencies, and programs relevant to adaptation, including some examples relevant to tribal adaptation (additional discussion can be found under the section on tribes and climate change). This section then presents key examples of how states and localities are addressing adaptation, focusing on some of the most common legal, regulatory, and policy frameworks that have been used around the country in the absence of a specific, comprehensive federal law or program to provide for adaptation.

This section on climate change adaptation is intended to provide a starting point for practitioners new to the area of climate adaptation or those seeking to understand how the field has changed in recent years. This section is not intended to be a comprehensive survey of laws or policy actions across different levels of government, nor does it fully address adaptation for any particular sector (e.g., natural resources and public lands management, transportation) or climate impact (e.g., sea-level rise, drought, wildfires). Where appropriate, this section provides examples of how different jurisdictions have adopted and/or implemented the specific legal, regulatory, and policy mechanisms discussed herein.

V. ADAPTATION—FEDERAL

§ 24:14 Appropriate government scope for climate adaptation

There is debate among scholars regarding which level of government should assume responsibility for climate change adaptation. Many emphasize the benefits of a local government role, including the greater sense of community ownership and responsibility;¹ the ability to incorporate local knowledge and tailor adaptation to local needs;² and the potential for greater community participation.³ Others have pointed out the disadvantages of local control, including lack of local capacity and resources and the need for cross-jurisdictional coordination.⁴ There is also concern that local control could result in an unfair distribution of adaptation costs, benefits, and risks by excluding traditionally marginalized actors and vulnerable popula-

tions,⁵ or by imposing negative externalities on other localities.⁶

Some commentators call for an overlapping “polycentric system,” where each level of government has some authority to prescribe rules for how resources are used, and no single level has primary authority.⁷ For example, legal scholar Damien Leonard calls for a new overarching law on climate change adaptation that integrates planning between different levels of government, similar to the principle of cooperative federalism carried out through the Coastal Zone Management Act (CZMA).⁸ Others call for a larger private sector role,⁹ noting the need for private citizens to take ownership of adaptation problems,¹⁰ and to avoid a “moral hazard” where government bailouts reduce incentives for personal responsibility.¹¹ There is also a view that addressing climate change is both a public and a private responsibility, where the government must work with non-government entities.¹²

§ 24:15 Scope of federal adaptation law

A. Lack of specific laws

In the late 2000s, the United States was moving on a course toward building federal adaptation law. President Obama’s administration ushered in a series of small measures to acknowledge, if not address, threats posed by climate change. In 2009, President Obama signed Executive Order 13514, which required agencies to evaluate climate-change risks and vulnerabilities and established a task force to

develop policy recommendations.¹ In 2013, Executive Order 13653 established a new federal interagency body, the Council on Climate Preparedness and Resilience,² and called for federal agencies to create adaptation plans. Thirty-eight federal agencies submitted adaptation plans in response.³ In 2017, upon taking office, President Trump issued Executive Order 13783 to revoke Executive Order 13653.⁴ As of publication, President-Elect Biden is expected to reinstate many Obama-era climate orders upon taking office in 2021.

Currently, there is no overarching federal climate adaptation legislation and no coordinating agency. However, this does not mean there is no federal climate change adaptation law; indeed, there are an overwhelming number of laws, agencies, and programs relevant to adaptation. Many of them revolve around disaster management and post-disaster recovery, although several agencies are beginning to pay more attention to pre-disaster mitigation and prevention. Federal laws on natural resource management and the federal government's role as a landowner also require federal engagement with climate adaptation. Rather than attempt an inventory of every relevant law, this overview provides an introduction to some of the major relevant approaches.

B. Research programs related to climate change adaptation

A number of federal agencies and programs are dedicated to gathering more information on climate change.⁵ Key examples are the U.S. Global Change Research Program (USGCRP),⁶ which issues a National Climate Assessment⁷ every four years, and the National Oceanic and Atmospheric Administration's (NOAA) Climate Program Office.⁸

§ 24:16 Assistance programs related to disaster management

Climate adaptation and disaster management share certain similarities. They both seek to reduce or respond to the harms caused by hazards. However, there are some distinct differences.¹ Disaster management may refer both to hazards that are directly affected by climate change (e.g., floods, drought) and those that are not (e.g., earthquakes, terrorism). Climate adaptation focuses on current *and* future threats, while disaster management traditionally focuses on current threats. For example, a flood map that illustrates historic or current flood risk may be useful for disaster management, while a flood map that shows projected future risk due to sea

Int. Dev.* 247-264 (2010).

level rise would be useful for climate adaptation. Laws and policies related to disaster management, therefore, are not entirely aligned with climate adaptation, but in the absence of dedicated climate adaptation governance, disaster governance structures are most often leveraged to adapt in the United States.

A. *Scope: Stafford Act and definition of disasters*

The Robert T. Stafford Disaster Relief and Emergency Assistance Act (Stafford Act) lays the groundwork for disaster relief and planning for natural disasters.² It establishes the process for a Presidential Disaster Declaration (PDD), which is required for many types of national disaster funding.³ Before a presidential disaster can be declared, there must be a state or tribal disaster declaration.⁴ As disaster relief is intended to become available when local resources are overwhelmed, a disaster must meet certain thresholds to garner a state declaration.⁵ As of this writing, the Federal Emergency Management Agency (FEMA) is proposing to raise these thresholds.⁶ Federally recognized tribes are able to directly ask the president for a disaster declaration without going through a state, but this process involves cost-sharing requirements.⁷

Once a state or tribal disaster declaration has been made, FEMA advises the President whether to declare a disaster.⁸ In deciding what to recommend to the President, FEMA considers whether the disaster is beyond the capabilities of the affected state, tribal, or local governments.⁹ While there are criteria for how much funding a disaster merits, there are no clear criteria for whether a disaster is beyond the capacity of state, tribal, or local governments.¹⁰ As a result, the process for declaring a disaster has been criticized for falling victim to political favoritism.¹¹

Disasters addressed by the Stafford Act include hurricanes, tornados, storms, floods, tidal waves, tsunamis, earthquakes, volcanic eruptions, landslides, snowstorms, and droughts.¹² The exclusion of several climate change-related hazards

¹²42 U.S.C. § 5122.

(e.g., heat waves) from the definition of disaster is noteworthy since these slow-moving disasters plague many communities.¹³ Erosion is addressed through the national disaster regime only if it is sudden, such as when a storm occurs.¹⁴

A PDD is important because of the funding and agency support that comes with it.¹⁵ Once a national disaster is declared, FEMA utilizes the incident command system to coordinate the response with other agencies (and in some cases, the military). It provides public assistance to support government and non-government entities and individual assistance for housing and other expenses.¹⁶ Payouts for disasters can be substantial. Congress provided roughly \$120 billion for Hurricane Katrina (2005), \$60 billion for Hurricane Sandy (2012), and \$20.6 billion for Hurricane Maria (2017) recovery efforts.¹⁷ Following Hurricanes Harvey and Maria in 2017, Congress appropriated \$23.5 billion for the FEMA Disaster Relief Fund, \$17.39 billion for the U.S. Army Corps of Engineers (USACE), \$28 billion to Department of Housing and Urban Development (HUD) Community Development Block Grants, \$1.65 billion to the Small Business Administration (SBA), and various smaller amounts to the Department of Commerce, Department of Defense, Department of Education, Customs and Border Patrols, and Veterans Affairs.¹⁸

Part of the difficulty in declaring a disaster based on damage is determining whether damage is due to the hazard or to aging, unmaintained, or vulnerable infrastructure. In 2018, the Bipartisan Budget Act granted FEMA additional authority under Section 428 of the Stafford Act to provide assistance to replace or *fully* restore a facility or system and its functions including communications, electric, and other critical services rather than just restoring a facility to its pre-disaster conditions, which may have been substantially less than full functionality.¹⁹

B. FEMA programs

FEMA is the main federal agency responsible for short-term disaster response, long-term disaster recovery, and pre-disaster risk reduction efforts. As mentioned in the opening of § 24:16, disaster management may overlap with climate adaptation when and if disaster management also addresses the long-term effects of climate change. Efforts at preventing future risk—also called hazard mitigation or disaster risk reduction efforts—are most likely to coincide with climate adaptation, especially when they address climate-related hazards. FEMA has traditionally focused primarily on disaster response and recovery, but emphasis has shifted to risk reduc-

¹³See, e.g., U.S. ARMY CORPS OF ENGINEERS, ALASKA BASELINE EROSION ASSESSMENT, STUDY FINDINGS AND TECHNICAL REPORT (2009).

¹⁴In *Severance v. Patterson*, the Texas Supreme Court based its decision on a distinction between slow-onset erosion and ‘avulsive’ erosion that occurs rapidly due to a storm. *Severance v. Patterson*, 370 S.W.3d 705, 712 (Tex. 2012).

tion in recent years.

1. Disaster recovery and risk reduction funding

FEMA oversees several hazard mitigation programs that provide funding for disaster mitigation and risk reduction, including the Hazard Mitigation Grant Program (HMGP), Building Resilient Infrastructure and Communities (BRIC),²⁰ and Flood Mitigation Assistance (FMA).²¹ FEMA allows a state or tribe that has received a disaster declaration in the past year to apply for HMGP funding, which the recipient can re-grant to localities or tribes to reduce their hazard risks.²² Rather than providing states with a set, consistent amount of funding, HMGP funds are calculated as a percentage of payouts made through the last disaster declaration.²³ BRIC funds do not require a disaster declaration, and the amount of funding available is whatever Congress chooses to allocate to the program that year.²⁴ Both HMGP and BRIC provide funding opportunities for mitigation actions such as property acquisition and relocation, as well as disaster preparedness actions such as installing disaster warning systems.²⁵ Both HMGP and BRIC require a 25% match, or 10% for small and impoverished communities.²⁶ FMA provides funds to states, territories, tribes, and local governments to prepare flood mitigation plans and carry out mitigation projects. FMA requires communities to participate in the National Flood Insurance Program (NFIP, more fully discussed in the next subsection).²⁷

BRIC provides for a larger amount of funding than its predecessor, the pre-disaster mitigation program: the President may set aside 6% of the funding spent on presidential disaster declarations in the previous federal year for BRIC funding.²⁸ BRIC is available annually to states for which the President issued a disaster declaration in the past seven years. BRIC breaks down funding opportunities between state and territory allocation, tribal awards, and the national competition category. In the 2020 application cycle, these totaled \$500 million in funding opportunities.²⁹ Applicants' projects will still be subject to a cost sharing structure, with 75% of the project to be funded with federal funding and 25% with non-federal funding, except for small impoverished communities, in which case 90% of funding is federal and 10% non-federal.³⁰

While BRIC seeks to strategically shift the federal focus from reactive disaster management to preventative infrastructure and resiliency projects, there are many critiques about the methods it uses to accomplish this. Most notably, BRIC carries

forward the arguably arbitrary principle of tying together hazard mitigation funding with how much was spent on a previous disaster declaration—a declaration that may or may not relate to a community’s vulnerability to disaster in the future.³¹

2. Flood insurance

The National Flood Insurance Program (NFIP) was established by the National Flood Insurance Act (NFIA) of 1968 to provide homeowners and renters with insurance coverage for flood damage.³² The NFIP is intended to “Better indemnify individuals for flood losses through insurance; Reduce future flood damages through State and community floodplain management regulations; and Reduce Federal expenditures for disaster assistance and flood control.”³³

To participate in NFIP, a household must be in a community with ordinances that meet minimum federal requirements to restrict development within Special Flood Hazard Areas (SFHAs): areas with flood, mudflow, or flood-related erosion hazards designated by FEMA in flood insurance rate maps (FIRMs). Homes in these areas that are purchased with a federally-backed mortgage must carry flood insurance³⁴ and must comply with local floodplain management ordinances.³⁵ Communities that participate in NFIP are eligible to apply for funding from FEMA’s Flood Mitigation Assistance program,³⁶ which can be used to prepare flood mitigation plans and implement measures to reduce flood losses (such as elevation or relocation of insured structures).³⁷ Communities may also participate in the Community Rating System (CRS), which reduces premiums if the community engages in risk reduction measures.³⁸

The NFIP has been widely criticized. Critics argue that the SFHA maps that underpin NFIP premium rates are often inaccurate and outdated, fail to consider climate change and sea level rise, and subsidize development in the most vulnerable areas.³⁹ The minimum federal requirements for local ordinances do not limit densities in vulnerable areas; nor do they prevent rebuilding of buildings that experienced

structural damage less than 50%.⁴⁰ According to the Government Accountability Office (GAO), oversight is not always strict, even where FEMA requires rebuilding to meet new standards.⁴¹ The GAO has suggested that the availability of federal assistance may inhibit actions to mitigate disaster losses, since individuals may not act to protect themselves from the effects of severe weather if they believe the federal government will eventually help pay for their losses.⁴² As one writer described the program:

“The NFIP is an actuarial joke. It would be like having a federal automobile insurance company that only insured teenage boys who drink and drive. By definition the properties covered by the program are doomed to be flooded, damaged, and even destroyed, not just once, but time and time again.”⁴³

Indeed, NFIP has been bankrupt since Hurricane Katrina in 2005. The NFIP borrows funds from the U.S. Treasury to cover shortfalls between premiums received and funds dispersed. In 2017, Congress cancelled \$16 billion of NFIP debt, although the program remains in debt.⁴⁴ In 2020, the GAO released a new report that concludes: “FEMA grants have been used to acquire and demolish flood-prone properties to help reduce flood damage. Reduced damage should lead to fewer or less costly claims for the National Flood Insurance Program, which FEMA also administers. But the number of such properties keeps growing, and the program still doesn’t collect enough in premiums to cover claims over the long term.”⁴⁵

Part of the challenge is that the number of flood insurance policies has declined over the last decade. According to one study, only 40% of homes in the FEMA-designated ‘100-year-floodplain’ had flood insurance policies (either public or private).⁴⁶ Up to 80% of the people affected by Hurricane Harvey in Texas had no insurance.⁴⁷

The Biggert-Waters Act of 2012 sought to update NFIP by reducing eligibility for flood insurance coverage and modifying premiums. Structures built before NFIP were no longer grandfathered into the program; homes that flood repeatedly were denied coverage; and insurance premiums were to be recalculated to accurately reflect actuarial risk.⁴⁸ The Act even authorized FEMA to update flood maps based

on climate change considerations.⁴⁹ However, a 2014 amendment rolled back these updates by repealing rate increases, restoring grandfathered rates, and limiting rate increases to rise more gradually.⁵⁰

Aware of concerns with the program, but unable to decide on how to balance affordability with risk reduction incentives, Congress has passed 16 short-term reauthorizations of the NFIP between 2017 and 2020.⁵¹ The most recent reauthorizes NFIP through September 30, 2021.⁵² The NFIP has no overarching sunset provision, termination, or expiration date, so portions of the Act must be routinely reauthorized by Congress. Several major reforms have been proposed, and some are still under consideration, but none have been adopted as of publication.⁵³

Only communities that have jurisdiction over their land can participate in NFIP; this means that unrecognized tribes and communities cannot participate.⁵⁴ There are additional challenges for tribes who wish to participate in NFIP, including a lack of flood mapping for many rural tribal lands, insufficient resources to administer NFIP requirements, and the expense of NFIP premiums. In 2012, GAO found that just 37 of the then 566 federally recognized tribes, or 7%, were participating in NFIP, with three tribes accounting for more than 70% of the policies.⁵⁵

In its current form, the NFIP may be doing more harm than good with respect to climate adaptation, by providing a “perverse incentive” for homeowners to build in or remain in flood-prone areas and by masking a market signal that might otherwise encourage homeowners and flood-prone communities to engage in climate adaptation.⁵⁶

C. HUD programs

Although the primary mission of the Department of Housing and Urban Development (HUD) is to “create strong, sustainable, inclusive communities and quality affordable homes for all,”⁵⁷ the department has played an increasingly large role in disaster recovery and risk reduction and, through these programs, adaptation. Indeed, HUD is one of the largest sources of funding for long-term disaster recovery, and investments in affordable housing and infrastructure influence the ability of communities to adapt to climate adaptation.⁵⁸

1. CDBG-DR and CDBG-MIT

The Housing and Community Development (HCD) Act of 1974 created the Com-

munity Development Block Grant (CDBG) program, which provides funds for urban communities to supply housing and services for low- and moderate-income persons.⁵⁹ These funds may be used to rebuild in the aftermath of a disaster; notably, the way in which communities rebuild has implications for their climate adaptation.

In addition, HUD offers CDBG Disaster Recovery (CDBG-DR) and CDBG-Mitigation (CDBG-MIT) funding in connection with federal disaster declarations.⁶⁰ These programs are designed specifically to address pre-disaster risk reduction (CDBG-MIT) and post-disaster recovery (CDBG-DR). Congress may appropriate funding under existing authorities following a disaster, and CDBG-DR has been commonly funded in this way since the 1990s.⁶¹ While CDBG-DR does not have a consistent annual budget, these supplemental allocations are sometimes larger than the conventional CDBG program. It is not required for CDBG-DR allocations to be tied to major disaster declarations, although this is the norm.

CDBG-MIT funds were developed as part of the CDBG-DR appropriations and are a sub-designation of funds intended to promote infrastructure resilience.⁶² Generally, expenditures follow CDBG statutory authorities, but because these programs are funded through supplemental appropriations, each appropriation may contain specific guidelines. States, tribal governments, and local governments submit action plans to HUD, which approves the plans and obligates funds.

2. One-time resilience competitions

HUD has held two resilience project competitions in the past decade. The first, Rebuild by Design, was held in coordination with the Hurricane Sandy Rebuilding Task Force, and was a competition to encourage Sandy-affected communities to propose resilience projects that also addressed potential effects of climate change. Seven winning projects were awarded \$930 million in CDBG-DR funds, and the projects are slated to be completed in 2022.⁶³

The second competition, launched in 2014, was the National Disaster Resilience Competition. This competition was open to communities across the nation, and through it, HUD awarded nearly \$1 billion to projects in 13 states.⁶⁴ According to HUD, “[p]rojects proposed include stormwater and water quality projects, low-income housing renovation and relocation, energy resilience, watershed restoration, bridge repair and replacement, and many other resilient infrastructure activities.”⁶⁵

Many competitions for community funding, including the one-time HUD competitions, have been criticized for being inequitable, as communities may win funding by having the most sophisticated proposal, rather than by facing the greatest threat

or demonstrating the greatest need.⁶⁶

§ 24:17 Non-disaster assistance programs

In addition to disaster-related assistance programs and risk reduction efforts, a wide variety of federal programs affect the ability of communities and ecosystems to withstand the effects of climate change. Infrastructure, access to resources, and ecosystem regulations, for example, all affect adaptation. Rather than attempt a comprehensive catalog, the following section presents a range of different ways in which the federal government affects adaptation to climate change.

A. U.S. Army Corps of Engineers (USACE)

USACE has come to play an important role in erosion and flood control across the United States. The Flood Control Act of 1941 authorizes an emergency fund to be used at the discretion of the Chief of Engineers for disaster preparation, repair, or restoration of flood control works, nonstructural alternatives to flood control works, emergency provision of clean water, and “activities necessary to protect life and improved property from a threat resulting from a major flood or coastal storm.”¹ Various statutes over time, from the Flood Control Act of 1944 to the Water Resources Reform and Development Act of 2014,² expanded on this broad authority to manage water projects. “Major structural or operational change” and modifications that “seriously affect” authorized purposes of a project require additional Congressional approval.³ Today, the Corps defines its mission as “partnering in peace and war to strengthen our Nations’ security, energize the economy and reduce risks from disasters.”⁴

In Alaska, the USACE has taken the lead on anti-erosion “hard armoring” projects.⁵ In 2005, Congress authorized the Corps “to carry out, at full federal expense, structural and non-structural projects for storm damage prevention and reduction, coastal erosion, and ice and glacial damage in Alaska, including relocation of affected communities and construction of replacement facilities.”⁶ This authority was repealed in 2009.⁷ A 2010 appropriation provided a similar authority,⁸ but required non-federal cost sharing of up to 35%. As of this writing, the North Slope Borough is negotiating a project under this authority to construct a five-mile-long revetment. The project would armor the shoreline with rocks weighing nearly

⁶⁶See Christopher Flavelle, The toughest climate dilemma: Who gets saved?, Bloomberg, 6 September 2016; Trace Lane, The U.S. Strategy for Flood Resilience is Underwater, Next City, 24 August 2016, <https://nextcity.org/daily/entry/us-strategy-flood-resilience-coastal-cities-competitions>.

three tons each at an estimated construction cost of \$328.6 million.⁹ With its strong economic basis in the oil and gas industry, the Borough is expected to be able to provide the 35% cost share. In contrast, small towns and Alaska Native Villages that are unable to meet the cost share requirements have been unable to benefit from this program.

In Miami, Florida, a city facing numerous climate-related risks including sea level rise, saltwater intrusion, and rising temperatures, the USACE is engaged in a *Miami-Dade Back Bay Coastal Storm Risk Management Feasibility Study*, to be completed by June 2021.¹⁰ The study “seeks not only to reduce coastal storm risk, but also to build on resilience by implementing strategic approaches that address identified stresses from major storms, and the impact on residents and economic activity.”¹¹ However, the study “will not provide a holistic or comprehensive risk reduction plan for the County” and explicitly does not address nuisance flooding or other residual risks.¹² The study is anticipated to propose a mix of structural measures—such as storm surge barriers, pump stations, and riprap that are designed to reduce the probability of flooding occurring—and non-structural measures—such as home elevation and building floodproofing that are designed to reduce the consequences of a flood once it occurs. During the public comment period, the draft study report was critiqued for a lack of nature-based approaches and for using standard cost-benefit analysis techniques and hazard estimates to assess potential equity implications.¹³ As these techniques are common throughout the federal government, challenging their application in Miami may lead to further conversations about appropriate techniques and evidentiary bases for evaluating adaptation alternatives.

B. Housing and Urban Development

As discussed above, HUD offers various grants for low-income housing and infrastructure to communities, including the Community Development Block Grant (CDBG) program.¹⁴ The program makes funds available to states, tribes, and municipalities on a semi-annual basis. Funding may be used “to develop viable urban communities by providing decent housing and a suitable living environment, and by expanding economic opportunities, principally for low- and moderate-income persons.”¹⁵ Nothing in the relevant statute or regulations refers explicitly to climate adaptation, but investments in housing and urban infrastructure are often closely related to adaptation actions. For example, every time a community builds new housing, it makes climate adaptation-related decisions about where to build, how the building will affect water, electricity, and septic services, and how well the building design will fare in a future climate. HUD also plays a large and growing role in disaster mitigation, as described in § 2:3.

The Department of Agriculture's Natural Resources Conservation Service (NRCS) administers several programs related to watershed planning and flooding and erosion control projects. The Watershed and Flood Prevention Program and the Emergency Watershed Protection Program both allow for structural measures, buyouts, and relocations to prevent erosion or reduce risk exposure.¹⁶ Under the latter program (which is more often funded by Congress), assistance may be provided after a disaster declaration, as discussed in § 24:16, or when NRCS determines that a watershed has been impaired such that there is an imminent threat to health, life, or property.¹⁷ There is a cost-share requirement of 25%, or 10% for projects within limited-resource areas.¹⁸

§ 24:18 Resource management

Numerous federal laws could appear in this section, as many resource-related laws have been amended in their legislative language or their implementation to address the effects of climate change.¹ Those mentioned here were chosen to illustrate a range of federal efforts to address climate adaptation.

A. National Environmental Policy Act

Much of the discussion of the National Environmental Policy Act (NEPA)² in the context of climate change considers how to evaluate a project's contribution to rising greenhouse gas levels in the atmosphere. However, the act also has potential relevance for adaptation insofar as project managers are required to consider the uncertain future effects of climate change on a project.³ First, an agency can address this uncertainty by deciding to return to a decision later in time when there is new information, so long as this intent does not result in "piecemealing" a decision or ignoring cumulative impacts.⁴ Second, when an agency within the Department of the Interior ("DOI") is evaluating alternatives, it can consider different climate scenarios for each regime, and plan to shift management if a particular scenario

¹⁶Watershed and Flood Prevention program authorized by Flood Control Act of 1944, Pub. L. Cal. 2007) (overturning a Forest Service decision to liberalize the rules limiting campfires in high-country parts of a wilderness area that were made in spite of a record raising a number of problems with the decision), *with* Theodore Roosevelt Conservation Partnership v. Salazar, 616 F.3d 497, 175 O.G.R. 824 (D.C. Cir. 2010) (upholding a tiered analysis of natural gas development that considered a broad plan but did not yet authorize a specific ground-disturbing activity).

occurs.⁵ This provision is based on 2008 DOI regulations that allow, but do not require, adaptive management.⁶

However, many federal actions are exempt from NEPA if undertaken as emergency response and recovery actions after a disaster declaration has been made under the Stafford Act.⁷ The Administrative Procedure Act similarly sets forth procedural exemptions for emergencies.⁸ In addition, the application of NEPA to adaptation actions such as relocation is unclear. For example, it is unclear which agency should take the lead with regard to the relocation efforts that have taken place thus far on the West Coast of Alaska—despite USACE having functionally taken on this role—and numerous environmental impact assessments have been conducted for each community rather than one cumulative analysis for each relocation project.⁹ More details on NEPA and recent interpretations and modifications are available in Chapter 10 of this treatise.

B. Management on federally-owned lands

As a major landowner, the federal government is also responsible for adaptation on federally-owned lands. This includes roughly 640 million acres of land, more than one-fourth of the total land area in the United States.¹⁰ The Bureau of Land Management (BLM), Fish and Wildlife Service (FWS), National Park Service (NPS), and Forest Service (FS) in the US Department of Agriculture (USDA) together manage over 600 million acres of land and are responsible for climate adaptation on those lands. The Department of Defense administers almost 9 million acres and is similarly responsible for adaptation actions, with a particular concern being that of coastal Navy bases facing sea level rise and coastal hazards.¹¹

Two critical areas where adaptation has emerged in recent discussions are wildfire management and cultural heritage preservation.

1. Wildfire management

The federal government is responsible for responding to wildfires that originate on federal lands.¹² The DOI manages wildfire response on national parks, preserves, wildlife refuges, and Indian reservations. The Forest Service manages wildfire response in the National Forest System. FEMA provides assistance to states with wildfire disaster declarations through Fire Management Assistance Grants (FMAGs). Grants may reimburse up to 75% of allowable suppression costs.¹³ Federal agencies also carry out projects to prevent wildfires. These may be considered climate adaptation insofar as these management responses will be required to address rising temperatures and increasingly frequent and severe droughts.

2. Cultural heritage

The National Park Service (NPS) Organic Act of 1916 mandates protection of nat-

ural and historic objects for enjoyment by the public and by future generations.¹⁴ The NPS Cultural Resources Climate Change Strategy recognizes the potential for climate change to complicate this mission and notes the need for NPS climate adaptation actions.¹⁵ The Historic Sites Act of 1935,¹⁶ Historic Preservation Act of 1966,¹⁷ and National Historic Landmarks Program all provide federal directives to ensure the protection of cultural heritage resources on federal lands.¹⁸

C. Water regulation

Numerous federal agencies are involved in water control and management, issues that are likely to become more contentious and difficult as climate change alters the availability of water, particularly in the West.¹⁹ DOI, USDA, USACE, the Federal Energy Regulatory Commission (FERC), and the Environmental Protection Agency (EPA) are all involved in the control, distribution, or monitoring of water resources. FERC, for example, issues permits and reauthorizations for existing permits for the construction and operation of hydroelectric dams.²⁰ The federal basis for engagement is grounded in land ownership and management (see § 24:18(B)), the Commerce Clause of the U.S. Constitution, and control of navigable water.²¹ Federal agencies have invested heavily in dams, power plants, and irrigation works, and their role in the future is uncertain. Chapters 13 (Water), 14 (Soil and Groundwater), and 18 (Drinking Water) of this treatise describe the federal regulatory frameworks governing water resources in the United States.

D. Adaptive management examples

Resource management laws have traditionally been based on the idea of stable ecosystems that can be managed with relatively static rules.²² For example, the U.S. Endangered Species Act aims to preserve all presently existing species in more or less their current genetic form.²³ Likewise, the Wilderness Act²⁴ focuses on maintaining landscapes in their current “untrammeled” form.²⁵ But ecosystems can and do change, and many are changing rapidly as the climate changes.²⁶ Effective response to climate change may require the law to provide natural resource decision-makers

with more flexibility and options for management that address current as well as future circumstances.²⁷ In other words, there may be a greater need for adaptive management.²⁸ Adaptive management generally involves setting management goals, monitoring outcomes, determining impacts, and refining goals to incorporate lessons learned.²⁹

Some U.S. natural resource laws already provide a degree of flexibility to agency decision-makers that enables adaptive management. “Multi-purpose” management laws include the Federal Lands Management Policy Act³⁰ (BLM) and the National Forest Management Act³¹ (for the Forest Service).³² Agencies could interpret multiple and sustained use standards in these laws to vary,³³ depending on projected climate change impacts.³⁴ The Forest Service has taken advantage of its broad enabling legislation to incorporate adaptive management provisions across its planning efforts by involving more monitoring and revisions.³⁵

Some agencies have found ways to work adaptive management provisions into permitting and planning processes, so as to require additional mitigation measures at a later time. An example is the letter of authorization issued by the National Marine Fisheries Service (NMFS) for activities that would otherwise violate the Marine Mammals Protection Act (MMPA) (the underlying framework is discussed in Chapter 23, Coastal and Ocean Protection). NMFS used its general authority under MMPA³⁶ to issue an adaptive management regulation whereby it can modify mitigation requirements after an initial authorization is issued.³⁷ The regulation specifies possible sources of data that could contribute to a decision to modify requirements.³⁸ Other examples include the U.S. Fish and Wildlife Service’s regulation on permits for eagle takes,³⁹ the USACE and EPA’s regulation for compensatory mitigation,⁴⁰ and the U.S. Department of Transportation’s rules for developing mitigation plans

for metropolitan transportation.⁴¹

1. Endangered Species Act

In 2008, for the first time, the Department of the Interior (DOI) listed a species (polar bears) as threatened due to climate change, due to the melting sea ice that serves as that species' habitat.⁴² In 2013, the North American wolverine was listed as threatened due solely to climate change due to the melting of spring snow.⁴³ Building on these examples, the Endangered Species Act (ESA) could theoretically pave the way for adaptation for species that are endangered and threatened by climate change, since listings results in changes in public and private sector actions to avoid jeopardizing listed species or their critical habitats.⁴⁴ But there are clear limitations to the power of the ESA. For example, DOI imposed no restrictions on fossil fuel emitters to reduce the threat of climate change to polar bears.⁴⁵ Revisions under the Trump administration also weakened the potential for ESA to protect critical habitat by changing the definition of critical habitat. That administration's actions also made it less likely for future species to be deemed threatened due to climate change, by allowing the use of cost-benefit analysis to determine whether species should or should not be protected.⁴⁶

2. Invasive species regulations

Laws and management plans have traditionally guarded against invasive species that can outcompete native species and reduce biodiversity and the value of the habitat for fish and wildlife.⁴⁷ For example, the Nonindigenous Aquatic Nuisance Prevention and Control Act of 1990, as amended by the National Invasive Species Act of 1996 (Act), was enacted to prevent and control infestations of the coastal inland waters of the United States by the zebra mussel and other nonindigenous aquatic nuisance species.⁴⁸ The Act defines "nonindigenous species" as "any species or other viable biological material that enters an ecosystem beyond its historic range, including any such organisms transferred from one country into another." Another example is Executive Order 13112, signed by President Clinton on February 3, 1999, which established a Council of Departments to prevent the introduction of invasive species and minimize the economic, ecological, and human health impacts that invasive species cause.

But as the climate and ecosystems are rapidly changing, new species are increasingly moving into new ecosystems. These "immigrants" may be considered invasive species, although they are simply adapting to changes in their previous ecosystems and opportunities in the new ecosystems. The traditional laws controlling the

introduction of invasive species by humans may not be appropriate for these migrating species.

§ 24:19 Other

The federal government influences climate change risk awareness and adaptation in a variety of ways, some of which are outside the scope of natural resource management, provision of assistance, or natural resource management. For an example, see the discussion of the Securities and Exchange Commission and its Guidance Regarding Disclosure Related to Climate Change in §§ 24:41 to 24:46.

§ 24:20 Federal adaptation law conclusions

Federal adaptation law is a maze of laws, agencies, and programs, most of which existed before Americans began paying attention to the need for climate change adaptation policy and which are therefore imperfect in their ability to address the specific needs of climate adaptation. In 2012, legal scholar Michael Gerrard described climate mitigation law as a “patchwork of scraps that are barely sewn together” and “adaptation laws are not even that; there is little cloth, and the existing scraps are hardly linked.”¹ Since then, several existing programs, particularly those centered around disaster preparedness and response, have attempted to address climate adaptation, but the patchwork quilt effect remains.

While some activists and practitioners would like to see adaptation law coalesce into a single law, agency, and program, this is unlikely to occur. In contrast to climate change mitigation, which focuses on the relatively narrow goal of reducing greenhouse gas emissions, the scope of adaptation is vast, including topics from water regulation and invasive species management to coastal management and housing. Many aspects of adaptation (particularly with regards to land use) have traditionally been managed at a state or local level, rather than at a federal level. Further, major reorganizations rarely occur in the federal executive branch, and a new federal agency would have to compete with existing entities for limited adaptation funding.

That said, there are abundant opportunities for better coordination and a potential role for a coordinating entity that could assist communities and individuals in navigating the federal bureaucracy of adaptation assistance.

VI. ADAPTATION—STATE*

§ 24:21 Introduction

This section presents an overview of state-level adaptation in the United States. Since the early 2000s, state governments have acted as leaders in advancing adap-

[Section 24:20]

¹Michael Gerrard, *Introduction and Overview*, in *THE LAW OF ADAPTATION TO CLIMATE CHANGE: U.S. and International Aspects* 1, 11 (Michael Gerrard & Katrina Fischer Kuh, Eds., 2012).

*The author would graciously like to thank the following people for reviewing this section and providing smart and helpful editorial suggestions and feedback: Vicki Arroyo, Executive Director, Georgetown Climate Center, and Professor from Practice, Georgetown University Law Center; Annie Bennett, Senior Associate, Georgetown Climate Center; J. Peter Byrne, John Hampton Baumgartner, Jr. Professor of Real Property and Law and Faculty Director, Georgetown Environmental Law and Policy Program, Georgetown University Law Center and Faculty Director, Georgetown Climate Center; Cynthia R. Harris, Staff Attorney, Research and Policy, Director, Tribal Programs, and Deputy Director, Center for State, Tribal, and Local Environmental Programs, Environmental Law Institute; and the co-authors of the chapter on climate adaptation in this treatise. The author would also like to thank Georgetown law students and Research Assistants Caitlyn Cook and Blake Hyde for the research and writing support they contributed to this section.

tation and resilience across the nation.¹ Initially, a limited number of coastal states, beginning with California, Florida, Maryland, and New Hampshire, led the charge to confront sea-level rise, flooding, and land loss outside of a disaster recovery context.² As time has passed and climate change has advanced, more coastal states in the Northeast, the Mid-Atlantic, the Great Lakes region, the Gulf, and the West Coast have followed suit. In addition, Colorado was an early non-coastal actor beginning in 2007. With the exacerbating prevalence and severity of climate-related impacts like drought, wildfire, and heat, a growing number of non-coastal states, including Montana, New Mexico, and Nevada, have also jumped on the adaptation bandwagon.

There is no “one-size-fits-all” or systematic approach to how states are pursuing—or should pursue—adaptation. Every state is unique and requires its own home-grown approach to adaptation due to any number of factors, including political leadership and direction, the exigency and frequency of different climate impacts, funding availability, history and culture, and local needs and interest. Despite this diversity of considerations, this section introduces the somewhat nascent but growing field for those new to this area of law.

This section identifies the range of legal, policy, and planning tools that states are utilizing—or, in many cases, repurposing—to adapt to climate change. First, this section discusses state executive and legislative actions related to climate adaptation and resilience, and then introduces different types of plans. Notably, planning has served as a critical and preliminary element for many states to develop comprehensive climate adaptation strategies. Moreover, plans have often set the stage for governors and state legislatures to advance the law in this area and vice versa. This section rounds out its coverage by exploring some of the different types of sector- and agency-specific plans and programs that states are using to implement the actions and mandates called for in their executive orders, statutes, and cross-sectoral or multi-agency plans. Critically, to effectively implement adaptation strategies and build long-term resilience, state governments must also have sustainable sources of funding and support adaptation at the local level.

This section presents a broad survey of the different types of adaptation-related laws, policies, plans, and programs that states are creating across sectors to address diverse climate impacts. The author of this section placed an emphasis on featuring

[Section 24:21]

¹The scope of this section is narrow by describing the field of climate adaptation from the vantage point of state governments. This section focuses on more sustained examples of how states are building their adaptive capacity through institutionalized and programmatic legal, policy, and planning approaches. Accordingly, this section will not directly discuss important and related, but largely distinct, examples of state efforts to increase resilience through federal and state hazard mitigation and disaster recovery processes. See, e.g., Georgetown Climate Ctr., *Rebuild by Design Competition After Hurricane Sandy*, ADAPTATION CLEARINGHOUSE (2013), <https://www.adaptationclearinghouse.org/resources/rebuild-by-design-competition-after-hurricane-sandy.html>; Georgetown Climate Ctr., *HUD National Disaster Resilience Competition*, ADAPTATION CLEARINGHOUSE (June 14, 2014), <https://www.adaptationclearinghouse.org/resources/hud-national-disaster-resilience-competition.html>.

²Some states—like Maine in 2003, Oregon in 2006, Alaska in 2007, and Pennsylvania in 2008—started taking discrete adaptation actions in the early 2000s, but only a few released statewide climate adaptation plans and took more comprehensive actions. Specifically, California, Colorado, Florida, Maryland, and New Hampshire are called out here due to the holistic nature of the actions they initiated between 2007 and 2009 that were more focused on climate adaptation versus mitigation. Notably, four of the five states—California, Florida, Maryland, and New Hampshire—released the nation’s first statewide climate adaptation plans within that period, which is a key distinction as to why their respective efforts are discussed here in depth. In contrast, Colorado did not release its first climate adaptation plan until 2011; however, it is the first example of a non-coastal state that released a climate adaptation plan and it has made more significant adaptation progress since 2007 than other non-coastal states. For a definition of and more information on state climate adaptation plans, see § 24:23 *infra*.

a comparative range of adaptation examples that are progressive, unique, and recent (as of 2020) to maximize this opportunity to understand the different ways states are approaching adaptation.³ This discussion, however, is not a comprehensive analysis of how every state in the United States is adapting to climate change. Nor does it look at every sector or climate change impact.

Moreover, it is important to note that this section focuses on state examples that were created more or less explicitly for the purpose of adapting or increasing resilience to climate change. This section does not discuss the many state programs that may not have been specifically designed for adaptation or resilience purposes but could be used to provide such benefits. For example, most states have enacted laws and policies to preserve and/or conserve privately and publicly owned land as open space (e.g., parks, protected areas, working lands like farms and forests). Open space programs can help communities mitigate flood risks from sea-level rise, heavy precipitation, and hurricanes, as well as extreme heat risks; however, most state open space efforts were not established for the purpose of accommodating and reducing impacts from climate change, nor have many been updated to reflect these possibilities and co-benefits.⁴ Therefore, this section does not include state efforts that provide important but only ancillary benefits for climate adaptation.

As the other sections in the climate adaptation chapter of this treatise discuss, states cannot carry the adaptation torch on their own. Actions must be coordinated in partnership with federal and local governments, nongovernmental partners, and most importantly, the people being directly affected by climate change. Regardless, states are a key part of this mosaic, and, through mounting actions, are emerging as increasingly significant players in the adaptation space.

§ 24:22 Executive and legislative actions

A state's governor, legislature, and/or agencies can serve as the initiator for climate adaptation at the state level. This part primarily features laws from a limited number of states that have issued or enacted more comprehensive executive orders or statutes around climate adaptation. This part is organized according to the following three categories of laws: (A.) statewide climate adaptation planning and interagency coordination requirements; (B.) state mandates to incorporate climate change data and considerations into state permitting, funding, and environmental compliance regulations and programs; and (C.) state support for local adaptation. Additional executive and legislative actions associated with planning, regulatory, and funding initiatives are discussed elsewhere in this section.

As will be shown throughout this section, most of these state laws follow national

³This section on state-level adaptation was informed by Georgetown Climate Center's work to update and maintain its State Adaptation Progress Tracker, which tracks and summarizes how states across the United States are adapting to climate change. For additional updates and information on state-level adaptation, visit Georgetown Climate Center's State Progress Tracker, *available at* <https://www.georgetownclimate.org/adaptation/plans.html>.

For more information and research on many of the resources featured in this section, see Georgetown Climate Center's Adaptation Clearinghouse, an online database and one-stop-shop for thousands of the best and emerging examples of federal, state, and local adaptation laws, policies, plans, case studies, and more, *available at* <https://www.adaptationclearinghouse.org>.

Note, this section only summarizes examples of state adaptation actions and does not fully capture all the benefits or critiques of any examples discussed herein.

⁴*Compare, e.g.,* Maryland's Program Open Space and the Florida Forever land acquisition programs that explicitly address and account for climate change in several different ways. Georgetown Climate Ctr., *Maryland GreenPrint and Program Open Space*, ADAPTATION CLEARINGHOUSE, <https://www.adaptationclearinghouse.org/resources/maryland-greenprint-and-program-open-space.html> (last visited Nov. 17, 2020); Georgetown Climate Ctr., *Florida Forever Land Acquisition Program*, ADAPTATION CLEARINGHOUSE, <https://www.adaptationclearinghouse.org/resources/florida-forever-land-acquisition-program.html> (last visited Nov. 17, 2020).

trends: most state adaptation actions focus primarily on climate-related impacts to water, particularly flooding and coastal resilience. However, exceptions exist.

California is one exception to this general trend because of its additional focus on wildfires.¹ Between 2018 and 2019, California issued a variety of executive orders and statutes that were explicit about growing the state's resilience to wildfires. Notably, in January 2019, Governor Gavin Newsom issued Executive Order N-05-19, which directed the California Department of Forestry and Fire Protection (CAL FIRE) and other state agencies to recommend regulatory and policy changes to prevent and mitigate wildfires that result from, among other things, climate change and drought.² In response, CAL FIRE identified "high priority fuels reduction projects and other measures to immediately begin to protect over 200 of California's most wildfire-vulnerable communities and put the state on a path toward long-term wildfire prevention and forest health."³ The governor also assembled a "strike force" to release a "60-day report" in April 2019 that examined California's recent catastrophic wildfires and made recommendations to the governor and state legislature.⁴ As a result of this report, on October 2, 2019, the governor signed approximately 22 bills into law, covering a comprehensive approach to wildfire issues.⁵ However, aside from California, the other examples in this part—and the section more broadly—predominantly relate to climate impacts to water.

A. Planning and agency governance structures

Of the executive and legislative actions presented in this § 24:23, the most common types are those that call for a state to: (1.) establish a state climate coordinating body or working group; (2.) establish a chief resilience officer or lead executive adaptation official; and/or (3.) develop a state climate adaptation plan. Generally, one or any combination of these mandates kick-starts state-level adaptation.⁶ While climate adaptation plans are explored in greater depth in § 24:23, of the 25 states with or in the progress of drafting a climate adaptation plan, most were initiated

[Section 24:22]

¹Note, other states like Arizona, Colorado, Idaho, Montana, Oregon, and Washington have previously or are currently undertaking actions to mitigate wildfire risk in their states through, for example, reports and defensible space laws; however, none of these explicitly mention or incorporate data about climate change. Moreover, while some states include wildfire considerations in their climate adaptation plans—Montana is the most recent example—(See § 24:23), there largely appears to be an absence of executive or legislative directives outside of California that are specifically implementing these plans.

²Georgetown Climate Ctr., *CA EO N-05-19 CAL FIRE to provide recommendations on wildfire prevention and mitigation, including at-risk populations*, ADAPTATION CLEARINGHOUSE (Jan. 8, 2019), <https://www.adaptationclearinghouse.org/resources/ca-eo-n-05-19-cal-fire-to-provide-recommendations-on-wildfire-prevention-and-mitigation-including-at-risk-populations.html>.

⁴The strike force was created by the governor to coordinate the state's efforts around energy sector safety and reliability, as well as its climate commitments. WILDFIRES AND CLIMATE CHANGE: CALIFORNIA'S ENERGY FUTURE—A REPORT FROM GOVERNOR NEWSOM'S STRIKE FORCE (Apr. 12, 2019), *available at* <https://www.gov.ca.gov/wp-content/uploads/2019/04/Wildfires-and-Climate-Change-California's-Energy-Future.pdf>.

⁵Bills included: Assembly Bill (AB) 38, which provides mechanisms to develop best practices for community-wide resilience against wildfires (such as by implementing defensible space standards) and mandates that homes built before 2020 be retrofitted to meet fire safety standards; Senate Bills (SB) 560, 70, and 167 that require utilities to develop wildfire reduction plans that take into account climate change; and AB 1823, which facilitates fuel reduction and other forest health projects and mandates that such projects be aligned with the state's objectives regarding climate change and forest management.

⁶*Contra* Minnesota, this part *infra*.

via a gubernatorial executive order.⁷ Maine, South Carolina, Vermont, and Washington, however, are four states that run contrary to this trend. In 2011, and again in 2019, the Maine Legislature called for two different climate adaptation coordinating bodies.⁸ In 2020, South Carolina and Vermont both passed statutes that called for the development of a statewide climate adaptation plan.⁹ Similarly, in 2009, the Washington State Agency Climate Leadership Act required state agencies to reduce emissions and develop an integrated climate change response strategy.¹⁰

Concurrently, how a state initiates adaptation can have a corresponding impact on its governance structure. In short, there is no “one-size-fits-all” approach—just like everything else with adaptation. For example, some states like Hawaii and Maryland have adopted more top-down frameworks that emphasize strong and consolidated executive direction. Specifically, Hawaii and Maryland both have commissions that lead climate adaptation strategies on behalf of their governors.¹¹ Although distinct, both commissions are composed of both agency heads across several departments and non-governmental representatives, meet regularly, inform and help prioritize annual state agency agendas and priorities around adaptation and resilience, and issue regular reports to state legislators. Furthermore, both commissions operate outside of an adaptation planning process.¹²

In contrast, states like Minnesota have been making progress on adaptation de-

⁷See Georgetown Climate Center’s State Adaptation Progress Tracker, available at <https://www.georgetownclimate.org/adaptation/plans.html>.

⁹Georgetown Climate Ctr., *South Carolina Disaster Relief and Resilience Act*, ADAPTATION CLEARINGHOUSE (Sept. 29, 2020), <https://www.adaptationclearinghouse.org/resources/south-carolina-disaster-relief-and-resilience-act.html>; Vermont Global Warming Solutions Act (Sept. 2020), available at <https://legislature.vermont.gov/Documents/2020/Docs/ACTS/ACT153/ACT153%20As%20Enacted.pdf>. The act created the Vermont Climate Council. The council is tasked with formulating a Climate Action Plan that must be adopted by December 1, 2021. The Climate Action Plan must include strategies to reduce greenhouse gas emissions, as well as those to build resilience to prepare Vermont’s communities, infrastructure, and economy to adapt to the current and anticipated effects of climate change.

¹²After the state released its climate adaptation plans in 2008 and 2011, the Maryland General Assembly codified the Maryland Commission on Climate Change into law. The Hawaii Commission was not created for the purpose of only drafting a statewide climate adaptation plan and its adaptation efforts primarily focus on sea-level rise and building coastal resilience. Based on the flexible language included in executive orders and statutes since 2018, it appears that an increasing number of states, such as in Maine and North Carolina, are replicating this model. Specifically, it is likely that these coordinating bodies will outlive and not sunset once they deliver a climate adaptation plan. These types of bodies can aid states in implementing, updating, and tracking progress on their adaptation plans over time to align with the long-term impacts occurring in states.

spite not having a commission, a climate adaptation plan, or even an executive or legislative mandate to create one or the other. Since July 2009, Minnesota state agencies have been collaborating on climate adaptation efforts on their own volition through the Interagency Climate Adaptation Team (ICAT). ICAT includes representatives from a number of Minnesota state departments and agencies and is led by the Minnesota Pollution Control Agency.¹³

Some states then fall in the middle of the spectrum between Maryland and Hawaii on one end and Minnesota on the other. For example, in 2009, Oregon's Governor Ted Kulongoski established both a climate adaptation plan and an interagency coordinating body, but not formally as through an executive order.¹⁴ This has shaped how the state conducts cross-agency actions and may produce different results compared to a state with a stronger executive mandate and direction. Alternatively, Florida Governor Ron DeSantis created the Office of Resilience and Coastal Protection and the position of Chief Resilience Officer via Executive Order No. 19-12, but no corresponding interagency body.¹⁵ Similarly, West Virginia created the state's first Resiliency Office and Chief Resilience Officer in 2020, which will focus only on flood and hazard mitigation and disaster recovery.¹⁶

These examples demonstrate that states may select from a diversity of governance structures for adaptation, and the exact structure can shape how a state plans for and implements its broader adaptation strategy. It is important to understand this structure to gain a comprehensive understanding of each state's approach to adaptation.

B. Permitting, funding, and environmental compliance

Apart from broad planning and governance mandates, this part more discretely explores how five states—Maryland, New Jersey, Florida, New York, and California—have incorporated or are incorporating climate change considerations into their permitting, funding, and environmental compliance processes. Maryland and New York present two of the most holistic examples nationally, but New Jersey, Florida, and California have enacted significant executive and legislative updates that can help to advance statewide resilience through the approval of state-authorized and -funded projects.¹⁷

In 2012, Maryland Governor Martin O'Malley directed all state agencies to

Note, Virginia (which has a statewide adaptation plan) and Louisiana (which does not have one) also have executive officials similarly focused on coastal resilience: Special Assistant to the Governor for Coastal Adaptation and Protection in Virginia and a Chief (Coastal) Resilience Officer in Louisiana. Interestingly, the Special Assistant is tasked with leading the development of a Coastal Master Plan modeled after Louisiana's. See § 24:24 *infra*; Georgetown Climate Ctr., *Virginia S 265: Special Assistant to the Governor for Coastal Adaptation and Protection*, ADAPTATION CLEARINGHOUSE (June 22, 2018), <https://www.adaptationclearinghouse.org/resources/virginia-s-265-special-assistant-to-the-governor-for-coastal-adaptation-and-protection.html>; Georgetown Climate Ctr., *Louisiana Executive Order Number JBE 2020-19 on Coastal Resilience*, ADAPTATION CLEARINGHOUSE (Aug. 19, 2020), <https://www.adaptationclearinghouse.org/resources/louisiana-executive-order-number-jbe-2020-19-on-coastal-resilience.html>.

¹⁶West Virginia State Resiliency and Flood Protection Act, W.V. CODE ch. 29 (2020), <http://www.wvlegislature.gov/wvcode/ChapterEntire.cfm?chap=29&art=31§ion=2>.

¹⁷Other states (e.g., Louisiana) also call for state agencies to infuse climate considerations into

consider the risk of sea-level rise, flooding, and extreme weather when constructing or reconstructing state buildings and facilities.¹⁸ The 2012 executive order also called for new and reconstructed state-owned structures to be elevated two or more feet above the 100-year base flood elevation. This requirement was codified and expanded in both 2014 and 2018. A 2014 law established the Coast Smart Council and required the development of “Coast Smart” siting and design criteria for state structures.¹⁹ A subsequent 2018 law amended the Coast Smart law by expanding the categories of structures that must comply with Coast Smart criteria to include new state highway facilities, and new or reconstructed local projects that are at least half state-funded.²⁰

In 2020, both New Jersey and Florida followed Maryland’s lead. Early in 2020, New Jersey Governor Phil Murphy issued Executive Order No. 100 to help New Jersey both adapt to climate change and mitigate GHG emissions.²¹ The order directs the New Jersey Department of Environmental Protection (DEP) to draft and adopt regulations for “Protecting Against Climate Threats.” New state-authorized or -funded projects will be required to take into account how climate change could impact a project and also quantify a project’s anticipated GHG emissions. Specifically, the order calls for DEP to “[i]ntegrate climate change considerations, such as sea level rise, into its regulatory and permitting programs, including but not limited to, land use permitting, water supply, stormwater and wastewater permitting and planning, air quality, and solid waste and site remediation permitting.”²²

Under Governor Ron DeSantis and the current Florida Legislature, the state has taken some actions to similarly address impacts from sea-level rise and flooding. In March 2020, the Florida Senate passed a resolution expressing its support for adopting policies to prepare the state for sea-level rise and flooding.²³ In the resolution, the Senate also recognizes the importance of resilient infrastructure in “fortifying” the state from those impacts. In that vein, the Florida Legislature passed a new law, also in March 2020, that establishes new rules and enforcement

agency plans, policies, and operations; however, these five states are featured herein because they have more specific and explicit mandates to undertake these types of actions.

mechanisms for state-financed coastal construction projects.²⁴ According to the law, “state-financed constructors” are public entities that manage or commission “a construction project using funds appropriated from the state.”²⁵ The purpose of the law is to ensure that (1.) projects funded by public monies can better withstand coastal flooding and will not exacerbate flooding impacts on surrounding communities; and (2.) project managers consider all design options and alternatives in the face of sea-level rise. The law requires that constructors prepare a sea-level impact projection (SLIP) study for state-funded coastal construction projects. The standards for SLIP studies will be developed by the Florida Department of Environmental Protection through a rulemaking.

While New York similarly developed climate-smart permitting and funding review criteria and policies, it distinguished itself by taking the extra step of also revising the regulations under the State Environmental Quality Review Act—New York’s equivalent of the federal National Environmental Policy Act (NEPA). To start, the state passed the Community Risk and Resiliency Act (CRRA) in 2014 under Governor Andrew Cuomo.²⁶ The law includes several provisions that amend existing state law, but all work together to update the state’s permitting, funding, and environmental compliance requirements at large. Like Maryland, New Jersey, and Florida, CRRA requires that climate change, severe weather, and sea-level rise be considered in certain specified state permitting and funding programs. To accomplish these objectives, CRRA also required the Department of Environmental Conservation (DEC) to write regulations (finalized in 2017) to establish statewide sea-level-rise projections that can be used in CRRA compliance.²⁷ In addition, CRRA called for the state to develop multiple types of implementation guidance detailing how to incorporate these projections into state agency review procedures and application requirements for covered programs. Various guidance documents fulfilling this directive were released in 2018 and 2020.²⁸

In 2018, DEC announced its first major update to the State’s Environmental Quality Review (SEQR) regulations in over two decades.²⁹ The update streamlines the state’s environmental review process and encourages both renewable energy and sustainable development. The update consists of two main climate-related changes. First, DEC expanded expedited review to environmentally beneficial projects, such as green infrastructure upgrades and retrofits.³⁰ Second, state draft environmental impact statements must now consider alternatives to avoid or reduce

²⁹DEC Adopts First Major Update to State’s Environmental Quality Review Regulations in 20 Years, N.Y. DEP’T OF ENVTL. CONSERVATION (June 28, 2018), <https://www.dec.ny.gov/press/114048.html>; *State Environmental Quality Review Act—Adopted Amendments 2018*, N.Y. DEP’T OF ENVTL. CONSERVATION (June 2018), <https://www.dec.ny.gov/permits/83389.html>.

³⁰More specifically, DEC expanded the list of “actions not subject to further review” (known as

an action's potential impacts on environmental conditions affected by climate change, such as sea-level rise and flooding.

Similar to the 2018 SEQR regulatory changes, in 2009, the California Governor's Office of Planning and Research finalized amendments to the California Environmental Quality Act (CEQA) guidelines for completing environmental impact assessments.³¹ The guidelines were updated to require that state agencies consider climate impacts to state actions in environmental analyses under CEQA.

C. Local government requirements and new authorities

Outside of state-owned properties and assets, local governments and communities are on the front lines of climate change. Accordingly, much of what states are doing to adapt to climate change is geared at targeting and supporting work at the local level. States support local government adaptation in two primary ways. First, states can enact mandates to ensure a certain minimum level of statewide compliance with preparedness and resilience-building activities. Second, states can issue optional directives to increase local authority and provide other forms of support like guidance and funding (*See also* § 24:26). Most mandates and optional directives originate from a legislature rather than a governor or executive agency (*Compare* the origin of planning and agency coordinating bodies *supra* § 24:22.). Moreover, the bulk are aimed at adapting to coastal and flooding threats compared to other climate impacts.

The most common type of state adaptation mandate requires local governments to include or consider sea-level rise and flooding in their local comprehensive plans (also called general or master plans) (*See* the section on local adaptation in this treatise).³² These, however, are usually standalone legislative provisions that include only that specific requirement. Instead, this part focuses on a few examples of how states legislatures—and a governor in Pennsylvania—are responding to local adaptation needs by enabling new actions at the local level or providing other forms of support.

States can draft new statutes (and update existing ones) to provide local governments with the necessary tools and powers they need to respond to climate change without fear of lacking clear state authority to do as such, even in home rule states.³³

“Type II” actions) to include green infrastructure upgrades or retrofits; and the installation of solar arrays on different sites like cleaned up brownfields, wastewater treatment facilities, and those zoned for industrial uses.

³¹*See* the guidelines from December 2009, *available at* https://resources.ca.gov/CNRALegacyFiles/ceqa/docs/Adopted_and_Transmitted_Text_of_SB97_CEQA_Guidelines_Amendments.pdf; *see also* Georgetown Climate Ctr., *Preparing for Climate Change in California*, STATE PROGRESS TRACKER, <https://www.georgetownclimate.org/adaptation/state-information/california/overview.html> (last updated Aug. 1, 2018).

³²*See, e.g.*, legal requirements in California, Florida, South Carolina, and Virginia in Georgetown Climate Center's State Adaptation Progress Tracker, *available at* <https://www.georgetownclimate.org/adaptation/plans.html>.

³³Generally, home rule means that a state's political subdivisions—its counties and municipalities—are authorized to legislate on almost all local matters, without seeking permission from the state; the usual exception involves preemption by or conflict with state law. In a Dillon rule state, local governments usually have less freedom to act without the permission of their state legislature. Specifically, in a Dillon rule state, local governments have the authority to act only in instances where they have been expressly granted such authority by their state legislature, or where such authority is necessarily implied by an express grant.

State laws that predate the advent of climate adaptation in both home rule, but especially Dillon rule states could potentially hinder a local government's ability to take some type of action if: (1) the original state authorization is not broad enough to cover or encompass a local government's intended climate course of action; or (2) even where state authority can be reasonably implied or inferred, a local government is still hesitant to take any action that does not derive from an express or

New Hampshire and Maryland present a few examples. In 2017, New Hampshire passed a new law that enables municipalities to create a tax incentive program to promote resilience in coastal areas.³⁴ Municipalities can establish “Coastal Resilience Incentive Zones” to grant property owners tax relief for undertaking “resilience measures” for qualified properties and structures impacted by sea-level rise, storm surge, and extreme precipitation.³⁵ In 2019, the state passed another innovative law that can help local governments overcome cross-jurisdictional governance challenges posed by sea-level rise and flooding.³⁶ Among other provisions, the law allows municipalities to either alter their existing boundaries or create a new municipality by combining existing ones. Another notable provision allows municipalities to establish Joint Municipal Development and Revitalization Districts, which can include land from several municipalities, and create agreements to share tax revenues and expenditures across jurisdictions. Together, these provisions can help local governments coordinate regional adaptation responses to sea-level rise and share the tax revenues and costs of these necessary responses.

Somewhat differently, Maryland passed a law in 2020 that gives local governments the ability to establish and fund a “Resilience Authority.”³⁷ A Resilience Authority can enable a local jurisdiction to generate funding through fees, bonds, and other non-tax means to manage large-scale infrastructure projects affected by sea-level rise, flooding, increased precipitation, erosion, and heatwaves. A local government can use this new source of revenue to support many types of infrastructure projects, including elevating buildings and developing flood barriers, stormwater infrastructure, and green spaces. Resilience Authorities can help local governments accelerate infrastructure financing, reduce implementation costs, and better adapt to climate change.³⁸

Furthermore, many states have gone one step further by developing guidance and tools to help local governments design and implement these types of state actions. In 2011, the Florida Legislature passed the Community Planning Act, which made significant changes to the state’s growth management laws. One update allows local coastal governments to create Adaptation Action Areas (AAA).³⁹ AAA are optional comprehensive plan designations for areas vulnerable to sea-level rise and coastal

clear grant of authority, likely due to fears of potential legal challenges. Where a state’s authority is unclear or not broad enough, a state may consider updating or expanding that authority to enable local governments to adapt to climate change with enhanced legal clarity. For more information on the difference between home rule and Dillon rule, see the section on local adaptation in this chapter of the treatise.

³⁴Georgetown Climate Ctr., *New Hampshire Coastal Resilience Incentive Zone Program for Municipalities*, ADAPTATION CLEARINGHOUSE (Sept. 3, 2017), <https://www.adaptationclearinghouse.org/resources/new-hampshire-coastal-resilience-incentive-zone-program-for-municipalities.html>.

³⁵Tax relief in this case means that property taxes will not increase for the cost of any property or structural improvements during the period of eligibility set by the municipality (which, barring exceptions, can be for a maximum period of five years).

³⁹Georgetown Climate Ctr., *Creation of “Adaptation Action Areas” in Florida’s Community Planning Act*, ADAPTATION CLEARINGHOUSE (June 2, 2011), <https://www.adaptationclearinghouse.org/resources/creation-of-e-adaptation-action-areas-e-in-florida-s-community-planning-act.html>.

flooding that can aid local governments in prioritizing funding for infrastructure and adaptation planning. Under the act, AAA are defined as areas at risk of flooding from sea-level rise, high tide events, storm surge, flash floods, and stormwater runoff. In 2015, Florida released the Adaptation Action Areas Guidebook: A Planning Guidebook for Florida's Local Government for municipalities considering using AAA.⁴⁰

In addition, Maryland passed a law in 2018 that, among other provisions, requires every local jurisdiction experiencing nuisance flooding (also called high tide or sunny day flooding) to develop a plan to reduce and address that type of flooding.⁴¹ The Maryland Department of Natural Resources developed guidance to assist local governments in this first-of-its-kind endeavor in the nation.⁴²

In a somewhat different executive vein, Governor Tim Wolf of Pennsylvania announced a plan at the end of 2020 to help municipalities address flooding caused or exacerbated by climate change.⁴³ The governor is requiring the State Planning Board to develop recommendations and best practices for land use, planning, zoning, and stormwater management to assist local governments in mitigating threats like flash flooding, which is increasing throughout the state. In addition, the State Planning Board must establish “state goals and strategic investments to assist municipalities, which will then be incorporated by state agencies into their appropriate funding applications.”⁴⁴ The governor's orders are largely in response to a lack of current legislative direction or action to help the state recover from successive flooding damages that did not qualify for disaster relief from the federal government.⁴⁵

§ 24:23 Climate adaptation plans

Climate adaptation planning has emerged as a crux for how most states have initiated and then built their broader adaptation strategies. Specifically, most states initiate adaptation strategies through planning and implementation of those plans. In the climate adaptation field, there is no accepted technical definition for a “climate adaptation plan” let alone a singular classification system or set of characteristics to

⁴⁰Georgetown Climate Ctr., *Adaptation Action Areas Guidebook: A Planning Guidebook for Florida's Local Government*, ADAPTATION CLEARINGHOUSE (Aug. 2015), <https://www.adaptationclearinghouse.org/resources/adaptation-action-areas-guidebook-a-planning-guidebook-for-florida-s-local-government.html>.

⁴⁵*Id.* (“There are two programs within the Federal Emergency Management Agency that can provide federal aid after a flooding disaster: public assistance and individual assistance. Public assistance provides reimbursements to state, county and local governments and eligible nonprofits for costs associated with response and recovery efforts. Each county included in a public assistance request must meet a cost threshold based on population and, in turn, the commonwealth overall must meet a threshold of \$19.5 million in damage costs. Individual assistance includes a wide range of programs for homeowners and renters, including cash grants, housing or home repair assistance. In 2018 in Pennsylvania, more than 5,000 homes were damaged in a series of incidents, but no single incident met the threshold. That year there was also approximately \$63 million in public infrastructure damages alone that were not reimbursable through federal disaster programs.”).

determine which states have a climate adaptation plan.¹ For purposes of this treatise, **climate adaptation plans** *outline or direct how states will prepare to address forecasted climate change impacts*. These plans vary in format, level of detail, and sectors covered, among other factors. Adaptation plans are usually preceded by or developed concurrently with a state-level vulnerability assessment to ensure that state strategies are scientifically based, driven, and informed.²

Between 2008 and 2009, Maryland, Florida, California, and New Hampshire released the nation's first climate adaptation plans.³ On April 20, 2007, Governor Martin O'Malley issued Executive Order 01.01.2007.07, which established the Maryland Commission on Climate Change and directed the commission to create a Climate Action Plan.⁴ To fulfill this mandate, Maryland produced two climate adaptation plans: the Comprehensive Strategy for Reducing Maryland's Vulnerability to

[Section 24:23]

¹E.g., Georgetown Climate Center tracks whether and how states are developing "climate adaptation plans." The center has established four criteria for determining which states have an adaptation plan. Specifically, a climate adaptation plan must be: (1.) comprehensive (multi-sector, multi-impact [e.g., some states have plans that focus only on sea-level rise or coastal impacts]); (2.) statewide (considers impacts to the full state, involves multiple state agencies); (3.) focused on adaptation (i.e., assesses the state's vulnerability to the full range of climate impacts and identifies strategies for reducing those impacts); and (4.) state supported or state led (meaning that the state has a primary role in developing the plan, rather than a nongovernmental or academic partner).

Some states listed as having a plan do not consider themselves as having a plan. For example, according to Georgetown Climate Center, New York State has a climate adaptation plan commissioned by former Governor David Paterson; however, under Governor Andrew Cuomo, the state is currently developing what it considers to be its first climate adaptation plan. Moreover, some states, like California, have multiple plans that meet Georgetown Climate Center's criteria.

²Although important, this section does not describe state vulnerability assessments in detail. Through Executive Order S-03-05, California is an example of a state that imposes upon itself an obligation to complete periodic statewide assessments of climate impacts and vulnerabilities. The fourth and latest version of the state's climate change assessment, as of publication of this section, was released on August 27, 2018. Most states that have climate adaptation plans called for by an executive order or statute are similarly required to update their climate adaptation plans and vulnerability assessments on a regular schedule, usually every five years. Georgetown Climate Ctr., *California's Fourth Climate Change Assessment*, ADAPTATION CLEARINGHOUSE (Aug. 27, 2018), <https://www.adaptationclearinghouse.org/resources/california-s-fourth-climate-change-assessment.html>.

Other states take different approaches to how they sequence and link their vulnerability assessments and adaptation plans. In June 2020, North Carolina released its first climate vulnerability assessment in conjunction with and a part of its Climate Risk Assessment and Resilience Plan. Georgetown Climate Ctr., *North Carolina 2020 Climate Risk Assessment and Resilience Plan*, ADAPTATION CLEARINGHOUSE (June 2, 2020), <https://www.adaptationclearinghouse.org/resources/north-carolina-2020-climate-risk-assessment-and-resilience-plan.html>. In April 2020, the State of New Jersey released its first Scientific Report on Climate Change ahead of its first climate adaptation plan and other related initiatives, including a separate Coastal Resilience Plan that is also being developed. *Climate Resilience for New Jersey*, N.J. DEPT OF ENVTL. PROT., <https://www.nj.gov/dep/climatechange/resilience.html> (last visited Nov. 17, 2020).

³Some states—like Maine in 2003, Oregon in 2006, Alaska in 2007, and Pennsylvania in 2008—started taking discrete adaptation actions in the early 2000s, but only a few released statewide climate adaptation plans and took more comprehensive actions. Specifically, California, Colorado, Florida, Maryland, and New Hampshire are called out here due to the holistic nature of the actions they initiated between 2007 and 2009 that were more focused on climate adaptation versus mitigation. Notably, four of the five states—California, Florida, Maryland, and New Hampshire—released the nation's first statewide climate adaptation plans within that period, which is a key distinction as to why their respective efforts are discussed here in depth. In contrast, Colorado did not release its first climate adaptation plan until 2011; however, it is the first example of a non-coastal state that released a climate adaptation plan and it has made more significant adaptation progress since 2007 than other non-coastal states.

⁴Georgetown Climate Ctr., *Maryland Executive Order 01.01.2007.07*, ADAPTATION CLEARINGHOUSE (Apr. 20, 2007), <https://www.adaptationclearinghouse.org/resources/maryland-executive-order-01-01-2007-07.html>.

Climate Change, Phase I: Sea-level Rise and Coastal Storms (issued September 12, 2008); and the Comprehensive Strategy for Reducing Maryland's Vulnerability to Climate Change, Phase II: Building Societal, Economic, and Ecological Resilience (issued January 24, 2011).⁵ The 2011 plan is broader than the 2008 plan because it evaluates multiple impacts to the state outside of sea-level rise and the coastal sector. Specifically, the 2008 plan addresses the effects of sea-level rise and coastal storms in the state on the existing and future built environment and infrastructure; the economy; human health, safety, and welfare; and natural resources. In contrast, the 2011 plan evaluates the impacts of precipitation changes and increased temperature changes on similar sectors.

Through Executive Order 07-128, on July 23, 2007, Florida Governor Charlie Crist established an Action Team on Energy and Climate Change to create a comprehensive Energy and Climate Change Action Plan.⁶ The plan was finalized on October 15, 2008.⁷ The plan highlights projected climate impacts to the state, including temperature and precipitation changes, sea-level rise, and extreme weather, and recommends adaptation strategies that the state could implement to increase Florida's resilience to these impacts. The Action Plan includes goals related to: the state's research needs; comprehensive planning; ecosystems and biodiversity; water resource; the built environment and infrastructure; the economy; insurance; emergency preparedness; human health and social effects; government organization and coordination; funding; and education.

Shortly after Maryland and Florida, California released its California Climate Adaptation Strategy in December 2009.⁸ On November 14, 2008, Governor Arnold Schwarzenegger issued Executive Order S-13-08 and called on the California Natural Resources Agency to develop a statewide adaptation strategy in coordination with public and private entities at all levels of government.⁹ The California strategy summarizes climate change impacts and recommends adaptation goals for seven sectors: public health; biodiversity and habitat; oceans and coastal resources; water; agriculture; forestry; and transportation and energy. California updated its adaptation strategy in 2014 and 2018.

Around the same time as California, New Hampshire finalized its own climate adaptation plan. In December 2007, New Hampshire's Governor John Lynch

established a Climate Change Policy Task Force through Executive Order 2007-3.¹⁰ The Task Force was charged with developing a state Climate Action Plan.¹¹ On March 25, 2009, the Task Force released the New Hampshire Climate Action Plan, which includes a chapter on Adapting to a Changing Climate.¹²

Beyond Maryland, California, and New Hampshire, the number of states with adaptation plans has grown, especially between 2018 and 2020, a period in which a number of coastal and non-coastal states made adaptation commitments for the first time. As of 2020, 18 states have released adaptation plans, plus the District of Columbia, for a total of 19 jurisdictions: Alaska, California, Colorado, Connecticut, Delaware, Florida, Maine, Maryland, Massachusetts, Montana, New Hampshire, New York, North Carolina, Oregon, Pennsylvania, Rhode Island, Virginia, and Washington.¹³ Among these, Connecticut, Delaware, Maine, Maryland, and New York are updating their plans or creating new ones.¹⁴ In addition, other states are in the process of or making strong progress on developing their inaugural adaptation plans, including Michigan, Nevada, New Jersey, New Mexico, South Carolina, Vermont, and Wisconsin.¹⁵

A plan's goals, objectives, and recommendations vary state-by-state. Moreover,

Vermont Global Warming Solutions Act (Sept. 2020), available at <https://legislature.vermont.gov/Documents/2020/Docs/ACTS/ACT153/ACT153%20As%20Enacted.pdf>. The act created the Vermont Climate Council. The council is tasked with formulating a Climate Action Plan that must be adopted by December 1, 2021. The Climate Action plan must include strategies to reduce greenhouse gas emissions, as well as strategies to build resilience to prepare Vermont's communities, infrastructure, and economy to adapt to the current and anticipated effects of climate change.

each state implements its plan differently and may or may not track its plan's implementation progress on discrete goals and objectives—either internally for a government audience and/or externally for the public. Implementation tracking can be a useful tool for many reasons, including demonstrating state progress on adaptation; informing the need for adaptive management approaches in the face of a changing climate and other plan revisions or updates to achieve stated goals and objectives; and promoting transparency and awareness among elected officials and the public.

While this part only provides an overview of state climate adaptation planning in the United States, Box 1 highlight a few interesting facts showcasing the range and unique nature of various states' plans:

Box 1: Examples of State Climate Adaptation Plans
<p style="text-align: center;">Colorado</p> <p>In 2011, Colorado was the first non-coastal state to develop and release a climate adaptation plan, the Colorado Climate Preparedness Project: Final Report.¹⁶ The state issued an updated version of the plan in 2018, the Colorado Climate Plan Update 2018—State Level Policies to Mitigate and Adapt.¹⁷ The 2018 plan includes new climate resiliency goals, for example, regarding state actions at the local level; and reports on state adaptation progress since 2015.</p>
<p style="text-align: center;">Massachusetts</p> <p>In 2018, Massachusetts was the first state to issue a combined statewide hazard mitigation and climate adaptation plan, the Massachusetts Statewide Hazard Mitigation and Climate Adaptation Plan.¹⁸ Given the similar goals and objectives for hazard mitigation and climate adaptation plans to reduce risks and vulnerabilities to people and the environment, Massachusetts pioneered a logical and seamless plan alignment. The natural hazards assessment conducted for this plan examines how hazard risks and vulnerabilities are becoming more severe or uncertain due to climate change. The plan outlines climate change impacts and adaptation strategies for five key sectors: populations, the government, the built environment, natural resources and the environment, and the economy.</p>

STATE OF WI., GOVERNOR'S TASK FORCE ON CLIMATE CHANGE REPORT (Dec. 2020), available at <https://climatechange.wi.gov/Documents/Final%20Report/USCA-WisconsinTaskForceonClimateChange20201207-HighRes.pdf>. In December 2020, Wisconsin's bipartisan Climate Change Task Force released the Climate Change Report, which contains 55 recommendations that, if implemented, will help the state adapt to the impacts of climate change and reduce climate emissions. One of the recommendations calls for the state to: "Fund and execute a statewide climate risk assessment and resilience plan."

¹⁶Georgetown Climate Ctr., *Colorado Climate Preparedness Project: Final Report*, ADAPTATION CLEARINGHOUSE (2011), <https://www.adaptationclearinghouse.org/resources/colorado-climate-preparedness-project-final-report.html>.

¹⁸Georgetown Climate Ctr., *Massachusetts Statewide Hazard Mitigation and Climate Adaptation Plan*, ADAPTATION CLEARINGHOUSE (Sept. 17, 2018), <https://www.adaptationclearinghouse.org/resources/massachusetts-statewide-hazard-mitigation-and-climate-adaptation-plan.html>.

In hazard mitigation plans, state and local governments develop strategies to protect people and property from future disaster events. These plans must meet requirements set by the Federal Emergency Management Agency (FEMA). Hazard mitigation plans start by identifying risks and vulnerabilities related to a given disaster or multiple types of disasters, like hurricanes, tsunamis, flooding, drought, and wildfires, and then potential strategies to reduce those risks and vulnerabilities. Importantly, a FEMA-approved hazard mitigation plan is a prerequisite for state and local governments to receive funding from FEMA for areas covered by a presidential disaster declaration. *Hazard*

Montana

In August 2020, Montana finalized its first-ever climate adaptation plan, the Montana Climate Solutions Plan.¹⁹ The plan—a **combined climate mitigation and adaptation plan**—calls for the state to: create a Montana Climate Solutions Network to connect communities and encourage cross-jurisdictional adaptation efforts; preserve Montana’s resources that support tourism and outdoor recreation; incentivize management practices on private lands that increase productivity while minimizing climate risks; increase resilience to wildfires; and increase the resilience of wildlife and rangelands. Notably, the state plan also includes a section on promoting the economic resilience of Montana’s citizens as the state’s economy and workforce are in the process of transitioning away from the fossil fuel industry.²⁰ In order to support and ensure justice for displaced workers and communities, the plan identifies the following as key strategies to build individual economic resilience: increasing apprenticeship opportunities; integrating career training into the public school curriculum; standardizing wages in up-and-coming industrial sectors; and supporting unionization.

Connecticut, Maine, and Rhode Island

Given the need for adequate and available funding to implement the objectives and projects identified in state adaptation plans, Connecticut, Maine, and Rhode Island have been working to evaluate **potential funding and financing mechanisms** as a part of—and not separately from—their adaptation planning processes.²¹ More states are simultaneously looking at funding and financing in tandem with adaptation planning to enhance the practicality and usefulness of their plans. For example, in 2019, Connecticut formed a Financing and Funding Adaptation and Resilience Working Group as part of Governor Ned Lamont’s call to update the state’s 2011 Connecticut Climate Change Preparedness Plan.²² The **working group identified several ways the state and its municipalities could fund and finance climate mitigation and adaptation projects.**²³

Mitigation Plan Requirement, FED. EMERGENCY MGMT. AGENCY, <https://www.fema.gov/emergency-manager/s/risk-management/hazard-mitigation-planning> (last updated Oct. 28, 2020). As stated in the section on federal adaptation, hazard mitigation funding from FEMA and other agencies has become a critical source of funding for climate adaptation in the absence of other, more sustainable and climate-specific sources of federal, state, and local funding.

¹⁹Georgetown Climate Ctr., *Montana Climate Solutions Plan*, ADAPTATION CLEARINGHOUSE (Aug. 2020), <https://www.adaptationclearinghouse.org/resources/montana-climate-solutions-plan.html>.

²⁰The fossil fuel industry has provided many Montanans with well-paying, secure jobs. However, as the fossil fuel industry is declining in the state, no comparable positions have emerged in other sectors.

Maine is similarly considering a range of potential funding and financing options across all levels of government and the private sector to support the climate mitigation and adaptation strategies recommended in its 2020 plan update, *Maine Won't Wait*.²⁴ The state also commissioned a study to **assess the impacts of climate on Maine's economy, revenues, and investment decisions**.²⁵ The purpose of the study is to help Maine estimate how much adapting—or not adapting—to climate change will cost the state.

In its 2018 Resilient Rhody plan, Rhode Island explicitly **highlighted barriers to paying for adaptation projects**. Importantly, the plan also identified both existing (e.g., state revolving funds and mitigation banking) and new and emerging financing mechanisms (e.g., environmental impact bonds and stormwater utilities) that could be used to overcome those barriers.

North Carolina

Many state climate adaptation plans include **equity and environmental justice considerations** to varying degrees. North Carolina's Climate Risk Assessment and Resilience Plan places a significant emphasis on equity and environmental justice, or what the state refers to as "**climate justice**."²⁶ In the plan, the state mapped "Potentially Underserved Populations" using North Carolina's environmental justice mapping protocol, which identifies U.S. Census block groups as potentially underserved if their populations are disproportionately non-white and experiencing poverty. After mapping "Potentially Underserved Populations," the state then overlaid projected climate impact maps to better assess these populations' exposure to risks like inland and coastal flooding, wildfire, and extreme heat. The plan concludes by recommending a future research agenda and policy updates to address institutionalized and systemic climate injustice.

§ 24:24 Supplemental and standalone plans and actions

For the many states that already have or are in the process of developing an official climate adaptation plan—and the even greater number of states that do not have one yet—there is both supplemental and standalone progress on other types of adaptation plans and initiatives. This part explores additional types of adaptation plans and related legal and policy actions that were not covered in Section 24:23. This part is organized to highlight the most common ways state agencies are structuring these plans. First, this part presents examples of state plans and actions that are intended to address climate-related impacts to water, especially on the coast. These plans focus on water, but provide cross-sectoral (e.g., infrastructure, natural resources) recommendations and direction to a state. Second, this part identifies examples of plans and initiatives through the lens of a given sector or agency.

In summary, states are most frequently undertaking actions to adapt to coastal and inland flooding. A few examples of other types of water-related plans look at how states are managing their freshwater supplies in the face of saltwater intrusion and salinization, drought, and competing user demands. These plans suggest that states are beginning to grow more comprehensive approaches to managing water

²⁴ME. CLIMATE COUNCIL, MAINE WON'T WAIT: A FOUR-YEAR CLIMATE ACTION PLAN (Dec. 2020), *available at* https://www.maine.gov/future/sites/maine.gov/future/files/inline-files/MaineWontWait_December2020.pdf.

²⁵DEP'T OF THE GOVERNOR'S OFFICE OF POL'Y INNOVATION & THE FUTURE, STATE OF ME., ASSESSING THE IMPACTS CLIMATE CHANGE MAY HAVE ON THE STATE'S ECONOMY, REVENUES, AND INVESTMENT DECISIONS (Sept. 1, 2020), *available at* <https://climatecouncil.maine.gov/reports> (this report was prepared for the state by Eastern Research Group, Inc. and Synapse Energy Economics).

²⁶Georgetown Climate Ctr., *North Carolina 2020 Climate Risk Assessment and Resilience Plan*, ADAPTATION CLEARINGHOUSE (June 2, 2020), <https://www.adaptationclearinghouse.org/resources/north-carolina-2020-climate-risk-assessment-and-resilience-plan.html>.

beyond just mitigating flood risks. The author of this section, however, is not similarly aware of any statewide plans to reduce extreme heat or wildfires.¹ Where state agencies are currently addressing those impacts, it appears to only be through sector-specific or individual agency or project plans.

A. *Water-related plans and actions*

This part starts by examining first-of-their-kind state exemplars aimed at building coastal resilience. It then transitions to novel examples of state efforts to address other climate-related impacts to freshwater.

1. Coastal master and resilience plans

Despite not having its own statewide climate adaptation plan, Louisiana is a leader in coastal adaptation and resilience. In 2006, Louisiana passed Act 8, which created the Coastal Protection and Restoration Authority and required the authority to develop a Coastal Master Plan (CMP) every five years.² The CMP provides a \$50 billion, 50-year blueprint for directing Louisiana's investments, regulations, and programs in coastal restoration, resilience, and protection.³

The CMP utilizes data on sea-level rise, flooding, and land loss over a 50-year planning horizon. The CMP includes objectives for enhancing flood protection; restoring, protecting, and sustaining natural processes, coastal habitats, and cultural heritage; and promoting a viable working coast. The state seeks to attain these objectives by investing in land-building, restoration, and structural (e.g., levees) and non-structural (e.g., elevating structures, buyouts) risk-reduction projects identified in the CMP. The CMP guides how the state will allocate funds towards these purposes over the applicable five-year period. Since the first CMP was adopted in 2007, the state has completed or funded 135 projects temporarily benefiting 36,000 acres of land.⁴

Consistent executive leadership has amplified the CMP's ability to affect state actions beyond the Coastal Protection and Restoration Authority alone. Via Executive Order JBE 2016-09 in 2016, Governor John Bel Edwards directed all state agencies, departments, and offices in Louisiana to carry out their regulatory programs, practices, grants, and contracts in a manner consistent with the CMP.⁵ In August 2020, Governor Edwards issued a second executive order that further emphasized the

[Section 24:24]

¹The author is not aware of any statewide plans for heat or wildfires that are analogous to statewide plans for flooding or water in terms of their depth or coverage of climate change. This is not to say that states do not have, for example, wildfire mitigation, protection, and recovery plans, because some in fact do. However, the author has not found examples of heat or wildfire plans that align with this section's focus on state-level actions that explicitly call out or significantly approach climate change.

²Georgetown Climate Ctr., *Louisiana's 2012 Coastal Master Plan*, ADAPTATION CLEARINGHOUSE (May 22, 2012), <https://www.adaptationclearinghouse.org/resources/louisiana-s-2012-coastal-master-plan.html>. Hurricane Katrina hit the Gulf in 2005, directly precipitating the legislative mandate for a CMP. The tragedies that resulted from Hurricane Katrina brought the state to develop a more comprehensive approach to coastal management and disaster preparedness. *Structure*, LA. COASTAL PROT. & RESTORATION AUTH., <https://coastal.la.gov/about/structure/> (last visited Jan. 14, 2021).

³Georgetown Climate Ctr., *Louisiana's 2012 Coastal Master Plan*, ADAPTATION CLEARINGHOUSE (May 22, 2012), <https://www.adaptationclearinghouse.org/resources/louisiana-s-2012-coastal-master-plan.html>; Georgetown Climate Ctr., *Louisiana 2017 Coastal Master Plan*, ADAPTATION CLEARINGHOUSE (June 2, 2017), <https://www.adaptationclearinghouse.org/resources/louisiana-2017-coastal-master-plan.html>.

⁴Georgetown Climate Ctr., *Louisiana 2017 Coastal Master Plan*, ADAPTATION CLEARINGHOUSE (June 2, 2017), <https://www.adaptationclearinghouse.org/resources/louisiana-2017-coastal-master-plan.html>. The most recent CMP is from 2017, and the next update is expected in 2021.

⁵Exec. Order No. JBE 2016-09, available at <https://gov.louisiana.gov/assets/ExecutiveOrders/JBE16-09.pdf>.

importance of the CMP to the state's plans and initiatives. Executive Order JBE 2020-19 requires all state agencies to pursue Louisiana's coastal protection and adaptation goals and incorporate resilience planning into their operations.⁶ To accomplish these goals, the governor established the position of Chief Resilience Officer and resilience leads in each state agency to coordinate state-agency actions with the CMP.

In accordance with Louisiana's model, other states are following suit with their own coastal master or resilience plans. In 2017 and 2019, Texas released a Coastal Resiliency Master Plan to guide future management of the state's coast in response to sea-level rise, storm surge, erosion, habitat loss and degradation, and declining water quality.⁷ In both plans, the Texas General Land Office lays out several resilience strategies to address these hazards in a system-wide approach. Similarly, New Jersey and Virginia are in the process of developing their coastal master or resilience plans.⁸

While Louisiana's Coastal Master Planning framework is gaining traction among coastal states, Rhode Island is pursuing a different approach. Instead of creating a plan to identify, prioritize, fund, and implement adaptation projects over a given planning horizon, Rhode Island's approach focuses on how the state can increase its overall resilience through data-driven permitting and land use processes. In June 2018, the State of Rhode Island's Coastal Resource Management Council (CRMC) adopted the Rhode Island Shoreline Change Special Area Management Plan (Beach SAMP) to help Rhode Island's coastal communities better adapt to climate and shoreline changes.⁹ The Beach SAMP includes guidance and tools for how state and local decisionmakers and private property owners can design and build more resilient development.

The Beach SAMP is the first SAMP of its kind in the United States to both cover a state's entire coastal zone and climate impacts.¹⁰ The planning boundary was identified through STORMTOOLS, an online, interactive mapping tool that displays different storm inundation scenarios—both with and without sea-level rise—for

⁶Georgetown Climate Ctr., *Louisiana Executive Order Number JBE 2020-19 on Coastal Resilience*, ADAPTATION CLEARINGHOUSE (Aug. 19, 2020), <https://www.adaptationclearinghouse.org/resources/louisiana-executive-order-number-jbe-2020-19-on-coastal-resilience.html>.

⁸Georgetown Climate Ctr., *New Jersey Executive Order 89 Establishing Statewide Climate Change Resilience Strategy*, ADAPTATION CLEARINGHOUSE (Oct. 29, 2019), <https://www.adaptationclearinghouse.org/resources/new-jersey-executive-order-89-establishing-statewide-climate-change-resilience-strategy.html>. Among other things, this executive order called for the development of a Coastal Resilience Plan, in addition to a statewide Climate Resilience Strategy.

OFFICE OF THE GOVERNOR, COMMONWEALTH OF VA., VIRGINIA COASTAL RESILIENCE MASTER PLANNING FRAMEWORK: PRINCIPLES AND STRATEGIES FOR COASTAL FLOOD PROTECTION AND ADAPTATION (Oct. 2020), available at <https://www.governor.virginia.gov/media/governorvirginiagov/governor-of-virginia/pdf/Virginia-Coastal-Resilience-Master-Planning-Framework-October-2020.pdf>. This document was drafted pursuant to Governor Ralph Northam's Exec. Order No. 24 from November 2018 and is part one of a two-part process to release a Coastal Master Plan, like Louisiana's, by the end of 2021.

⁹Georgetown Climate Ctr., *Rhode Island Shoreline Change Special Areas Management Plan (BEACH SAMP)*, ADAPTATION CLEARINGHOUSE (June 2018), <https://www.adaptationclearinghouse.org/resources/rhode-island-shoreline-change-special-area-management-plan-beach-samp-a.html>.

¹⁰Under the federal Coastal Zone Management Act, Special Area Management Plans or "SAMPs" are resource management plans that states can develop to better manage specific geographic areas within their coastal zones. Coastal Zone Management Act, 16 U.S.C. § 1452(3). Here, Rhode Island created a SAMP to cover its entire coastal zone.

Rhode Island.¹¹ With STORMTOOLS, Rhode Island has the ability to assess risk at the individual structure and parcel level for all properties along the coast and within the Beach SAMP planning boundary.

The Beach SAMP contains the Coastal Hazard Application Guidance, a five-step risk assessment process for proposed development within the Beach SAMP Planning Boundary. In August 2018, CRMC amended its regulations to require that project applicants complete and file a Coastal Hazard Application worksheet with their permit application in accordance with the template and guidance provided in the Beach SAMP.¹² This is one example of a coastal regulatory program in the U.S. to put forward permit requirements that address future risk from sea-level rise, storm surge, and coastal erosion.

2. Other examples of water-related plans and actions

Apart from sea-level rise and flooding, Maryland, Colorado, and California present examples of how states are addressing other climate-related impacts to freshwater.

Maryland developed the nation's first state-level plan to combat saltwater intrusion and salinization.¹³ In response to a state law that called for the plan, Maryland's 2019 Plan to Adapt to Saltwater Intrusion and Salinization looks at the impacts of these threats on the state's freshwater resources, coastal wetlands and forests, and human uses (e.g., agriculture), and identifies future research and adaptation priorities.¹⁴ Through the Maryland Department of Planning, the state is beginning to implement priorities contained in the plan.¹⁵ Specifically, the state is drafting a Wetlands Adaptation Plan to protect wetlands being lost or "drowned" by sea-level rise. The plan will map and identify both priority wetlands that can be restored and conserved in place, as well as wetland migration corridors that can serve as a pathway to their establishment on higher ground. The state is also developing the template for a wetlands conservation easement, or "coastal easement," that would preserve undeveloped space (i.e., buffers on private property) to ensure that wetlands will have room to move inland.

Compared to Maryland, Colorado is addressing different western water impacts. The state was one of the first to prominently feature climate data and considerations in its comprehensive water plan. In 2015, Colorado released the Colorado Water Plan to put forward an adaptive water management approach for the state.¹⁶ Colorado is facing increased demand and stress on its water supply due to a steadily increasing population. This is compounded by climate impacts, such as higher

¹¹Georgetown Climate Ctr., *Rhode Island: STORMTOOLS for Mapping Coastal Flooding*, ADAPTATION CLEARINGHOUSE (2016), <https://www.adaptationclearinghouse.org/resources/rhode-island-stormtools-for-mapping-coastal-flooding.html>. CRMC has defined the Beach SAMP Planning Boundary as the land area along the coastline projected to be inundated by seven feet of sea-level rise with a 100-year-return-period storm event, as illustrated using STORMTOOLS.

¹⁵Agenda, Adaptation & Resiliency Working Group Quarterly Meeting, Maryland Comm'n on Climate Change (Nov. 16, 2020), available at <https://mde.maryland.gov/programs/Air/ClimateChange/MCCC/ARWG/Meeting%20Agenda%2011.16.20.pdf>.

¹⁶Georgetown Climate Ctr., *Colorado Water Plan*, ADAPTATION CLEARINGHOUSE (2015), <https://www.adaptationclearinghouse.org/resources/colorado-water-plan.html>.

temperatures and changes in precipitation and spring runoff. The purpose of the plan is to create a sustainable water future for the state out to 2050 in light of these impacts and competing user groups. To meet these challenges, the plan includes specific goals, quantifiable outcomes, and adaptation strategies for each of Colorado's eight water basins. In 2017, the state issued an update and progress report on the 2015 plan in a report called *Ripple Effects: Colorado Water Plan in Action 2017*.¹⁷

Last but not least, a recent initiative in California suggests an opportunity for future statewide approaches to more comprehensively manage freshwater resources that include, but are not limited to, mitigating flood risks. In April 2019, California Governor Gavin Newsom issued Executive Order No. N-10-19 that requires the state to develop a comprehensive strategy to build a climate resilient water system.¹⁸ The order directed the secretaries of the California Natural Resources Agency, California Environmental Protection Agency, and the California Department of Food and Agriculture to prepare a Water Resilience Portfolio that will address the needs of California's communities, environment, and economies throughout the twenty-first century.¹⁹ On July 28, 2020, Governor Newsom released the Water Resilience Portfolio.²⁰ The portfolio will serve as the state's blueprint to better address a myriad of climate impacts beyond flooding—like extreme droughts, rising temperatures, declining fish stocks, and depleting groundwater supplies—that are affecting the state's water supply and quality. This is a noteworthy example of a state action to coordinate water management and climate adaptation and resilience to address more than one climate impact.

B. Sector- and agency-specific plans and actions

This part looks at how state agencies are addressing the multiple climate impacts facing their states through the lens of a single sector or agency focus. To supplement and contrast with § 24:22 *supra*, this part intentionally includes sector-specific examples of how agencies are adapting to non-water-related impacts, namely extreme heat and wildfires. Many states have included goals and objectives for extreme heat and wildfires in their climate adaptation plans but have yet to subsequently act on or implement those goals and objectives on a programmatic planning or regulatory level.²¹ As stated at the beginning of § 24:22, this author is not aware of any statewide plans to mitigate these climate threats in a way that is

¹⁷Georgetown Climate Ctr., *Ripple Effects: Colorado Water Plan in Action 2017*, ADAPTATION CLEARINGHOUSE (Nov. 2017), <https://www.adaptationclearinghouse.org/resources/ripple-effects-colorado-water-plan-in-action-2017.html>.

¹⁸Exec. Order No. N-10-19, *available at* <https://www.gov.ca.gov/wp-content/uploads/2019/04/4.29.19-EO-N-10-19-Attested.pdf>.

¹⁹The new Water Resilience Portfolio will build upon the state's water plan predecessors that have been issued since 1957. Legally mandated water plans are released every five years, with the most recent update from 2018. The 2018 update addresses climate change broadly under goals to increase the resiliency of the state's water infrastructure and incorporate climate change data into water management and education efforts, among others. Dep't of Water Res., Natural Res. Agency, State of Cal., *California Water Plan Update 2018: Managing Water Resources for Sustainability* (2018), *available at* <https://water.ca.gov/-/media/DWR-Website/Web-Pages/Programs/California-Water-Plan/Docs/Update2018/Final/Accessible-California-Water-Plan-Update-2018.pdf>.

²⁰CAL. NAT. RES. AGENCY, CAL. ENVTL. PROT. AGENCY, & CAL. DEP'T OF FOOD & AGR., 2020 WATER RESILIENCE PORTFOLIO: IN RESPONSE TO THE EXECUTIVE ORDER N-10-19, *available at* <https://waterresilience.ca.gov/wp-content/uploads/2020/01/California-Water-Resilience-Portfolio-2019-Final2.pdf>.

²¹Note: The author of this section has not undertaken a thorough analysis or conducted outreach to propose why there is an absence of statewide extreme heat and wildfire adaptation plans and initiatives. The author speculates that one possible reason is that the most severe impacts of extreme heat are highly localized and therefore, these impacts are better (or more typically) tackled at the local or community level. Compare §§ 24:22, 24:23 to learn more about how California is undertaking executive

analogous to those for coastal resilience, flooding, or water management.

State transportation agencies are increasingly conducting vulnerability assessments and planning to adapt to multiple effects of climate change, including extreme heat. As of 2020, the Massachusetts Department of Transportation (MassDOT) is in the process of developing a Statewide Climate Change Adaptation Plan for the state's infrastructure system.²² The plan will be used to help the state identify which of its publicly owned assets are at the greatest risk of inland flooding. Notably, MassDOT will also look at the effects of extreme heat on transportation assets and operations. Currently, MassDOT is conducting a vulnerability assessment during the first phase of this process. When completed, the plan will guide the state's actions to increase the resilience of its infrastructure to improve public safety and infrastructure reliability and reduce maintenance and operational costs.²³ Other states, like Arizona, California, Delaware, and Oregon, have completed or are undertaking vulnerability assessments for their transportation infrastructure and incorporating adaptation considerations into programmatic-level planning and guidance, in addition to project-level decisions.²⁴

Outside of the transportation sector, Washington and Oregon present examples of

and regulatory—compared to comprehensive planning—actions to address climate change and wildfires.

²²*MassDOT Statewide Climate Change Adaptation Plan Objectives*, MASS.GOV, <https://www.mass.gov/service-details/massdot-statewide-climate-change-adaptation-plan-objectives> (last visited Nov. 24, 2020).

²³This effort will be integrated with other ongoing state-led efforts, such as the Coastal Transportation Asset Vulnerability Assessment and the Deerfield River Watershed Vulnerability Assessment.

²⁴*See Resilience Program*, AZ. DEP'T OF TRANSP., <https://azdot.gov/business/environmental-planning/programs/sustainable-transportation/resilience-program> (last visited Nov. 24, 2020) ("The management of the roadway system has now evolved from a decentralized, project-based focus to one that encompasses enterprise-wide endeavors: administration, asset management, technology adoption, planning, design, construction, operations and maintenance. In addition, the expansion of risk analysis for extreme weather management and climate adaptation has complicated the long-term delivery of these complex transportation systems. ADOT seeks to combine risk, science, technology, and engineering to improve the understanding of weather-related risks to its transportation system, in order to accomplish its mission 'Connecting Arizona. Everyone. Every Day. Everywhere' and its vision to become the most reliable transportation system in the nation. ADOT has developed a programmatic approach to addressing all aspects of weather and natural hazards—including extreme weather and future measurable climate trends through a formal Resilience Program and three Transportation Research Board (TRB) papers and presentations . . .").

See Climate Change, CALTRANS, <https://dot.ca.gov/programs/transportation-planning/office-of-smart-mobility-climate-change/climate-change> (last visited Nov. 24, 2020) ("Increasing temperatures, larger wildfires, heavier rain storms, and rising sea levels and storm surges associated with climate change are posing a significant risk to our natural and human resources and to the State's transportation infrastructure. The Climate Change Branch in Caltrans' Division of Transportation Planning is responsible for overseeing the development, coordination, and implementation of climate change policies in all aspects of the Department's decision making. It serves as a resource for technical assistance, training, information exchange, and partnership-building opportunities. . . . Caltrans is conducting Climate Change Vulnerability Assessments to identify segments of the State Highway System vulnerable to climate change impacts including precipitation, temperature, wildfire, storm surge, and sea level rise. The climate change data were developed in coordination with climate change scientists and experts at Federal, State, and regional organizations at the forefront of climate science. The results of the Climate Change Vulnerability Assessments will be used to guide analysis of at-risk assets and develop adaptation plans to reduce the likelihood of damage to the State Highway System, thereby allowing Caltrans to both reduce the costs of storm damage, and to provide transportation that meets the needs of all Californians."). Note, the vulnerability assessments and corresponding district-mappings tools were completed in 2019. Georgetown Climate Ctr., *Caltrans District Climate Change Vulnerability Assessments (2019)*, ADAPTATION CLEARINGHOUSE (Oct. 2019), <https://www.adaptationclearinghouse.org/resources/caltrans-district-climate-change-vulnerability-assessments-2019.html>.

See DEL. DEP'T OF TRANSP., STRATEGIC IMPLEMENTATION PLAN FOR CLIMATE CHANGE, SUSTAINABILITY, AND RESILIENCE FOR TRANSPORTATION (July 2017), available at https://deldot.gov/Publications/reports/SIP/pdfs/SIP_FINAL_2017-07-28.pdf (Executive Summary, p. i: "This Strategic Implementation Plan for Climate Change, Sustainability and Resilience for Transportation (SIP) is the Delaware Department of

state agency actions connecting wildfires to natural resources conservation and public health, respectively. In February 2020, the Washington Department of Natural Resources (DNR) released its Plan for Climate Resilience.²⁵ The plan is a response to increasing climate impacts in the state, including the 2015 wildfire season, the worst wildfire season in recent history. In the plan, DNR identifies eight focus areas with corresponding adaptation responses it can implement to reduce the state's climate threats.²⁶ Among the eight focus areas, DNR draws specific attention to the nexus between climate change, wildfires, and forest management by suggesting several adaptation responses for each including:

- Wildfires: Reduce human-caused fires; enhance wildfire and timber workforces; and create post-wildfire recovery and restoration strategies.
- Forest management: Build climate-resilient seed management techniques; reforest with more climate-resilient tree species; enhance DNR's forest health assistance capacity for small forest landowners; and support climate-informed urban forest management that includes fire-adaptation strategies.

The importance of this plan was underscored by an order issued by the state's Commissioner for Public Lands, Hilary S. Franz, that committed DNR to "take all practicable steps within existing authorities and as guided by DNR's Plan for Climate Resilience to incorporate climate change considerations into all relevant decisions, policies, procedures, and operations"²⁷

In Oregon, the Health Authority published a report on the Oregon Climate and Health Program in 2019, which identifies ways that the public health system is adapting to the increasing number and severity of wildfires in Oregon and highlights future adaptation opportunities.²⁸ In response to Governor Kate Brown's Executive Order 20-04, the state also released the Climate and Health in Oregon 2020 Report.²⁹ The 2020 report documents how climate hazards like wildfires, heat, and drought

Transportation's (DelDOT) first attempt to develop a strategic and cohesive plan to promote a more resilient and sustainable transportation system in Delaware.").

See Georgetown Climate Ctr., *Oregon Dept. of Transportation Climate Change Adaptation Strategy Report*, ADAPTATION CLEARINGHOUSE (Apr. 2012), <https://www.adaptationclearinghouse.org/resources/oregon-dept-of-transportation-climate-change-adaptation-strategy-report.html> ("The Oregon Department of Transportation's (ODOT) Climate Change Adaptation Strategy Report is intended to provide a preliminary assessment of likely climate change impacts on ODOT assets and operations and adaptation strategies. . . . The report provides detailed recommendations on the data collection needs for further assessing the state's vulnerability, actions the state is already taking to prepare for impacts, and recommendations for additional adaptation measures.").

²⁵WA. DEP'T OF NATURAL RES., SAFEGUARDING OUR LANDS, WATERS, AND COMMUNITIES: DNR'S PLAN FOR CLIMATE RESILIENCE (Feb. 2020), available at https://www.dnr.wa.gov/publications/em_climateresilienceplan_feb2020.pdf?duly0m. The two guiding principles of the plan are to be proactive (rather than reactive) and to expand collaborations and partnerships across agencies, sectors, and levels of government. DNR will also make equity and environmental justice a cornerstone of its climate resilience approach by convening an Equity and Environmental Justice Advisory Committee, identifying frontline and/or highly impacted communities, and developing a formal Environmental Justice and Equity Strategy.

²⁶The eight focus areas included in the plan are: (1.) wildfires; (2.) forest management; (3.) agriculture and grazing; (4.) urban, commercial, and industrial land; (5.) ecosystem conservation; (6.) aquatic resources and coastal management; (7.) geological surveying; and (8.) recreation.

disproportionately affect communities of color, tribal communities, farmworkers, and underinvested rural communities.

§ 24:25 State-level funding for adaptation

In order to accomplish this critical work, states must have sustainable and sufficient sources of funding. The current amount and availability of state funding is not on parity to attend to all of the needs affected and exacerbated by the climate crisis. Some states are dedicating funding for adaptation through general appropriations or raising entirely new sources of revenue. Although considerably more effort is needed, this part presents examples of novel state-level funding sources for adaptation actions, including climate taxes and bonds. Innovative state financing systems that support the development of local adaptation plans and projects are discussed in the next part of this section (See § 24:26). Typically, financing mechanisms like revolving loan programs and infrastructure banks do not create a new source of revenue in and of themselves, but rather serve as a “pass through” for federal and state grants and other appropriations. Like most of the other state actions presented herein and observed to date, states are primarily funding adaptation and resilience programs and projects for water—and especially to reduce coastal and inland flooding threats.

Outside of allocating or reallocating general appropriations, some states are generating revenue for adaptation and resilience by creating new—and increasing existing—taxes. In 2010, Hawaii established the “environmental response, energy, and food security tax,” otherwise known as the “barrel tax,” to provide resources for addressing the effects of climate change in the state.¹ This law increased the per-barrel tax on petroleum products and created a fund for clean energy, agriculture, and adaptation initiatives in Hawaii.² Subsequently in 2015, Hawaii passed another law—An Act Relating to Beach Protection—to allocate \$3,000,000 of hotel tax revenues to a special fund to develop and implement plans to slow the degradation of Hawaii’s beaches; restore and conserve beaches; coordinate cross-county activities; and form public-private partnerships.³

In 2019, New Jersey reallocated an existing tax to help the state continue increasing its coastal and flood resilience after Hurricane or “Superstorm” Sandy devastated the state in 2012. In June of that year, the New Jersey Legislature passed a constitutional measure—Senate Bill No. 3920—setting aside a portion of the state’s Corporate Business Tax (CBT) to provide funding for the nationally recognized state-run Blue Acres Buyout Program and open space, farmland, and historic prop-

[Section 24:25]

erties acquired through the state's Green Acres Program.⁴ Under New Jersey's Constitution, 6% of the total money collected through the CBT is reserved for these purposes on an annual basis.⁵ Collectively, the Blue and Green Acres programs acquire properties voluntary from willing owners to mitigate growing flood hazards throughout the state and conserve working lands and natural resources. Compared to individual bond measures, the CBT provides the Blue and Green Acres programs with a more sustainable, consistent source of funding. Moreover, this law will enable the state to design and implement longer-term, multi-phased plans for buyouts and open space acquisitions that are not dependent on competitive federal funding opportunities (*See* section on federal adaptation in this chapter of the treatise).

California presents a different example of a tax to support coastal and flood resilience via natural resource restoration and conservation strategies. In 2016, the state-established San Francisco Bay Restoration Authority approved the San Francisco Bay Clean Water, Pollution Prevention, and Habitat Restoration Measure, also known as Measure AA, which is a \$12-per-year parcel tax for the San Francisco Bay area of California.⁶ The tax succeeded with over 70% support in all nine Bay Area counties covered by the tax.⁷ Measure AA was the first parcel tax in the history of the state to be levied throughout an entire region encompassing multiple counties. Measure AA is anticipated to generate \$500 million over 20 years for critical tidal marsh restoration projects around San Francisco Bay.

In addition to taxes, California has significant experience generating revenue through a means other than taxes: bonds. California voters have approved bond measures to provide funding for sea-level rise and climate preparedness projects. In June 2018, Proposition 68 authorized over \$4 billion in general obligation bonds to fund natural resource conservation and resilience (\$1.55 billion), parks and recreation (\$1.28 billion), and water projects (\$1.27 billion), including \$443 million for climate preparedness and habitat resiliency, and \$550 million for flood protection.⁸

California has also passed several bills relating to financing water projects. In November 2014, voters approved Proposition 1—the Water Quality, Supply, and

⁴Tom Johnson, *New Law Simplifies How State Allocates Funds to Preserve Open Space*, NJSPOTLIGHT (June 28, 2019), <https://www.njspotlight.com/2019/06/19-06-27-new-law-simplifies-how-state-allocates-funds-to-preserve-open-space/>.

⁵N.J. Const. art. VIII, § II, ¶ 6(a) (2019), available at <https://www.njleg.state.nj.us/lawsconstitution/constitution.asp> (“Commencing July 1, 2019, there shall be credited to a special account in the General Fund an amount equivalent to six percent of the revenue annually derived from the tax imposed pursuant to the ‘Corporation Business Tax Act (1945),’ P.L.1945, c.162 (C.54:10A-1 et seq.), as amended and supplemented, or any other State law of similar effect. . . . Commencing July 1, 2019, seventy-eight percent of the amount annually credited pursuant to this subparagraph shall be dedicated, and shall be appropriated from time to time by the Legislature, only for: providing funding, including loans or grants, for the preservation, including acquisition, development, and stewardship, of lands for recreation and conservation purposes, including lands that protect water supplies and lands that have incurred flood or storm damage or are likely to do so, or that may buffer or protect other properties from flood or storm damage; providing funding, including loans or grants, for the preservation and stewardship of land for agricultural or horticultural use and production; providing funding, including loans or grants, for historic preservation; and paying administrative costs associated with each of those efforts.”).

⁶Georgetown Climate Ctr., *San Francisco Bay Clean Water, Pollution Prevention, and Habitat Restoration Measure*, ADAPTATION CLEARINGHOUSE (June 7, 2016), <https://www.adaptationclearinghouse.org/resources/san-francisco-bay-clean-water-pollution-prevention-and-habitat-restoration-measure.html>.

⁷The affected counties include San Francisco, San Mateo, Santa Clara, Contra Costa, Alameda, Napa, Solano, Sonoma, and Marin County, California.

⁸Georgetown Climate Ctr., *California Proposition 68—Parks, Environment, and Water Bond*, ADAPTATION CLEARINGHOUSE (June 5, 2018), <https://www.adaptationclearinghouse.org/resources/california-proposition-68-parks-environment-and-water-bond.html?preview=true>; Georgetown Climate Ctr., *Preparing for Climate Change in California*, STATE PROGRESS TRACKER, <https://www.georgetownclimate.org/adaptation/state-information/california/adaptation-plan-status.html> (last updated in 2018).

Infrastructure Improvement Act of 2014—a \$7.545 billion general obligation bond.⁹ The measure provided funding for investments for part of a statewide, comprehensive water plan for California. In part, Proposition 1 was intended to help the state address drought and the impacts of climate change on water supplies and ecosystems. The state later enacted the California Drought, Water, Parks, Climate, Coastal Protection, and Outdoor Access for All Act of 2018, which authorized \$4 billion in bonds to finance a new program to increase the public’s access to parks and provide environmental benefits including climate and drought resilience.¹⁰

Other states, such as Massachusetts, have passed bond initiatives to fund adaptation projects at the state and local levels.¹¹ New York and Rhode Island are also evaluating the possibility of using bonds to invest in nature-based solutions and help communities build resilience.¹² California too proposed a new bond explicitly focused on climate change.¹³ However, due to the global COVID-19 pandemic, as of the time of publication, all three states postponed putting any of these bond measures on a ballot for voter approval.

§ 24:26 State support for local adaptation

One of the most significant ways states can build resilience is by supporting actions at the local level. While this support can take a variety of forms, this part will focus on two prevalent categories: (A.) funding for communities through grant, certification, and revolving loan programs; and (B.) capacity building around data, tools,

and other types of technical, peer-learning, and networking assistance.¹

A. Funding

1. Grant and certification programs

Funding is a critical and necessary form of support that states must provide local governments and communities. The costs associated with climate adaptation can be burdensome and too much for individual counties and municipalities to shoulder alone. Several states, including California, Florida, and Maryland, have and increasingly offer grants and other types of financial assistance to serve a range of adaptation needs, from conducting vulnerability assessments and gathering data to engaging in adaptation planning and funding on-the-ground projects.² Some states offer grants targeted at a specific sector or climate impact, while others have more programmatic grant programs that cut across sectors and impacts and focus on building holistic community resilience.

Massachusetts is a leader in this last area.

Massachusetts's Municipal Vulnerability Preparedness or "MVP" grant program helps local governments and communities in the state address climate change.³ The program is structured into two progressive phases. As a part of phase one, the state funds communities that want to be certified as a "MVP community" through MVP Planning Grants. To become a MVP community, cities and towns work with the state to complete a climate vulnerability assessment and develop an action-oriented resiliency plan. MVP-certified communities are then eligible to participate in the second phase of the program to compete for MVP Action Grants. Action Grants provide municipalities with funding to implement the priority projects they identified in their resiliency plans. The opportunity to win Action Grants incentivizes municipalities to become MVP certified. Collectively, these two phases allow communities to understand their unique climate hazards and risks and then develop a roadmap and execute projects to mitigate those risks. To date, the state has invested over \$44 million in the MVP program, achieving an 89-percent participation rate among municipalities across the Commonwealth.⁴

Other states on the East Coast have initiated programs like the Massachusetts MVP program. In 2020, North Carolina rolled out a similarly designed program

[Section 24:26]

¹Note, state guidance specifically developed to implement executive and legislative mandates is another important form of state support for local adaptation. Given the nexus to executive and legislative actions, however, these examples are discussed separately in § 24:21 *supra*.

²See, e.g., California provides several different types of grant and financing support for regions and municipalities. For an example of some of these sources by sector, see Georgetown Climate Ctr., *Preparing for Climate Change in California*, STATE PROGRESS TRACKER, <https://www.georgetownclimate.org/adaptation/state-information/california/adaptation-plan-status.html> (last updated in 2018); and for additional examples, see also Georgetown Climate Ctr., *Preparing for Climate Change in California*, STATE PROGRESS TRACKER, <https://www.georgetownclimate.org/adaptation/state-information/california/completed-goals.html> (last updated Dec. 18, 2018); *Florida Resilient Coastlines Program*, FL. DEPT OF ENVTL. PROT., <https://floridadep.gov/rcp/florida-resilient-coastlines-program> (last visited Dec. 4, 2020); Georgetown Climate Ctr., *Maryland Community Resiliency Grants/CoastSmart Communities Grants*, ADAPTATION CLEARINGHOUSE, <https://www.adaptationclearinghouse.org/resources/maryland-community-resiliency-grants-coastsmart-communities-grants.html?preview=true> (last visited Dec. 4, 2020).

³*MVP Program Information*, MASS.GOV, <https://www.mass.gov/service-details/mvp-program-information> (last visited Dec. 7, 2020).

⁴Press Release, Baker-Polito Administration Awards \$11.1 Million in Climate Change Funding to Cities and Towns (Sept. 15, 2020), <https://www.mass.gov/news/baker-polito-administration-awards-111-million-in-climate-change-funding-to-cities-and-towns>.

specifically for coastal communities.⁵ Likewise, since 2019, the Rhode Island Infrastructure Bank (RIIB), in partnership with nonprofit organization, The Nature Conservancy, has awarded funding to municipalities through the Municipal Resilience Program (MRP).⁶ The MRP supports community-driven planning processes to identify and mitigate priority local hazards. The MRP builds on the financing goals and recommendations included in the state's climate adaptation plan, *Resilient Rhody*.⁷ Through the two-step MRP, participating municipalities must first follow the "Community Resilience Building" process to develop a vulnerability assessment and resiliency plan. Once this step is completed, a municipality becomes certified as a "Resilient Rhody Municipality." These municipalities can then apply for action grants to implement projects identified as a result of the first step. Eligible projects must be identified through the Community Resilience Building process, make a community more resilient, and involve a capital investment that will result in construction. MRP Action Grants require a 25-percent match from municipalities and are not available for research-related activities, such as studies and strategic plans.

In 2019 and 2020, the state piloted the MRP in a few municipalities. Over time, the state aims to introduce the MRP to all of Rhode Island. As of August 2019, the state and other nongovernmental partners spent over \$13 million on municipal adaptation efforts to implement adaptation projects including, among others, dam repair, road elevation, watershed restoration, and green stormwater infrastructure.⁸

In comparison, other states, like Minnesota and New York, have created phased certification programs. These programs are similar to the ones in Massachusetts, North Carolina, and Rhode Island, but are a bit broader in terms of the support they offer. Moreover, the programs in Minnesota and New York are oriented to providing a mechanism for peer recognition rather than grants alone to drive local action. Even before the three aforementioned states launched their certification and grant programs, the State of Minnesota developed the GreenStep Cities program early in 2010 to assist municipalities across the state with implementing sustain-

This investment will fund matching grants up to 75% to directly support Rhode Island's cities and towns to identify top hazards, improve community resiliency, and strengthen public safety in the face of increased flooding and more frequent and more intense storm events driven by climate change. The Municipal Resilience Program has already been successful in identifying strategies and providing action grants to implement projects in five communities. This funding will unlock additional resources for those communities and allow 20 additional municipalities to participate in the program over the next two years."). As discussed in § 24:25, this bond has yet to be put on a ballot for voter approval given the global COVID-19 pandemic.

able best management practices.⁹ Managed by a public-private partnership, this “challenge, assistance, and recognition program” provides technical assistance and peer recognition for cities that adopt best practices in sustainability and resilience. The GreenStep program identifies 29 best practices that municipalities can adopt to plan for climate impacts, increase energy efficiency and green and resilient buildings, and foster green businesses and jobs, among others. Of the 29 best practices, the final one specifically focuses on climate adaptation and community resilience. Each best practice can be implemented by completing one or more actions that can be tailored to fit local context. Over the course of the program’s first ten years, participants totaled 140 municipal entities representing nearly half of Minnesota’s population.¹⁰

Akin to Minnesota, New York DEC, in partnership with five other state agencies, oversees the Climate Smart Communities program, a network of communities throughout the state taking action to reduce greenhouse gas emissions and increase climate resilience.¹¹ Specific to adaptation, the program calls for communities to alter the built and natural environment to proactively prepare for or retroactively respond to climate change impacts. Communities can start by taking the Climate Smart Communities Pledge. Pledged communities can then become “certified” as a gold, silver, or bronze community for actions that mitigate local risks to climate impacts and increase resilience in ways that go above and beyond what is required to be a foundational member. The program’s certification component is designed to maximize local performance and encourage peer recognition among participants. The program’s incentives include free technical assistance from the state and priority for grants for certified communities under the Climate Smart Communities Grant Program, which started in 2016. Under the Climate Smart Communities Grant Program, the state provides a 50-50 match to municipalities for climate adaptation and mitigation projects. As of December 2020, 315 communities have taken the Climate Smart Communities pledge, and 62 have become certified.¹²

2. Revolving loan funds

As stated in § 24:25 and the section on federal adaptation in this treatise chapter, the lack of consistent federal leadership on adaptation and dedicated funding—through congressional appropriations or other means—has incentivized states to become innovative in how they use limited pots of money to further adaptation in their jurisdictions. Some states have identified revolving loan funds as a promising financial opportunity to grow these limited dollars. If revolving loan funds receive start-up capital, the hope is that they will eventually become self-sustaining financial mechanisms.

In 2020, the states of Virginia and South Carolina established revolving loan funds to mitigate flood risks at the local level. Virginia’s Community Flood Preparedness Fund is a low-interest revolving loan fund that can help local governments and communities adapt to increasing coastal and inland flooding from

multiple sources, including sea-level rise and precipitation.¹³ The purpose of the fund is to enhance the state's overall coastal resilience by funding flood prevention and mitigation projects and prioritizing projects in low-income areas and those that are designed with nature-based solutions.¹⁴ Revenue for the fund will primarily come from carbon auctions generated through the state's participation in the Regional Greenhouse Gas Initiative (RGGI), in addition to the local repayment of loans and from other federal and state sources.¹⁵

Somewhat similarly, South Carolina's Resilience Revolving Fund allows local governments to apply for low-interest loans to conduct home buyouts to move residents out of floodplains and restore ecosystems to attain flood mitigation, economic, ecosystem, and community benefits.¹⁶ In 2020, South Carolina also established a Disaster Relief and Resilience Reserve Fund. Funds in the Disaster Relief and Resilience Reserve Fund can only be used to "develop, implement, and maintain [South Carolina's forthcoming] Statewide Resilience Plan, and for disaster relief assistance, hazard mitigation, and infrastructure improvements."¹⁷ For locations that are covered by a presidential disaster declaration, the state may immediately activate the reserve fund to "aid resilient rebuilding in affected communities with significant" need unmet via federal disaster recovery funding from agencies like the Federal Emergency Management Agency and Department of Housing and Urban Development. For example, the state and local governments can turn to the fund for the non-federal match required by federal agencies for most grants.

The Rhode Island Infrastructure Bank (RIIB) presents another, but longer-standing revolving loan model. RIIB is a quasi-public entity that finances infrastructure investments for municipalities, businesses, and homeowners by leveraging revolving loan funds.¹⁸ These revolving funds are capitalized by federal grants, state appropriations, and money from other sources. Established by the Rhode Island General Assembly in 1989, the state expanded RIIB's mandate in 2015 to include energy and brownfield remediation. Today, RIIB backs several different types of local investments; this includes projects that build climate resilient infrastructure, which can emphasize the use of natural- and nature-based solutions to reduce flooding and improve water quality.

B. Data, tools, and technical, peer-learning, and networking assistance

Data, tools, and technical, peer-learning, and networking assistance are other critical types of support states can provide local governments and communities. These can take a variety of forms and are often supported by public-private partnerships with the federal government, colleges and universities, and local community-based organizations. This part merely highlights a few of the range of examples across states, sectors, and climate impacts.

Local governments must have localized, site-specific data to identify the climate

risks and hazards plaguing their jurisdictions. Climate adaptation plans, laws, and policies are built around vulnerability assessments and other tools that capture this information. States like Louisiana and Rhode Island have developed digitized maps and planning tools that incorporate climate data on sea-level rise, storm surge, and coastal erosion to enable state and local policymakers to better understand and plan to mitigate current and future flooding threats.¹⁹ Other states have similar online tools that display localized flood data; however, unlike Louisiana and Rhode Island, they do not include data to show how climate change is impacting the spatial extent and severity of flooding.

Another way that states can use data is to inform benefit-cost analyses and help local policymakers and communities better understand the costs associated with different adaptation actions—including inaction or no action. Until recently, Colorado did not have a tool to quantify the cost of future risks. In 2020, the state released the online Future Avoided Cost Explorer or “FACE:Hazards” tool.²⁰ Colorado’s risk profile will continue to increase in the coming years. FACE:Hazards includes a suite of resources that will enable local decisionmakers to evaluate the costs of future risks from flooding, drought, and wildfire across seven economic sectors over different climate and population projections between today and 2050. This data can support local actions to make communities more resilient and save money over the long term.

In addition to decision-support data, states are increasingly trying to find centralized ways to provide information to local policymakers and communities in a “one-stop-shop” platform. California’s Adaptation Clearinghouse, Resilient CA, and Massachusetts’s resilient MA are online clearinghouses created and maintained by the state.²¹ The sites are organized differently, but the content of both clearinghouses cuts across various sectors and climate impacts to share data and resources like case studies and guides on vulnerability assessments, planning, funding, and communication, among others. Notably, California’s clearinghouse was required by

¹⁹See the data collected and presented in Louisiana’s Coastal Master Plan, which is updated every five years, *supra* § 24:24 and Georgetown Climate Ctr., *Louisiana 2017 Coastal Master Plan*, ADAPTATION CLEARINGHOUSE (June 2, 2017), <https://www.adaptationclearinghouse.org/resources/louisiana-2017-coastal-master-plan.html>; Georgetown Climate Ctr., *Rhode Island: STORMTOOLS for Mapping Coastal Flooding*, ADAPTATION CLEARINGHOUSE (2016), <https://www.adaptationclearinghouse.org/resources/rhode-island-stormtools-for-mapping-coastal-flooding.html> (“STORMTOOLS is a set of comprehensive mapping tools providing a series of maps and data sets that depict the sea level rise and storm surge in Rhode Island. The site now features a set of data layers for municipalities. STORMTOOLS is intended as a way to make the data outputs of a complex set of modeling processes freely available, and is designed to help homeowners and municipalities in Rhode Island better understand their risks from coastal storms and flooding, and to plan for sea level rise.”); for a description of Rhode Island’s Shoreline Change Special Area Management Plan (BEACH SAMP), see also *supra* § 24:24.

This content parallels the steps a community can take to become more resilient from beginning to learn about how climate change is impacting Massachusetts to implementing or ‘taking action.’ The site also contains interactive maps, access to state documents, and a robust search feature that connects users to adaptation-related resources from Massachusetts partners (e.g., nonprofits) and other states.”). For a clearinghouse with a national lens and scope, see also Georgetown Climate Center’s Adaptation Clearinghouse, available at <https://www.adaptationclearinghouse.org>.

statute.²²

Beyond data and decision-support tools, states can also provide communities with training and technical assistance. Outside of water-related climate issues, like flooding, some states are providing more diverse forms of this type of support. For example, Michigan is concentrating on the intersection of climate and public health, driven by the unprecedented global COVID-19 pandemic in 2020. In 2020, Michigan launched Catalyst Communities, a program to “provide education, training, planning, and technical resources to local public officials as they prepare for climate impacts on emergency response and public health.”²³ The program has four focus areas: emergency preparedness, adaptation planning, economic resilience, and equity.²⁴ The Michigan Department of Health and Human Services also released the Climate and Health Adaptation Guide for Michigan Communities.²⁵

In regard to heat, the Minnesota Department of Health developed an Extreme Heat Toolkit to provide information, tools, and resources for local governments and public health professionals. The toolkit can enable these groups to prepare for and respond to an increasing number of extreme heat events.²⁶ In addition, local officials can better identify populations that face the greatest public health risks from extreme events by detailing a range of “characteristics that increase the risk of heat-related illnesses.”²⁷

Massachusetts’s Greening the Gateways program also addresses urban heat. The program seeks to increase tree canopy in environmental justice neighborhoods and “Gateway Cities” that have lower tree canopy, a large renter population, higher wind speeds, and an older housing stock.²⁸ This cross-state agency program defines “Gateway Cities” as urban centers facing economic and social challenges due to recent industry and manufacturing losses. The program is currently operating in 18 residential neighborhoods with the goal of covering 5% of each area in new tree canopy cover.

Lastly, states can also serve as a convenor to bring different stakeholders together to promote peer-learning, networking, and capacity building. Delaware created the Resilient and Sustainable Communities League—more affectionately known as “RASCL”—to provide Delawareans from all levels of government and the public and private sectors with information, technical assistance, and networking opportunities

to achieve resiliency and sustainability goals.²⁹ The state helps lead RASCL by holding an annual summit and also quarterly “RASCL Coffee Hours” in each county throughout the state “to address hot topics and encourage dialogue between communities and resilience practitioners.”³⁰ Maine and New Hampshire have similar bodies co-managed through public-private partnerships.³¹ In addition, organizers in Maine and New Hampshire strive to connect on a regional scale across state boundaries through different events like annual meetings and Beaches Conferences.

§ 24:27 Conclusion

This section lays out the range of the legal, policy, and planning tools and approaches states are using to adapt to climate change. While there is significant diversity among states, some trends, including the following three, are clear. First, climate adaptation plans are often, but not always, the precipitating and coordinating mechanism around how a state develops a comprehensive adaptation strategy. Nonetheless, some states are making progress in this space on discrete climate impacts, like flooding and sea-level rise, or within particular sectors, like transportation or public health, through specific plans or laws. Second, the majority of state adaptation actions are addressing climate change impacts to water. While this is a necessary focus, states should also direct more attention to non-water-related impacts, especially for wildfires. Third, many states are filling a critical role to support local governments and communities by enacting new legal authorities and implementing new grant programs. States must look for increased opportunities to provide funding and other types of support to meet the growing needs of the people and entities on the front lines of climate change.

Within the first two decades of this millennium, states have emerged as leaders to address the ongoing climate crisis. Regardless, more work is needed across all levels of government. Moving forward, it is anticipated that states will continue to act and grow in this space—particularly in the mid and far west—as indicated by an increasing number of new laws and statewide climate adaptation plans and plan updates. The hope is that a greater number of state actors can better enable the nation at-large to confront a cross-boundary phenomenon with state-specific implications.

VII. ADAPTATION—LOCAL

§ 24:28 Framework for local adaptation

Local governments in the United States can play a significant role in developing and implementing climate adaptation policies.¹ As discussed in the section on federal climate adaptation, the federal government does not currently have a single,

[Section 24:28]

¹Generally, “local government” refers to sub-units of government within the state, created via a charter or state statute. The United States Census Bureau classifies local governments as one of two

comprehensive climate adaptation program, relying instead on a combination of existing laws, programs, and agencies that, to date, has focused largely on post-disaster management and recovery, though with an increasing eye toward pre-disaster mitigation and prevention.² Likewise, state governments vary in their treatment of climate adaptation policies, with some states—such as California, Maryland, New Hampshire, and Colorado—taking the early lead on developing statewide climate adaptation plans.³ Some state legislatures have also passed laws that support local responses, including: helping to coordinate regional responses to climate change impacts; increasing funding to bolster local infrastructure; developing science to support climate projections at the local level; and providing guidance and best practices for local governments to address a range of climate threats.⁴ Indeed, as explored throughout this section, many of the federal and state programs and funding sources directly support the development and implementation of adaptation measures at the local level. Local governments, in turn, frequently leverage a combination of planning, regulatory, and funding tools to implement adaptive measures to prepare for and respond to climate change impacts.

A. *Role of local government in climate adaptation*

Local governments are frequently where the rubber meets the road in climate adaptation, particularly in larger and more progressive cities. This is for several reasons. First and foremost are the practical considerations. Local governments are often the first responders to climate change impacts that occur both during non-emergent—or “steady-state”—periods (e.g., sea-level rise, extreme heat, drought), and also in the aftermath of emergencies (e.g., hurricanes, wildfires). Local governments are also tasked with overseeing land use policies, adopting zoning ordinances and building codes, and implementing comprehensive plans that can influence the vulnerability—and resilience—of people, infrastructure, and natural resources to climate change impacts.⁵

Further, as discussed in §§ 24:14 to 24:20’s treatment of federal adaptation activities, there are a number of policy reasons to explain why local governments are especially suited to developing adaptation responses.⁶ Local governments and stakeholders can be well-positioned to understand not only local climate hazards and risks—such as where streets tend to flood—but also the community needs and priorities that must be considered when calibrating adaptation responses.⁷ Additionally, there are many opportunities for local decision-making to be shaped by

types: general purpose or special purpose. “General purpose” governments include counties, municipalities, and townships. “Special purpose” governments include special districts (which provide specific services and operate independently of “general purpose” governments) and school districts. “Criteria for classifying governments,” U.S. CENSUS BUREAU, *Government Finance and Employment: Classification Manual* 1-1 (2006), https://www2.census.gov/govs/pubs/classification/2006_classification_manual.pdf (last visited Feb. 23, 2021). ⁷§ 24:14.

⁸It should be noted that, while some larger cities may have the resources to support the science

sustained community engagement, particularly in frontline communities where equitable adaptation policies require participation and input from the residents and stakeholders who are the most heavily impacted by extreme heat, sea-level rise, and other climate threats.⁸

Yet local governments can be constrained by several factors when attempting to implement meaningful adaptation solutions.⁹ Barriers may be political and resource-based. Elected officials in some jurisdictions may lack the political will to confront the realities of what some may see as an existential threat, particularly for gradual climate threats like sea-level rise or extreme heat. The lack of political will can be particularly challenging to overcome in the absence of state or federal requirements to require local adaptation measures—with some exceptions—beyond meeting minimum requirements.¹⁰ Even in areas where political will is less of an obstacle, jurisdictions may lack technical expertise, administrative capacity, or financial resources to coordinate responses within and across jurisdictional lines. Other than in large, well-resourced cities, local governments rarely have in-house capacity to conduct the climate modeling necessary to inform adaptation responses; this work is frequently delegated to university researchers or state agency partners. And, as discussed further below, adaptation measures may compete with other local priorities, which could also lead to the inequitable distribution of adaptation resources across socio-economically stratified populations that have disparate levels of resilience to climate change impacts.

Despite these challenges, local governments nevertheless wield important planning, regulatory, and funding powers to implement adaptation responses. While many of the mechanisms discussed here were not created explicitly for the purpose of adaptation to climate change, they are part of the array of tools available to local governments to proactively address climate change impacts—both in coordination with and independent of state and federal government measures.

B. Legal questions for local governments

Local governments seeking to develop and implement adaptation measures must balance the legal and policy tradeoffs of each action. Each of the adaptive measures discussed in this section should be considered in the context of the legal questions outlined below.¹¹

1. Local government authority

A threshold question for adaptation actions taken at the local level is whether the action is within the scope of the local government's authority. Some actions may require a legislative change by local council, while other actions may require authorization by the state. The scope of the local government's authority depends on whether it resides in a Home Rule state or Dillon Rule state.

In a Home Rule state, the state's political subdivisions—its counties, townships, municipalities—are authorized to adopt a wide range of legislative decisions across

for projecting risk, this is not the case for every city or locality. Smaller jurisdictions may not always have the same resources to synthesize localized data.

⁸See generally *Equitable Adaptation Legal & Policy Toolkit*, GEORGETOWN CLIMATE CENTER (2020), <https://www.georgetownclimate.org/adaptation/toolkits/equitable-adaptation-toolkit/introduction.html> (last visited Jan. 28, 2021) [hereinafter *Equitable Adaptation Toolkit*].

⁹§ 24:14.

¹⁰See §§ 24:21 to 24:27 on State-level adaptation.

¹¹Smart Growth Fixes for Climate Adaptation and Resilience: Changing Land Use and Building Codes and Policies to Prepare for Climate Change at 8-10, Environmental Protection Agency (2017), https://www.epa.gov/sites/production/files/2017-01/documents/smart_growth_fixes_climate_adaptation_resilience.pdf [hereinafter *EPA Smart Growth Guide*].

almost all local matters, without seeking permission from the state.¹² In Home Rule jurisdictions, local governments have broad authority to act, so long as doing so is not inconsistent with the state constitution, state law, or its own charter.¹³

By contrast, in a Dillon Rule state, local governments may possess significantly less freedom to act without the permission of their state legislature.¹⁴ Specifically, in a Dillon Rule state, local governments have the authority to act only in instances where they have been expressly granted such authority by their state legislature, or where such authority is necessarily implied by an express grant.¹⁵ In the climate adaptation context, the Dillon Rule could limit a local government's ability to enact land use ordinances and policies if the measures are outside the scope of its power granted by the state.¹⁶

Examination of whether local government action is permitted under the Dillon Rule requires a two-step analysis. The first step asks whether the locality possesses the authority to act. Local governments may exercise only those powers that are: (1) expressly granted by the state; (2) necessarily and fairly implied from that grant; or (3) essential and indispensable to the existence of the unit of local government and its ability to exercise its express powers.¹⁷ The second step asks whether the locality properly executed the authority. Granted authority is properly executed when either: (1) the enabling authority provides specific direction for how to execute the

¹²1 Am. Law. Zoning § 2:6 (5th ed.), American Law of Zoning, Patricia E. Salkin, Chapter 2. Authority to enact land use regulations. Constitutional home-rule powers.

¹³For example, under a broad Home Rule grant, Lafourche Parish (LA) has authority to pass zoning ordinances that protect the general welfare and safety, and could therefore adopt FEMA-recommended advisory based flood elevations. *Colvan Cattle Co., LLC v. Lafourche Parish Government*, Case 2:08-cv-00907-EEF-SS Document 41. U.S. District Court, Eastern District of Louisiana, 2009.

¹⁴While many states have adopted either the Home Rule or Dillon Rule, some states have adopted a hybrid approach. For example, some states are both a Home Rule and Dillon Rule state, meaning that the Dillon Rule applies in matters for which Home Rule is not otherwise provided for under the state constitution or by legislative statute. Some states may have “limited Home Rule,” where Home Rule applies to some jurisdictions within the state and the Dillon Rule to other jurisdictions (e.g., Alabama, where the Dillon Rule applies to counties only).

¹⁵§ 4:11. Delegation of powers by legislature—Municipal powers under Dillon’s Rule. 2 McQuillin Mun. Corp. § 4:11 (3d ed.) (Municipalities in a Dillon Rule state “exercise only those powers that the state expressly grants to it, the powers necessarily and fairly implied from that grant, and the powers that are indispensable to the existence of the unit of local government.”).

¹⁶These limitations may not necessarily restrict local governments from taking action to prepare for and adapt to climate change impacts. For example, in Virginia, a Dillon Rule state, local governments are granted broad authority under a state enabling statute to consider flood risks when making planning and zoning decisions. This arguably permits Virginia municipalities to consider sea level rise, because “considering future projections of sea level rise when exercising zoning powers is consistent with the legislature’s intent to ‘promote the health, safety, [and] general welfare of the public.’” Gill, Lauren. *The Dillon Rule and Sea Level Rise: An Analysis of the Impact of the Dillon Rule on Potential Adaptation Measures*. Virginia Coastal Policy Clinic, William & Mary L.S. (2013). *But see, e.g.,* Marble Technologies, Inc. v. City of Hampton, 279 Va. 409, 690 S.E.2d 84 (2010) (holding that the city of Hampton exceeded its local authority in a Dillon Rule state because it lacked express or implied authority to enforce a city ordinance that used a federal criterium for designating lands to be a part of the Resource Protection Area under the Chesapeake Bay Preservation Act).

¹⁷John F. Dillon, Commentaries on The Law of Municipal Corporations § 237 (89) at 448-49 (5th. ed. 1911) (“It is a general and undisputed proposition of law that a municipal corporation possesses and can exercise the following powers, and no others: First, those granted in express words; second, those necessarily or fairly implied in or incident to the powers expressly granted; third, those essential to the declared objects and purposes of the corporation,—not simply convenient, but indispensable”) (emphasis in original); *see also* 13B MICHIE’S JURIS. MUN. CORP. § 25 (2016) (“A municipal corporation possesses and can exercise the following powers, and no others. First, those granted in express words by general statutes or charters; second, those necessarily or fairly implied in or incident to the powers expressly so granted; third, those essential to the declared objects and purposes of the corporation, not simply convenient, but indispensable.”); *id.* at § 26 (describing the Dillon Rule of strict construction, which controls the powers of local governing bodies).

power and the locality follows that direction; or (2) if the enabling authority does not provide specific direction and the localities' actions are considered within reason.¹⁸

2. Preemption by state or federal law

Even if a local government has Home Rule authority, the local action must not be preempted by existing state or federal law.¹⁹ Generally, state laws set minimum requirements that local governments may exceed, but local governments may not fall below the floor established by the state or federal legislature. For example, as discussed further below in § 24:30, local governments may adopt floodplain requirements that *exceed* state or federal standards, but may not adopt requirements below the floor set by the state or federal government.²⁰

3. Potential takings liability

A government action that changes an area's zoning or affects a property owner's use of the land could constitute a "taking" of private property that requires the payment of just compensation to the owner.²¹ Zoning ordinances and regulations are less likely to trigger takings claims if they can be "rationally related to protecting a genuine public purpose."²² Public purposes like reducing loss of life or damage to property can be demonstrated by using information from climate vulnerability assessments and other mapping tools, which can provide information about the likelihood that an at-risk area may be exposed to climate change hazards.²³

4. Compliance with the American with Disabilities Act

Local governments are required by the Americans with Disabilities Act (ADA) to "make reasonable modifications to policies, practices, or procedures to prevent discrimination on the basis of disability."²⁴ For example, if a local government were to pass a zoning ordinance that requires new construction projects in a flood zone be elevated, it should also require modifications (e.g., elevators or ramps) to provide disabled people with a means of accessibility.²⁵

C. *Other considerations*

1. Equitable adaptation

It is universally acknowledged that not all communities or populations of people are equally affected by the impacts of climate change. Climate change is a threat multiplier that could exacerbate existing social and economic challenges in frontline

¹⁸Dillon, *supra* note 17, at § 239 (91), 453 ("The rule of strict construction does not apply to the mode adopted by the municipality to carry into effect powers expressly or plainly granted, where the mode is not limited or prescribed by the legislature, and it is left to the discretion of the municipal authorities. In such a case the usual test of validity of the act of a municipal body is, Whether it is reasonable? And there is no presumption against the municipal action in such cases.") (emphasis in original); *see also* Michie's *Juris.*, *supra* note 17, at § 25.

¹⁹*See* chapter 7 of this treatise on State Environmental Law and Programs for detailed discussion of federal preemption.

communities. “Frontline communities” refer to populations that are disproportionately hit the earliest and/or hardest by climate change impacts, and who frequently possess fewer resources to adapt.²⁶ Frontline communities may include low-income households and communities of color who, following generations of racist housing policies, now reside in climate-vulnerable areas. Frontline communities may also include majority Black or Latinx populations who currently live in low-flood-risk areas, but are at-risk of displacement by wealthier residents who live in coastal, flood-vulnerable areas and seek to relocate inland away from the flood risk.²⁷

It is therefore critical that climate adaptation approaches are planned, developed, and implemented with the participation of frontline communities that disproportionately experience the impacts of climate change. Local governments have begun adopting inclusive strategies throughout the entirety of the decision-making process for adaptation. In Louisiana, six coastal parishes (with the support of federal and state funding) convened a nearly year-long community engagement process to identify community assets and priorities to inform adaptive measures for increasing community resilience to flooding from climate threats like sea-level rise, erosion, land subsidence, and hurricanes.²⁸ In Washington, DC, the District’s Department of Energy and Environment developed a community engagement guide—informed by a working group of residents to tailor the city’s adaptation actions to community needs—for agency partners in local government.²⁹ Importantly, incorporating community feedback through the lifecycle of the adaptation process (from planning to implementation) ensures that adaptation actions are targeted to communities that would benefit the most from these measures.

2. Nexus between climate adaptation and other local priorities

As discussed further below in § 24:30, local governments can address climate adaptation needs through a community’s land use and building policies, and adopt

²⁶See generally *Equitable Adaptation Toolkit*. Frontline communities include, but are not limited to: people of color, low-income residents, immigrants, senior citizens, people experiencing housing insecurity or homelessness, incarcerated individuals, and persons with disabilities.

²⁷See, e.g., Jesse Keenan et al., *Climate gentrification: from theory to empiricism Miami-Dade County, Florida*, Environmental Research Letters 13 (2018), <https://iopscience.iop.org/article/10.1088/1748-9326/aabb32> (using the term “climate gentrification” to describe the economic and physical displacement of frontline populations in Miami-Dade County as property values increase in low flood risk areas where Black and Latinx populations historically reside); Carolyn Kormann, *Miami Faces an Underwater Future*, New Yorker (Jul. 3, 2018), <https://www.newyorker.com/news/news-desk/miami-face-s-an-underwater-future> (last visited Feb. 22, 2021) (featuring personal accounts of Miami residents experiencing climate gentrification). See also Galia Shokry et al., *Understanding climate gentrification and shifting landscapes of protection and vulnerability in green resilient Philadelphia*, Urban Climate 31 (2020), <https://reader.elsevier.com/reader/sd/pii/S2212095519300732?token=631395E9A78E51A9D137783E6CA124E8BB38AD3EBA91C897F6CE5BA24FFD1FE0D8B72B46C5220AD12FF807111069689B> (last visited Feb. 22, 2021) (finding a significant positive correlation between the relatively high rate of climate-resilient investments in gentrifying neighborhoods and areas with high-income and/or White residents in Philadelphia, compared with underinvestment in the city’s lower-income and none-White neighborhoods). The disproportionate allocation of resources to communities of color, low-income, and other frontline communities both before and after a climate disaster has also been well-documented. See, e.g., Robert Benincasa, *Search the Thousands of Disaster Buyouts FEMA Didn’t Want You to See*, NPR (Mar. 5, 2019), <https://www.npr.org/2019/03/05/696995788/search-the-thousands-of-disaster-buyouts-fema-didnt-want-you-to-see> (last visited Feb. 22, 2021) (reporting that the percentage of federal buyouts after a disaster have been disproportionately in neighborhoods that are majority White or non-Hispanic).

smart growth strategies that offer multiple benefits and increase the community's resilience across a variety of issues—beyond adapting to climate change. These co-benefits can include improving the environment and public health (protecting air and water quality), or also be financial (saving people money by using energy more efficiently, offering transportation options, and creating economic opportunities). Implementing climate measures through regular processes like updates to zoning and building codes could also help build political support for further action or spur large, wholesale policy changes—such as facilitating gradual retreat from high at-risk areas—by starting first with more modest adjustments. These modest adjustments could include offering incentives for installing green infrastructure—which could reduce stormwater runoff and provide relief from extreme heat—or enhancing regulatory requirements for building materials to be fire-resistant.³⁰

So-called “smart growth principles” can also make communities more resilient to climate change in the long term.³¹ For example, the principle to “strengthen and direct development toward existing communities” could become an adaptation strategy if it takes into account future climate projections and directs development away from areas with a community that is at increased risk of wildfire, flooding, or other climate change impacts, and instead encourages new development in existing development areas that do not present such risks.³²

D. Coordination with state governments

Local governments that play an active role in planning for climate change impacts frequently rely on their states and other stakeholders (e.g., academic institutions and nonprofit organizations) for information and other resources. State and local governments can coordinate in several different ways. For example, some local governments participate in state-level adaptation planning efforts. States can also support local adaptation efforts by coordinating local initiatives or providing technical assistance, such as by creating downscaled climate models to understand local climate risks and vulnerabilities, and providing financial support, planning tools, and guidance.

E. Key actors

The focus of this part of the section is on the role of local government in developing and implementing adaptation responses. “Local government” in this context refers to legislative bodies, executive offices, and administrative agencies at the municipal and county levels that are authorized to exercise a range of powers and serve a variety of functions in providing services to local communities.³³

Beyond these formal decision-makers, it is important to acknowledge the other actors and entities that are instrumental to local climate adaptation strategies. These entities form the basis of critical public-private partnerships that can leverage funding and other resources.³⁴ As with other local government functions, the closer climate change decisions are to the people most impacted by them, the greater the potential need for a holistic and inclusive approach to implementing programs and policies. Other key actors who may play central roles in comprehensive, local adaptation processes include community groups and stakeholders (e.g., faith-based

groups, residents, elected and non-elected leaders), nonprofit organizations, local businesses, and members of the private sector.

§ 24:29 Planning tools

Local governments may consider integrating climate adaptation considerations into a number of different types of new or existing planning processes.¹ A few common types of plans are discussed below.

A. Local climate adaptation plans

Similar to states that have developed climate adaptation plans, an increasing number of counties and municipalities have developed local or regional adaptation plans.² Even in states that have yet to develop a statewide adaptation plan, local jurisdictions have adopted their own adaptation strategies to prepare for and reduce the potential impacts of climate change.³ Just as statewide adaptation plans vary in detail and scope, there is no uniform definition to a local climate adaptation plan.⁴

Compared to state plans, local adaptation plans are able to address more geographically specific climate change impacts. Many local adaptation plans are informed by vulnerability assessments, or studies that identify the probability of local development and other assets being exposed to different types of climate hazards.⁵ The types of assets taken into account may include both built infrastructure (e.g., public transportation, roadways, stormwater systems) and other community resources (e.g., medical and emergency services, affordable housing, schools). The outcomes of vulnerability studies can help local decision-makers better deploy scarce resources to neighborhoods and communities that are most in need.

The resulting local adaptation plans may differ across a range of factors:

- **Geographical coverage**—Local adaptation plans can be:
 - **Regional** (e.g., Southeast Florida Regional Climate Adaptation Plan)—Regional plans often facilitate cross-pollination of resources across county lines, enabling jurisdictions to collaborate on building capacity, sharing information, or even collaborating on specific programs; for example, the NFIP's Community Rating System.⁶

[Section 24:29]

¹Local plans that are conducive to incorporating adaptation strategies include: agency-specific strategic plans; airport plans; Coastal Zone Management Plans; comprehensive plans; drought plans; emergency preparedness plans; erosion plans; hazard mitigation plans; heat event plans; stormwater management plans; transportation plans; water resource management plans. Vicki Arroyo and Terri Cruce, *State and Local Adaptation*, *The Law of Adaptation to Climate Change: U.S. and International Aspects* 569, 584 (Michael B. Gerrard & Katrina Fischer Kuh eds., 2012) [hereinafter Arroyo and Cruce].

²The Georgetown Climate Center maintains an active database of state and local adaptation plans. See *State Adaptation Progress Tracker*, GEORGETOWN CLIMATE CENTER, <https://www.georgetownclimate.org/adaptation/plans.html> (last visited Feb. 22, 2021).

³See, e.g., Columbus, Ohio Climate Adaptation Plan (adopted in December 2018), https://byrd.osu.edu/sites/byrd.osu.edu/files/CCCAP%20-%20FINAL_0.pdf.

⁴See discussion of State-level adaptation in § 24:23. There are many resources available to local communities interested in finding information and developing tools to adapt to climate change. These include the Georgetown Climate Center's *Adaptation Clearinghouse*, which maintains a database of adaptation resources and a tracker for state and local adaptation plans; the *Climate Adaptation Knowledge Exchange* (CAKE); and NOAA Coastal Services Center's *Digital Coast*, which provides resources to local coastal managers and planners.

⁵U.S. CLIMATE RESILIENCE TOOLKIT, <https://toolkit.climate.gov/tool/climate-change-extreme-weather-vulnerability-assessment-framework> (last visited Feb. 22, 2021).

⁶Regional Climate Action Plan, SOUTHEAST FLORIDA REGIONAL COMPACT, <https://southeastfloridaclimat>

- **County-wide** (e.g., Cumberland County, NC, Climate Resiliency Plan)—Adaptation plans developed and implemented at the county level are particularly common in rural areas that do not have large urban centers, which are more likely to have developed a city-specific climate adaptation plan.⁷
- **City-specific** (e.g., Boston, MA (Climate Ready Boston); Keene, New Hampshire (Climate Adaptation Action Plan), Phoenix, AZ (Phoenix Climate Action Plan)).⁸
- **Tribal** (e.g., Swinomish Climate Change Initiative: Climate Change Adaptation Action Plan).⁹
- **Scope of the plan**—In addition to differences in geographic coverage, local adaptation plans vary in scope, with some plans focusing on a specific threat (e.g., heat waves), and others focusing on a full range of climate change impacts. For example, Washington, DC's adaptation plan, *Climate Ready DC*, identifies dozens of potential actions across four key “adaptation strategies” (transportation and utilities; buildings and development; neighborhoods and communities; governance and implementation) that respond to multiple climate change impacts (rising temperatures and heat, rainfall and flooding, sea-level rise and storm surge).¹⁰ For administrative, political, or other reasons, some jurisdictions may adopt more narrow plans that focus instead on a specific adaptation strategy (e.g., green infrastructure), a single climate change impact (e.g., sea-level rise), or the role played by a certain government entity (e.g., the District Department of Transportation's (DDOT) Climate Change Adaptation Plan).¹¹ Indeed, elements of these more narrowly focused strategies could later be incorporated into future, more comprehensive adaptation plans, as was the case with DDOT's *Climate Change Adaptation Plan*,

ecomcompact.org/regional-climate-action-plan/ (last visited Feb. 23, 2021). The Community Rating System (CRS) is a subprogram of the National Flood Insurance Program that encourages communities to go above and beyond minimum floodplain management practices in exchange for a reduction on insurance premiums. See *infra* federal section at § 24:16.

which was later incorporated into *Climate Ready DC*.

- **Relationship to other climate plans**—Some plans are developed as standalone climate adaptation plans, while others are incorporated with climate mitigation measures as part of a broader, comprehensive climate action plan or “sustainability plan.”¹² For example, the Iowa City Climate Action and Adaptation Plan combines recommendations for actions that result in greenhouse gas reductions with proposals to adapt to climate change impacts in the region.¹³ In contrast, *Climate Ready DC* was developed separately from the District’s climate mitigation plan, *Clean Energy DC*, which identifies actions that could help the city meet targets for emissions reduction.¹⁴

B. Comprehensive plans (also called general plans, master plans, and growth or smart growth plans)

Comprehensive plans are a critical tool for local government to inform future growth and development in communities. While the elements of a comprehensive plan are dictated by individual state law, comprehensive plans generally provide guidance for future planning in land use and transportation.¹⁵ The visions for development set forth under comprehensive plans are then implemented through zoning ordinances—which, in many states, are required to be consistent with the local comprehensive plan.¹⁶ Due to a comprehensive plan’s influence on zoning regulations, the process of developing or updating comprehensive plans could be an opportunity for local governments to identify climate change impacts, assess the vulnerability of people and infrastructure, and identify areas where they should be kept out of harm’s way.¹⁷ For example, zoning policies could restrict development in areas that are at high-risk from flooding, sea-level rise, erosion, wildfire, and other climate hazards.

C. Hazard mitigation plans

Hazard mitigation plans (HMPs) are another opportunity for local governments to incorporate climate change into existing planning processes. State, territorial, local, and federally recognized tribal governments can use HMPs to address natural hazards by developing a framework to prevent or alleviate loss of life or damage to property from wildfires, floods, and other natural disasters.¹⁸ HMPs must be approved by the Federal Emergency Management Agency (FEMA).

Local governments that have developed an approved HMP become eligible to receive certain non-emergency disaster assistance under various FEMA grant programs, including the Hazard Mitigation Grant Program (HMGP), Public Assistance Grant Program (PA), Building Resilient Infrastructure and Communities (BRIC), Pre-Disaster Mitigation Grant Program (PDM), and Fire Management As-

sistance Grant Program (FMAG) (see discussion about federal climate adaptation at §§ 24:16 to 24:18 for a more in-depth treatment of some of these programs).¹⁹ For example, certain funds can be used for floodplain management activities, such as creating an undeveloped buffer to protect natural resources.²⁰

HMPs can also include land use activities, such as the adoption of ordinances and other regulatory tools to inform development decisions in affected areas, or promote a managed retreat strategy by acquiring and demolishing or relocating structures.²¹ HMP activities may also include plans for retrofitting buildings and critical facilities that have been damaged by disasters, or conducting community outreach programs to educate property owners and residents about climate risks and measures that can be adopted to protect their homes and businesses.²²

Local governments are not required to follow and implement their hazard mitigation plans. However, HMPs can be incorporated into local comprehensive plans to help inform hazard mitigation strategies in development and zoning processes.²³

§ 24:30 Regulatory and land use tools

Even without climate adaptation plans or other standalone planning efforts that focus on specific climate hazards, local governments can proactively address or respond to climate change impacts through their regulatory and land use powers. Local governments can leverage regulatory tools to facilitate adaptation practices that help ensure that property—and the residents and businesses they house—is developed out of harm’s way. Regulatory tools can not only influence where structures are built, but also how their physical features can help adapt to climate risks like extreme heat or flooding.

The list of regulatory and land use practices that can support adaptation activities is long, and the suitability of each tool depends on the locality and the climate hazard. They include: downzoning permissible uses to limit new development in vulnerable areas; creating setbacks and buffers to site structures away from at-risk areas; rebuilding restrictions that limit the right to rebuild structures after they have been substantially damaged; and building moratoria that provide local governments with time to reassess zoning and development regulations after a major climate event.¹ A few of the commonly used regulatory and land use tools that can be used to address a range of climate hazards (flooding, wildfire, extreme heat) are discussed below.

A. Zoning

¹⁹Stafford Act Disaster Relief and Emergency Assistance Act, Title 44 CFR 201.6; <https://www.fema.gov/emergency-managers/risk-management/hazard-mitigation-planning/regulations-guidance>; *Local Mitigation Plan Review Guide*, FEDERAL EMERGENCY MANAGEMENT AGENCY, https://www.fema.gov/sites/default/files/2020-06/fema-local-mitigation-plan-review-guide_09_30_2011.pdf; *Mitigation Planning and Grants*, FEDERAL EMERGENCY MANAGEMENT AGENCY, <https://www.fema.gov/emergency-managers/risk-management/hazard-mitigation-planning/requirements> (last visited Feb. 23, 2021).

¹See generally Jessica Grannis, *Adaptation Tool Kit: Sea-level Rise and Coastal Land Use* (2011), https://www.georgetownclimate.org/files/report/Adaptation_Tool_Kit_SLR.pdf [hereinafter *Sea-level Rise Toolkit*]; Byrne and Grannis at 272-74.

Zoning is one of the most powerful tools local governments have to prepare communities for climate change impacts. Zoning maps classify different areas of a community based on permitted uses of the land (e.g., residential, commercial, industrial). Zoning ordinances—which specify design requirements for development (e.g., building densities) and determine land use and development within delineated districts—can be used to make sure structures are developed out of harm’s way. Changes to zoning ordinances may require legislative action taken by local councils (see Section 24:28 above for an overview of common legal consideration when local governments adopt zoning ordinances).

Localities can incorporate climate risk (e.g., sea-level rise) into zoning ordinances.² For example, zoning ordinances can implement more stringent regulations in existing flood hazard areas, or regulate larger geographic areas to reduce risks posed by flooding. A zoning ordinance could expand an area defined as a regulatory floodplain, or create overlay districts to add additional requirements for zoning in flood vulnerable areas (see discussion below in Subsection D on the use of floodplain regulations). Overlay zones, which impose additional regulations on top of an existing zone based upon the area’s special characteristics (e.g., floodplains or wildland-urban interfaces), can also be used to impose design and construction standards to minimize threats to structures like flooding or wildfire.³

Zoning ordinances can also be used to require development practices that help communities adapt to climate change impacts. For example, Seattle was one of the first cities to require new construction in certain zones to include additional planted areas, which can include green roofs.⁴ Zoning ordinances can also require new construction projects to have a certain percentage of pervious groundcover or cool pavement. One example is Chicago, which has required large, redeveloped properties to increase pervious surfaces by 15% compared to earlier conditions.⁵ Local governments can also modify zoning codes to require cool pavements in certain locations to reduce the urban heat island effect.⁶

B. Subdivision and cluster development

Like zoning ordinances, subdivision ordinances specify development criteria like minimum lot sizes and development densities. Unlike zoning ordinances, which regulate development on individual parcels, subdivision ordinances regulate the

²See, e.g., Va. Code Ann. §§ 15.2-2283, 15.2-8884.

³*Sea-level Rise Toolkit* at 19. Wildland-urban interface (WUI) refers to areas where development meets undeveloped land, which are at high risk from wildfires. The WUI is not a fixed location. For example, an undeveloped forest only becomes part of the WUI when development is introduced to the area. Jim Schwab and Stuart Meck, *Models for Mitigating Wildfire Hazards Through Zoning*, Am. Plan. Ass’n (2005), <https://planning-org-uploaded-media.s3.amazonaws.com/document/Zoning-Practice-2005-03.pdf> (last visited Feb. 26, 2021). For a summary of WUI regulations and land use options at the neighborhood, community, individual, and structural scales, see *Community Wildfire Safety Through Regulation: A Best Practices Guide for Planners and Regulators*, NAT’L FIRE PROTECTION ASS’N (2013), <https://www.nfpa.org/-/media/Files/Public-Education/By-topic/Wildland/WildfireBestPracticesGuide.ashx> (lasts visited Feb. 26, 2021).

⁴Green roofs consist of multiple layers—such as vegetation or a growing medium—planted over a waterproof membrane, protecting the underlying roof. Sara P. Hoverter, *Adapting to Urban Heat: A Tool Kit for Local Governments* 22 (2012), https://www.georgetownclimate.org/files/report/Urban%20Heat%20Toolkit_9.6.pdf [hereinafter *Urban Heat Toolkit*].

⁵Pervious surfaces refer to surfaces like grass or permeable pavement, which allow water to penetrate into the soil. *Id.* at 41.

⁶The urban heat island effect refers to the warming of cities compared to surrounding rural areas due to the lack of shade and the prevalence of heat-retaining surfaces such as pavements and buildings. *Id.* at 2.

division of individually saleable lots within large tracts of land.⁷

Local governments can use subdivision ordinances to encourage beneficial practices like cluster development, which concentrates development on a specific tract while preserving the rest of the tract as open space.⁸ The resulting open space can be used for adaptation practices such as capturing stormwater runoff, which can reduce flood risk and protect water quality. In areas susceptible to wildfire, clustering development allows for more green space to help control the spread of wildfire.⁹

In some rural areas without zoning, subdivision ordinances can also be used to encourage development patterns to keep homes out of harm's way. Subdivision ordinances can also ensure adequate road access and points of evacuation for residents, firefighters, and rescue workers when there is a wildfire.¹⁰

C. Building codes

Just as zoning codes can be used to require green roofs and other features on new development, local governments can also use building codes to establish standards and requirements for a particular type of building, regardless of the zoning district. As with zoning codes, a change to a building code is likely to require local legislation.

Local governments use building codes to establish standards for individual building types (e.g., residential, commercial). The building codes can be used to set requirements for building construction to maximize protection from climate hazards (e.g., reduce risk of flooding through elevation or requiring certain construction techniques or materials). Building codes primarily apply to new development, though local governments can also use building codes to incorporate requirements for building retrofits or repairs.¹¹

D. Floodplain regulations

Local governments can use floodplain regulations to implement adaptation strategies. Indeed, the adoption of floodplain ordinances is a requirement for communities that voluntarily participate in the National Flood Insurance Program (NFIP).

In order for federal flood insurance to be made available in their communities, local governments are required to adopt and enforce floodplain management ordinances that regulate new construction in special flood hazard areas (SFHAs).¹² SFHAs are mapped by FEMA—the NFIP's administering agency—which uses historical flood data to develop flood insurance rate maps (FIRMs) and identifies areas of the floodplain according to different flood risk zones.¹³

⁷*Sea-level Rise Toolkit* at 34.

⁸*Id.*

⁹Smart Growth Fixes for Climate Adaptation and Resilience: Changing Land Use and Building Codes and Policies to Prepare for Climate Change, Environmental Protection Agency (2017), https://www.epa.gov/sites/production/files/2017-01/documents/smart_growth_fixes_climate_adaptation_resilience.pdf [hereinafter *EPA Smart Growth Guide*].

¹⁰*Id.* at 74.

¹¹For example, including a cool roof requirement in a building code places the cost of installing a cool roof primarily on the building owner. However, for new development, the cost is similar to that of constructing a traditional roof. The cost is usually financed over a period of years to match the saving. *Urban Heat Toolkit* at 17.

¹²NFIP regulations, sections 60.0-60.3, National Flood Insurance Program Requirements.

¹³SFHAs include A-Zones and V-Zones. A-Zones are areas that are upland or located in riverine floodplains and are vulnerable to the 100-year flood (or have a one percent annual chance of flooding based upon historical data). V-Zones are coastal floodplains that are susceptible to damage from storm-induced velocity wave action, and are more strictly regulated than A-Zones. FEMA also designates flood zone areas outside of SFHAs, called X-Zones (representing the 500-year floodplain, which have a

Many local governments directly adopt FEMA's model floodplain ordinance, which imposes minimum regulations on development in the SFHA. FEMA's ordinance contains primarily design requirements for development; for example, elevating structures to or above the base flood elevation (BFE).¹⁴ However, FEMA's reliance on historical flood data to determine flood risk means that the NFIP does not account for the impact of future sea-level rise. Therefore, in order to qualify for the NFIP, many local governments that adopt FEMA's model floodplain ordinance may not be adequately accommodating increased risks of future flood due to sea-level rise, erosion, subsidence, and/or extreme storm events that will increase in both frequency and intensity.

In order to be better prepared for future climate risks, many local governments have elected to adopt higher standards for regulating floodplains and taken other measures to update their floodplain management practices. For example:

- Communities can expand the regulatory flood zone boundaries so that more structures are required to comply with local floodplain regulations, as the city of Baltimore did in 2014 when it amended the floodplain ordinance to extend floodplain regulations to the 500-year floodplain and add new flood resilience measures.¹⁵
- Local governments can restrict the height and size of structures in flood hazard areas. By reducing the density of development, local governments can reduce the number of people and structures at risk of harm or damage from storms and sea-level rise. Likewise, jurisdictions may also exempt structures that are being elevated from height restrictions and other regulations, so that the structural elevation does not conflict with local codes. For example, after Superstorm Sandy, New York City waived height and setback requirements so that flood-damaged structures could be rebuilt to higher standards and prepare for future flood risk.¹⁶
- Communities can participate in the Community Rating System (CRS), a sub-program of the NFIP that encourages communities to increase floodplain standards above the minimum requirements set forth in the NFIP. In exchange for receiving discounts in their flood insurance premiums, communities must implement a range of flood risk measures, from higher regulatory standards like requiring buildings be elevated above the BFE to conducting community outreach and education around flood risk.¹⁷ In order to maximize benefits under the CRS program, many participating communities have collaborated across jurisdictional boundaries to pursue CRS activities at a regional scale.¹⁸

§ 24:31 Funding and financing tools

Local governments can use a variety of funding and financing mechanisms to promote climate adaptation practices, which could include capital improvement projects, planning, and program development. Local governments can fund many

0.2 to one-percent annual chance of flooding based upon historical data). However, FEMA does not currently require regulation in X-Zones. *See Flood Zones*, FEDERAL EMERGENCY MANAGEMENT AGENCY, <https://www.fema.gov/glossary/flood-zones> (last visited Feb. 23, 2021).

activities through a city's General Fund, which is funded in part by property, income, and sales taxes.¹ Municipal budgets may not be the most reliable source of funding for adaptation projects, given that the amount of funding available for these purposes may fluctuate from year to year if other spending obligations are prioritized. Additionally, the use of general funds for adaptation activities may bring about an inequitable distribution of resources, such as when property owners become exempt from the property taxes used to fund a stormwater management program, even when they contribute to stormwater runoff (e.g., churches and universities).²

Aside from the municipal budget, funds for adaptation projects could be generated through several other sources, including taxes, stormwater utility or other fees, state and federal grants, bonds, low-interest loans, and public-private partnerships.³ Where possible, local governments may coordinate funding across multiple agencies. For example, in Boulder, Colorado, the city's Greenways Master Plan leverages funding from the city's Transportation Fund, Stormwater and Flood Control Utility Fund, and the State Lottery Fund.⁴

A few commonly used measures are discussed below.

A. Stormwater fees

Many local governments collect stormwater fees from property owners and industrial and commercial customers to help maintain the public stormwater system, as well as pay for impacts to water quality and address flood concerns. The fees are collected based on a property's contribution to stormwater runoff; the fees are then used to help operate the local stormwater system. In this way, compared to general funds, stormwater fees may be a more equitable source of funding for stormwater management because the fee levels are directly related to a property's impact on the local stormwater infrastructure.

To encourage more adaptation-friendly practices from the consumer side, more and more localities are offering financial incentives for adopting certain practices to alleviate impact on the stormwater system. Local governments can offer a partial or full refund of stormwater fees for property owners that install green stormwater infrastructure (GSI) that reduces or treats stormwater runoff at its source, thereby reducing flood risk and protecting floodplains. For example, in Newport News, Virginia, property owners can earn up to a 15% rebate on their stormwater fee for reducing runoff.⁵ Governments can also use revenue from stormwater management fees to offer one-time payments for the installation of vegetation or porous pavements that can help capture and filter stormwater. An illustration is the District of

⁵Newport News, VA., Code of Ordinances §§ 37.1-15.

Columbia, which offers homeowners a rebate of \$5 per square foot to replace impervious surfaces with vegetation, and \$10 per square foot to install permeable pavers.⁶

B. Permit and inspection Fees

Aside from stormwater utility fees, local governments also use permit and inspection fees to fund measures like installing green infrastructure to reduce urban heat island effects, manage stormwater, improve air quality, and help meet other sustainability goals. Permit fees could help fund green infrastructure programs, such as in Portland, Oregon, which established a “% for Green” fund, which is used to fund the city’s Green Streets program.⁷ The fund requires construction projects in the public’s right-of-way—that do not already include green street features—to contribute one percent of the construction budget to support green street facilities.⁸

Like stormwater fees, permit and inspection fees allow for a more direct allocation of funding for specific projects. However, permit fees may not provide a consistent source of revenue during periods when construction may lag, and stormwater utility fees may require approvals by the local legislative body, among other legal and regulatory constraints (e.g., having legal authority to establish a stormwater user fee, meeting other applicable state requirements).⁹ Therefore, local governments may need to combine fees with other funding sources to ensure a dedicated funding stream for local adaptation projects.

C. Bonds

Like states, local governments can sell bonds to raise funds for the construction of public projects and infrastructure, such as roads or schools. Local governments can borrow money from private investors, which is then repaid on a schedule at a fixed interest rate. Bonds therefore offer potential as one mechanism for local governments to fund climate adaptation projects; for example, urban forestry or cool pavement projects.¹⁰

Municipal bonds traditionally take one of two forms. A revenue bond is backed by a specific project or source (e.g., service fees and assessments) and can be used to finance large capital expenditures.¹¹ General obligation bonds are backed by a government entity or tax revenue and used to fund public projects.¹² Increasingly, cities have also adopted “green bonds” that can be earmarked specifically for environmental and climate investments.¹³ For example, in 2014 the state of California issued a \$300 million general obligation bond (backed by the state’s General Fund) to finance projects for flood prevention, energy conservation in public build-

ings, clean water and drinking water, and air pollution, among other categories.¹⁴

§ 24:32 Conclusion

In addition to working with federal and state agency partners, many local governments are already equipped with planning, regulatory, and funding tools to proactively prepare for existing and future climate change impacts. Indeed, some local governments may be uniquely situated to both identify their climate risks, as well as proactively implement adaptive solutions that can be tailored to meet the needs of their communities. Whether in drafting long term plans or adopting regulatory measures to meet the challenges of preparing for climate hazards, each locality will need to calibrate its actions not only in consideration of its legal authority, but also with the input of communities at the frontlines of climate change. Local climate actions are most effective when they are planned, developed, and implemented in coordination with community members, particularly those that are hardest hit by climate change impacts.

VIII. GEOENGINEERING: REGULATING CARBON DIOXIDE REMOVAL/NETS UNDER INTERNATIONAL LAW

§ 24:33 Overview of carbon dioxide removal/negative emissions technologies

The Paris Agreement's entry into force in 2016 was hailed as a hallmark achievement by the world community. However, there is growing recognition that meeting its objectives may require not only aggressive emissions reduction policies, but also wide-scale deployment of so-called "carbon dioxide removal" (CDR) approaches.¹ Carbon dioxide removal options, also frequently known as "negative emissions," aim to address climate change by effectuating the removal of carbon dioxide from the atmosphere and then storing it terrestrially or in the world's oceans,² or utilizing it in industrial or chemical processes.³ This can be achieved by enhancing natural sinks for carbon, or deploying chemical engineering to remove carbon dioxide from the atmosphere.⁴

CDR is usually recognized of one of two major categories of an emerging set of climate response mechanisms collectively known as "climate geoengineering," defined by the UK's Royal Society as "the deliberate large-scale manipulation of the

¹⁴*Final Report: 2014 Green Bonds*, OFFICE OF THE STATE TREASURER (Dec. 2018), <https://www.treasury.ca.gov/publications/2014green.pdf> (last visited Feb. 26, 2021).

[Section 24:33]

¹Niall MacDowell, et al., *The role of CO₂ capture and utilization in mitigating climate change*, 7 NATURE CLIMATE CHANGE 243-49 (2017). The most recent "emissions gap report" of the United Nations Environment Program concluded that annual emissions by 2030 need to be a whopping 15 GtCO₂e lower annually than current unconditional Paris NDCs to hold temperatures to 2 °C above pre-industrial levels, and 32 GtCO₂e lower to meet the 1.5 °C objective, UNEP, *Emissions Gap Report 2020*, Executive Summary, at X, <https://www.unep.org/emissions-gap-report-2020> (last visited Feb. 16, 2021). The lion's share of scenarios utilizing integrated assessment models thus contemplate large-scale deployment of CDR, perhaps to the tune of 10-20 GtCO₂/yr. in the latter part of the century. Ottmar Edenhofer, et al., *Climate Change 2014 Mitigation of Climate Change Working Group III Contribution to the Fifth Assessment Report of the Intergovernmental Panel on Climate Change* (2014), at 14-15.

⁴Timothy Lenton, *The Global Potential for Carbon Dioxide Removal*, GEOENGINEERING OF THE CLIMATE SYSTEM 53 (Roy Harrison & Ron Hester eds., 2014).

planetary environment to counteract anthropogenic climate change.”⁵ The other major category, Solar Radiation Management (SRM), encompasses approaches that could reflect a small portion of incoming solar radiation back to space—such as by injecting aerosol particles into the upper atmosphere—and thus exerting a cooling effect.⁶ This section focuses on the law associated with CDR approaches, given the fact that SRM remains a largely notional concept at this point.

CDR options include the following:

- Bioenergy and carbon capture and storage (BECCS), a process by which biomass is converted to heat, electricity, or liquid or gas fuels, coupled with carbon dioxide capture and sequestration (CCS);⁷
- Ocean fertilization (OF), a process for dispersing iron or other nutrients in regions of the world’s oceans regions to stimulate phytoplankton production, thus potentially enhancing carbon dioxide uptake;⁸
- Increasing ocean alkalinity, and thus carbon dioxide uptake, by adding substances such as lime or olivine to oceans or in coastal regions;⁹
- Direct air capture (DAC), a process to extract carbon dioxide from ambient air in a closed-loop industrial process;¹⁰
- Terrestrial enhanced mineral weathering, a process to accelerate the uptake of carbon dioxide from the atmosphere by magnesium and calcium-rich rocks;¹¹ and
- Afforestation and reforestation initiatives,¹² and efforts to increase sequestration of carbon dioxide in soils.¹³

There is increasing recognition of the potentially critical role for CDR approaches in climate policymaking.¹⁴ The vast majority of mitigation scenarios developed in integrated assessment models, under which temperatures are maintained at 2°C or

below, contemplate extensive deployment of CDR technologies during the course of this century,¹⁵ with bioenergy and carbon capture with storage cited as the primary option.¹⁶ Moreover, carbon dioxide removal could play a critical role in reversing potential overshoot of carbon budgets during this century and beyond.¹⁷

However, CDR approaches also pose potentially serious risks, including building upon the inequities of climate change for some of the world's most vulnerable populations. For example, ocean iron fertilization could result in shifts in community composition that could threaten the integrity of ocean ecosystems.¹⁸ Large-scale deployment of bioenergy and carbon capture and storage could divert large swathes of land from food production, imperiling food security for vulnerable populations,¹⁹ It could also result in large land grabs,²⁰ and threaten biodiversity.²¹ Enhanced mineral weathering could pose risks to agricultural applications by releasing potentially toxic levels of chromium and nickel,²² could pose potential threats to human health through inhalation of ultrafine particles,²³ and might adversely impact ocean environments by substantially altering biogeochemical cycles.²⁴

Yet despite the momentous implications that large-scale CDR deployment may pose for society, legal purview over these approaches at both the domestic and international level remain amorphous and contested. The next section describes the current status of legal regulation of CDR, and other potentially pertinent institutions.

§ 24:34 The international law of carbon dioxide removal

As Kuokkanen and Yamineva observe, there are no dedicated international regimes to regulate climate geoengineering. However, a number environmental

treaties and general principles of international law are, or may be, pertinent.¹ To date, two international regimes have sought to regulate ocean fertilization schemes. In 2008, the Parties to the London Convention on the Prevention of Marine Pollution by Dumping of Wastes and Other Matter (London Convention)² passed a resolution in 2008 to regulate ocean fertilization. The Resolution provided that ocean fertilization would not constitute “dumping” for the purposes of the Convention if: (1) restricted to “legitimate scientific research”; and (2) the activity was subject to a case-by-case assessment framework to be developed by the Scientific Groups of the Convention, and its successor agreement, the London Protocol.³ In 2010, the Parties adopted a framework to guide that assessment.⁴ Under the framework, ocean fertilization scientific research projects will be construed to be contrary to the aims of the Convention and Protocol unless “conditions are in place to ensure that, as far as practicable, environmental disturbance would be minimized, and the scientific benefits maximized.”⁵

There are obvious limitations to the potential role of the London Convention in this context. London Convention resolutions are not legally binding.⁶ Moreover, by its terms, the 2008 resolution is restricted to regulation of one CDR approach, OF, though it might provide guidance for similar approaches in the future. Finally, the scope of the Convention itself is narrowly limited to assessment of the impacts of disposal/placement of materials in the seas, which means it would not be applicable to the vast majority of CDR options.

In 2013, the Parties to the London Protocol passed an amendment to regulate marine geoengineering,⁷ defined as “a deliberate intervention in the marine environment to manipulate natural processes, including to counteract anthropogenic climate change and/or its impacts, and that has the potential to result in deleterious effects, especially where those effects may be widespread, long lasting or severe.”⁸ The initial regulatory scope of the amendment is limited to ocean fertilization, which is restricted to legitimate scientific research and subject to an extensive assessment framework before a permit may be issued by a Party.⁹ However, the amendment also permits adding other marine geoengineering approaches to its regulatory framework, under Annex 4, in the future.¹⁰

Unlike resolutions passed by the Parties to the Convention/Protocol, amendments

¹⁰1996 Protocol to the 1972 Convention on the Prevention of Marine Pollution by Dumping of Wastes and Other Matter, 7 Nov. 1996, [2006] ATS 11 (entered into force 24 March 2006), at art. 22(1).

to these instruments are legally binding.¹¹ However, an amendment does not come into force until two-thirds of the Parties have accepted it,¹² and to date only a handful of Parties have done so.¹³ Other limitations include the fact that the scope of potential carbon dioxide options is limited to marine-based interventions, and at least one major potential actor, the United States, is not a Party.¹⁴

The Parties to the Convention on Biological Diversity (CBD) also passed a resolution in 2008,¹⁵ restricting ocean fertilization activities to small scale scientific studies in coastal waters, and subject to prior assessment of potential impacts.¹⁶ However, the resolution also provided for potentially expanding the scope of permitted activities in the future in the presence of an adequate scientific basis and effective regulatory architecture.¹⁷ Subsequent resolutions on ocean fertilization passed by the Parties have largely tracked this language, though the restriction of research to coastal areas was dropped in a subsequent resolution.¹⁸ In 2012, the Parties passed a resolution that expanded the purview of the regime's focus to "climate-related geoengineering" interventions, which was capaciously defined as "any technologies that deliberately reduce solar insolation or increase carbon sequestration from the atmosphere on a large scale and that may affect biodiversity . . ."¹⁹ The resolution called on the Parties and Executive Secretary to engage in additional research to address gaps on a range of issues, including the potential impacts of geoengineering schemes on biodiversity,²⁰ and the current status of the international regulatory framework pertinent to the interests of the CBD.²¹

A number of other international treaty regimes might engage on carbon dioxide removal issues in the future. Perhaps the most logical regime would be the Paris Agreement,²² given its role as the primary international agreement to address climate change. Article 4(2) provides that Parties are to effectuate their nationally determined contributions (NDCs) through "domestic mitigation measures." The term "mitigation" is not defined in Paris. However, it is in Paris's parent agreement, the United Nations Framework Convention on Climate Change (UNFCCC).²³ In that agreement, *mitigation* encompasses measures "limiting . . . anthropogenic emissions of greenhouse gases *and protecting and enhancing . . . greenhouse gas*

²³United Nations Conference on Environment and Development: Framework Convention on Climate Change, May 9, 1992, 31 I.L.M. 849.

sinks and reservoirs . . .”²⁴ “Sinks,” in turn, constitute “any process, activity or mechanism *which removes a greenhouse gas, an aerosol or a precursor of a greenhouse gas from the atmosphere.*”²⁵ Thus, CDR options clearly are a form of sinks that Parties can include as a mitigation element of their NDCs. Indeed, most of the world’s major emitters have already included one form of CDR, afforestation/reforestation initiatives, in their NDCs.²⁶ However, the Parties have yet to incorporate CDR approaches into their formal NDC agendas.²⁷

Of course, CDR pledges would be subject to provisions of the Paris Agreement that seek to assess the impacts of climate response measures on axes such as sustainable development,²⁸ human rights,²⁹ and notions of climate justice and equity.³⁰ Moreover, deployment of CDR approaches to fulfill Paris obligations would be subject to the implementation guidelines set forth in the Paris Rulebook,³¹ especially provisions pertinent to mitigation.³²

There are several other treaties that might also be apposite. The Convention on the Prohibition of Military or Any Other Hostile Use of Environmental Modification Techniques prohibits its Parties from engaging in “the hostile use of environmental modification techniques having widespread, long-lasting or severe effects as the means of destruction, damage or injury to any other State Party.”³³ The term “environmental modification techniques” encompasses “deliberate manipulation of natural processes . . . including its . . . atmosphere . . .”³⁴ Thus, the treaty would appear to be germane to the deployment of CDR approaches that have, or may have, negative transboundary impacts. However, it is far from clear if CDR deployment characterized by a State as a means to *combat climate change* would be construed as a “hostile use” of these techniques.³⁵ Moreover, ENMOD’s membership is limited,³⁶

and the treaty has not been invoked in potentially apposite cases.³⁷

Several provisions of the United Nations Convention on the Law of the Sea could be pertinent to ocean-based CDR approaches.³⁸ This would include provisions to regulate scientific research,³⁹ as well as those that address potential pollution impacts of the placement of materials in the ocean.⁴⁰ The Biodiversity Beyond National Jurisdiction (BBNJ) agreement,⁴¹ currently being formulated under UNCLOS, also contains a number of provisions that could be pertinent to research and potential deployment of ocean-based CDR, including those related to establishment of specially-protected areas and transboundary environmental impact assessments.⁴²

A number of general principles of international law might also be applicable to carbon dioxide removal options with potential transboundary impacts. These include the precautionary approach,⁴³ transboundary environmental impact assessment,⁴⁴ and principles of State responsibility.⁴⁵

Of course, it should be recognized that many carbon dioxide removal options may have few or no transboundary impacts, meaning that they will likely be predominantly regulated at the national and sub-national level.⁴⁶ For example, in the United States, BECCS would likely be governed primarily by domestic laws related to land-use, as well as federal and state laws governing carbon dioxide sequestration.⁴⁷ Enhanced mineral weathering could be subject to an array of laws and regulations associated with land-use, air and water pollution and waste management.⁴⁸ Direct Air Capture deployment at a large scale would be subject to the National Environmental Policy Act and federal and state laws on carbon dioxide sequestration,⁴⁹ as well as the Clean Air Act.⁵⁰ Nations committed to deployment of these approaches may also carve out special rules for regulation in the future, as well as to

facilitate deployment.⁵¹ In Europe, European Union regulations pertinent to land-use, land-use change and forestry (LULUCF), carbon capture and sequestration, and soil strategies would play a major role in governing many CDR approaches.⁵²

§ 24:35 Conclusion

As the diffusion of carbon dioxide removal options in society grows, it is likely that the ambit of international regimes engaged in this emerging climate response will widen. This turn to polycentric governance may prove beneficial in several ways, including facilitating broader representation of perspectives, and building in redundancies that minimize mistakes in governing.¹ At the same time, this approach may pose a number of challenges, including potentially increasing transaction costs, and complexities that may privilege powerful actors.² It is likely that many countries will also begin to develop additional legislation to address the specific concerns associated with carbon dioxide removal, as well as development of national policies to support research, development and integration into existing accounting and climate policy frameworks.³

IX. TRIBAL

§ 24:36 Introduction

Literature on the legal strategies to address climate change has predominantly focused on federal and state actions (or inaction, as the case may be). But these are not the only sovereigns addressing the negative impacts of climate change: tribal governments are increasingly stepping up with innovative solutions. Aside from protecting their own communities, tribal action on climate change may also prove helpful to other sovereigns in developing effective climate responses.

This section focuses on climate change in tribal communities. To better understand why tribes are legally able to adopt tribal climate change measures, an introduction to tribal sovereignty is helpful to practitioners unfamiliar with the field of federal Indian law. This section begins with an introduction to tribal governments, and then moves to a discussion of federal Indian law generally, with a special emphasis on tribal sovereignty. Next, this section explains the legal precedent underlying the adoption of tribal environmental law, including climate change responses. With this introduction in place, the discussion turns to the impacts of climate change on tribal communities and explores responses that have been adopted by various tribes, focusing on adaptation plans and mitigation efforts.

§ 24:37 Federal Indian law and tribal sovereignty

A. Overview

Most tribes predate the formation of the United States of America. Although the

level of sophistication varied, these tribes possessed functioning governments long before contact with European powers. Tribal governments are not uniform in the manner in which they are structured. For example, some tribal governments, such as the Little Traverse Bay Band of Odawa Indians, possess separation of powers, inclusive of an independent judiciary. Other tribal governments, such as the Sault Ste. Marie Tribe of Chippewa Indians, do not utilize separation of powers, preferring instead to have one governmental entity inclusive of executive, legislative, and judicial powers. Within some tribes, such as the Hopi Nation, traditional leaders and elders play an important role in government functions.

Just as tribal governmental structures differ, so too does tribal law. Tribes have developed tribal customary law based on centuries of customs and traditions. Because tribes have enacted their own tribal laws and yet may look to federal and state law for guidance, tribes may create a hierarchy of laws detailing the order in which law should be applied. For example, the Hopi Nation adopted a resolution ordering that law be applied within the Hopi Nation's territory according to the following order: (1) the Hopi Constitution and By-laws; (2) Ordinances of the Hopi Tribal Council; (3) Resolutions of the Hopi Tribal Council; (4) the customs, traditions and culture of the Hopi Tribe; (5) federal law; (6) Arizona [the state where the Nation is located] law; and (7) the common law.¹ Given that many different sources of law may apply to a matter arising within Indian Country,² tribes increasingly create intertribal and intratribal common law. In fact, "the wide majority of tribal courts apply intertribal common law in almost every decision involving nonmembers."³ Accordingly, the law applicable in Indian country can be multifaceted and certainly differs as between tribes.

Ultimately, although tribal sovereignty is limited in some ways, as discussed below, tribal sovereignty persists today. Once the federal government recognizes tribal sovereignty, that sovereignty continues unless divested by Congress. Accordingly, any discussion of law applicable within Indian country must start with the premise that tribal sovereignty remains and then look to see whether that sovereignty has been divested in any way by the federal government. The relationship between tribal governments and the federal government has been evolving for some time. The next part of the chapter details the history of this relationship.

B. Introduction to the relationship between the federal government and tribal governments

The relationship between tribes and the federal government is dynamic. As stated above, tribes pre-dated the formation of the federal government, and, as a result, had thriving, fully functional governments in place at the time the United States of America was formed. The legal relationship between the federal government and tribes has its roots in Medieval and Renaissance legal traditions. Starting during the Crusades, the Roman Catholic Church played a vital role in providing the legal justifications for such foreign actions. Generally, the Church justified the Crusades under the legal theory that only individuals who believed in a Christian God had le-

[Section 24:37]

¹Hopi Tribal Council Res. No. H-12-76. While a tribe may adopt an order of application regarding different sources of law, it is important to note that federal law will likely preempt where it conflicts with tribal ordinances. On questions of territorial jurisdiction, state law at times may supersede if it can be justified on public health grounds.

²Indian country is defined as (a) all land within the limits of any Indian reservation; (b) all dependent Indian communities; and (c) all Indian allotments. 18 U.S.C. § 1151. Although originally enacted as part of the Federal Criminal Code, this definition has been extended to civil cases as well.

³Matthew L.M. Fletcher, *Toward a Theory of Intertribal and Intratribal Common Law*, 43 Hous. L. Rev. 701, 720 (2006).

gitimate power. This concept was expanded during Europe's "Age of Discovery," when European nations established the right to explore and "discover" massive areas of land under the authority of the papal bull *Romanus Pontifex*.⁴ The Church issued papal bulls to European countries, which then gave the countries legal authority to explore and assert dominion over non-Christian people who were discovered in the new territories. Under this legal justification, those arriving in the new world believed that they had legally discovered the territory and, therefore, owned the territory in question if the original inhabitants did not possess European-Christian norms.

The modern United States of America built on these foundational legal principles. Initially, however, many tribal nations were politically and militarily strong. As a result, the newly created federal government originally perpetuated the British policy of negotiating with tribes on a government-to-government basis.⁵ Most negotiations between tribal governments and the federal government were conducted using treaties. The use of treaties was also consistent with the fact that tribal governments were extra-constitutional.

Starting in 1823, however, the relationship between the federal government and tribes started to change. Chief Justice Marshall applied the ideas promulgated during the European "Age of Discovery" to the United States when he adopted the Doctrine of Discovery in *Johnson v. M'Intosh*, the first of the Marshall trilogy of cases that serve as the foundation of modern federal Indian law.⁶ In *Johnson*, the U.S. Supreme Court considered whether Indian tribes maintained title to their property and could therefore sell the property, or whether the United States had obtained title through Britain's discovery of the property in question.⁷ Ultimately, Chief Justice Marshall determined that the Doctrine of Discovery applied and therefore Indians had the right to occupy the land in question but that exclusive title rests with the discoverer. Furthermore, Marshall explained in his decision that the United States, as the exclusive owner of the property, maintained the legal right to extinguish the Indian right of occupancy at any time.

Johnson and the other two cases comprising the Marshall trilogy—*Cherokee Nation v. Georgia* and *Worcester v. Georgia*,⁸ decided in 1831 and 1832, respectively—are generally considered the foundation of federal Indian law. Both *Cherokee Nation* and *Worcester* arose from the State of Georgia's efforts to assert its sovereignty over the Cherokee Nation, located within the boundaries of Georgia at the time. Georgia passed laws abolishing the boundaries of the Cherokee Nation and asserting the laws of Georgia over the Cherokee Nation. In *Cherokee Nation*, the Cherokee Nation attempted to bring an original action in the U.S. Supreme Court to stop Georgia's actions. The U.S. Supreme Court addressed whether its original jurisdiction

⁴The Pope of the Roman Catholic Church issued the papal bull *Romanus Pontifex* to Christian nations. The papal bull *Romanus Pontifex* was a legal document binding on all other Christian monarchs. The papal bull *Romanus Pontifex* confirmed the Christian nation's ability to colonize the territories defined within the document. DAVID H. GETCHES ET AL., CASES AND MATERIALS ON FEDERAL INDIAN LAW 44-48 (West, 6th ed. 2011). For more information on the papal bull *Romanus Pontifex* and the role of the Roman Catholic Church in the development of the Doctrine of Discovery see JAMES MULDOON, POPES, LAWYERS, AND INFIDELS (1979).

⁵DAVID H. GETCHES ET AL., CASES AND MATERIALS ON FEDERAL INDIAN LAW 44-48 (West 6th ed. 2011).

⁶*Johnson v. M'Intosh*, 21 U.S. 543, 5 L. Ed. 681, 1823 WL 2465 (1823).

⁷Given Great Britain was the legal predecessor to the United States, the United States assumed Britain's legal rights to the property in question upon the United States' succession from Great Britain.

⁸*Cherokee Nation v. State of Ga.*, 30 U.S. 1, 8 L. Ed. 25, 1831 WL 3974 (1831); and *Worcester v. State of Ga.*, 31 U.S. 515, 8 L. Ed. 483, 1832 WL 3389 (1832).

extended to Indian nations.⁹ In holding that it did not, the Court reasoned that Indian nations were not foreign nations, but, rather, “domestic dependent nations.” In *Worcester*, Georgia had imprisoned a missionary working within the Cherokee Nation’s territory for failure to comply with Georgia law, raising the issue of whether the laws of the state of Georgia applied within the territory of the Cherokee Nation. The U.S. Supreme Court concluded that the laws of the state of Georgia had no force or effect within Indian country.

Cherokee Nation and *Worcester* are important to understanding the extent of tribal jurisdiction. *Cherokee Nation* recognized the separateness and sovereignty of tribal nations. At the same time, *Cherokee Nation* set forth the basis of the federal trust responsibility. The relationship between tribes and the United States was established as one resembling that of a ward and guardian or a beneficiary and trustee.¹⁰ Based upon this relationship, a trust responsibility has arisen such that the United States must ensure the protection of tribal and individual Indian lands, assets, resources, and treaty rights.¹¹ *Worcester* held that the laws of states generally do not apply in Indian country. Although subsequent congressional acts and court decisions have modified *Worcester*, the presumption against the applicability of state law in Indian country remains. This presumption is especially strong where application of state law would interfere with inherent tribal governmental functions.

Following *Worcester*, the U.S. Supreme Court was relatively silent on the issue of federal Indian law until events occurring nearly 50 years later during the development of the Allotment Era.¹² In 1883, the U.S. Supreme Court decided *Ex Parte Crow Dog*,¹³ which involved the murder of one Indian by another Indian in Indian country. The U.S. Supreme Court held that the federal court did not have jurisdiction over the crime, because both the defendant and victim were Indian and the crime occurred within Indian country. In reaction to this decision, Congress passed the Major Crimes Act, which granted the federal courts concurrent jurisdiction over enumerated crimes that occur within Indian country, regardless of the political affiliation of the individuals involved.¹⁴

The U.S. Supreme Court determined that Congress had the authority to enact the Major Crimes Act in *U.S. v. Kagama*.¹⁵ In reaching this decision, the Supreme Court determined that the United States owes Indian tribes a “duty of protection” and, therefore, the federal government has plenary authority over Indian country.¹⁶ Since this time, the federal government has exercised substantial authority in Indian

⁹The U.S. Supreme Court has original jurisdiction, meaning the parties can file first in the U.S. Supreme Court, in claims between states and claims between states and foreign nations.

¹⁰*Cherokee Nation*, 30 U.S. at 17.

¹¹COHEN’S HANDBOOK OF FEDERAL INDIAN LAW § 5.04[3] (Nell Jessup Newton, et al. eds. Lexis Nexis 2005 ed.).

¹²This historical period is typically referred to as the Allotment Era of federal Indian law, because the federal government explicitly rejected its policy of recognizing tribal sovereignty through enactment of treaties by ending the treaty making period and moving toward a policy of allotment with the express purpose of assimilating Indians. In addition to the cases discussed, allotment acts themselves represent the increased role of the federal government in Indian country. This is because the federal government took an active role in the management of Indian country by allotting land to individual Indians.

¹⁶118 U.S. 375, 383-84 (1886); *See also* *Lone Wolf v. Hitchcock*, 187 U.S. 553, 23 S. Ct. 216, 47 L. Ed. 299 (1903). *Lone Wolf v. Hitchcock* involved the ability of Congress to abrogate provisions of a treaty between the federal government and Indian nations. In holding that Congress did have the authority to abrogate treaties, the U.S. Supreme Court relied on Congress’ plenary authority to act within Indian country.

country.

Toward the end of the 19th century, Congress enacted a series of acts, such as the General Allotment Act or Dawes Act,¹⁷ to divide or allot land held by tribes into individual parcels; many parcels were 160, 80, and 40 acres. Allotted lands were then taken from the tribes and given to individual Indians. Remaining lands were often opened up to non-Indian homesteaders for settlement. As a result of the allotment acts, much of Indian country is now “checkerboarded,” meaning that many different entities may own land in Indian country—e.g., the United States, tribes, Indians, and non-Indians. As one prominent scholar pointed out, “[t]he primary effect of the Allotment Act was a precipitous decline in the total amount of Indian-held land, from 138 million acres in 1887 to 48 million in 1934.”¹⁸

The Allotment Era of federal Indian law ended in 1934 with the passage of the Indian Reorganization Act (IRA). In addition to ending allotment of Indian lands, IRA also affirmed the ability of tribal governments to formally adopt tribal constitutions. This marked the beginning of the Indian Reorganization Era and a shift away from the failed assimilationist policies of the Allotment Era toward policies embracing and promoting tribal sovereignty.

Following the Indian Reorganization Era, federal Indian law entered the Termination Era, which is roughly associated with the 1950s and early 1960s. During this time period, the federal government “terminated” its federal relationship with many tribes, such as the Menominee of Wisconsin and the Klamath of Oregon, on the basis that those tribes allegedly no longer needed federal superintendence. Termination of the federal relationship devastated many of the affected tribes. As a preliminary matter, any reservations previously set aside for a terminated tribe became disestablished, resulting in substantial land and resource losses. Since then, the federal government has reinstated its federal relationship with many of the tribes that were terminated under the termination acts. However, the effects of this failed policy are still felt today. In many cases, restoration of recognition did not return the tribe’s reservation and, therefore, failed to fully restore the tribe to its pre-termination status.¹⁹

Following the civil rights movement of the 1960s, the federal government moved toward a policy of promoting tribal self-determination, the modern Self-Determination Era. President Nixon ushered in this historical era with his message to Congress on July 8, 1970.²⁰ President Nixon explicitly rejected the policy of termination and indicated that the federal government should adopt policies promoting tribal autonomy and allowing for tribes to take over federal programs where appropriate. Congress overwhelmingly adopted the majority of the policies articulated by President Nixon in his 1970 message to Congress. Most notably, Congress adopted the Indian Self-Determination and Education Assistance Act in 1975, which allowed for tribes to take control of programs previously administered by the federal government in Indian country.

While Congress tended to adopt pro-tribal sovereignty legislation during this period, the U.S. Supreme Court started issuing decisions that have slowly constrained tribal sovereignty. For example, in 1978, the U.S. Supreme Court decided *Oliphant*

v. Suquamish Indian Tribe,²¹ which involved the ability of a tribal court to assert jurisdiction over a non-Indian who committed a crime within Indian country. The U.S. Supreme Court held that the tribal court did not have jurisdiction over non-Indians committing felonious crimes within Indian country, severely limiting tribal criminal jurisdiction. The U.S. Supreme Court also has restricted tribal civil jurisdiction, which is discussed further below in the context of tribal environmental regulation.

The preceding is a very short introduction to the history of the relationship between tribes and the American federal government. Having some familiarity with the basic foundations and history of this relationship assists in understanding the contours of environmental law applicable in Indian country. Accordingly, with this background in place, the next section examines how environmental law applies within Indian country.

§ 24:38 Environmental law and tribal sovereignty¹

Tribes have the authority to enact environmental law affecting their territories under either their tribal inherent authority or under a federal delegation of authority. This section focuses on the contours of environmental law enacted under tribal inherent authority, which exists by virtue of tribes' sovereign status. It is under this authority that tribes have generally taken measures to respond to climate change.

Today, inherent tribal sovereignty persists with regard to matters of self-governance and tribal membership.² Quoting another scholar of federal Indian law: "Tribal powers of self-government are recognized by the Constitution, legislation, treaties, judicial decisions, and administrative practice."³ Tribes maintain those aspects of sovereignty that have not been removed by virtue of treaty, statute, or "by implication as a necessary result of their dependent status."⁴ Any examination of tribal authority should start with the presumption that the tribe in question possesses sovereignty, unless the tribe has been divested of its sovereignty by the federal government.⁵

"Indian tribes are neither states, nor part of the federal government, nor subdivisions of either. Rather, they are sovereign political entities possessed of sovereign authority not derived from the United States, which they predate."⁶ As such, tribes maintain sovereign authority over their members and territories to the extent not

Although this assertion is generally true, as previously mentioned, some tribes were "terminated" during the Termination Era of the mid-twentieth century. COHEN'S HANDBOOK OF FEDERAL INDIAN LAW § 1.06 (Nell Jessup Newton, et al. eds. Lexis Nexis 2005 ed.) (citing Charles F. Wilkinson & Eric R. Biggs, *The Evolution of the Termination Policy*, 5 *Am. Ind. L. Rev.* 139, 151–154 (1977)). "Although the termination acts did not expressly extinguish the governmental authority of such [terminated] tribes, most were unable to exercise their governmental powers after losing their land base. Termination thus weakened the sovereignty of terminated tribes." *Id.* at § 1.06.

⁵COHEN'S HANDBOOK OF FEDERAL INDIAN LAW § 4.01[1][a] (Nell Jessup Newton, et al. eds. Lexis Nexis 2005 ed.).

⁶*Nanomantube v. Kickapoo Tribe in Kansas*, 631 F.3d 1150, 1151–52, 111 Fair Empl. Prac. Cas. (BNA) 610, 94 Empl. Prac. Dec. (CCH) P 44089 (10th Cir. 2011) (quoting *N.L.R.B. v. Pueblo of San Juan*, 276 F.3d 1186, 1192, 169 L.R.R.M. (BNA) 2129, 145 Lab. Cas. (CCH) P 11225, 146 Lab. Cas.

limited by federal law.⁷ This authority includes the ability to regulate through tribal environmental laws.⁸

Despite inherent tribal sovereignty, jurisdictional uncertainty sometimes arises in relation to a tribe's authority over the actions of non-members and non-Indians acting within the tribe's territory. In the civil context, this is because tribes have been divested of their inherent sovereignty over non-citizens on non-Indian land unless certain conditions exist.⁹ In *Montana v. United States*, the United States Supreme Court considered the extent of a tribe's inherent sovereignty over non-Indians.¹⁰ Ultimately, because of implicit divestiture of the Nation's inherent sovereignty,¹¹ the Court determined that the Crow Nation did not have authority to regulate the hunting and fishing of non-Indians owning fee land within the Crow Nation's reservation boundaries.¹² However, the Court acknowledged that, despite the implicit divestiture of tribal inherent sovereignty over non-Indians on fee land within reservation boundaries, tribes may regulate the activities of such individuals under two circumstances.

First, tribes may regulate the activities of individuals who have entered into "consensual relationships with the tribe or its members."¹³ Second, a tribe retains the "inherent power to exercise civil authority over the conduct of non-Indians on fee lands within its reservation when that conduct threatens or has some direct effect on the political integrity, the economic security, or the health or welfare of the tribe."¹⁴ These are known as the two "*Montana* exceptions."

Notably, the *Montana* decision involved the actions of non-Indians living on non-Indian owned land within the tribe's territory. It may therefore be argued that tribes have a greater interest in regulating the activities of non-members and non-Indians on tribally-controlled land within the tribe's territory. However, the U.S. Supreme Court's decision in *Nevada v. Hicks* casts a shadow on this assumption.¹⁵ In *Hicks*, the U.S. Supreme Court considered whether the Fallon Paiute-Shoshone Tribes had jurisdiction over Mr. Hicks' civil claim (based on tribal and federal law)

(CCH) P 10090 (10th Cir. 2002) (en banc)).

⁹*Id.* Tribes' criminal jurisdiction is generally limited to Indians. *Oliphant v. Suquamish Indian Tribe*, 435 U.S. 191, 98 S. Ct. 1011, 55 L. Ed. 2d 209 (1978).

¹⁰*Id.*

¹¹*Id.* See also Bruce Duthu, *Implicit Divestiture of Tribal Powers: Locating Legitimate Sources of Authority in Indian Country*, 19 AM. INDIAN. L. REV. 353 (1994). "According to this theory, courts can rule that, in addition to having lost certain aspects of their original sovereignty through the express language of treaties and acts of Congress, tribes also may have been divested of aspects of sovereignty by implication of their dependent status." Kevin Gover and James B. Cooney, *Cooperation Between Tribes and States in Protecting the Environment*, 10-WTR NAT. RESOURCES & ENV'T 35 (1996).

¹²*Montana v. U. S.*, 450 U.S. 544, 564–565, 101 S. Ct. 1245, 67 L. Ed. 2d 493 (1981) (holding that the "exercise of tribal power beyond what is necessary to protect tribal self-government or to control internal relations is inconsistent with the dependent status of the tribes, and so cannot survive without express congressional delegation"). Since *Montana*, the Supreme Court has also considered the ability of tribe to regulate the conduct of non-members and non-Indians on other types of lands. For example, in *Strate v. A-1 Contractors*, 520 U.S. 438, 117 S. Ct. 1404, 137 L. Ed. 2d 661 (1997), the Court held that the Indian tribe did not possess the inherent sovereignty to adjudicate a civil complaint arising from an accident between two non-Indians on a state highway within the tribe's reservation boundaries. The *Strate* Court explained that "[a]s to nonmembers, we hold, a tribe's adjudicative jurisdiction does not exceed its legislative jurisdiction." 520 U.S. at 453.

¹³*Id.* at 565.

¹⁵*Nevada v. Hicks*, 533 U.S. 353, 121 S. Ct. 2304, 150 L. Ed. 2d 398 (2001).

against Nevada game wardens, in their individual capacities.¹⁶ In concluding that the tribal court did not have jurisdiction to hear the tribal-law based claims, the U.S. Supreme Court found that the *Montana* exceptions did not apply.¹⁷ It may therefore be argued that the Court implicitly suggested in *Hicks* that *Montana* applied to the actions of non-members and non-Indians within Indian country regardless of the status of land where the activity occurred.

In sum, because of their inherent sovereignty, tribes generally have regulatory authority over their citizens within their physical territory. Tribes generally lack jurisdiction over non-Indians acting on non-Indian land within tribal territory,¹⁸ unless one of the two *Montana* exceptions applies. Tribes may have regulatory authority in such circumstances if: 1) the non-Indians in question have consented to tribal jurisdiction; or 2) the non-Indian conduct “threatens or has some direct effect on the political integrity, the economic security or the health or welfare of the tribe.”¹⁹ Through delegated authority, such as the treatment as a state (TAS) provisions of many federal environmental statutes, tribes may have jurisdictional authority over non-Indians.

§ 24:39 Climate change and Indian country

A. Climate change impacts in Indian country

Climate change is a global environmental problem, and yet, the adverse impacts of climate change are disproportionately felt in tribal communities. There are currently 574 federally recognized American Indian tribes and Alaska Native villages. American Indian reservation and trust lands comprise 56 million acres and are located across 35 states.¹ Under the Alaska Native Claims Settlement Act, another 44 million acres was transferred to Alaska Natives Corporations.² While each tribe is unique and independent, many tribes share a common history of colonization and a connection to the land—legally and culturally. As discussed above, the majority of tribal nations were removed from their traditional homelands and placed on reservations. Many of the legal rights tribes possess today are tied to the reservations where they were relocated. Beyond these legal considerations, many tribes have a strong spiritual and cultural connection to their land and the environment. They view the Earth as a living being to be cared for and respected. Their culture and traditions are often connected to the larger environment and tied to certain environmental occurrences. Consequently, “[a]s climate change threatens to dramatically change the environment, culture and tradition that is tied to environmental occurrences is threatened.”³

From diminishing sea ice and flooding to loss of forest resources from insect damage, the impacts of climate change have been particularly apparent for Indigenous people in northern Canada and Alaska. Over the past century, salmon popula-

¹⁶*Id.*

¹⁷533 U.S. at 355-369, 374-375.

¹⁸Although *Montana* involved the activities of non-Indians on non-Indian fee land, suggesting that the status of the land plays a role in the determination of jurisdiction, *Nevada v. Hicks* muddies the analysis of tribal jurisdiction. This is because the *Hicks* Court applied the *Montana* exceptions to a situation where the alleged wrongful activity occurred on property owned by a tribal member.

tions—an important traditional food source for Pacific Northwest tribes—have declined due to dams, loss of habitat, pollution and other factors. Climate change impacts have further stressed salmon populations through the rise in ocean water temperatures and streamflow pattern changes. In the Southwest, climate change is threatening already scarce water resources. All of these impacts raise questions about the future availability of resources and continued viability of Indigenous people and their traditional way of life.⁴ Due to climate-related disasters, such as coastal flooding or land erosion, tribal communities in Alaska, the Southeast, and the Pacific Northwest will have to decide whether to relocate, away from tribal lands that have become inhabitable.⁵

B. Tribal responses to climate change

Having examined the ability of tribes to enact environmental law by virtue of their inherent tribal sovereignty as well as the impacts of climate change in Indian country, this section identifies examples where a tribe has in fact enacted laws related to the environment by virtue of its inherent sovereignty. The U.S. has yet to enact a pervasive regulatory scheme designed to cope with the effects of climate change, although, as discussed elsewhere in this chapter, there are certainly federal programs and laws that may be helpful in addressing climate change.⁶ Similar to other sovereign entities located in the United States,⁷ tribes too have enacted laws targeting climate change. Given that the federal government has yet to legislate pervasively in this area, the tribes' legal actions related to climate change are enacted under tribal inherent sovereignty and not a delegation of federal authority.

As the original stewards of this land, tribes have been responding to historical extremes in the Americas for years. This expertise, also known as Traditional Ecological Knowledge (TEK) or indigenous knowledge (IK), has been integrated into tribal responses to climate change. Put another way, "Indigenous peoples . . . 'interpret and react to climate change impacts in creative ways, drawing on traditional knowledge as well as new technologies to find solutions, which may help society at large to cope with impending changes.'"⁸ TEK "can play a role in advancing understanding of climate change and in developing more comprehensive climate adaptation studies, in part because they focus on understanding relationships of interdependency and involve multigenerational knowledge of ecosystem phenology (the study of cyclic and seasonal natural phenomena) and ecological shifts."⁹ Case study examples of tribal adaptation and mitigation strategies exercised by tribes through their inherent sovereignty and employing TEK are discussed below.

⁹National Climate Assessment.

¹⁰Portions of this section of the chapter were taken from Elizabeth Ann Kronk Warner, *Indigenous*

As discussed in §§ 24:14 to 24:32 of this chapter,¹¹ adaption plans play an important role in responding to climate change. This section describes the climate change adaptation plans of four Native communities (Confederated Salish and Kootenai Tribes, Jamestown S’Klallam Tribe, Swinomish Indian Tribal Community, and the Nome Eskimo Community) and then identifies trends that may be emerging in tribal adaptation plans based on the descriptions below.

Confederated Salish and Kootenai Tribes¹²

The Confederated Salish and Kootenai Tribes (CSKT), located within Montana, have adopted an adaptation plan titled the “Climate Change Strategic Plan.”¹³ On November 29, 2012, the CSKT adopted Resolution No. 13-52, acknowledging the impact of climate change on the Tribes’ reservation, the Flathead Reservation, and declaring the “intent and commitment” of the Tribes to address the effects of climate change on the Reservation.¹⁴ “The Northwest has already observed climate changes including an average increase in temperature of 1.5°F over the past century. . . . Locally, all models predict warmer temperatures, lower snowpack, and more frequent and severe droughts and floods.”¹⁵ For the Tribes, the changes in water and its impact on the fisheries that the Tribes rely on are some of the most important effects of climate change.¹⁶ Although each of the Tribes located on the Flathead Reservation—including Salish, Pend d’Oreilles, Kalispel, and Spokane Indians—is culturally distinct, they all share a strong knowledge of the natural environment and respect for all creation.¹⁷

Adaptation in the Face of Climate Change, 31 *Journal of Environmental and Sustainability Law* 129 (2015).

¹¹See *infra* §§ 24:14 to 24:32.

¹²The discussion of the Confederated Salish and Kootenai Tribes Climate Change Strategic Plan is largely taken from Elizabeth Ann Kronk Warner, *Tribes as Innovative Environmental “Laboratories,”* 86 *Colorado Law Review* 790 (2015).

¹³Confederated Salish and Kootenai Tribes of the Flathead Reservation, *CLIMATE CHANGE STRATEGIC PLAN*, 3 (Sept. 2013), available at <https://www.cakex.org/documents/confederated-salish-and-kootenai-tribes-climate-change-strategic-plan> (“The Confederated Salish and Kootenai Tribes (CSKT) include the Salish, Kootenai, and Pend d’Oreilles Tribes. As the first to organize a tribal government under the Indian Reorganization Act of 1934, the Tribes are governed by a tribal council. The Tribal Council has ten members. The council elects from within a Chairman, Vice Chairman, Secretary, and Treasurer. The Tribal Council represents the Arlee, Dixon, Elmo, Hot Springs, Pablo, Polson, Ronan, and St. Ignatius districts in Montana. CSKT employs nearly 1,400 people. As of 2012, there were about 7,900 enrolled tribal members. Approximately 5,300 tribal members live on the Flathead Reservation and 2,600 tribal members live off the Reservation. The 2010 population of the Reservation was 28,324, an eight percent increase over the 2000 census, but non-Indians outnumbered Indians by two-to-one.”).

¹⁴*Id.* at i.

¹⁵*Id.* at 2.

¹⁶*Id.* at 22-23 (“All models predict warmer temperatures, lower snowpack, more frequent and severe droughts and floods.”). Anticipated climatic impacts also include increased storm events, decreased snow pack, changes in hydrology, changes in the forest and vegetation, increased wildlife, decreased air quality, and changes to wildlife in addition to impacts on fish. *Id.* at 24-26.

¹⁷*Id.* at 6.

Through Resolution No. 13-52, the CSKT Tribal Council called on the Tribes “[t]o develop appropriate policies and strategies for addressing effects and projected impact of climate change on the Tribe and the Reservation” and “[t]o develop potential programmatic and/or regulatory actions and changes consistent with said policies[.]”¹⁸ Notably, the Resolution called for the incorporation of TEK into the Climate Change Strategic Plan and also recognized that climate change may result in cultural impacts, as well as negative social, environmental, and economic consequences. The focus on culture in the Strategic Plan is consistent with the Tribes’ overall use of cultural considerations for natural resources in land use planning. The Strategic Plan later explains that TEK is uniquely related to cultural resources and that both must be protected. In fact, the Strategic Plan places a special emphasis on the importance of protecting tribal culture and TEK, in addition to providing excerpts of tribal elder observations related to climate change.

As a result of Resolution No. 13-52, the Tribes eventually adopted their Climate Change Strategic Plan in September 2013. The Tribes’ Strategic Plan aligns with local regional, state, and city efforts to address the impacts of climate change. The Plan includes a discussion of the characteristics and history of the Tribes, the climate impacts, the planning focus, vulnerability and risk assessment, goals and actions, and an implementation plan. The Strategic Plan focuses on nine sectors that may be affected by climate change: forestry, land, fish, wildlife, water, air, infrastructure, people, and culture. The Plan also provides priority levels for each of the areas examined, and the Tribes rated the priority for culture as high. In relation to the high priority placed on culture, the Strategic Plan concludes that, “[p]rotecting land-based cultural resources is essential if the Tribes are to sustain Tribal cultures.”¹⁹

Ultimately, the Tribes’ Strategic Plan develops goals and actions related to each of the nine sectors considered.²⁰ Where possible, the Tribes incorporate TEK into their goals and actions. For example, the forestry goals include developing a greenhouse to grow native and cultural plant species.²¹ Similarly, the land goals include engaging in practices to promote the growth of native plants.²² In terms of obtaining the cultural goals, the Tribes task the Tribal Council and CSKT Elders Advisory Council, who possess TEK, with this responsibility.²³

In the Executive Summary of the Strategic Plan, the Tribes acknowledged that the Plan is an “early step” in the Tribes’ efforts to combat the impacts of climate change and much future work will be required.²⁴ Having taken the initial step of developing the Strategic Plan, the Tribes established several steps of an implementation plan to effectuate the Strategic Plan.²⁵

Jamestown S’Klallam Tribe

¹⁸*Id.* at ii, 6, 22-23.

¹⁹*Id.* at 18.

²⁰*Id.* at 54-66.

²¹*Id.* at 54.

²²*Id.* at 57.

²³*Id.* at 66.

²⁴*Id.* at 1.

²⁵*Id.* at 67.

The Jamestown S’Klallam Tribe (JSK) and its ancestors have occupied the Olympic Peninsula of Washington State for centuries.²⁶ Over the last two centuries, “the Jamestown S’Klallam people have successfully navigated a variety of societal changes, all while maintaining a connection to the resource-rich ecosystems of the region.”²⁷ The Tribe is now facing another change because of the impacts of climate change, but “[c]hanging climate and its associated impacts are not entirely new to the Tribe, which has successfully adapted to past climate variations.”²⁸ In light of the negative impacts of climate change on the JSK tribal community, the Tribe engaged in adaptation planning “[t]o protect and preserve culturally important resources and assets; ensure continued economic growth; and promote long-term community vitality[.]”²⁹

The JSK Adaptation Plan begins with a discussion of the Tribe and resilience, then explains the impacts of climate change on the Tribe, and concludes by discussing the three key areas of concern: Group 1 (very high priority areas of concern); Group 2 (high priority areas of concern); and Group 3 (medium priority areas of concern). The Tribe identifies several impacts of climate change that are threatening its homeland’s eco-system. These impacts include: increasing temperatures; changing precipitation patterns; sea level rise and coastal flooding; ocean acidification and temperature increases; forest habitat changes; and negative impacts to human health, such as shifting tribal demographics, storm events, and air pollution. Furthermore, in relation to human health, the JSK Adaptation Plan concludes that “[p]opulation-wide changes to tribally valued plants and animals have the potential to disrupt cultural, spiritual, socioeconomic, and nutritional health.”³⁰

²⁶Jamestown S’Klallam Tribe, CLIMATE CHANGE VULNERABILITY ASSESSMENT AND ADAPTATION PLAN 7 (S. Petersen & J. Bell eds., 2013), *available at* <https://www.adaptationclearinghouse.org/resources/jamestown-s-eyklallam-tribe-climate-vulnerability-assessment-and-adaptation-plan.html>.

²⁷*Id.* Later in the JSK Adaptation Plan, the Tribe goes on to explain that “[t]he Tribe has been responding and adapting to a changing climate for thousands of years. Preparing for continued and accelerated change is not something new, but a continuation of the holistic natural resource and culturally driven approach that has kept the Jamestown S’Klallam Tribe a vibrant and growing community.” *Id.* at 52.

²⁸*Id.* at 7.

²⁹*Id.*

³⁰*Id.* at 24.

The Tribe also established vulnerability rankings in its Adaptation Plan, which factored in exposure, sensitivity, and adaptive capacity.³¹ The vulnerability rankings correspond to the overall group ranking. According to the Tribe, “*Climate exposure* is the extent and magnitude of a climate or weather event. *Sensitivity* is the degree to which that area of concern is susceptible to a climate impact. *Adaptive capacity* is [sic] the ability of the area of concern to adjust to or respond to the changing conditions.”³² Once the vulnerability rankings were assessed, the vulnerabilities were ranked so that the Tribe could prioritize based on its limited resources.³³ Following this ranking, the Group 1 vulnerabilities included: salmon, clams and oysters, shellfish biotoxins, wildfire, and cedar harvests.³⁴ Most of the Group 1 vulnerabilities ranked particularly high in cultural importance.³⁵ Group 2 vulnerabilities included: casino and longhouse market, transportation Highway 101, and the Blyn tribal campus water supply.³⁶ And, finally, vulnerabilities in Group 3 were: Jamestown Beach water supply, NR Lab & Planning Department buildings, and the Blyn tribal campus wastewater tanks.³⁷

Because the climate change-related stressors negatively impacting salmon are not limited to tribal territory, the JSK Adaptation Plan calls on the Tribe to coordinate with the federal government, state government, private industry, and private landowners to try to increase the resiliency of salmon.³⁸

As with the CSKT adaptation plan and as demonstrated by the foregoing discussion, JSK references “culture” as a reason adaptation planning is important. Specifically, the Tribe explains that a “persisting idea of an ecosystem-wide homeland” is culturally essential to the JSK community,³⁹ and, therefore, the ecosystem-wide homeland must be protected as much as possible from the impacts of climate change.

In addition to considering cultural impacts, the JSK Adaptation Plan also acknowledges the importance of TEK. In evaluating the extent of the impacts of climate change on the tribal community, the JSK Adaptation Plan explains that “[t]he scenarios created for this project are meant to assist in adaptation planning and should be combined with local knowledge, such as patterns of flooding and existing storm impacts, in order to identify areas or infrastructure at most risk from sea level rise.”⁴⁰

Swinomish Indian Tribal Community

⁴⁰*Id.* at 17.

The Swinomish Indian Tribal Community is located within the state of Washington, and approximately 3,000 people live on the Reservation.⁴¹ The Tribe adopted the Swinomish Climate Change Initiative Climate Adaptation Action Plan (Swinomish Adaptation Plan). The Swinomish Adaptation Plan was the culmination of a study initiated by the 2007 Proclamation, although the Tribe acknowledges that the Plan is a first step.⁴²

The Plan defines “Adaptation (climate change)” as “[a]ctions to respond to and/or counter the effects of climate change; relocation and armoring are examples of adaptation actions.”⁴³ The Plan points out that the Tribe has a proven record of adaptation. As M. Brian Cladoosby, Chairman of the Swinomish Indian Senate, explained, “our community and culture have also proven their ability to endure and survive many times before. . . . If adaptation is to be our future, we at Swinomish have already proved ourselves equal to the challenge.”⁴⁴

The Swinomish Adaptation Plan is organized based on five categories, with related climate change impacts and action items identified within each of these categories. The first four categories are Coastal Resources, Upland Resources, Physical Health, and Community Infrastructure and Services.⁴⁵ “A fifth overarching category, Cultural Traditions and Community Health, has threads to all categories, given the ties and significant [sic] of cultural and community health to a great number of issues, and as such is the subject of special focus.”⁴⁶ Accordingly, the Swinomish Adaptation Plan specifically considers the impacts of climate change on culture.

The Plan explains that the Swinomish Indian Reservation brought together several Coast Salish groups, with the Treaty of Point Elliot in 1855, “who shared a culture centered on fishing, and a ceremonial calendar revolving around cedar houses.”⁴⁷ The Plan further recognizes that “[t]raditional foods such as salmon and seafood are ‘cultural keystone’ aquatic species to the Tribe; much more than food sources, these foods are a vital contribution to the cultural, spiritual, and social life of tribal members.”⁴⁸ The loss of these cultural resources can have profound effects on the tribal community because “[l]oss of a traditional food is directly related to loss of morale, and cultural health and well-being.”⁴⁹

The Swinomish Adaptation Plan explains that acknowledging the connection between culture and the health of the community is important because “the projected impacts [of climate change] are expected to affect long-standing traditions of tribal members, including shellfish harvesting, salmon fishing, hunting, gathering of native plants, and use of cedar and other species.”⁵⁰

⁵⁰*Id.*

Like other plans discussed above, the Swinomish Adaptation Plan specifically calls for the incorporation of TEK, in order to find solutions to the impacts of climate change on the Tribe's culture. The Plan explains that TEK can be helpful in addressing the impacts of climate change because "Indigenous knowledge offers valuable insights and tools to respond to challenges such as climate change and to find solutions."⁵¹

Furthermore, the Plan explains that tribal self-determination is linked to the community's health and tribal culture. The Plan asserts that the tribal community should be able to determine what lifestyle leads to good health and that development and restoration should be community driven.⁵² The Swinomish Adaptation Plan goes on to state that "[s]elf determination is a key health indicator that incorporates healing, restoration, and development, all enacted by and at a community/local level. Self-determination means the freedom to decide how to create and sustain 'good health.' . . . Self-determination is the ability to exercise sovereign rights."⁵³

In addition to the broad focus on culture, the Swinomish Adaptation Plan also looks more narrowly at cultural resilience. The Plan explains that "[r]esilience is important because certain impacts of climate change may lead to *grief* and *despair*, e.g. from decline in shellfish, salmon, land animals such as elk, the loss of traditional gathering and hunting places, and impacts to traditional plants."⁵⁴ The Plan, therefore, considers how tribal culture may increase resiliency to climate change. For example, one idea to increase resiliency through traditional tribal culture is the creation of a repository of indigenous plants, which would become a place for traditional teaching and healing.⁵⁵

Similarly, Chapter 4 of the Swinomish Adaptation Plan concludes with suggestions of how to adapt to climate change and preserve tribal culture at the same time generally. To accomplish this, the Plan recommends integrating indigenous knowledge into ongoing planning and programs and also exploring treaty implications of adaptation planning.⁵⁶

Following its in-depth discussion of the impacts of climate change on tribal culture, the Swinomish Adaptation Plan then goes on to summarize the impacts of climate change on the remaining four identified categories. In terms of its Coastal Resources, climate change has impacted the tribal resource because of “[i]nundation from sea level rise and storm surge; includes impacts on shoreline areas, structures, habitat, and natural resources within those areas,”⁵⁷ and, “[d]ecreased habitat viability due to changing water quality parameters.”⁵⁸ For its Upland Resources, the Tribe anticipates increased wildfire risk as a result of climate change.⁵⁹ In terms of the physical health of its citizens, the Tribe anticipates heat-related illnesses, increased incidence of respiratory disease, and toxic seafood contamination.⁶⁰ In terms of the Tribe’s Community Infrastructure and Services, the Tribe anticipates that climate change will lead to: “[i]nundation of low-lying roads and bridge approaches,” “[r]oad closure from storm/tidal surge event and/or wildfire,” “[r]educed potable water supplies due to decreased sources,” “[c]ontamination of drinking water supplies from flooding,” and “[s]ervice disruption of communication and energy systems.”⁶¹

In creating the Plan, the Tribe worked directly with its community to hear the community’s concerns and suggestions. Interviews with tribal community members identified tribal strengths that can be built upon to increase the community’s resiliency. Consistent with this focus on the tribal community, evaluation of potential adaptation methods includes conformity with community goals. Ultimately, the Plan focuses an entire chapter, Chapter 9, on community participation, acknowledging that “[a]n essential ongoing component of any climate change project is communicating the issues to the affected community and involving the community in responses to identified issues.”⁶²

*Nome Eskimo Community*⁶³

⁶²*Id.* at 81.

⁶³This is only one example from Alaska. Because many Alaska Natives are particularly hard hit by the negative impacts of climate change, many Alaska Native communities have been actively engaged in climate change adaptation planning. To access information on other Alaska Native climate change adaptation plans and assessments, see Tribal Climate Change Assessments and Adaptation Plans, available at: http://www7.nau.edu/itep/main/tcc/docs/resources/TribalCCAssessmentsAdaptationPlans_updated%20March%202020.pdf.

Climate change adaptation planning is not limited to tribes. Other Native organizations, such as the Nome Eskimo Community (NEC), a tribe in Alaska, have also engaged in tribal adaptation planning. The NEC represents the Alaska Native population in Nome, Alaska, which is located in northwest Alaska on the southern coast of the Seward Peninsula. The NEC includes Alaska Native representation incorporating Central Yupik, Iñupiaq, and St. Lawrence Island Yupik. Given the increasing negative impacts of climate change on Nome and the Alaska Native populations found there,⁶⁴ the NEC and the Alaska Center for Climate Assessment & Policy came together to draft the Nome Tribal Climate Adaptation Plan (September 2017).⁶⁵

As an initial starting point, the Plan participants developed community values to guide their work on climate change adaptation strategies. These values included “maintaining cultural activities, fostering community and relationships, and ensuring healthy people and ecosystems.”⁶⁶ With these values in place, the Plan participants discussed changes to their community as a result of climate change and their primary related concerns to these changes.

Ultimately, the Plan participants developed eight initiatives with specific actions attached to address the negative impacts of climate change. These eight initiatives included: “Adapt food preservation techniques for changing weather and climate conditions; Promote the use of traditional food preservation techniques that are less energy intensive; Reconnect families to subsistence activities; Increase awareness of near-term climate and related environmental conditions; Increase tribal representation in subsistence management; Protect tribal cemeteries from erosion; Support research and monitoring; and Build capacity for addressing concerns about increased shipping.”⁶⁷

These initiatives were developed incorporating three core themes: “supporting opportunities to share traditional knowledge and engage youth and Elders; using local materials, labor, and expertise, whenever possible; and learning from Elders and other communities.”⁶⁸ This incorporation of traditional knowledge is consistent with many other tribal adaptation plans discussed above. Additionally, at an early stage of the Plan development, community members were interviewed to ascertain how climate change was impacting their communities.

D. Trends in tribal climate change adaptation planning

Examination of the tribal adaptation plans discussed above illuminates several potential emerging trends in tribal adaptation planning. All of the tribal adaptation plans either explicitly or implicitly discussed the importance of tribal culture and the impacts of climate change on tribal culture and traditions. Given the intimate connection between culture and health and wellness, preservation of tribal culture is important for the well-being of tribal communities. Most of the tribal adaptation plans considered: 1) the necessity of coordination with local governments and com-

⁶⁴Some of the impacts that the Alaska Natives reported experiencing were: temperature increases, permafrost thaw, sea ice forming later and melting earlier and, as a result, the increased presence of vessel activity in the Bering Strait (concerns were related to increased risk of oil spills/environmental pollution and the impacts of tourism), stronger storms that lead to erosion, changes in precipitation, the drying up and disappearance of tundra lakes and ponds, as well as numerous other impacts.

⁶⁸*Id.* at 23.

munity;⁶⁹ 2) traditional knowledge or TEK;⁷⁰ and 3) resiliency.⁷¹

Tribal incorporation of traditional knowledge or TEK into their adaptation plans may provide the detailed environmental information and flexibility in governance necessary to ensure effective adaptive management. It is interesting to note that the majority of the tribes and Native communities studied are focusing on increasing their community resiliency rather than merely surviving the impacts of climate change. A number of plans discussed species migration and other disturbances to traditional food sources.⁷² As traditional foods no longer become accessible due to habitat alterations, tribes may increasingly be forced to identify other species to rely on.

Finally, several of the adaptation plans incorporated interviews with tribal community members and discussed the importance of tribal sovereignty or self-determination. The CSKT, Swinomish, and NEC incorporated interviews with community members into their tribal adaptation plans. Such incorporation parallels the call for TEK and recognizing the unique connection many tribal members have with their environment, as discussed above. The CSKT and Swinomish adaptation plans also mention the importance of tribal sovereignty and self-determination.⁷³

E. Tribal mitigation efforts

Whether incorporated into a broader tribal adaptation plan or on its own, mitigation strategies are another way that tribes have been confronting the disproportionate impacts of climate change on their communities. Recognizing the connection between adaptation and mitigation—adaptation efforts may become more difficult or costly if mitigation actions are not taken—many tribes are adopting more proactive mitigation responses.⁷⁴ This section identifies various policies implemented by tribes to slow the rate of climate change and reduce related impacts.

F. Renewable energy development

Many tribal lands have abundant renewable energy resources. Within the contiguous 48 states, tribal lands comprise approximately 5.8% of the total U.S. land base, yet represent an estimated 6.5% of the total U.S. utility-scale renewable energy technical potential.⁷⁵ Several tribes have viewed climate change as an opportunity to add renewable energy development to their economic portfolio. Renewable energy

⁶⁹The CSKT, JSK and NPT adaptation plans all referenced coordination with local governments in their adaptation plans, as discussed above.

⁷⁰The CSKT, JSK and Swinomish adaptation plans all reference TEK, as discussed above.

⁷¹The JSK, NPT and Swinomish adaptation plans all reference resiliency, as discussed above.

⁷²See, e.g., 1854 Treaty Authority, *1854 Ceded Territory Climate Change Vulnerability Assessment and Adaptation Plan*, 101 (2016), <https://www.1854treatyauthority.org/environment/climate-change.html> (plan evolved from a collaboration between the 1854 Treaty Authority, Bois Forte Band of Chippewa, Fond du Lac Band of Lake Superior Chippewa, and Grand Portage Band of Lake Superior Chippewa) (“Changing temperature and precipitation patterns along with the associated ecosystem shifts will also lead to species migration, the loss of certain species as they are outcompeted by other species, and the arrival of new species within the 1854 Ceded Territory and on reservations. The decline or loss of certain species, such as moose that provide a significant source of sustenance for band members, will likely mean a decline in traditional hunting. This could lead to increased economic and social problems associated with loss of cultural and traditional livelihoods and the loss of cultural identity”).

⁷³It is important to note that many tribal adaptation plans developed by consultants ultimately fail to be implemented. Ristorph, E.B. 2018. “Improving the Quality of Alaska Native Village Climate Change Planning.” *Journal of Geography and Regional Planning* 11(10):143-155.

⁷⁴U.S. Climate Resilience Toolkit, Mitigation, <https://toolkit.climate.gov/topics/tribal-nations/mitigation>.

development can provide revenue to the tribe and employment to the community. In comparison to traditional fossil fuel development, renewable energy development can also be implemented more in accordance with Indigenous values.

In 1994, tribes from the northern Great Plains joined together to form the Intertribal Council on Utility Policy (Intertribal COUP). Looking to meet growing energy demands in a sustainable way, Intertribal COUP turned toward renewable energy development. Since its formation, Intertribal COUP has been leading the effort to reduce greenhouse gas (GHG) emissions through tribal wind power development. Tribally led renewable energy projects allow the tribe to ensure that development occurs in a way that does not result in other community harms. The Rosebud Sioux Tribe, a member of COUP, established a tribally owned, utility-scale wind energy generation facility. When deciding where to site its wind turbine, the Rosebud Sioux Tribe conducted studies to minimize the impacts on areas of cultural significance, as well as on the environment generally.⁷⁶ The same consideration of cultural values has not always been taken by the federal government and renewable energy projects on public lands.⁷⁷

More recently, the federal government established programs to assist tribes in developing renewable energy projects. The Energy Policy Act of 2005, Pub. L. No. 109-48, directly addressed energy development in Indian country and established an Office of Indian Energy Policy and Programs within the U.S. Department of Energy (DOE). The Act further authorized grants, loan guarantees, and technical assistance to tribes. For 2021, the Office announced up to \$15 million in new funding to deploy energy technology on tribal lands.⁷⁸ Aside from the DOE, other federal agency programs are also available to provide technical assistance and funding. For example, the Internal Revenue Service (IRS) provides clean renewable energy bonds to governmental bodies, including tribes, to finance the cost of a qualified renewable energy facility.⁷⁹ Additionally, the National Renewable Energy Laboratory's State, Local, and Tribal program is available to provide tribes with technology and market analytics, direct technical assistance, capacity building, and resilience assessment and planning for energy technology delivery.⁸⁰

G. Carbon sequestration

Some tribes, such as the Nez Perce Tribe in Idaho, are involved in the carbon credit market and have dedicated tracts of tribal land for biological carbon sequestration. In the 1990s, the Nez Perce Forestry & Fire Management Division developed a carbon offset strategy to market carbon sequestration credits. The Tribe reinvested revenue from the sale of carbon to acquire previously forested lands (often former tribal lands lost through allotment) and then replicate the process with additional afforestation projects.⁸¹ The Tribe's first afforestation project, known as the Tramway Project, helped the Tribe establish marketable carbon offsets,

⁷⁶The Effects of Climate Change, *supra* note § 24:39.

⁷⁷*See, e.g.*, Miriam Raftery, East County Magazine, Wind Storm: Tribes implore President Obama to stop Ocotillo Express Wind Project, save cultural resource sites (Mar. 23, 2012), available at: <https://www.eastcountymagazine.org/wind-storm-tribes-implore-president-obama-stop-ocotillo-express-wind-project-save-cultural-resource>; Quechan Tribe of Ft. Yuma Indian Reservation v. U.S. Dept. of the Interior, 927 F. Supp. 2d 921, 934 (S.D. Cal. 2013), *aff'd*, 673 Fed. Appx. 709 (9th Cir. 2016) (finding that the federal government had complied with applicable law in approving the wind power project and dismissing the tribe's challenge).

⁷⁸Current Funding Opportunities, Office of Indian Energy Programs, Department of Energy, <http://www.energy.gov/indianenergy/funding/current-funding-opportunities>.

⁷⁹<https://www.irs.gov/pub/irs-drop/n-15-12.pdf>.

⁸⁰<https://www.nrel.gov/state-local-tribal/decision-support-tribes.html>.

⁸¹When tribes purchase land, they initially hold that land in fee. In order for the land to become part of Indian country, the federal government must take the land into trust on behalf of the tribe. The

understand potential carbon markets, and cover the costs of project implementation. The Nez Perce Tribe contracted with the Montana Carbon Offset Coalition, now known as the National Carbon Offset Coalition, and the Chicago Climate Exchange.⁸²

As part of the DOE's Regional Carbon Sequestration Partnership Initiative Grant, the Nez Perce Tribe has been involved in increasing awareness and educating other tribes regarding carbon sales and opportunities for carbon sequestration projects in Indian country. Initially, learning the process required to engage in carbon offset markets can require significant investment by tribes, both in terms of time and commitment. Additionally, the lack of federal legislation on climate change has reduced the current value of carbon, which could impact the willingness of tribes to invest in carbon offset projects.⁸³ However, carbon sequestration is consistent with the balanced approach many tribes take to land-management and can provide another revenue stream while preserving cultural resources. Such efforts can be part of a tribe's broader goal to reclaim ancestral territory previously lost during the Allotment or Termination Eras.

In 2013, California launched its cap-and-trade program, creating another opportunity for tribes to participate in the carbon credit industry. However, in order to participate, tribes must agree to a 100-year commitment and limited waiver of their sovereign immunity. Not surprisingly, many tribes may be concerned that such requirements may restrict their ability to meet the changing needs of their communities in the future and be hesitant to grant a limited waiver of the tribe's sovereign immunity for a century. Currently, 11 tribes have received approval to participate in the California program.⁸⁴

H. Prescribed burning

The practice of prescribed burning further illustrates the overlap between adaptation and mitigation strategies. Creating warmer and drier conditions, climate change has been a key factor in increasing the risk and extent of wildfires in the United States.⁸⁵ Aside from generally mitigating the risks of wildfire, prescribed burns can also be part of a climate change response. Prescribed burns release less carbon dioxide than wildfires. Whereas wildfires often consume large trees that store significant amounts of carbon, prescribed fires are designed to burn underbrush and small trees that store less carbon.⁸⁶ A reduction in high severity fires through prescribed burning could result in a reduction in forest emissions.

Historically, state and federal approaches to wildfire management were synonymous with wildfire suppression. Indeed, the U.S. Forest Service (USFS) prevented publication of studies that indicated fire suppression was detrimental. However, after increasing dialogue about the deleterious effects of wildfire exclusion on the ecosystem as a whole, the USFS officially recognized fire as a management policy in

Department of Interior oversees this process and follows the land acquisition process set forth in 25 U.S.C. § 151. Notably, the Bureau of Indian Affairs—the federal agency responsible for protecting and improving the trust assets of tribes—has yet to implement a formal policy regarding trust lands and carbon sequestration projects.

⁸²Tribal Climate Change Project Profile, Nez Perce Tribe, Carbon Sequestration Program, https://c-pb-us-e1.wpmucdn.com/blogs.uoregon.edu/dist/c/389/files/2010/11/tribes_NezPerce_web5.pdf.

⁸³*Id.*

⁸⁵Center for Climate and Energy Solutions, Wildfires and Climate Change, available at <https://www.c2es.org/content/wildfires-and-climate-change/>.

⁸⁶Christine Wiedinmyer & Matthew Hurteau, Prescribed Fire As a Means of Reducing Forest Carbon Emissions in the Western United States, 44 Environ. Sci. Technol. 1926 (2010).

1978.⁸⁷ While prescribed burning has become more widely used across the United States, fire has long been used by the Karuk Tribe as part of its TEK to achieve ecological balance and restore landscape resilience. The Karuk's proactive use of fire has protected their lands within the Klamath River basin by reducing the availability of forest fuels and therefore the risk of large-scale wildfires. Traditional fire use is a primary tool in the Karuk's wildland management and protection of cultural resources. According to the U.S. Climate Resilience Toolkit, "[f]ire is important for restoring grasslands for elk, managing for food sources such as tan and black acorns, maintaining quality basketry materials, and producing smoke that can shade the river for fish."⁸⁸

Also located along the Klamath River, the Yurok Tribe has sought to restore cultural burning practices on its ancestral lands. The Cultural Fire Management Council (CFMC), a Yurok community-based nonprofit organization, has played an active role in this effort and works in partnership with the federal government, states, and tribes (including the Karuk Tribe), and other nonprofit organizations.

The Indigenous Peoples Burning Network (IPBN) was formed in 2015, which includes tribes in California, New Mexico, Minnesota, and Oregon. One of the ultimate goals of IPBN is to support tribes to reclaim their fire culture through self-determination.⁸⁹

Overall, prescribed burns have been widely advocated as an effective practice for reducing fuels and wildfire hazards while restoring ecological function to fire-adapted ecosystems.⁹⁰ However, recent studies indicate that climate change will reduce prescribed burning opportunities in certain parts of the United States. To be safe and effective, prescribed burns require alignment of certain conditions—time, resources, fire specialists, and suitable weather conditions—known as a burn window. Climate change is projected to reduce the number of days with a burn window and make it more difficult to predict good burning days in general.⁹¹ As a result, adaptive management will be necessary if prescribed burns are to continue being used as a mitigation strategy into the future.

§ 24:40 Conclusion

Climate change impacts on tribes must be viewed in the context of the historical relationship that tribes have with the federal government through treaties and federal policies; as well as the cultural relationship that tribes have with the environment. As sovereigns, tribes have the authority to respond to climate change. Several tribes have already taken the initiative to do so through adaptation measures and mitigation strategies. Tribal adaptation plans frequently incorporate:

1) the necessity of coordination with local governments and community; 2) traditional knowledge; and 3) resiliency. Although adaptation plans often include mitigation efforts, tribes may also enact mitigation strategies on their own. Such efforts have included renewable energy development, carbon sequestration, and prescribed burning. Overall, tribal responses to climate change are an exercise of tribal sovereignty and can serve as an example to other sovereigns.

X. CLIMATE-RELATED FINANCIAL DISCLOSURE AND RISK MANAGEMENT

§ 24:41 Introduction

The private sector has dramatically improved its understanding of how efforts to transition to a lower carbon economy and the physical consequences of a changing climate will impact the economy as well as the role that industry plays in mitigating and adapting to climate change. The financial sector, in particular, has recently recognized the importance of understanding and accounting for such risks in investment, lending, and other financial decision-making. This recognition has moved the discussion of climate change disclosure and risk management from impact investors and socially responsible investing efforts to mainstream players concerned about how climate change will affect markets and the economy as a whole.

However, financial regulators in the United States have not been of one mind as to how to address these issues. Different federal agencies are taking distinct approaches, ranging from complete inaction, to research and consideration of recognized climate risks, and even actively erecting barriers against incorporating climate change concerns into decision-making. As of the time of this writing less than a month after the inauguration of President Biden, the potential for change is great. President Biden has committed to taking bold actions on climate change, including in the financial sector and on corporate disclosure requirements, and began acting on these commitments as soon as he took office. With new leadership in the federal government, significant shifts are underway in the regulatory direction.

This section discusses recent U.S. regulatory activity, the evolving law around climate-related disclosures, and how the U.S. approach contrasts with efforts elsewhere around the world.

§ 24:42 Changing expectations around corporate disclosures and financial risks of climate change

Climate change can pose significant risks to individual companies. Shareholders, asset managers, and financial institutions increasingly view information about such risks as critical to their investment and lending decision-making. Their use of this information in turn influences corporate disclosure practices. Many companies are improving their consideration of climate change risks in their internal risk management programs. Banks, investment firms, insurance companies, and the like are coming to terms with their own exposure to climate-related risks. As discussed later in this section, changing expectations for and uses of climate-related risk information over time shifts the legal standards for mandatory disclosures by public companies. In this way, the rapid expansion of voluntary disclosures of climate-related information is also leading to changes in required disclosures.

The formation of the Financial Stability Board's Task Force on Climate-Related Disclosure (TCFD) in 2015 galvanized efforts already underway to improve

disclosure of climate change-related risks and opportunities.¹ The TCFD released recommendations in 2017,² which have since served as a unifying framework that has informed voluntary and regulatory disclosure efforts around the world. Asset managers, pension funds, sovereign wealth funds, and other stakeholders have continued to engage companies on expanding their climate-related disclosures, often through consolidated efforts by groups such as Climate Action 100+, Ceres, UN PRI, and WBCSD. The TCFD's framework for improving climate-related reporting encouraged companies to incorporate as much information as possible into their mandatory disclosures and provided recommendations for how to approach disclosures on governance, strategy, risk management, and metrics and targets (including scenario analysis). It focuses on reporting information considered material by the jurisdictions in which the company reports.

Numerous organizations have emerged to provide guidance on climate-related corporate disclosures and do not limit their guidance to how to comply with mandatory reporting requirements. Different voluntary reporting frameworks and guidance documents were designed to achieve disparate goals and respond to the interests of a varied group of stakeholders. These tools are not limited to helping companies discern what information a company must disclose by law.³ Some of these organizations also encourage companies to report a broader array of information than that envisioned by the TCFD—including reporting information that may not be financially material or information that covers topics beyond the climate-specific focus of the TCFD. The proliferation of voluntary reporting frameworks can create confusion in the absence of corresponding guidance from regulators to help companies navigate the various approaches to evaluating and disclosing climate-related risks and opportunities. Adding to this challenge, a number of ratings organizations and investor advisory firms have begun to incorporate climate change

[Section 24:42]

¹The Financial Stability Board is an international body established in 2009 by the G20 to promote international financial stability. It monitors and makes recommendations about the global financial system, influencing financial regulation around the world. More information is available at www.fsb.org. The Task Force on Climate-related Financial Disclosures (TCFD) was created to improve and increase reporting of climate-related financial information. Learn more at <https://www.fsb-tcfd.org/>.

²Task Force on Climate-related Financial Disclosures (TCFD), *Recommendations of the Task Force on Climate-related Financial Disclosures* (June 15, 2017), available at <https://assets.bbhub.io/company/sites/60/2020/10/FINAL-2017-TCFD-Report-11052018.pdf>; see also, TCFD, *2020 Status Report* (October 2020), available at <https://www.fsb.org/2020/10/2020-status-report-task-force-on-climate-related-financial-disclosures/>.

³Some of the most well-known organizations with their own reporting frameworks or guidance include: CDP, <https://www.cdp.net/en>; Global Reporting Initiative, <https://www.globalreporting.org/>; Integrated Reporting, <https://integratedreporting.org/>; The Climate Registry, <https://www.theclimateregistry.org/>; The Sustainable Accounting Standards Board (SASB), <https://www.sasb.org/>; Principles for Responsible Investment (UN PRI), <https://www.unpri.org/climate-change/climate-related-disclosure-/3971.article>; Climate Disclosure Standards Board (CDSB), <https://www.cdsb.net/>; World Business Council for Sustainable Development (WBCSD), <https://www.wbcsd.org/>; among others. Although most, if not all, of these organizations predate the TCFD creation, the TCFD has become the overarching framework to which these groups point to. Some encourage companies to disclose much more than would be required to fulfill the needs of the investment community, also encouraging disclosures deemed important to other stakeholders. SASB aligns its guidance with U.S. securities law, designing its industry-specific disclosure recommendations around what could be material under U.S. securities law. For this reason, SASB has emerged as a preferred methodology for some asset managers and owners, such as BlackRock. In addition, Ceres has been a significant advocate for climate-related disclosures, launching some of the reporting initiatives already mentioned, advocating for better practices in the corporate world, and highlighting the need for analysis of the systemic risks of climate change in our financial system. See more about their work at <https://www.ceres.org/our-work/disclosure>.

consideration into their work.⁴

That said, two trends help cut through the confusion.

First, the voluntary reporting organizations have begun to align their work and, in some cases, consolidate. Many of the voluntary reporting and standards organizations have committed to aligning their guidance with the TCFD framework. SASB and others have also developed industry-specific guidance on disclosing procedures that helps companies more concretely address questions of when risks related to the transition to a low carbon economy (often referred to as “transition risks”—these include risks that arise from new regulation designed to mitigate climate and usher in a lower carbon economy) and the physical risks of climate change (floods, fires, increasingly intense storms, drought, heat, etc.) are financially material to their particular company. These more detailed efforts provide additional guidance for how companies can report in a manner that is in line with the TCFD recommendations.

Second, some of these organizations have committed to better explaining how their reporting frameworks or guidance documents fit together with that of the other organizations and, in some cases, consolidating efforts to lessen the confusion among users as to how their reporting guidance and ratings intersect.⁵ As voluntary reporting becomes more detailed and qualitative—and as investors and financial entities use that information in new ways—it shifts the range of what may need to be disclosed to the SEC as well.

§ 24:43 Federal securities law, climate risk disclosure, and investment practices

Publicly traded companies must share information about their finances and business with investors and the public under U.S. securities law, which imposes liability

⁴For example, S&P Global Ratings launched an ESG Evaluation program and ESG Risk Atlas that included climate change risks in April 2019; Moody’s acquired climate data and risk analysis company, Four Twenty Seven, Inc., in July 2019; and MSCI acquired a data analytics company that conducts climate change scenario analysis for investors called Carbon Delta in September 2019 and launched a new ESG tool in November 2019. for misleading investors in these disclosures.¹ The Securities Act of 1933 (The Securities Act) and the Securities Exchange Act of 1934 (The Exchange Act) form the core legal regime. The Sarbanes–Oxley Act of 2002 and the Dodd–Frank Act of 2010 added modifications that affect corporate governance and disclosure requirements.² The U.S. Securities and Exchange Commissions (SEC) promulgates reporting requirements through which these companies provide the information required.³

However, U.S. companies have, to date, shared most climate-related information in voluntary reports rather than in SEC filings, with only limited discussions of climate-related risks contained in reports to the SEC. What information public companies must report to the SEC is limited by the concept of materiality, with some exceptions. Companies primarily need to report only information that is financially material to the company, or whose omission would make other reported information materially misleading (discussed in more detail below).

A. Relevant SEC disclosure requirements

The SEC, in exercising its regulatory, oversight, and enforcement powers, requires public companies to file, among other requirements:

1. Registration statements and prospectuses for all securities sold in the U.S. (with some exemptions);⁴
2. Annual and other periodic reports (for those with certain levels of assets and numbers of owners); and
3. Materials provided to shareholders ahead of votes, such as the annual proxy materials.⁵

False or misleading statements or omissions can lead to enforcement by the SEC or private actions filed by shareholders.

SEC Regulation S-K outlines the primary disclosure requirements imposed on public companies (a.k.a. “filers”).⁶ The specific disclosure items most relevant to environmental and climate-related information include: Item 101 Business Description, Item 103 Disclosure of Legal Proceedings, Item 105 Risk Factors, and Item 303 Management Discussion and Analysis (MD&A).⁷

⁶Regulation S-K, 17 C.F.R. § 229, https://www.ecfr.gov/cgi-bin/text-idx?tpl=/ecfrbrowse/Title17/17cfr229_main_02.tpl.

⁷Of note, the 2020 updates to the items 101, 103, and 105 are reflected in these descriptions. SEC, Final Rule, “Modernization of Regulation S-K Items 101, 103, and 105,” 85 Fed. Reg. 63726 (Oct. 8, 2020).

Environmental and Climate-Related Information Required Under SEC Disclosure Regulations	
Item 101⁸ <u>Business Description—complying with environmental regulation</u>	Requires companies to describe the business. Significantly, disclosure must describe “the material effects” of complying with regulations, “including [what effects] environmental regulations, may have upon the capital expenditures, earnings and competitive position of the registrant.” Filers must disclose “estimated capital expenditures for environmental control facilities for the current fiscal year and any other material subsequent period.”
Item 103⁹ <u>Disclosure of Legal Proceedings</u>	Requires companies to disclose “material pending legal proceedings, other than ordinary routine litigation incidental to the business.” Environmental litigation is not considered excludable as “routine.” ¹⁰ Environmental proceedings considered material to the business—and whose alleged damages exceed 10% of current assets—must be disclosed. Litigation that involves a government authority as a party and could result in sanctions of \$300,000 or more should be disclosed. ¹¹ However, the company may also choose a different threshold for a material proceeding that is in excess of \$300,000 but less than \$1 million. ¹²
Item 105¹³ <u>Risk Factors</u>	Requires companies to discuss “the material factors that make an investment in the registrant or offering speculative or risky.” This is an area where companies often discuss potential new environmental regulation that could impact the business.
Item 303¹⁴ <u>Management Discussion and Analysis (MD&A)</u>	Requires filers to describe “known trends or uncertainties that have had or that the registrant reasonably expects will have a material favorable or unfavorable impact on net sales or revenues or income from continuing operations” and “events that will cause a material change in the relationship between costs and revenues.” These include “material events and uncertainties known to management that would cause reported financial information not to be necessarily indicative of future operating results or of future financial condition.” Examples include matters that would impact future but have not impacted past operations, or ones that have impacted the past but are not expected to impact future operations.

SEC rules also require companies to disclose additional material information not specifically requested in the line-item disclosures if it is “necessary to make the required statements, in the light of the circumstances under which they are made, not misleading.”¹⁵ Rule 12b-20 has a similar requirement.¹⁶ Rule 10b-5 extends liability for misstatements made outside of SEC filings, such as in voluntary sustainability or climate reports.¹⁷

In response to the line-item reporting requirements described above, companies may need to discuss plans for responding to climate-related impacts on their industry, demand for their product and its potential to dramatically change, specific climate-related law changes, or significant climate litigation that could materially affect their business, among other topics. Companies may also need to review their voluntary disclosures, to ensure those reports are consistent with the information reported to the SEC, and that any omissions of information in a company’s manda-

¹¹This amount was increased from \$100,000 in the 2020 rule revision. Modernization of Regulation S-K, 85 Fed. Reg. 63726 (Oct. 8, 2020).

¹²Also a consequence of the 2020 rule revision.

¹³17 C.F.R. § 229.105.

¹⁴17 C.F.R. § 229.303.

¹⁵17 C.F.R. § 230.408.

¹⁶17 C.F.R. § 240.20b-20 (“In addition to the information expressly required to be included in a statement or report, there shall be added such further material information, if any, as may be necessary to make the required statements, in the light of the circumstances under which they are made not misleading.”).

¹⁷17 C.F.R. § 240.10b-5 (making it unlawful to defraud or make an untrue statement or material fact or omit a material fact necessary for the statements made, in light of the circumstances, to not be misleading).

tory reporting could not potentially result in misleading investors. Under the current reporting framework, what a company must report remains largely based on what it finds material to its financial status and is particular to the circumstances of that individual business. Beyond the line items enumerated above that could encompass some climate-related information, there are not yet requirements to disclose specific climate-related information in SEC reporting.

B. SEC action on climate change

1. 2010 climate guidance

The SEC issued guidance, in 2010, on how existing reporting requirements could require disclosure of climate-related information.¹⁸ The SEC emphasized that a much broader range of information should be considered when making that materiality determination than that which is ultimately disclosed as financially material to the company.¹⁹ The guidance noted four types of information likely to trigger disclosure:

1. The impacts of legislation and regulation;
2. International accords;
3. Indirect consequences of regulation or business trends; and
4. The physical impacts of climate change.

Although the 2010 guidance listed ways that climate change can impact businesses, it did not provide any specific guidance on how a company should approach determining materiality of climate-related information.

The SEC failed to follow the 2010 guidance with substantive enforcement efforts, issuing only a handful of letters requesting additional information from issuers.²⁰ Reviews of corporate disclosures in subsequent years revealed little significant change;²¹ climate-related disclosures issued by publicly-held companies varied in format and specificity and often relied on boilerplate language.²² Without a robust enforcement initiative following the guidance, the Commission potentially missed an opportunity to better define disclosure practices for climate change-related information.

2. 2016 Concept release

The SEC again opened a door to new guidance, or even regulation, on climate-

¹⁸Commission Guidance Regarding Disclosure Related to Climate Change, 75 Fed. Reg. 6290, 6295 (Feb. 8, 2010).

¹⁹The SEC emphasized that “registrants are expected to consider all relevant information even if that information is not required to be disclosed.” For example, in disclosing “known trends, events . . . [or] uncertainties” in Item 303 (MD&A disclosure), companies should remember that “[w]hile these materiality determinations may limit what is actually disclosed, they should not limit the information that management considers in making its determinations.”

²⁰SEC staff issued a handful of comment letters to companies about their climate change disclosure decisions (25 letters to 23 companies from 2010 to 2013 out of more than 45,000 comment letters and 14 letters to 14 companies out of over 41,000 letters issued from 2014 to 2017). As of 2012, SEC staff had noticed little change in climate-related disclosures as a result of the 2010 guidance. U.S. Gov’t Accountability Off., GAO-18-188, *SEC Has Taken Steps to Clarify Disclosure Requirements* at 14-15 (2018) (describing the letters issued after the 2010 guidance and noting that, in the 2012 report to the Senate Committee on Appropriations examining climate-related disclosures after the 2010 guidance, the SEC found no notable changes).

²¹Jim Coburn & Jackie Cook, Ceres, Cool Response: The SEC & Corporate Climate Change Reporting 4 (2014), https://www.ceres.org/sites/default/files/reports/2017-03/Ceres_SECguidance-append_020414_web.pdf (reviewing disclosures and finding little discussion of specific material information or quantification of climate impacts in the first few years after the 2010 guidance was issued).

²²U.S. Gov’t Accountability Off., GAO-18-188, *SEC Has Taken Steps to Clarify Disclosure Requirements* at 18-20 (2018).

related and Environmental, Social, and Corporate Governance (ESG)²³ issues in a 2016 concept release. In a section covering public policy and sustainability matters the SEC sought comment on whether additional disclosure requirements or guidance specific to ESG and climate-related information were needed to inform investment and voting decisions, and whether to create new line-item reporting requirements on these topics.²⁴

The Concept Release recognized the potential for a shift in what corporate boards of directors should consider when making materiality determinations as investor expectations change.²⁵ The SEC finalized updates to items 101, 103, and 105 (described above) in October 2020. However, the regulatory body did not move forward with new actions on climate change information like those contemplated in the Concept Release and related public comments.²⁶

3. Recent SEC discussion of climate-related disclosures

The Commission's advisory committees are slowly arriving at the conclusion that the SEC must consider additional guidance or disclosure requirements on climate-related information. In May 2020, the Investor-As-Owner Subcommittee of the SEC's Investor Advisory Committee recommended the Commission update reporting requirements to include "material, decision-useful ESG factors" and specifically referenced climate-related information.²⁷ The SEC's Asset Management Advisory Committee has since created a subcommittee to consider ESG issues—including climate—and released an update on its progress in September 2020.²⁸

SEC leadership as of the end of 2020 has been reticent to move forward with new guidance or regulations on climate change-related disclosures. The three Republican commissioners openly expressed concern about trying to incorporate environmental, social, and governance (ESG) issues into the mandatory disclosure regime, viewing these issues as "amorphous" and lacking in consensus definitions.²⁹ Indeed, in a 2020 rulemaking, SEC revised Rule 14a-8 in a manner that could hinder efforts to

²³ESG refers to a broad range of issues from climate change and environmental compliance to racial equity, board diversity, and how a company supports its employees, among others. The term is not synonymous with sustainable or impact investing. Consideration of ESG issues can inform sustainable investment strategies or be used to screen certain types of stocks for impact investing purposes, but it can also be integrated into an investment strategy for a more complete picture of current and future financial performance to inform a more traditional investing approach. For an overview of what the term encompasses, see Pippa Stevens, "Your complete guide to investing with a conscience, a \$30 trillion market just getting started," CNBC (Dec. 14, 2019), <https://www.cnbc.com/2019/12/14/your-complete-guide-to-socially-responsible-investing.html>. ²⁹COMMISSIONER HESTER PIERCE, *Scarlet Letters: Remarks before the American Enterprise Institute* (June 18, 2019) ("While ESG advocates can point to studies that certain ESG policies serve companies well, the amorphous nature of such policies makes it hard to generalize. In any case, the research, even on discrete points, is mixed. Other research has highlighted the cost of ESG investment strategies.

push companies to address climate-related risks. The revised Rule imposes obstacles on shareholder efforts to include proposals in company proxy statements. This is important because it historically has been a process used to push companies to take action on climate change, or at least to disclose more information about their approach to the crisis.³⁰

In contrast, the two Democratic commissioners have supported SEC action on climate change. Commissioner Allison Lee, a Democrat, has noted that the broad, principles-based “materiality” standard has not produced sufficient disclosures to ensure companies are divulging comparable and reliable information to investors.³¹ Commissioner Lee has highlighted the importance of better climate-related disclosures in avoiding panicked sell-offs, stating: “[W]e must price climate risk accurately and drive investment toward an orderly, sustainable transition to green portfolios—rather than panicked scrambles and stock sell-offs as we see more and more climate disasters.”³² SEC’s newest commissioner,³³ Democratic Commissioner Caroline Crenshaw, joined Commissioner Lee in criticizing a recent Regulation S-K modernization rule in part because it “fails completely to address climate risk, similar to other recent modernization rulemakings that have failed to deal adequately with this and other critical factors that impact an issuer’s long-term sustainability, such as human capital management.”³⁴ The two commissioners argue the SEC should “address climate, human capital, and other ESG risks, in a comprehensive fashion with new rulemaking specific to these topics,” and propose creating “an internal task force and ESG Advisory Committee that is dedicated to building upon the recommendations of leading organizations, such as the Task Force on Climate-Related Financial Disclosures, and defining a clear plan to address sustainable investing.”³⁵

President Biden’s campaign platform included a commitment to “[r]equiring public companies to disclose climate risks and the greenhouse gas emissions in their

The ambiguity of ESG makes research inherently difficult.”); COMMISSIONER ELAD L. ROISMAN, *Keynote Speech at the Society for Corporate Governance* (July 7, 2020) (“In my experience, there is not consensus on what, exactly, ‘ESG’ means. I often wondered how the three concepts of environmental, social, and governance matters got lumped together.”); Chris Flood, *SEC chair warns of risk tied to ESG ratings*, FINANCIAL TIMES (May 28, 2020) (“Jay Clayton, chairman of the Securities and Exchange Commission, said any analysis that combined separate environmental, social and governance metrics into a single ESG rating would be ‘imprecise.’”) available at <https://www.ft.com/content/2c662135-4fd3-4c1b-9597-2c6f8f17faed>.

³⁵*Id.*

operations and supply chains.”³⁶ The President does not have direct control over the SEC’s regulatory direction, but he will change the makeup and leadership of the commission. SEC Chairman Clayton stepped down at the end of 2020, as is customary when there is a change in administration.³⁷ President Biden has nominated former Commodity Futures Trading Commission (CFTC) chairman Richard Gensler to serve as SEC chairman. Commissioner Lee was named Acting Chair while Gensler awaits confirmation.³⁸ Policy direction is already shifting as a result of the change in leadership. Acting Chair Lee spoke on the importance of regulatory involvement on climate-related and ESG disclosures in early November 2020.³⁹ She has also created a new position in her office focused on climate change. The new Senior Policy Advisor for Climate and ESG, Satyam Khanna, “will advise the agency on environmental, social, and governance matters and advance related new initiatives across its offices and divisions.”⁴⁰ This is a strong indicator that there will be a renewed focus on the topic across the Commission’s divisions.

C. Climate-related Information’s Evolving Legal Materiality

The legal standard for corporate disclosure requirements in the U.S. centers on the term “material,” as reflected in the numerous times the term is used in applicable regulations and guidance materials, such as the aforementioned Regulation S-K. The U.S. Supreme Court defined “material” information as information a “reasonable investor” is “substantially likely” to view as “significantly altering the total mix of information” available.⁴¹ Given that the materiality standard, and thus the information a company must disclose, is partially defined by a reasonable investor’s views and actions, the information a publicly-traded company must include in its disclosures can change over time as investor expectations change, even absent new regulations.⁴²

Changing investment and disclosure practices with regard to climate-related information suggest such a transformation is in process. Indeed, a rapid increase in focus on climate change by shareholders and asset managers may already be changing the scope of what companies must disclose in their mandatory filings to the

⁴¹*TSC Industries, Inc. v. Northway, Inc.*, 426 U.S. 438, 96 S. Ct. 2126, 48 L. Ed. 2d 757, Fed. Sec. L. Rep. (CCH) P 95615 (1976). The SEC adjusted its definition to align with the Supreme Court in Rule 12b-2, which defines “material” as limiting the disclosure required to “those matters to which there is a substantial likelihood that a reasonable investor would attach importance in determining whether to buy or sell the securities registered.” 17 C.F.R. § 240.12b-2. *See also* Business and Financial Disclosure Required by Regulation S-K, Concept Release, 81 Fed. Reg. 23916, 23925 (Apr. 22, 2016) (explaining that SEC changed the definition of materiality used in Rule 12b-2 in 1982 to that adopted by the Supreme Court in *TSC Industries, Inc. v. Northway, Inc.*).

⁴²Hana Vizcarra, *The Reasonable Investor and Climate-Related Information: Changing Expectations for Financial Disclosures*, ENVIRONMENTAL LAW REPORTER, Vol. 50, Issue 2, 10106-10114 (2020).

SEC.

Institutional investors have moved, from voicing concern about climate-related risks and their interest in receiving more information from public companies, to actively incorporating such information into their investment practices. In addition to engaging companies on how to improve climate-related disclosures and strategies for responding to the impacts of climate change (engagement that accelerated after the TCFD issued its recommendations in 2017), asset managers have started to incorporate climate-related data into their internal analysis, including partnering with climate data firms to go beyond company-level information revealed in corporate financial disclosures.⁴³ They are also increasingly committing to voting against management, divesting,⁴⁴ or taking other actions if companies fail to take significant action to address climate change risks.⁴⁵

Absent new disclosure guidance or line-item requirements, courts may still expect to encounter cases about climate-related information in disclosures. Shareholders can bring a securities fraud suit under SEC rule 10b-5 (discussed above) based on a company's material misrepresentation or omission in disclosures. It is important to note that claimants must show that the company either intended to deceive, manipulate, or defraud, or had a reckless disregard for the truth.⁴⁶ State attorneys general can also pursue claims regarding misrepresentation and fraud based on state law.

In all of these cases, courts assess whether specific climate-related information is material to individual companies. As more of these cases arise, the likelihood that courts will find some climate-related information material for a particular company increases. Two court decisions have already acknowledged this potential, although the specific facts of their cases led them to find the disclosures at issue were not

⁴³*Id.* at 10109-10110 (describing increasing use of climate-related information by investors) and *supra* Sec. 24.X, notes 6 and 7.

⁴⁴Divestment, or eliminating investments in certain industries or companies from a portfolio, has long been a tactic of those seeking to take a stand on an issue and potentially drive change in the market (although the capacity for divestment to drive change is limited if it does not result in a net loss of capital for the industry or company). *See* Felix Mormann, "Why the divestment movement is missing the mark," *NATURE* (Nov. 2, 2020) (describing the limitations of the fossil fuel divestment movement), <https://www.nature.com/articles/s41558-020-00950-2>. Some institutional investors have determined that divesting their portfolios of fossil fuel stock is important for consistency with their climate-related goals. Schools, pension funds, and private investors have made such decisions. *See, e.g.*, Georgetown University, Press Release, "Fossil Fuels Divestment Continues Georgetown's Commitment to Sustainability," (Feb. 6, 2020) (announcing a new university policy on fossil fuel and impact investments that includes a commitment to divest the school of fossil fuel stock), <https://www.georgetown.edu/news/fossil-fuels-divestment-continues-georgetown-commitment-to-sustainability/>; Rockefeller Brothers Fund, "Fossil Fuel Divestment" (describing its efforts to divest from fossil fuels), <https://www.rbf.org/mission-aligned-investing/divestment>; Ann Bernard, "New York's \$226 Billion Pension Fund Is Dropping Fossil Fuel Stocks," (Dec. 9, 2020) (reporting on the New York state pension fund announcement that it plans to divest from fossil fuel stocks and other companies that contribute to climate change).

⁴⁵For example, BlackRock's 2021 stewardship expectations and voting guidelines specifically note that the asset manager will vote against boards that do not adequately disclose or plan for climate change. BlackRock, "Our 2021 Stewardship Expectations" (2020), <https://www.blackrock.com/corporate/literature/publication/our-2021-stewardship-expectations.pdf>. The California State Teachers Retirement System (Calstrs) is supporting an effort to elect independent board members to ExxonMobil's board and is planning to accelerate greening of its investments in light of the election of Biden. ⁴⁶*See* BG Litigation Recovery I, LLC v. Barrick Gold Corporation, 180 F. Supp. 3d 316, 322, Fed. Sec. L. Rep. (CCH) P 99072 (S.D. N.Y. 2016).

materially misleading.⁴⁷

The evolving materiality standard, and the potential for courts to assess the standard, may not lead to consistent, comparable disclosures across industries without more specific action from the SEC. Academics have proposed various approaches to revising SEC disclosure requirements to expand discussion of sustainability issues, including climate.⁴⁸ As previously mentioned, SEC Commissioners Lee and Crenshaw have suggested the SEC create an internal task force as well as an advisory committee on ESG disclosures; these bodies would review recommendations of outside organizations and subsequently develop a plan for SEC action. However, without additional guidance from the SEC, companies must navigate a variety of demands from investors and other stakeholders without a solid understanding of how regulators view these disclosure approaches.

D. State attorneys general and corporate disclosure

State attorneys general have a history of influencing corporate climate disclosures. For example, during the 2000s, the New York attorney general conducted investigations into the disclosures of power and coal producers. This pressured the SEC to issue its 2010 guidance and resulted in settlements requiring climate-specific disclosures from the targeted companies.⁴⁹

More recently, New York pursued ExxonMobil for securities fraud, ultimately losing in court.⁵⁰ In *New York v. Exxon Mobil Corp.*, the court considered whether ExxonMobil misled investors in disclosures about the potential impacts of future climate policies on product demand and examined how ExxonMobil incorporated this information into its project-level business planning. Plaintiffs failed to convince the court of the materiality of the company's statements and supposed omissions. The court found the plaintiffs' experts unpersuasive and found no evidence of impact on investors' analyses or decisions during the relevant timeframe. However, the court acknowledged that climate-related information *could* be material in certain circumstances under existing securities law standards. Massachusetts has also sued Exxon and its case includes a claim that the company misled investors, as well as allegations of misleading consumers.⁵¹

Other state cases have focused on consumer protection claims, reflecting differences in the underlying state law available to them and perceptions of the difficulty

⁴⁷See *Ramirez v. Exxon Mobil Corporation*, 334 F. Supp. 3d 832, Fed. Sec. L. Rep. (CCH) P 100241 (N.D. Tex. 2018) (denying a motion to dismiss in a shareholder suit against ExxonMobil but acknowledging that certain types of information related to climate change transition risks could be material to reasonable investors) and *New York v. Exxon Mobil Corp.*, 65 Misc. 3d 1233(A), 49 ELR 20199 (N.Y. Sup. Ct. 2019) (slip copy) (acknowledging the potential materiality of climate-related information but not finding the future cost estimates of an energy transition material to a reasonable investor's decisions made between 2013 and 2016).

⁴⁸Eccles and Youmans (2016) suggest requiring a statement of significant audiences and materiality to better define what environmental, social, and governance issues boards consider material and the specific stakeholders to which they relate. Fisch (2019) proposes creating a new "SD&A" (sustainability, disclosure, & analysis) section of SEC filings modeled after the MD&A, in which companies would identify and explain the three sustainability issues most significant to their operations. Esty and Karpilow (2019) suggest a three-tiered mandatory ESG reporting regime. These proposals would likely require additional SEC guidance on their applicability to climate-related topics should they be incorporated into SEC disclosure requirements.

⁵⁰*New York v. Exxon Mobil Corp.*, 65 Misc. 3d 1233(A), 49 ELR 20199 (N.Y. Sup. Ct. 2019) (slip copy).

⁵¹*Commonwealth of Massachusetts v. Exxon Mobil Corp.*, No. 19-3333 (Mass. Sup. Ct. Oct. 24, 2019).

in proving investors were misled by information in corporate disclosures or left out of those disclosures.⁵²

E. ESG and climate change considerations in ERISA plan investment decisions

Former President Trump issued a directive to the Department of Labor in 2019 to review data on Employee Retirement Income Security Act (ERISA) plans, identify trends in investments in the energy sector, and review guidance on fiduciary responsibilities.⁵³ Two rules finalized by the Employee Benefits Security Administration (EBSA)⁵⁴ towards the end of 2020 emphasize the limits of how ERISA plan fiduciaries can consider ESG topics, including climate, in their investment planning and in the exercise of their shareholder rights.

EBSA finalized a new rule on investment duties under ERISA in November 2020.⁵⁵ The rule cautioned against considering ESG factors in ERISA-covered plan investments, emphasizing financial outcomes over other considerations, and restricted fiduciaries from offering ESG-themed funds as default options. The regulation included requirements for potentially burdensome documentation of economic returns and risks to support investment choices.

Some observers have argued the new requirements would limit ERISA plan fiduciaries' voice in overseeing corporate decision-making around climate change preparedness and planning and other ESG topics. Professor and legal scholar Ann Lipton even argues the rule "may functionally disenfranchise ERISA fiduciaries."⁵⁶ EBSA, in the rulemaking documents, states that "plan assets may never be enlisted in pursuit of other social or environmental objectives at the expense of ERISA's fundamental purpose of providing secure and valuable retirement benefits." EBSA adds that "an ERISA fiduciary's evaluation of plan investments must be focused solely on economic considerations that have a material effect on the risk and return of an investment based on appropriate investment horizons, consistent with the plan's funding policy and investment policy objectives. The corollary principle is

⁵²See, e.g., *Minnesota v. American Petroleum Institute*, 62-CV-20-3837 (Minn. Dist. Ct. June 24, 2020) (alleging that API, ExxonMobil, and Koch Industries violated the Minnesota Consumer Fraud Act and asserting claims of strict and negligent liability for failure to warn as well as common law fraud and misrepresentation, deceptive trade practices, and violating the state's False Statement in Advertising Act.), <http://climatecasechart.com/case/state-v-american-petroleum-institute/>; *District of Columbia v. ExxonMobil*, 2020 CA 002892 B (D.C. Super. Ct. June 25, 2020) (asserting Consumer Protection Procedures Act violations, that oil and gas companies engaged in deceptive and unfair conduct and misled consumers), <http://climatecasechart.com/case/district-of-columbia-v-exxon-mobil-corp/>; *Connecticut v. ExxonMobil Corp.*, HHDCV206132568S (Conn. Super. Ct. Sept. 14, 2020) (alleging violations of the state's Unfair Trade Practices Act), <http://climatecasechart.com/case/state-v-exxon-mobil-corp/>; *Massachusetts v. ExxonMobil*, No. 19-3333 (Mass. Sup. Ct. Oct. 24, 2019) (including claims the company misled investors and that they misled consumers under the state's Consumer Protection Act).

⁵³Exec. Order No. 13868, *Promoting Energy Infrastructure and Economic Growth*, 84 Fed. Reg. 15495 (April 10, 2019), <https://www.govinfo.gov/content/pkg/FR-2019-04-15/pdf/2019-07656.pdf>.

⁵⁴EBSA is a sub-cabinet division of the Department of Labor that administers and enforces the fiduciary, reporting, and disclosure provisions of Title I of the Employee Retirement Income Security Act of 1974 (ERISA). EBSA's authority covers private retirement plans, some health plans, and welfare benefit plans. See *What We Do*, <https://www.dol.gov/agencies/ebsa/about-ebsa/about-us/what-we-do> and *History of EBSA and ERISA*, [https://www.dol.gov/agencies/ebsa/about-ebsa/about-us/history-of-ebsa-and-erisa#:~:text=The%20Employee%20Benefits%20Security%20Administration,Welfare%20Benefits%20Administration%20\(PWBA\)](https://www.dol.gov/agencies/ebsa/about-ebsa/about-us/history-of-ebsa-and-erisa#:~:text=The%20Employee%20Benefits%20Security%20Administration,Welfare%20Benefits%20Administration%20(PWBA)) (last visited Jan. 25, 2021).

⁵⁵Employee Benefits Security Administration, Department of Labor, *Final Rule - Financial Factors in Selecting Plan Investments*, 85 Fed. Reg. 72846 (Nov. 13, 2020), <https://www.federalregister.gov/documents/2020/11/13/2020-24515/financial-factors-in-selecting-plan-investments>.

⁵⁶Ann Lipton, *I Just Read the Department of Labor's New ERISA Voting Proposals and Boy Are My Fingers Tired (from typing)*, Business Law Prof Blog, https://lawprofessors.typepad.com/business_law/2020/09/i-just-read-the-department-of-labors-new-erisa-voting-proposals-and-boy-are-my-fingers-tired-from-ty.html.

that ERISA fiduciaries must never sacrifice investment returns, take on additional investment risk, or pay higher fees to promote non-pecuniary benefits or goals.”⁵⁷ Nevertheless, EBSA did recognize that ESG factors can represent material financial risk or opportunity.⁵⁸

EBSA also finalized a rule in December 2020 on an EBSA fiduciary’s duties for proxy voting and exercising shareholder rights.⁵⁹ The regulation clarifies that plan fiduciaries are not required to vote all proxies, but emphasizes that votes they do make should be based on pecuniary factors.⁶⁰ The rule lists specific principles a plan fiduciary must consider when deciding whether to exercise shareholder rights, including not using plan assets to further “policy-related or political issues, including ESG issues.”⁶¹

President Biden signed Executive Order 13990 on his first day in office, which directs all agencies to review regulations promulgated during the Trump administration that may be inconsistent with the new administration’s climate policies.⁶² EBSA’s 2020 rulemakings are expected to be part of this review and potentially revised as a result of it.

§ 24:44 U.S. climate-related financial risk management

Other financial regulators are considering how climate change poses systemic risks to the financial system and what steps to take to address these risks. Federal regulators have not yet imposed climate-specific mandatory disclosure requirements, nor have they started down the path of requiring climate-related stress testing for banks as other countries have begun to implement. However, climate change is a topic of study that could result in U.S. regulators taking similar action.

A. *Commodity Futures Trading Commission (CFTC) Climate-Related Risk Report*

The Commodity Futures Trading Commission (CFTC) was created in 1974 to regulate the U.S. derivatives markets.¹ The CFTC’s Market Risk Advisory Committee (MRAC) commissioned a report on climate-related systemic risk that was

⁵⁷85 Fed. Reg. 72846, 72848.

⁵⁸“The final rule recognizes that there are instances where one or more environmental, social, or governance factors will present an economic business risk or opportunity that corporate officers, directors, and qualified investment professionals would appropriately treat as material economic considerations under generally accepted investment theories. For example, a company’s improper disposal of hazardous waste would likely implicate business risks and opportunities, litigation exposure, and regulatory obligations. Dysfunctional corporate governance can likewise present pecuniary risk that a qualified investment professional would appropriately consider on a fact-specific basis.” Id.

⁵⁹EBSA, Final Rule, “Fiduciary Duties Regarding Proxy Voting and Shareholder Rights,” 85 Fed. Reg. 81658.

⁶⁰Id. at 81663 (“The final rule carries forward from the proposal a provision that requires plan fiduciaries, when deciding whether to exercise shareholder rights and when exercising such rights, including the voting of proxies, to carry out their duties prudently and solely in the interests of the plan participants and beneficiaries and for the exclusive purpose of providing benefits to participants and beneficiaries and defraying the reasonable expenses of administering the plan.”).

⁶¹Id. at 81665.

⁶²Exec. Order No. 13990, Protecting Public Health and the Environment and Restoring Science To Tackle the Climate Crisis, 86 Fed. Reg. 7037 (Jan. 20, 2021), <https://www.federalregister.gov/documents/2021/01/25/2021-01765/protecting-public-health-and-the-environment-and-restoring-science-to-tackle-the-climate-crisis>.

[Section 24:44]

¹The Commodity Futures Trading Commission Act created the CFTC in 1974. See more about its history at <https://www.cftc.gov/About/AboutTheCommission>.

released in September 2020.² The subcommittee responsible, the Climate-Related Market Risk Subcommittee, was given a broad mandate: to evaluate climate-related risk across the U.S. financial system and markets, and not just limited to the jurisdiction of the CFTC.

The report identifies and examines climate-related risks and provides specific recommendations for addressing them. These recommendations range from establishing an economy-wide price on carbon to incorporating climate-related risks within the monitoring and oversight functions of federal financial regulatory agencies.³ The report advises that the Financial Stability Oversight Council (FSOC)⁴ research the financial implications of climate-related risks, including sub-systemic shocks to markets, and that the CFTC investigate how such risks impact markets and market participants under its oversight. The report further recommends that U.S. regulators join international groups established specifically to address these risks, and that financial supervisors require financial firms address climate-related risks through their risk management frameworks and pilot climate risk stress testing. The report calls upon state insurance regulators to require insurers to assess, address, and disclose climate risks in their underwriting activity and investment portfolios, and focuses on how financial regulators can help improve disclosure and standardize classification systems.

Notably, the report calls on the SEC to clarify the definition of materiality for disclosing medium- and long-term climate risks both quantitatively and qualitatively, and advises the SEC to update its 2010 climate risk guidance. The report further recommends that regulators review and clarify the law on using climate-related factors in investment decisions for retirement and pension plans under the ERISA and non-ERISA fiduciary duties and encourages a rethinking of rules recently issued by EBSA, described above. A number of the Climate-Related Market Risk Subcommittee's suggestions are already being acted on.⁵

B. Federal Reserve is researching climate-related risk to the financial system

The Federal Reserve has actively engaged on the issue of how climate change could impact the health of the U.S. financial system.⁶ This is illustrated in a number

²Managing Climate Risk in the U.S. Financial System, Report of the Climate-Related Market Risk Subcommittee, Market Risk Advisory Committee of the U.S. Commodity Futures Trading Commission (Sept. 2020), available at <https://www.cftc.gov/sites/default/files/2020-09/9-9-20%20Report%20of%20the%20Subcommittee%20on%20Climate-Related%20Market%20Risk%20-%20Managing%20Climate%20Risk%20in%20the%20U.S.%20Financial%20System%20for%20posting.pdf> (last visited Jan. 25, 2021).

³*Id.*

⁴The FSOC was created by the Dodd-Frank Wall Street Reform and Consumer Protection Act in 2010 to monitor the stability of the financial system. Chaired by the Secretary of Treasury, it comprises the various agency financial regulators and responsible for identifying risks and responding to emerging threats to financial stability. The FSOC has supervisory authorities over certain nonbank financial firms. Learn more at U.S. DEPT. OF THE TREASURY, *About FSOC*, <https://home.treasury.gov/policy-issues/financial-markets-financial-institutions-and-fiscal-service/fsoc/about-fsoc> (last visited Jan. 19, 2021).

⁵For example, as is noted in the next section, the Federal Reserve has since joined the Network of Central Banks and Supervisors for Greening the Financial System and is actively researching climate-related systemic risks. The Biden administration is also expected to act on considering new SEC guidelines or regulations around climate-related disclosures and may reconsider the EBSA rulemaking.

⁶The Federal Reserve System is the U.S.'s central bank that manages the nation's monetary policy, promotes stability of the financial system and safety and soundness of financial institutions, fosters payment and settlement system safety and efficiency, and promotes consumer protection. BOARD OF GOVERNOR OF THE FEDERAL RESERVE SYSTEM, *About the Fed*, <https://www.federalreserve.gov/aboutthefed.htm> (last visited Jan. 19, 2021). The Federal Reserve System was created in 1913 by the Federal Reserve Act and is composed of the Board of Governors and twelve regional banks. *Id.* At Federal

of recent actions by this body.

Federal Reserve Chair Jerome Powell stated, in January 2020, that the Fed has a role to play “to ensure that the financial system is resilient and robust against the risks of climate change” and is working to understand how to do so.⁷ In November 2020, the Federal Reserve included climate change in its Financial Stability Report for the first time.⁸ On December 15, 2020, the Federal Reserve Board formally joined the Network of Central Banks and Supervisors for Greening the Financial System (NGFS),⁹ a network of central banks and supervisory authorities formed in 2017 to share practices on climate-related financial risk management.¹⁰ In January 2021, the Fed announced a new Supervision Climate Committee to be led by Kevin Stiroh, mentioned below and a senior official who has worked closely on climate change and financial risk.¹¹

The Federal Reserve Banks, part of the Federal Reserve System, are also taking action. The Federal Reserve Bank of San Francisco, for example, hosted a conference on climate change in 2019, publishing a series of papers,¹² and its October 2019 issue of Community Development Innovation Review was titled “Strategies to Address Climate Change Risk in Low- and Moderate-income Communities.”¹³ Most recently, the Federal Reserve Bank of San Francisco released a new report on climate change as a financial risk that describes “how uncertainty about the magnitude, scope, and timing of the economic damages from climate change translates into financial risk, which can adversely affect financial markets, asset classes, and institutions as well as the income and balance sheets of businesses, households, and governments.”¹⁴ Furthermore, the now former executive vice president of the Federal Reserve Bank of New York, Kevin Stiroh (mentioned above), regularly speaks about climate change and financial risk. For example, in 2020 he delivered remarks on climate change and risk management in bank supervision at an event at Harvard Business School.¹⁵ Stiroh is also the co-chair of the Basel Committee on Banking Supervision’s high level Task Force on Climate-related Financial

Risks (TCFR), established in February 2020 with the goal of developing a supervisory practices to mitigate climate-related risks.¹⁶

The Federal Reserve Board acts independently of the White House but works closely with the Treasury Department to manage the U.S. economy. In his January 27 Executive Order on Tackling the Climate Crisis at Home and Abroad, President Biden instructed the Treasury Secretary to participate in international fora working on managing climate-related risks.¹⁷ Biden's Secretary of the Treasury, Janet Yellen, has committed to creating a high level climate team within the department to work on these issues.¹⁸ This could provide additional support for the Federal Reserve's efforts to engage on climate-related risk in international bodies as well as tackle the challenges presented in the U.S. financial system.

C. Federal Office of the Comptroller of the Currency's Proposed Restrictions of Bank Lending Policies Related to Climate Change

Lenders are making commitments and changing their policies in ways that place pressure on companies that rely on such lenders for financing. These banks are committing to disclosing climate-related risks in their assets and to making estimates of the environmental and climate impacts of their lending practices. The largest banks have made commitments not to finance certain types of projects that exacerbate GHG emissions—such as oil and gas exploration in the Arctic National Wildlife Refuge, coal projects, and tar sands development.¹⁹ For example, Goldman Sachs Group Inc., JP Morgan Chase & Co., Wells Fargo & Co., Citigroup, Morgan Stanley, and, most recently, Bank of America, have all stated that they will not

British banks NatWest Group PLC (the former RBS Group PLC) and Barclays PLC have both committed to using their business to further the Paris agreement, the 2015 deal that called on global governments to curb rising temperatures. Citigroup Inc. earlier this year said it would walk away from clients that aren't taking climate change seriously.”); Christopher Flavelle, *Global Financial Giants Swear Off Funding an Especially Dirty Fuel*, THE NEW YORK TIMES (Feb. 12, 2020), <https://www.nytimes.com/2020/02/12/climate/blackrock-oil-sands-alberta-financing.html>; Tsevetana Paraskova, *Deutsche Bank Immediately Ends Funding For Oil Sands And Arctic Oil Projects*, OILPRICE.COM (July 27, 2020), <https://oilprice.com/Latest-Energy-News/World-News/Deutsche-Bank-Immediately-Ends-Funding-For-Oil-Sands-And-Arctic-Oil-Projects.html>; Lananh Nguyen, *BofA Says It Won't Finance Oil and Gas Exploration in the Arctic*, BLOOMBERG (Nov. 30, 2020), https://www.bloomberglaw.com/product/blaw/document/QKMMNJT1UM0W?criteria_id=85a1d6e099f94377191fb0a56233eddb.

finance oil and gas projects in the Arctic National Wildlife Refuge coastal plain.²⁰

Morgan Stanley and Bank of America have committed to disclosing the climate change impacts of their financing through the Partnership for Carbon Accounting Financials (PCAF), which released the “Global GHG Accounting and Reporting Standard for the Financial Industry” in November 2020.²¹ JP Morgan recently announced it will establish emission targets for its financing portfolio and become carbon neutral in its operations in 2020.²² The bank will advocate for the federal government to establish a price on carbon and will engage its corporate clients on climate-related strategies and carbon disclosures, in addition to tracking their carbon intensity. Adding to the divestment pressures, the Rockefeller family, which owes its fortune to the John D. Rockefeller’s Standard Oil Co., has committed to pressuring banks to stop investing in fossil fuels, creating the organization BankFWD to engage on the topic.²³

Partly in response to these commitments, the Office of the Comptroller of the Currency (OCC)²⁴ finalized a new rule designed to prevent banks from refusing to finance categories of projects or companies, requiring them to undergo individual risk assessments to support their decision to deny services to any particular potential customer. The rule, which applies to banks with more than \$100 billion in assets, was proposed in November 2020 and finalized in the last week of the Trump presidency, ten days after the public comment period on the proposal closed.²⁵ The rule requires large banks to provide services offered to all lawful businesses in a given market if it provides those services to any, relying on language in the Dodd-Frank Wall Street Reform and Consumer Protection Act of 2010. The OCC states that “a bank may not rely on factors that cannot be quantified” when deciding

The OCC was created in 1863 by the National Currency Act. *Id.* at History, <https://www.occ.treas.gov/about/who-we-are/history/index-history.html> (last visited Jan. 19, 2021).

²⁵OCC, Proposed Rule, *Fair Access to Financial Services*, 85 Fed. Reg. 75261, <https://www.federalregister.gov/documents/2020/11/25/2020-26067/fair-access-to-financial-services>; OFFICE OF THE COMPTROLLER OF THE CURRENCY, Press Release, “OCC Finalizes Rule Requiring Large Banks to Provide Fair Access to Bank Services, Capital, and Credit,” (Jan. 14, 2021), <https://www.occ.gov/news-issuances/news-releases/2021/nr-occ-2021-8.html>.

whether or not to provide a financial service to a customer.²⁶ The OCC specifically mentioned climate-related commitments from banks as a reason for its proposal (and in particular pointed to a letter from the Alaska congressional delegation about banks announcing they would not finance oil and gas development in the Arctic)²⁷ but does not directly mention them in the final rule. The OCC argues the regulation is needed to ensure fair access to lending.

The Comptroller of the Currency has since placed a pause on the rule, preventing it from being published in the Federal Register in order to allow the next nominated Comptroller of the Currency time to review it.²⁸ Congressional Democrats are reportedly considering using the Congressional Review Act to eliminate it.²⁹

§ 24:45 International financial regulatory actions on climate-related risks

Central banks and regulators in other countries are assessing climate change risks to their respective financial systems. Many are implementing new risk management strategies, and several have begun to enact new disclosure requirements and guidance for public companies and financial institutions, as well as enact stress tests for banks. Helpful examples include the European Central Bank and the Bank of England, as well as actions taken by central banks in Canada, Australia, New Zealand, and Hong Kong.

The European Central Bank listed climate change as a key risk driver in 2019.¹ The European Union issued a non-financial reporting directive in 2014 and required companies to include non-financial statements in their annual reports beginning in 2018. The European Commission in late 2019 released guidelines on reporting climate-related information to assist companies in complying with the disclosure requirement.²

The Bank of England (BoE) plans to test the UK financial system's resilience to climate change risks in 2021 against three climate scenarios. The test includes insurers as well as banks, and utilizes a 30-year modeling horizon.³ The BoE's Prudential Regulatory Authority issued expectations in 2019 for how banks and insurers should manage their climate-related financial risks, and address such risks through risk management, as well as expectations for conducting scenario analysis

and disclosure.⁴ The UK's Financial Reporting Council in 2019 stated that companies should report on both the direct and indirect effects of climate change and, importantly, highlighted the importance of the auditor.⁵ In December 2020, the Financial Conduct Authority finalized a new climate-related disclosure rule requiring companies to conform their disclosures with the TCFD's recommendations, or otherwise explain why they have not done so beginning in 2021. The rule includes a technical note on climate-related disclosure obligations under existing rules.⁶

The Bank of Canada initiated in 2019 a multi-year research effort to assess climate-related risks. The Canadian government's Expert Panel on Sustainable Finance at the time also released recommendations for supporting sustainable finance, including integrating climate risks into the supervision of federally regulated institutions.⁷ Australia, for its part, updated its regulatory guidelines in 2019 to formally include climate change,⁸ and in September 2020, New Zealand announced mandatory reporting in line with TCFD recommendations, with disclosure obligations likely beginning in 2023.⁹ In December 2020, Hong Kong announced financial institutions and listed companies would be required to disclose the financial impact of climate change in line with TCFD recommendations by 2025, at the latest.¹⁰ Hong Kong will adopt new standards for disclosure and is preparing a pilot climate risk stress test for 2021.¹¹

§ 24:46 Conclusion: A new administration will accelerate existing climate-disclosure trends

The implications of climate change for individual companies, investment and lending portfolios, or the nation's financial system is now firmly ensconced as a topic of concern for corporate boards, investors, and financial firms. How its risks and opportunities are analyzed, disclosed, and incorporated into business and investment decisions remains fraught with challenges.

The last few years have been a period of contradictions for climate disclosure and

financial risk management in the U.S. On the one hand, the private sector has made some progress in incorporating climate-related information into risk management and financial analysis. But, on the other, federal regulatory bodies with the power to referee the points of contention have either been on the sidelines or taken steps to stifle the discussion. This state of affairs is already changing with the new Biden administration and is expected to continue to do so as the new administration implements its plans to engage the powers of the government across agencies to ensure better disclosure, assessment, and management of risks from climate change by companies and the financial system and also as independent financial regulators start acting on their statements about the financial risks of climate change.

XI. LITIGATING CLIMATE CHANGE

§ 24:47 Introduction

Climate change is increasingly coming before state and federal judges alike.¹ These cases are not the purview of environmental litigation alone; climate change claims today drawn upon torts, consumer protection, securities fraud, and constitutional law in addition to plaintiffs leveraging more traditional challenges to environmental regulatory and permitting decisions. Thus far, courts have demonstrated a willingness to follow the science and not be swayed by politically-motivated denialism when considering cases with climate-related fact patterns, even if they disagree with plaintiffs' understanding of how the science impacts legal outcomes.²

This section categorizes four main types of cases bringing climate change-connected claims: (1) challenges against federal regulation of greenhouse gases and consideration of climate in government decisionmaking; (2) constitutional and public trust cases; (3) state and municipal governments seeking damages, under the public nuisance doctrine, from private industry for climate change-related impacts; and (4) state cases against companies for inadequate corporate disclosures and consumer protection. The first two types of claims pit private citizens, nongovernmental organizations, and governmental bodies against the federal government utilizing statutory law and constitutional principles; the latter two are led by state and municipal challengers against private industry under both tort law and federal laws and regulations governing securities.

§ 24:48 Regulating greenhouse gases and considering climate in government decisionmaking

The 2007 *Massachusetts v. EPA* Supreme Court decision affirmed the EPA's authority to regulate greenhouse gas emissions as air pollutants under the Clean Air Act and a responsibility to do so should it determine that greenhouse gases (GHGs) endanger public health and welfare.¹ (See § 24:12 for a more detailed discussion.)

[Section 24:47]

¹Recognizing this increase in climate-related fact patterns, the Climate Judiciary Project is educating courts on the basics of the science that underpins these cases. Environmental Law Institute, *The Climate Judiciary Project: Educating Judges on the Science Underpinning Arguments in Climate Cases*, <https://www.eli.org/judicial-education/recent-ongoing-upcoming-projects>.

²Maria L. Banda, *Climate Science in the Courts: A Review of U.S. and International Judicial Pronouncements*, Environmental Law Institute (April 2020), <https://www.eli.org/research-report/climate-science-courts-review-us-and-international-judicial-pronouncements>.

[Section 24:48]

¹For a detailed look at the case, how it came to be, and how it was argued at the Supreme Court, see Richard Lazarus's book *The Rule of Five: Making Climate History at the Supreme Court*, Harvard University Press (2020).

sion of this case.) The EPA made this endangerment finding on December 7, 2009,² triggering an obligation to regulate emissions of GHGs.

The Supreme Court narrowed this authority somewhat as applied to stationary sources in *Utility Air Resources Group v. EPA* (*UARG*).³ In *UARG*, the Court found that emissions of GHGs alone could not trigger the CAA's Prevention of Significant Deterioration (PSD) or Title VI permitting programs. However, the Agency could apply the PSD "best available control technology" requirements to GHG emissions from sources already subject to the PSD program, due to emissions of other pollutants.⁴

Subsequently, during the Obama administration, EPA promulgated regulations designed to limit GHG emissions from sources, including power plants, landfills, and oil and gas production.⁵ The Trump administration later rescinded or revised these rules,⁶ demonstrating a distinct interpretation of the CAA from that which underpinned the Obama-era rules.⁷

In 2012, the EPA issued New Source Performance Standards (NSPS) for volatile organic compounds (VOCs) from oil and gas sources.⁸ This rule did not directly regulate GHGs, but did contribute indirectly to reducing emissions of methane because controls for VOCs also had the side benefit of controlling methane emissions. In 2016, the EPA issued a new NSPS rule for oil and gas that separately regulated methane in addition to VOCs.⁹ Both rules covered emissions sources at the well site, gathering and boosting stations, processing plants, and compressor stations. However, the 2016 rule expanded the sources covered by the standards at those sites.¹⁰ EPA also issued Control Technique Guidelines in 2016 to states with moderate nonattainment areas for ozone, in effect directing them to amend their state implementation plans to address VOCs from existing sources via a set of controls

that would also reduce methane emissions at those sources.¹¹ Less than two weeks later, EPA issued an Information Collection Request (ICR) to operators, asking them to identify ways to control methane from existing oil and gas sources—a necessary information-gathering step for developing methane emissions regulations for existing oil and gas sources.¹²

With the change in administration in 2017 came a change in priorities. EPA canceled its Information Collection Request for existing oil and gas operations and withdrew the Control Technique Guidelines.¹³ President Trump directed EPA to reconsider the 2016 methane standards for the oil and gas industry in the “Executive Order on Promoting Energy Independence and Economic Growth.”¹⁴ In September 2020, EPA published two final rules eliminating methane emissions standards for oil and gas sources, removing storage and transmission sources from even the standards for VOCs, and revising the remaining requirements for VOCs.¹⁵ The decision not to regulate methane and the changes to which sources were included relied on a different interpretation of the Agency’s authority under the CAA than the one previously held by the agency.¹⁶ The EPA acknowledged in its Regulatory Impact Analysis that these rule changes would result in higher emissions than those that would have occurred under the rule promulgated during the Obama administration.¹⁷ However, the EPA argued in the rulemaking that the prior rule improperly included transmission and storage sources, saying they should not be considered part of the Crude Oil and Natural Gas Production Source Category. The EPA also argued that it must make a new determination that methane emissions from the remaining sources in the source category contribute significantly to pollution that can endanger public health or welfare in order to regulate methane—an additional determination that the Agency did not previously believe the CAA required.

States and environmental organizations challenged these rulemakings but the litigation did not reach a conclusion before President Biden took office.¹⁸ In a January 20, 2021 executive order, President Biden instructed the EPA to consider revising or rescinding the Trump-era rules by May 2021 and to propose rules applicable to

existing oil and gas sources by September 2021.¹⁹ In February, the EPA asked the D.C. Circuit to put litigation over the Trump-era rules on hold while it reviewed the regulation. It therefore appears these cases are unlikely to result in opinions on the validity of the Trump-era rules.

The Obama administration also proposed the Clean Power Plan aimed to reduce GHG emissions from existing power plants with a “best system of emission reduction” (BSER) for coal- and natural gas-fired power plants that allowed for both improvements to coal plant operating efficiency and shifting generation to lower- and zero-emitting generators like natural gas and renewable energy sources, providing substantial flexibility to states as to how to achieve the standards set.²⁰ The Clean Power Plan never went into effect because the Supreme Court stayed the rule pending its review by the D.C. Circuit.²¹ The Trump administration repealed and replaced the Clean Power Plan with its own guidelines for GHG emissions from existing power plants, called the Affordable Clean Energy rule (ACE Rule).²² The ACE Rule proposed instead setting emissions standards that relied only on heat-rate improvement technologies and practices and not generation shifting. Tellingly, the Agency acknowledged the ACE Rule would actually *increase* emissions. Just before President Biden took office, the D.C. Circuit vacated the ACE Rule and rejected the Trump-EPA’s argument that its repeal of the CPP and promulgation of the ACE Rule instead derived from the “only permissible reading” of Section 7411(d) of the CAA.²³ The D.C. Circuit decision reflects a more flexible view of the approaches the agency could take, and therefore the Biden administration is arguably free to determine a new best system of emissions reduction for GHGs at existing power plants without needing to address the ACE rule’s approach. However, there remains potential for the Supreme Court to take a narrower view of the scope of authority set out in Section 7411(d).

Subsequent to President Biden taking office, the EPA asked the Department of Justice (DOJ) to seek abeyances or stays in any ongoing litigation involving Trump-era regulations. In the meantime, the Agency would review these actions and consider how to proceed, in line with the new administration’s policy priorities.²⁴ As a result, many of the cases considering the Trump administration’s interpretations

²³*American Lung Association v. EPA*, No. 19-1140 (D.C. Cir. Jan. 19, 2021).

²⁴On Jan. 20, 2021, President Biden signed Executive Order 13990, “Protecting Public Health and the Environment and Restoring Science To Tackle the Climate Crisis,” instructing agencies to review agency actions during the Trump administration for consistency with the new administration’s policies and consider suspending, revising, or rescinding them. Executive Order 13990 of Jan. 20, 2021, 86 Fed. Reg. 7037 (Jan. 25, 2021). The administration froze activities on all pending regulations for 60 days to allow time for this review and EPA instructed the DOJ to seek stays or abeyances in ongoing litigation involving regulations promulgated during the Trump administration period in office. See Ron Klain, Regulatory Freeze Pending Review (Jan. 20, 2021), <https://www.whitehouse.gov/briefing-room/presidential-actions/2021/01/20/regulatory-freeze-pending-review/> and Rebecca Beitsch, *biden EPA asks DOJ to hit pause on defense of Trump-era rules*, THE HILL (Jan. 22, 2021) (describing a letter from EPA’s Acting General Counsel Melissa Hoffer to DOJ), <https://thehill.com/policy/energy-environment/535450-biden-e>

of bedrock environmental law statutes will not result in court opinions, including the reinterpretations of the CAA to limit EPA's authority to regulate greenhouse gases. However, the legal interpretations previewed in the Trump-era regulatory actions may portend likely arguments used to challenge Biden-era regulations. This is particularly true in the CAA context, where legal arguments that would limit EPA's authority to regulate GHGs from power plants and the oil and gas sector were used to justify rescissions of Obama-era rulemakings and will likely re-emerge in litigation challenging Biden-era replacements.

Litigation involving climate change also arises in the context of the National Environmental Policy Act (NEPA). NEPA requires federal agencies to take a hard look at the environmental consequences of its potential actions, such as making decisions on permit applications or constructing publicly-owned facilities, when considering its options.²⁵ Parties have challenged agency decisions on the basis of not fulfilling their obligation to consider the potential action's contribution to climate change.²⁶ The Trump administration's Council on Environmental Quality (CEQ) revised guidance on how to consider greenhouse gases in NEPA evaluations. As of publication, the Biden administration had already announced its intention to rescind and replace this guidance, and reconsider revisions to implementing regulations made during the Trump administration that deemphasized the importance of considering cumulative impacts of actions.²⁷ Courts did not have the opportunity to issue their interpretations of the Trump CEQ's guidance, but application of revised guidance and regulations promulgated by the Biden administration are likely to generate additional cases.

Questions about how well the federal government integrates information about climate change into its day-to-day decisionmaking are arising under statutes beyond NEPA. While NEPA cases involving climate change tend to hinge on a government action's *contribution* to climate change, a newer trend are cases centered on how well the government is prepared to *adapt* to the physical impacts of climate change. For example, environmental groups have questioned the adequacy of the government's consideration of a changing climate in making critical habitat designations under the Endangered Species Act (ESA).²⁸ They have also argued that a company violated the Clean Water Act (CWA) by failing to consider the impact of sea level rise in a distribution terminal's storm water prevention plans and violated Resource Conservation and Recovery Act (RCRA) by posing an imminent danger to the public and environment as a result of this failure.²⁹ Improved awareness of the physical impacts of climate change is likely to only encourage the number of citizen suits

Haw. 2021) (a case filed in January 2021 challenging a 2020 rule defining the term "habitat" that limits how critical habitat designations under the Endangered Species Act can be made, alleging it fails to allow for consideration of how climate change will impact habitats).

²⁹See *Conservation Law Foundation v. ExxonMobil Corp.*, No. 1:16-cv-11950 (D. Mass. 2016) (alleging the company failed to consider climate change impacts like sea level rise, increased precipitation, and the frequency and intensity of storms creating an imminent threat of release of wastes in violation of RCRA, violating its CWA discharge permit because of more frequent discharges, and making its stormwater pollution prevention plan and spill prevention control measures inadequate; the

filed asking companies and permitting officials to incorporate information into their decisionmaking on how climate change will impact the facilities being built or permitted.

§ 24:49 Constitutional/public trust cases against the government

In 2010, the non-profit public interest firm Our Children's Trust formed to advance cases, representing youth, that seek to secure a constitutional right to a healthy and stable climate.¹ In 2011, the firm initiated an effort to file rulemaking petitions or lawsuits, in all fifty states, demanding each state take action on climate change.

The organization also represented clients in *Juliana v. United States*, a case against the federal government filed in 2015.² Youth plaintiffs in the *Juliana* case argued that the permitting, authorization, and subsidization of fossil fuel by the federal government violate their constitutional right to life, liberty, and property, and the federal government failed to protect public trust resources. Plaintiffs also claimed the government violated their substantive due process rights to a "climate system capable of sustaining human life," their right to equal protection under the law, their rights under the Ninth Amendment, and the public trust doctrine.³

While acknowledging the reality of climate change, its harms, and the federal government's contribution to it by affirmatively promoting fossil fuel use,⁴ the Ninth Circuit Court of Appeals determined an Article III court could not redress the plaintiffs' claims. Rather, the court held remediation of the type requested by plaintiffs fell under the purview of the executive and legislative branches of government,⁵ effectively reversing a district court decision that would have allowed the case to move forward. In reaching this conclusion, the court did not consider whether the rights claimed by plaintiffs existed. Rather, even assuming the government had deprived plaintiffs of a substantive constitutional right to a "climate system capable of sustaining human life," the court determined it was beyond its constitutional powers to order the government to develop a plan to phase out fossil fuels and

case was stayed in March 2020 to allow EPA to address the renewal of the facility's permit).

[Section 24:49]

¹See Our Children's Trust, Our Mission, <https://www.ourchildrenstrust.org/mission-statement>.

²See Our Children's Trust, *Juliana v. US*, <https://www.ourchildrenstrust.org/juliana-v-us> for a timeline of the case.

³Plaintiffs argued that the government's permitting, authorizing, and subsidizing fossil fuel development cause climate change-related injuries to them. They argued a stable climate is critical to their right to life, liberty, and property under the constitution. They alleged that their 5th Amendment rights have been violated because the government knowingly caused atmospheric CO₂ to rise, such that it interfered with a stable climate, by permitting, authorizing, and subsidizing of fossil fuel extraction, production, transportation, and utilization. They also argued that the government has violated the equal protection principles of the Fourteenth Amendment by denying the youth plaintiffs the same protection of their rights afforded previous generations, due to the increased impacts of climate change that their generation will endure, arguing they should be treated as a protected class. They also argue the Ninth Amendment affords them the "right to be sustained by our country's vital natural systems, including our climate system"—an implied right to a stable climate system. Finally, plaintiffs alleged defendants violate the public trust doctrine. That is, they argued that the government is a trustee of the natural resources for present and future generations and it must refrain from substantially impairing these resources. *Juliana v. U.S.*, No. 6:15-cv-01517, Amended Complaint (D. Or. Sept. 10, 2015).

⁴*Juliana v. United States*, 947 F.3d 1159, 1167 (9th Cir. 2020) ("The government affirmatively promotes fossil fuel use in a host of ways, including beneficial tax provisions, permits for imports and exports, subsidies for domestic and overseas projects, and leases for fuel extraction on federal land.").

⁵*Juliana v. United States*, 947 F.3d 1159, 1171 (9th Cir. 2020) ("But it is beyond the power of an Article III court to order, design, supervise, or implement the plaintiffs' requested remedial plan. As the opinions of their experts make plain, any effective plan would necessarily require a host of complex policy decisions entrusted, for better or worse, to the wisdom and discretion of the executive and legislative branches.").

reduce atmospheric CO₂. The Ninth Circuit denied a request for a rehearing *en banc* on February 10, 2021. (See Section 24:12 for a more detailed discussion of the history of the *Juliana* case.)

Our Children’s Trust represents plaintiffs with claims against numerous states as well as the federal government.⁶ None of these claims have yet met with success either.

One of the most recent developments in the state cases as of the time of publication was *Aji P. v. Statei*, in the state of Washington, which was ultimately dismissed by the state appellate court. Youth plaintiffs from Washington state sued the state of Washington, the governor, and state agencies for “creating, operating, and maintaining a fossil fuel-based energy and transportation system that [the State] knew would result in greenhouse gas (‘GHG’) emissions, dangerous climate change, and resulting widespread harm.”⁷ Plaintiffs petitioned the court to declare they had a fundamental constitutional right to a “healthy and pleasant environment, which includes a stable climate system that sustains human life and liberty” and to order the state to develop a climate recovery plan. Their complaint included claims based on substantive due process, equal protection, state constitutional law, and the public trust doctrine.

The appellate court affirmed the trial court’s dismissal of the Washington case on February 9, 2021, finding the case involved nonjusticiable political questions and resolving it would “violat[e] the separation of powers doctrine.”⁸ The court stated the claims were “constitutionally committed to the legislative and executive branches,” noting the “climate recovery plan” the plaintiffs requested amounted to legislation and the court “cannot force the legislature to legislate, and we cannot legislate ourselves.”⁹ The court also found there was “no judicially manageable standard” to resolve the claims; the court would be making decisions “beyond the scope of our authority with resources not available to the judiciary.”¹⁰ The court added the state already made a policy determination on the subject of the plaintiffs’ claims with its recently enacted clear air rule regulating GHG emissions, one that the court could not replace with its own regulatory regime.¹¹ “[B]y wading into the waters of what policy approach to take, what economic and technological constraints exist, and how to balance all implicated interests to achieve the most beneficial outcome, the court would . . . usurp the authority and responsibility of the other branches.”¹²

Despite the lack of success so far in these cases, active litigation remains and does not show signs of subsiding. These claims raise awareness of government actions regarding climate change—whether actions contributing to or ameliorating it.

§ 24:50 State and municipal cases seeking damages for climate change impacts from companies

¹²*Id.* at ¶ 18.

[Section 24:50]

¹*Connecticut v. American Elec. Power Co., Inc.*, 406 F. Supp. 2d 265, 35 Env’tl. L. Rep. 20186 (S.D.

York sued the five biggest power companies in the United States,² claiming their emissions were a nuisance by contributing to global warming. On June 20, 2011, after working its way through the federal courts, the Supreme Court unanimously held that the CAA displaces federal common law nuisance claims brought to reduce GHG emissions.³ This case foreclosed future claims in federal court and set up the dynamic currently playing out in state and federal courts around the country—namely, climate liability cases based on state nuisance claims, fighting remand to federal court (See § 24:12 for a more detailed discussion of the *Connecticut v. American Electric Power Co.* case.).

Following the *Connecticut v. AEP* case, the Ninth Circuit also dismissed *Native Village of Kivalina v. ExxonMobil*.⁴ The plaintiffs in *Kivalina* sought damages from energy and power companies for their contributions to climate change, resulting in erosion so severe as to require the Alaska Native village relocate. The court dismissed their private and public nuisance claims, relying on *Connecticut v. AEP* in finding the CAA displaced federal common law claims.

As a result of these decisions, states and local governments have turned to state common law claims to pursue damages from oil and gas companies (and, in one case, an industry association as well) to help them adapt to the impacts of climate change. As of publication, at least fourteen cases alleging public and private nuisance, trespass, negligence, and other claims have been filed since 2017 by municipalities, counties, states, and an industry association.⁵ No court has yet reached a decision on the merits as plaintiffs continue to fight defendants' efforts to remove the cases to federal court. The First, Fourth, and Ninth Circuits have all remanded cases to state court.⁶ However, removal efforts continue. For example, defendants in the Baltimore case asked the Supreme Court to consider whether the case involves a federal officer and thus requires resolution in federal court.⁷ They have also asked the Court to go beyond this narrow jurisdictional review and consider the Fourth Circuit's remand order in its entirety. Oral arguments were held in January 2021.

None of these cases has yet met with success. Nevertheless, they will continue to contribute to inhabit litigation dockets until courts have an opportunity to consider the merits of the claims—albeit only if they survive the removal fights. At least one law professor has argued that even if none of these cases succeed, they will have a significant impact on corporate activity simply due to the process of discovery during litigation.⁸ One thing is certain: these cases highlight the potential for substantial impacts to municipal budgets that await coastal communities when

faced with the costs of adapting to climate change.

§ 24:51 State cases against companies for inadequate corporate disclosures and consumer protection

State attorneys general have also initiated cases against companies, asserting securities fraud and consumer protection claims. The state attorneys general allege the companies inadequately disclosed climate-related risks and misled consumers and shareholders. The strategy of claims based in corporate climate related disclosure dates to the early 2000s, when the New York attorney general conducted investigations into the disclosures of power and coal producers.¹ These investigations contributed to pressure on the Securities and Exchange Commission to issue guidance on climate-related disclosures in 2010, and also resulted in settlements requiring climate-specific disclosures from the targeted companies² (See §§ 24:41 to 24:46 for a more expansive discussion of climate-related disclosures and securities law.)

More recently, New York pursued ExxonMobil for securities fraud, ultimately losing in court.³ In *New York v. Exxon Mobil Corp.*, the court considered whether ExxonMobil misled investors in disclosures about the potential impacts of future climate policies on product demand; the court examined how ExxonMobil incorporated this information into its project-level business planning. Plaintiffs failed to convince the court of the materiality of the company's statements and supposed omissions. The court ultimately found the plaintiffs' experts unpersuasive and found no evidence of impact on investors' analyses or decisions during the relevant timeframe. However, the court acknowledged that climate-related information *could* be material in certain circumstances under existing securities law standards.⁴ Massachusetts recently sued ExxonMobil, which included a claim that the company misled investors, as well as allegations of misleading consumers.⁵

Other state cases have focused on consumer protection claims, reflecting both differences in the underlying state law available to them and perceptions of the difficulty in proving investors were misled by information in corporate disclosures or left out of those disclosures.⁶ The *New York v. Exxon* securities fraud case was the first of these cases to reach trial and decision. It remains to be seen how much suc-

suits, with the possibility that these disclosures will reach the public.”), <https://www.newagebd.net/article/129499/the-climate-change-lawsuits-against-big-oil>.

cess the consumer protection claims will have.

§ 24:52 Conclusion

Climate change is creeping into court through an ever-expanding range of fact patterns and legal theories. Whether securities law, torts, consumer protection, or even claims of previously unacknowledged constitutional rights, climate change litigation has transcended the confines of environmental law. At the same time, climate change is also causing traditional environmental lawsuits to evolve, by giving rise to new claims and statutory interpretations under bedrock environmental laws such as the CAA, CWA, RCRA, and NEPA. Also multiplying is litigation aimed at limiting a private sector or government entity's impact on the climate or to pressure them to better incorporate the physical impacts of climate change into their decision-making.

Ultimately, the physical damages produced as the changing climate's physical impacts become more severe and the government takes more direct action to regulate emissions are likely to fuel a rapid rise in climate related litigation. Adaptation to climate change will foster more litigation still. For example, climate change-threatened Superfund sites could spur litigation over the need to reopen remediation decisions;¹ the impacts of sea level rise and storms on coastal communities could give rise to claims of constitutional takings claims as local, state, and federal government entities attempt to weather the impacts on their communities or handle extreme weather events.² As climate change impacts every facet of our lives, so will it percolate into an ever-broader spectrum of areas of the law and the litigation that results.

XII. CONCLUSION

§ 24:53 In general

Climate change presents an existential threat on a global level, requiring a combination of mitigation measures *ex ante* to reduce GHG emissions, adaptation activities *ex post* to react to the climate impacts many communities are already witnessing, and exploring new scientific—and legal—frontiers presented by geoengineering. The United States, as a major GHG emitter, is poised to lead this effort.

Yet the United States currently lacks a comprehensive climate change strategy,

conduct and misled consumers), <http://climatecasechart.com/case/district-of-columbia-v-exxon-mobil-corp/>; Connecticut v. ExxonMobil Corp., HHDCV206132568S (Conn. Super. Ct. Sept. 14, 2020) (alleging violations of the state's Unfair Trade Practices Act), <http://climatecasechart.com/case/state-v-exxon-mobil-corp/>; Massachusetts v. ExxonMobil, No. 19-3333 (Mass. Sup. Ct. Oct. 24, 2019) (including claims the company misled investors and that they misled consumers under the state's Consumer Protection Act). Cases in Boulder, Baltimore, South Carolina, Delaware, and Hoboken, NJ also include consumer protection claims. See Sher Edling, Climate Case Chart, <https://www.sheredling.com/wp-content/uploads/2021/01/2021-01-26-Climate-Case-Status-Charts.pdf> (listing the current status of cases and the claims alleged as of Jan. 26, 2021).

[Section 24:52]

¹The Government Accountability Office ("GAO") estimates that over 60% of nonfederal National Priorities List ("NPL") sites are at risk of flooding or experiencing damage from other impacts of climate change and has said the EPA does not consistently incorporate climate change information into its remedial assessments. Patashnik, Note, *The Trolley Problem of Climate Change: Should Governments Face Takings Liability if Adaptive Strategies Cause Property Damage?*, 119 Colum. L. Rev. 1273, 1273 (2019); Thomas Ruppert, *Castles—and Roads—in the Sand: Do All Roads Lead to "Taking"?*, Environmental Law Reporter, Vol. 48, Issue 10, 10914-10932 (2018).

with no overarching statutory regimen and no single federal agency tasked with directing national efforts. Nevertheless, a fragmented yet growing body of climate change law has emerged from this leadership vacuum, a mixture drawn existing statutes, regulations, funding mechanisms, and agency programs originally created for other purposes. Much of the action in both law and policy is occurring on the state, tribal, and local levels, whose constituencies are at the frontlines of climate change impacts. These regional efforts may ultimately serve as laboratories, from whose successful experiments the federal government may draw upon in the future.

Citizens, impatient with the slow pace of change, are pressing the courts to force federal action. At the same time, public and private actors are attempting to hold corporate entities accountable for the effects of their GHG emissions through litigation. Financial institutions alongside regulatory bodies are also increasingly playing a role in the arena of climate risk disclosure and management.

Potential exists for the federal government to take robust action on climate change. After all, the question is not if, but when—and what will be the extent of the consequences of delay.

§ 25:1 Introduction

It is commonplace to say that environmental protection law has been ossifying since 1990, when the Clean Air Act was last amended. It is true that Congress has not enacted major environmental legislation since those amendments, but environmental protection law continues to evolve without Congress’ direct intervention. Regulations are created and revised to implement the laws of the 1970s and 1980s. And the white spaces left by Congress with no legislative directive also are being addressed by states, companies, and private action. Like water flowing downstream, environmental protection law continues to wind its way despite bends, curves, and obstructions in its way.

An understanding of today’s environmental protection law would not be complete without investigating where environmental protection law is headed and how it is

*By Scott Schang.

adapting around Congress' near abandonment of its legislative oversight of environmental protection. This Part of the treatise first provides insights into recent reform efforts that call for revising environmental protection statutes. Then one of the field's leading authors examines the United States' progress on sustainability. Hopefully, these final three chapters will give the reader a sense of likely future directions and trends in environmental protection law.

§ 25:2 Reinvention efforts¹

Efforts to re-think U.S. environmental law go almost as far back as the laws themselves. If the "first wave" of command-and-control statutes² dates roughly from the 1970 Clean Air Act to the passage of CERCLA in 1980, by the late eighties there already were calls for new ideas and systemic reform.

For example, the high-profile, bipartisan "Project 88," co-chaired by Senators Tim Wirth and John Heinz, generally is credited with advancing market-based approaches for environmental protection, including the sulfur dioxide cap-and-trade program enacted in the 1990 Clean Air Act Amendments.³ Originally conceived during a presidential election, it later was celebrated as an important, if rare, case of policy agreement among industry, environmentalists, and government.⁴

Just 10 years later came a similarly ambitious, consensus-based reform process, the "Enterprise for the Environment" (E4E) effort chaired by former EPA Administrator William Ruckelshaus.⁵ The blue-ribbon panel represented all sectors, including current leadership in Congress and the White House, and produced 12 recommendations for reforming the environmental protection system.⁶ Yet these prescriptions failed to gain traction in the politicized atmosphere of the late 1990s.

The past 15 years have seen no shortage of general proposals for overhauling U.S. environmental protection law. Some, taking their cues from Project 88, have coincided with the election cycle and been directly targeted at an incoming Congress and/or White House.⁷ Others have been outputs of the political process, as with a decade-long series of National Academy of Public Administration reports produced at the specific request of Congress.⁸ Still others were triggered by reflecting on

⁸See, e.g., Jonathan Howes and DeWitt John, *Setting Priorities, Getting Results: A New Direction for EPA* (NAPA, 1995); Howes and John, *Resolving the Paradox of Environmental Protection: An Agenda for Congress, EPA, & the States* (NAPA, 1997); Howes and John, *Environment.gov: Transforming Environmental Protection for the 21st Century* (NAPA, 2000); Jonathan Howes and Bruce McDowell, *Taking Environmental Protection to the Next Level: An Assessment of the U.S. Environmental*

milestones such as the 25th anniversary of modern environmental protection⁹ or evaluating the progress made in the wake of the 1992 Rio Earth Summit.¹⁰

Like Project 88 and E4E before them, what these initiatives have in common is their broad scope yet comparatively isolated success and short shelf life. In the late nineties, efforts like the President's Council on Sustainable Development did have some official cachet and dovetailed with independent NAPA and Aspen Institute calls for "flexibility" in the system,¹¹ leading to acclaimed EPA programs like Project XL, the Common Sense Initiative, the agency's public involvement policy and creation of the EPA Office of Information, and the Smart Growth Initiative. These programs introduced incremental but lasting reforms.

But even close PCSD observers lament the missed opportunity for a wider vision such as the U.S. had agreed to at the 1992 Earth Summit. They cite the Council's subsequent lack of support from high-level political leaders and the public, lack of outreach to the same, failure to recommend a federally coordinated national strategy, absence of a permanent institutional mechanism for implementing recommendations, and lack of political accountability for success or failure.¹²

The cyclical nature of these environmental reform initiatives and the marked similarity of their content have led to meta-studies that summarize and categorize the various kinds of recommendations made. In 2000, the Congressional Research Service analyzed the previous decade's worth of "new approaches" to environmental protection and found that their proposals fell into five categories:¹³

- **Information.** Approaches to improve the quantity and quality of information and to organize it effectively so as to enhance the knowledge base underlying decisions affecting the environment, such as "sound science" and improving regulatory decisions, in particular risk analysis and cost-benefit analysis.
- **Public Sector Processes.** Approaches to revise or create new governmental structures or processes for making environmental decisions, such as increasing delegation to states, creation of an independent cost-benefit/risk assessment review body, and establishment of a "regulatory budget."
- **Incentives.** Approaches that emphasize incentives as opposed to regulatory or financial penalties for achieving environmental ends, such as grants, loans, tax breaks, procurement policies, technical assistance, and regulatory waivers.
- **Market Mechanisms.** Approaches that rely on markets and common law for environmental decisions to the extent possible, such as trading, banking, offsetting of pollution rights, pollution taxes, and liability risks under tort law.
- **Management Principles.** Approaches to inculcate environmental values in public and private managerial decisions, such as corporate environmental management systems, supply chain management, and pollution prevention.

¹³Adapted from Blodgett, *Environmental Protection: New Approaches*, *supra* note 11, at 9-44.

In chapter 26, George Washington University law professor Lee Paddock examines a number of environmental reinvention reports and finds that “[t]he similarity of the conclusions from these studies and policy recommendations is striking.”¹⁴ He distills the conclusions into seven broad categories: (1) establishing priorities, setting goals, and measuring progress; (2) improving access to information, including good scientific data; (3) public engagement; (4) partnering and other forms of collaboration; (5) bringing new financial resources to the table; (6) innovation in developing and deploying a broad range of approaches to solving environmental problems; and (7) individual and corporate responsibility and extended producer responsibility.

Professor Paddock argues that although these reports produced a clear and relatively consistent reform agenda, “[e]qually striking . . . is the fact that the basic system of environmental management and the allocation of human and financial resources are little changed at their core after nearly 20 years of introspection.”¹⁵ He concludes that some rethinking of environmental governance remains necessary, but also points to political deadlock at both the federal and state levels—which has only intensified in the years since his original article appeared. His (and the others’) prescriptions for regulatory reform, increased networking and partnerships, economic incentives, public information, education and participation, and innovation in environmental management remain relevant; but many would depend on overcoming the same political indifference and institutional inertia that has sidelined most similar proposals for the past two decades or more.

§ 25:3 Sustainability

The intersection of environmental protection law and sustainable development is neither clear cut nor well defined. As Professor John Dernbach traces in chapter 27, sustainability is a broad concept that combines concern for the environment with concern for economic and social progress. It is not clear whether environmental protection law is a precursor to sustainability, a part of it, or an artifact that will be left behind as sustainability grows as a concept and/or practice.

Environmental protection law and sustainability are clearly closely related, even if sustainability’s exact pedigree is unclear. Section 101 of the National Environmental Protection Act arguably contains the first formulation of sustainability despite the fact that the 1987 Brundtland Commission’s formulation of sustainable development is often credited as sustainability’s start. Compare these two excerpts:

The Congress, recognizing the profound impact of man’s activity on the interrelations of all components of the natural environment . . . declares that it is the continuing policy of the Federal Government . . . to use all practicable means and measures . . . in a manner calculated to foster and promote the general welfare, to create and maintain conditions under which man and nature can exist in productive harmony and fulfill the social, economic, and other requirements of present and future generations of Americans.¹

Sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs. It contains within it two key concepts:

- the concept of ‘needs’, in particular the essential needs of the world’s poor, to which overriding priority should be given; and
- the idea of limitations imposed by the state of technology and social organization

¹⁴See §§ 26:1 et seq., *infra*.

¹⁵See §§ 26:1 et seq.

[Section 25:3]

¹42 U.S.C.A. § 4331(a).

on the environment's ability to meet present and future needs.²

The seeds of modern sustainability can be found in both.

Professor Dernbach's expansive view of sustainability in chapter 27 provides a prescription for better environmental governance through planning and integration. It remains to be seen whether his vision of intelligent governance leading progress will win out over progress pulling environmental governance along with it.

§ 25:4 Private environmental governance

Over the past decade, non-governmental actors have been taking on traditional government functions, such as standard setting and policing other entities' environmental compliance. This so-called private environmental governance is beginning to have such broad impact that it merits independent discussion.¹

Professor Paddock and others have noted the growth of "individual and corporate responsibility and extended producer responsibility."² This effort has shown significant growth recently and has arguably developed into a form of private governance:

Private Governance occurs when non-governmental entities, including private organizations, dispute resolution organizations, or other third party groups, make rules and/or standards which have a binding effect on the "quality of life and opportunities of the larger public." Simply put, private—not public—entities are making public policy.³

The impact of such efforts has been significant. The Forest Stewardship Council and Sustainable Forest Initiative together account for over 418 million acres of certified forests in North America, according to the organizations' websites. Wal-Mart, GE, and many other companies have undertaken extensive product supply chain management programs that at times have the purchasing companies acting as inspector and enforcer of both government and non-government environmental standards. Private, voluntary certifications and standards have had a significant impact on the sustainability of some fisheries.

The motivations behind these various efforts are varied. Protecting a hard-won corporate image is important. Preventing a public uproar over an environmental scandal may be far cheaper than enduring one. Some companies consider environmental protection an element of their corporate ethics. Others undertake such efforts in the hope of forestalling more onerous government intervention. There are, no doubt, more motivations as well.

The impact of private environmental governance is still unclear in terms of demonstrable environmental protection outcomes. But it is better to have institutions striving to inculcate environmental values into the very way in which they conduct their business than to have it remain an external factor that government imposes.

Having private actors take on traditional government functions also raises important factors that merit further research and discussion. For example:

- What role does the public play when companies or companies and non-governmental organizations create voluntary codes of conduct?

²Report of the World Commission on Environment and Development: Our Common Future, ch. 2 (1987).

[Section 25:4]

¹See, e.g., "A Summit on Private Environmental Governance: Facing the Challenges of Voluntary Standards, Supply Chains and Green Marketing," available at http://www.eli.org/Seminars/past_event.cfm?eventid=768.

²See § 26:44, *infra*.

³http://en.wikipedia.org/wiki/Private_governance.

- Why should private entities be responsible to other private entities for environmental compliance?
- What is the appropriate role, if any, for government in this new system?
- To what degree will private environmental governance invite so-called greenwashing, or public relations efforts disguised as environmental protection efforts?

This area is still in its infancy, but represents an important aspect of environmental protection law that bears close attention.⁴

§ 25:5 Conclusion

Environmental protection law remains a work in progress. As new environmental risks are understood, new governance solutions are proposed. While congressional action may have reached a nadir, new efforts such as private environmental governance and the public's embrace of sustainability provide evidence of dynamism in this field.

Despite the many changes in environmental conditions and law in the past four decades, the need to internalize externalities remains perhaps the most pressing constant. Garrett Hardin made clear in 1968 that the tragedy of the commons is a central cause of environmental decline.¹ In the 21st century, we continue to face this issue through common use of the atmosphere to dispose of greenhouse gases, largely unchecked exploitation of global fisheries, lack of adequate regulation of fresh water usage, and many other examples.

Our environmental governance system largely continues to allow usage of common resources without users bearing the full cost of the use to current and future generations and without recognizing the many benefits our natural world provides that are not monetized. Sustainability may be one method to tackle externalities, and private environmental governance and reform of environmental protection law may be other or complementary methods. Finding ways to accommodate an expanding human population through innovation, efficiencies, and internalizing externalities remain central challenges for environmental protection law as it continues to evolve and adapt.

⁴For a comprehensive discussion of private environmental governance, see Vandenberg, *Private Environmental Governance*, 99 *Cornell L. Rev.* (forthcoming), available at http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2237515.

PART I. CHANGING CIRCUMSTANCES

§ 26:1 Introduction

Almost 40 years after the dawn of the modern age of federal environmental law, the nature of the environmental challenges faced by the United States has so fundamentally changed that the country's system of environmental governance must be completely re-imagined to ensure healthy air, clean water, a stable climate, safe drinking water, vital ecosystems, and continuing biodiversity. For most of this time environmental governance has primarily been, and been seen as, a regulatory process within the domain of government. Today, environmental governance must become a shared enterprise, anchored by government regulatory programs, but fully integrating economics-based and values-based behavioral drivers as well. Rather than relying primarily on direct regulations to control behavior, government (and other organizations) must employ a variety of direct and indirect measures in a new system of environmental governance to achieve desired environmental outcomes. These measures may include collaboration, voluntary programs, information, participation, taxes and fees, business drivers such as reputation and investor relations, education, and consumer pressure, among others. This will require government to rethink how its human and financial resources are deployed to leverage the maximum possible environmental results from those approaches.

§ 26:2 Changing world in which change is accelerating

The changes necessitating this shift from environmental programs heavily focused on traditional regulation to a leveraged management system that relies on a variety of actors to help shape environmental outcomes have come in many forms:

- The complex, societywide issues associated with greenhouse gas (GHG) emissions were not on the scientific radar screen in the early 1970s.
- The value of wetlands and the effect of persistent bioaccumulative toxins on fisheries were not well understood outside of the scientific community.
- Urban sprawl and intense development along many coastal areas were not as severe as they are today.
- The impact of nonpoint sources of water and air pollution, though anticipated, were not the focus of the regulatory system and not thought to be as signifi-

cant as they have proved to be.¹

- The impacts on air quality and climate from motor vehicles, ships, and aircraft have dramatically changed as the economy has globalized, ships and trucks have become the virtual warehouse for just-in-time manufacturing and big-box retailing, and the number of vehicle miles traveled has skyrocketed.
- The rapid growth in abandoned urban industrial property resulting from major changes in the manufacturing patterns and, at least in part, from the unintended consequence of the liability system designed to drive cleanup of old industrial waste sites.
- The increasing pace of scientific breakthroughs like nanotechnologies are beginning to outpace the ability of the regulatory system to respond using traditional approaches.
- The dramatic shift in the United States from a manufacturing economy to a service economy—where service businesses now account for three-fourths of the nation's economy and 80% of its employment²—has eliminated many major industrial point sources, but now includes a vastly larger number of smaller sources of pollution.
- The scale of environmental problems such as climate change, mercury contamination, biodiversity loss, and illegal logging and the cost of responding to the problems has dramatically increased.
- Globalization of the economy means that consumer decisions have environmental impacts both locally and in countries throughout the world.
- The public desires to be more fully engaged in decisions about environmental issues in their community and more generally.

As Marian Chertow and Daniel Esty observed in their book *Thinking Ecologically*:

In the past, when environmental insults were obvious and the targets of controls were big smokestack industries, making companies pay for their despoliation had a moral logic that offered wide appeal. Today, however, when many of the harms we face reflect the cumulative impact of millions of individual and small enterprises, the enemy is “us” and the moral certainty of the crusade is harder to sustain.³

Point source pollution control over the last 35 years has produced tremendous public health and economic benefits. But it has also been a very expensive enterprise, with the nation spending in excess of \$200 billion annually to carry out our environmental laws.⁴ Most of these costs have been absorbed by the same point source facilities that have been the focus of environmental regulation. These costs have become embedded in the price of goods and services and are, for the most part, not particularly visible to the public.

However, the cost of dealing with many of the new sources of environmental problems like GHGs, nonpoint source water pollution, and urban sprawl may be far more apparent to the public since many of the costs will not be as easily blended into the economy, at least in the short term. The cost of rehabilitating major ecosystems is staggering, requiring sources of revenue that stretch far beyond the scope of traditional environmental funding. For example, the cost of achieving the water quality goals for a healthy Chesapeake Bay are estimated to be in excess of

[Section 26:2]

\$25 billion,⁵ the cost of the Comprehensive South Florida Ecosystem Restoration Plan is expected to exceed \$19 billion,⁶ and a 2006 version of the Great Lakes Regional Collaboration Implementation Act called for more than \$20 billion in spending over a five-year period.⁷

The costs of a serious effort to stabilize carbon dioxide (CO₂) emissions are even higher, with one recent estimate by Prof. Robert Stavins indicating that the cost will be between 0.5% and 1% of gross domestic product (GDP) annually depending on the chosen reduction targets.⁸ Given a GDP of about \$13 trillion,⁹ this is an annual cost of between \$65 billion and \$130 billion. The scale of these costs is driving policymakers to find new ways of approaching environmental problems.

§ 26:3 The consequences of change

The nature of today's environmental problems and the costs to remedy those problems has dramatic consequences for the design of an effective system of environmental governance. The public can no longer simply turn over environmental problems to "expert" government agencies and expect the problems will be resolved without their involvement or commitment. And the public cannot expect these major environmental problems to be solved without committing either significant new tax or fee revenues or new sources of nongovernmental funding to the problems. Legislatures and government agencies can no longer concentrate most of their efforts on large public and industrial facilities and expect that major ecosystem problems will be adequately addressed. Simply writing rules, requiring permits, enforcing the permits, and reporting to the public about how many permits have been issued and how many penalties have been imposed is increasingly an insufficient response. The public wants to know how much cleaner its air and water is as a result of what government is doing.

Industrial facilities and service operations cannot simply outsource or offshore their environmentally damaging operations and expect that they have satisfied their environmental obligations, nor can they expect that mere compliance with a limited set of environmental standards will be sufficient to satisfy their customers' expectations or the demands of their investors and insurers. Farmers and developers who have for the most part escaped the reach of the environmental regulatory system cannot expect this situation to continue as the consequences of land use on the environment become more evident.

Both government and facility owners must recognize that members of the public want more information about environmental conditions, want more and earlier opportunities to participate in environmental decisions, and want to have a real voice in the decisionmaking process.

This new system of environmental governance will be complex and difficult to manage; government "controls" much of the regulatory system but often only has the ability to influence economics-based and values-based environmental behavioral drivers that many of the new approaches rely upon. Thus, any new system of

⁹Central Intelligence Agency, The 2008 World Factbook 657 (2007), available at <https://www.cia.gov/library/publications/the-world-factbook/print/us.html>.

environmental governance will require new societal arrangements. In some cases, government will still set the standards and the rules of behavior. In other cases, new forms of stakeholder consultation will be needed where government, citizens, businesses, and nongovernmental organizations (NGOs) work with each other to achieve agreed-upon environmental goals. In still other cases, companies will establish their own environmental standards driven by economic factors including cost savings and the opportunity to differentiate their products, but also by reputation, customer demand, insurance availability, investor decisions, and other factors like corporate values. Governments' role in this area may simply be to recognize these economic forces driving corporate behavior and to not intervene in a way that would limit these forces. Or, government may be in a position to encourage corporate "beyond compliance" behavior through a variety of incentives or by providing information to the public.

In some cases, communities will drive environmental behavior through forces such as common law, legislative liability standards, local environmental regulation, customer demands, investment decisions, company reputation, and educational campaigns. Governments' role in these circumstances may be to provide information supporting community-based activities or to provide wider community access to government processes.

In yet other cases, NGOs will drive company behavior through negotiations, threats of public action, or shareholder actions. Government may be able to facilitate NGO action through participation in collaborative efforts and by providing information, including scientific data.

PART II. CALLS FOR NEW APPROACHES TO ENVIRONMENTAL GOVERNANCE

§ 26:4 Regulatory critiques

For nearly 20 years, a wide range of organizations, including the U.S. Environmental Protection Agency (EPA) and state environmental agencies, has recognized that the traditional regulatory approach cannot, by itself, achieve the kind of environmental outcomes needed to solve many of the nation's most critical environmental problems. As early as 1987, EPA began to reexamine the most important environmental risks facing the country and found that many of those risks (including the relatively highly ranked risks related to habitat destruction, loss of biodiversity, climate change, and nonpoint source discharges to surface water) were outside of the Agency's core regulatory programs.¹ The following discussion looks at several of the critiques of the core regulatory system in chronological order.

§ 26:5 National Academy of Public Administration: setting priorities, getting results

In 1995, the National Academy of Public Administration (NAPA), in what would become a long series of reports on EPA, produced a list of the most serious "residual" environmental risks. The list was similar to that produced by EPA in 1987, and included polluted runoff from farms and urban development, high levels of ground-

[Section 26:4]

¹U.S. EPA, *Unfinished Business: A Comparative Assessment of Environmental Problems* (1987).

level ozone, climate change, biodiversity loss, and degradation of coastal zones.¹ NAPA noted: “One thing which the problems in the list have in common is that they are caused not only by the emissions of chemicals from smokestacks and drainage pipes, but from thousands or even millions of different sources, or from patterns of land use,”² and pointed out that “EPA’s traditional command-and-control approaches are relatively ineffective tools for managing most of the problems on the list”³ To better cope with the nation’s environmental problems, NAPA suggested a shift “from a system that relies heavily . . . on tightly defined pollution controls set by federal lawmakers and regulators, to a system that would rely more heavily . . . on the ability of individuals, firms, communities, and states to meet national environmental standards in ways that make the most sense to them.”⁴

Although the need to rely more heavily on actors outside government to produce desired environmental outcomes was noted by NAPA more than 13 years ago, this shift in focus has proven difficult to accomplish.

Coincident with the NAPA work, the Aspen Institute through its “Series on the Environment in the 21st Century” and President William J. Clinton’s Council on Sustainable Development took in-depth looks at the U.S. environmental regulatory system.

§ 26:6 The Aspen Institute

The Aspen Institute’s Series on the Environment in the 21st Century was one of the first efforts to seriously engage government, business, and environmental organizations in a *balanced* stakeholder dialogue focused on developing a new environmental management system for the United States based on “the belief on all sides that current environmental protection and enhancement strategies are not sufficient to meet the environmental challenges of the next century.”¹ This belief led to a goal of developing “a new way to protect and enhance the environment consistent with a sustainable society characterized by a vibrant economy, protection of public health and the natural environment, and social and environmental justice.”² The Aspen participants called this new way “The Alternative Path.” They explain that

[a] company or other regulated entity choosing to operate under the Alternative Path may design a tailored, more efficient environmental management plan with increased flexibility as to how the environmental goals are achieved. This may involve waivers of currently applicable regulatory requirements. In return, however, the plan must be developed in an open, transparent, consensus-based stakeholder process; it must ensure the attainment of better environmental performance than would be achieved under the traditional regulatory process; and it must not result in significant increase in risk to any exposed population or shift risks from one population to another.³

The Alternative Path provided a quid pro quo for regulated entities: increased flexibility to identify and utilize the most efficient means of accomplishing

[Section 26:5]

³*Id.* at 3–4.

environmental results in return for a commitment to achieving environmental outcomes beyond the minimums established by law, increased transparency, stakeholder involvement, and a greater focus on prevention and continuous improvement.⁴ As the Aspen Institute report noted:

The Alternative Path is founded on a new, more cooperative relationship [among] regulators, the regulated companies and communities, and affected constituencies—stakeholders who are impacted by the decisions and outcomes. At the heart of this relationship is a mutually beneficial approach—allowing more flexible and efficient compliance methods in return for achieving superior environmental performance and involving stakeholders more directly in the information sharing and decision making process.⁵

The Clinton Administration’s Regulatory Reinvention effort adopted the Aspen concept in 1995 launching Project XL (Excellence and Leadership), a high-profile experimental effort to test the Alternative Path.⁶

The Aspen Institute’s proposal involved a rather limited innovation: providing more flexibility in the permitting process or avoiding the need for some new permits by allowing companies to operate under facilitywide caps or through the use of other mechanisms in return for superior performance commitments and greater involvement of stakeholders. However, even this limited innovation faced significant obstacles when it was introduced in the XL program and has not survived in any major EPA programs today. It also focused on reforms in the regulatory system rather than going beyond the regulatory system to introduce new economics- or values-based approaches. The President’s Council on Sustainable Development (PCSD) took a broader approach to reform.

§ 26:7 PCSD

The PCSD, an elaborate multi-year, multi-stakeholder effort,¹ examined in depth the need to diversify the methods used to drive desired environmental results. The council found that

Future progress requires that the United States broaden its commitment to environmental protection to embrace the essential components of sustainable development: environmental health, economic prosperity, and social equity and well-being. This means reforming the current system of environmental management and building a new and efficient framework based on performance, flexibility linked to accountability, extended product responsibility, tax and subsidy reform, and market incentives.²

Specifically, the PCSD recommended an “alternative path” similar to the Aspen Institute proposal,³ but went well beyond Aspen in recommending new approaches to environmental management. PCSD’s recommendations included the following:

- A “voluntary system that ensures responsibility throughout a product’s life cycle by all of those involved in the life cycle. The greatest opportunity for

extended product responsibility rests with those throughout the commerce chain—designers, suppliers, manufacturers, distributors, users, and disposers—that are in a position to practice resource conservation and pollution prevention at lower cost”;⁴

- Tax policies, e.g., carbon taxes, that discourage environmentally damaging production and consumption decisions and eliminate subsidies that encourage activities inconsistent with economic, environmental, and social goals;⁵
- Greater use of market incentives such as cap-and-trade systems, congestion pricing, and energy efficiency surcharges on utility bills;⁶
- “[O]pen information policies and practices, recognizing that disclosure and active dissemination of information should be the rule, not the exception”;⁷
- A system of indicators that report progress toward national sustainable development goals to the public on a regular basis;⁸
- Changes in the formal education system to help students, educators, and education administrators learn about the environment, the economy, and social equity;⁹
- “[N]onformal access to information on, and opportunities to learn and make informal decisions about, sustainability as it relates to citizens’ personal, work, and community lives”;¹⁰
- “[V]oluntary, multistakeholder, collaborative approaches to protect, restore, and monitor natural resources and to resolve natural resources conflicts”;¹¹ and
- Incentives such as tax credits, conservation reserve payments and resource depletion fees “to stimulate and support the appropriate involvement of corporations, property owners, resource users, and government at all levels in the individual and collective pursuit of stewardship of natural resources.”¹²

The PCSD report is the first major set of environmental policy recommendations to fully embrace a triangulated approach to environmental management that relies on an enhanced regulatory system, economic incentives and disincentives, and individual and organizational values based on better environmental education and improved access to information to achieve the goal of sustainable development. Almost all of the elements of advanced environmental governance needed to address the problems discussed in the case examples later in this Article are included in the PCSD recommendations.

EPA incorporated some of these ideas into its programs through, for example, Project XL, the Common Sense Initiative,¹³ its public involvement policy,¹⁴ the cre-

⁴*Id.* at 40. This recommendation moves beyond traditional regulatory approaches to incorporate programs such as EPA’s Green Chemistry® and Energy Star® programs but does not recommend a move as far as some of the product regulation approaches adopted by states, e.g., Minnesota’s electronics and metals regulations, or in European Union Directives.

ation of its Office of Information,¹⁵ the Agency's five-year strategic planning and goal-setting process,¹⁶ and its Smart Growth Initiative.¹⁷ However, the Agency has not adopted the kind of systematic governance changes envisioned by the PCSD.

§ 26:8 NAPA: resolving the paradox of environmental protection and “enterprise for the environment”

NAPA revisited the issue of environmental governance in 1997. It found that EPA's main challenge is to

learn to maintain and improve a regulatory system that is both nationally consistent and individually responsive to the particular needs of each state, community, and company. That paradox can be resolved only if the agency and Congress continue to adopt performance-based tools. These include information management systems, market-based controls, compliance-assurance strategies, regulations which encourage firms to choose among compliance strategies, and new partnerships with states and businesses.¹

Former EPA Administrator William Ruckelshaus served on the 1997 NAPA panel and at about the same time launched an effort of his own to identify ways that the environmental governance system needed to evolve to deal with the most pressing environmental problems. Enterprise for the Environment (E4E), yet another broadly representative stakeholder-based project, concluded:

[T]he current environmental protection system must be improved if it is to deal effectively with the serious environmental problems and challenges faced by the United States. Participants also agree that steps must be taken to both improve the quality of the environment and increase the effectiveness, efficiency, and fairness of the nation's environmental protection system. They believe that in the future, the system should encourage businesses, nonprofit organizations, government agencies, and individual citizens to reach higher levels of responsibility, accountability, commitment, and stewardship. In other words, because of both the nature of the environmental challenges that lie ahead and the inefficiencies associated with the current environmental protection system, E4E participants believe the system must evolve for progress to be possible.²

Key E4E recommendations included the following:

- Setting and pursuing clear environmental goals and milestones;
- Offering flexibility of means to meet environmental goals coupled with clarity or responsibility, accountability for performance, and transparency of results;
- Relying on a broader set of policy tools including economic incentives that reward superior performance and stimulate technology innovation, incentives that change individual behavior, and disclosure of consistent and accurate source-level information;
- Promoting collaborative problem solving;
- Encouraging high levels of stewardship; and

²NAPA, *The Environmental Protection System in Transition: Toward a More Desirable Future 3* (Center for Strategic & Int'l Studies 1998).

- Creating decision processes that meaningfully involve affected stakeholders.³

§ 26:9 NAPA: environment.gov.

Perhaps the most in-depth examination of environmental governance over the past decade is NAPA's report entitled *Environment.gov*,¹ involving 16 research teams who examined a wide range of issues from state and federal innovations programs to emissions trading to watershed planning to the working relationship between EPA and the states. The NAPA panel's blunt conclusion was that

[t]he nation's current environmental protection system cannot deliver the healthy and sustainable world that Americans want. Absent significant change in America's environmental governance, the accumulation of greenhouse gases will continue to threaten the stability of the global climate and all of the systems that depend upon it; the uncontrolled runoff of fertilizer and other pollutants will continue to choke rivers, lakes, and estuaries with oxygen-depleting algae; smog will continue to degrade the health of millions of Americans. The regulatory programs in place in this country simply cannot address those problems at a price America can afford.²

Instead, NAPA recommended that clear, measurable goals be established for making progress on the big environmental problems of nutrient loading, smog, and GHGs. NAPA further recommended that these issues be given priority attention, and a much broader range of innovative tools (including market-based mechanisms, collaboration, third-party auditing, industry leadership programs, and industry self-regulation) to attack these problems. Finally, NAPA recommended that much more information, including information on progress in meeting environmental goals, be gathered and made available to the public.³ In essence, in *environment.gov*, NAPA seconded the recommendations of the PCSD.

§ 26:10 Think-tank perspectives

Think-tanks from a range of perspectives have also pointed out the need for a change in the regulatory system. The free market-oriented Reason Foundation observed that

[t]he old . . . vision [of environmental management], shaped in the 1960s and 1970s, implicitly, and some-times explicitly, viewed the information challenge as one of identifying general environmental problems and then specifying uniform remedies to those problems; information relevant to environmental problem solving was perceived to be the sort that could be collected and centralized within as agency of experts, then translated into a series of one-size-fits-all regulations that prescribed acceptable technologies, cleanup methods, and single-purpose wilderness management plans. The public sector was the sector of choice for solving environmental problems, and punishment rather than cooperation was the method of choice for securing compliance on the part of the private sector.¹

Their new vision of environmental regulation includes the following five attributes:

³*Id.* at 4. Many of these recommendations also received support in a 1997 report issued by the National Environmental Policy Institute. See Nat'l Env'tl. Policy Inst., *Environmental Goals and Priorities: Four Building Blocks for Change* (1997).

[Section 26:10]

¹Alexander Volokh et al., *Introduction* to *Race to the Top: The Innovative Face of State Environmental Management* (The Reason Foundation Policy Study No. 239, 1998).

- Stresses problem solving instead of primarily relying on punishment;
- Strives to balance competing values, both environmental values against other values, and some environmental values against other environmental values;
- Seeks flexibility in methods of compliance, so that companies can choose the lowest cost way of following the law instead of having to follow a single prescribed way;
- Views the private sector as a key partner in environmental improvement; and
- Tries to bring decisionmaking authority to the lowest possible level where it makes sense—so that local problems can have local solutions, state problems can have statewide solutions, and federal problems can have federal solutions.²

In a similar vein, the Progressive Policy Institute (PPI), an organization associated with the Democratic party centrists, noted in 1999: “Environmental policy must be modernized to keep pace with the dramatic transformation in the environment, economy, and population. The first generation of rules simply cannot get the job done.”³

PPI recommended that second-generation strategies rely on better information that will drive performance and accountability, increased civic engagement to help solve place-based environmental problems, and expanded use of market-based incentives and regulatory flexibility to improve environmental performance and spur innovation.⁴

§ 26:11 NAPA: taking environmental protection to the next level

Major regulatory reform studies were noticeably absent in the early part of the 2000s. However, NAPA reentered the arena in 2007 with its report *Taking Environmental Protection to the Next Level: An Assessment of the U.S. Environmental Services Delivery System*.¹ The study, requested by the Office of Management and Budget, was designed to provide “an independent assessment of the U.S. environmental services delivery system and ways to optimize the capabilities of each level of government to achieve the greatest environmental and public health results.”²

NAPA found numerous reasons for a new approach to the delivery of environmental services such as the increased need to focus on diffuse sources of pollution, the

²*Id.*

³Debra Knopman & Emily Fleschner, Progressive Pol’y Inst., Briefing, Second Generation of Environmental Stewardship: Improve Environmental Results and Broaden Civic Engagement (1999). The study noted:

- Two-fifths of smog-causing nitrogen oxides come from factories and power plants. The rest comes from cars, trucks, railroads, airplanes, and other miscellaneous non-industrial sources whose actual emissions are difficult to control under the Clean Air Act rules.
- Agricultural runoff—not included in the Clean Water Act permitting program—is now the most extensive source of water pollution, affecting 70% of rivers and streams failing to meet water quality standards.
- More than two-thirds of greenhouse gas emissions—totally unregulated under the Clean Air Act—come from electricity consumed to heat, cool, and light homes and buildings, and from fossil fuels for transportation; industry energy use accounts for the remaining third.
- More than two-thirds of threatened and endangered species reside on private lands where the Endangered Species Act is least effective.

⁴*Id.*

[Section 26:11]

²*Id.* at 1.

limits to EPA's authority in areas such as nonpoint source pollution and brownfields rehabilitation, the increased public demand for information, the need to engage local governments and private organizations in resolving major ecosystem-based environmental problems, and the high cost of large-scale rehabilitation efforts.³

What is clear from the changes in the nature of environmental problems in each media is that the specific job each program is mandated to do by statute—its outputs [rules, permits, inspections, enforcement actions]—may not be enough to achieve the desired environmental outcome—clean air, clean water, or clean land. But ultimately, the environmental outcome is what voters, taxpayers, and the affected public care about. Most people do not understand or care about the details of program administration, but they do care a great deal about what difference the programs make to them individually, to the economy, and to the natural environment. The program outputs—and the effectiveness and efficiency with which they are produced—remain very important of course, and should continue to be measured and used to improve program management, but they are no longer enough to demonstrate the kind of “results” for which the agencies are now responsible.

. . . Producing a clean environment, rather than issuing permits for individual facilities and checking compliance with them, requires managers to involve many more partners, use new forms of collaborative management, obtain and work with greatly improved and more timely data, measure environmental outcomes rather than just program outputs, devise accountability systems that include far more parties than just EPA and the states, and accomplish many other unfamiliar tasks.⁴

To significantly improve the manner in which EPA delivers environmental services, NAPA recommended that the Agency:

- Strengthen its position as a partnering agency while maintaining a strong regulatory presence;
- Create a nonpoint source water pollution program on a par with its point source program;
- Directly serve as the coordinator for or support regional coordination efforts in resolving ecosystem-scale problems;
- Provide the scientific support needed to effectively address ecosystem-scale problems;
- Find, or help other units of government find, new sources of funding that can support large ecosystem restoration projects;
- Support innovative approaches to environmental problem solving; and
- Continue to improve outcome-oriented, performance management systems.⁵

§ 26:12 Study conclusions

The similarity of the conclusions from these studies and policy recommendations is striking. They recognize the need for a strong regulatory and enforcement system to anchor a diverse range of new approaches and tools that will help drive environmental improvement. The studies emphasize the importance of

- Establishing priorities, setting goals, and measuring progress;
- Improving access to information including good scientific data;
- Public engagement;
- Partnering and other forms of collaboration;
- Bringing new financial resources to the table;
- Innovation in developing and deploying a broad range of approaches to solving environmental problems; and

³*Id.* at 5–6.

⁴*Id.* at 8.

⁵*Id.* at 159–84.

- Individual and corporate responsibility and extended producer responsibility.

Equally striking, though, is the fact that the basic system of environmental management and the allocation of human and financial resources are little changed at their core after nearly 20 years of introspection. Daniel Fiorino observed in his book, *The New Environmental Regulation*:

Despite the several efforts to innovate, regulation in 2001 was not much different from what it had been in 1991. Behavior and relationships had changed somewhat; law and policy had changed very little. So William Ruckelshaus could write in 1998 that EPA had made progress but “only at the margins of the agency’s programs.” This statement was only slightly less valid by 2005.¹

Experiments have occurred for the most part on the margins of environmental governance. This is evidenced by many factors. Alternative path programs have not achieved long-term support at the federal level and remain relatively small programs at the state level. Collaborative decisionmaking and partnerships are increasingly used by EPA and a number of states but collaboration and partnering are still not embedded as a core element of environmental management. Some advances have occurred in public involvement especially with EPA’s public engagement policy, but many government administrators still are reluctant to fully engage the public. Innovation programs at both the federal and state level tend to be isolated from media programs, often making mainstreaming of innovation difficult, and little attention has been paid to how to engage NGOs and the public in the innovation process. More information is available but information is still not routinely seen as a central management strategy. Government-sponsored public education efforts, where they exist, remain a small part of most programs, limiting the impact that the agencies could have on individual behavior and on the behavior of smaller businesses. And, except for voluntary programs like Energy Star® or Green Chemistry® and a limited number of state product laws such as the Minnesota electronic waste legislation,² thinking about corporate responsibility and extended producer responsibility remains a minor element of the environmental governance equation.

PART III. CASE EXAMPLES

§ 26:13 New approached to environmental protection

Environmental problem solving has become increasingly complex over the past decade or more. As the following case examples demonstrate, government agencies, NGOs, and businesses have begun developing new ways of achieving environmental progress. These new approaches point the way for building a system of governance that can leverage significantly more resources to achieve environmental results.

§ 26:14 Impaired waters—Chesapeake bay

Even though significant progress has been made over the last 30-plus years in limiting water pollution from industrial sources and publicly owned treatment works, approximately 40% of lakes and rivers in the United States that have been assessed remain polluted. These waters do not meet water quality standards largely because of nonpoint sources of pollution such as agricultural and urban runoff and

[Section 26:12]

¹Fiorino, *supra* note 1, at 153.

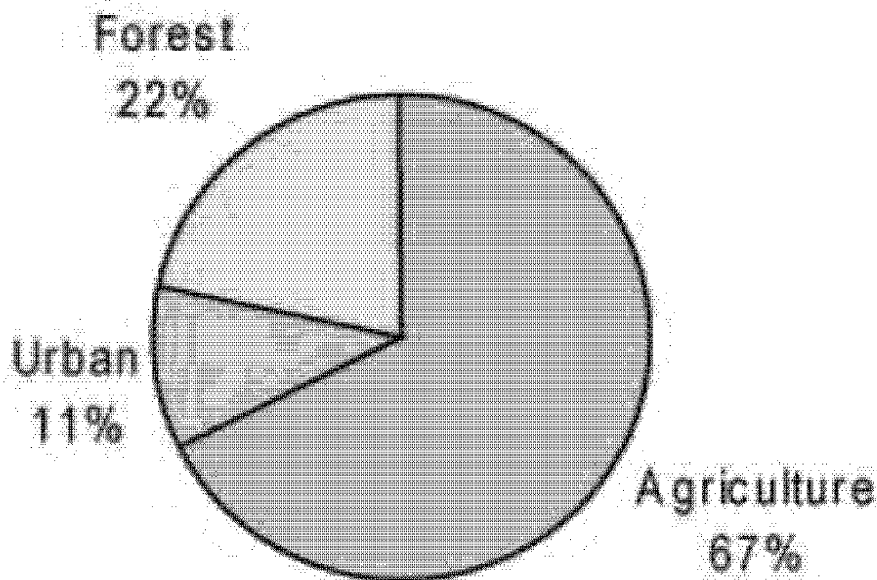

²Minn. Stat. §§ 115A.1310 to 115A.1330 (2007).

airborne deposition.¹ Solving the “impaired waters” problem in the United States is a complex challenge that requires a very different approach to governance. Consider the case of the Chesapeake Bay.

With a drainage area of 64,000 square miles in six states, the bay is North America’s largest estuary, and home to 3,600 species of fish, plants, and animals and 16 million people.² Water quality in the bay is seriously degraded by sediment, phosphorus, and nitrogen resulting in unwanted algae blooms, dead zones where levels of dissolved oxygen cannot support fish, and loss of critical habitat for crabs and other species.³ Achieving nutrient loading levels sufficient to produce a healthy bay is a tremendous challenge, with as much as a 70% reduction in nutrients needed. As the Figures below derived from NAPA’s study of the Chesapeake Bay indicate, agriculture is the largest source of all three pollutants, contributing as much as two-thirds of the sediment pollution. Conventional point sources are the second largest source of phosphorus and nitrogen impairment, followed closely by urban and development sources. Finally, vehicles and power plants are a major source of nitrogen pollution through atmospheric deposition.⁴

Chesapeake Bay Pollution Sources⁵

Sediment Sources to the Bay (2002)

⁴NAPA, *supra* note 48, at 48–49.

⁵*Id.* at 48.

Phosphorus Sources to the Bay (2002)

Nitrogen Sources to the Bay (2006)

Point sources are an important part of the nutrient problem and states, particularly Maryland, have used their traditional regulatory authority under the Clean Water Act (CWA) to impose stringent Enhanced Nutrient Removal (ENR) technology in new wastewater treatment permits.⁶ Clearly, though, most of the Chesapeake Bay problem is attributable to nonpoint sources (as much as 70%), with agriculture being the leading source of pollution and urban development a major and growing contributor.⁷

In addition to its role in regulating wastewater treatment facilities, the traditional regulatory system was an important tool in leveraging the wider Chesapeake Bay cleanup. In 1998, the American Canoe Association and the American Littoral Society sued EPA under § 303(d) of the CWA.⁸ The consent decree settling the case required EPA to issue total maximum daily loads (TMDLs) for the Chesapeake Bay and its Virginia tributaries if Virginia failed to complete TMDLs for those water bodies by 2010, spurring significant work on Chesapeake Bay issues by the state of Virginia.⁹

Although effluent standards and TMDLs play an important role in the Chesapeake Bay, two factors make the Chesapeake Bay a striking example of new approaches to governance: (1) the extremely large number of organizations involved in the cleanup process; and (2) the wide range of tools that are being used to help improve water quality. NAPA found that the Chesapeake Bay cleanup strategy requires the joint efforts of the following:

- 6 states, the District of Columbia, and 3,169 local governments;
- 23 federal agencies;
- 678 watershed associations;
- A large number of riverkeepers;
- 2 interstate river basin commissions;
- 30 regional councils (multi-county councils of local governments);
- 36 state-created tributary strategy teams;
- 87,000 farmers;
- 5-6 million homeowners;
- Hundreds of lawn care companies;
- An uncounted number of land developers, homebuilders, construction companies, agribusinesses, and other companies that send pollution to the bay; and
- A very large number of civic and nonprofit organizations.¹⁰

The diffuse sources of pollution, the scale of the reductions needed to achieve a healthy bay, and the complex intergovernmental arrangements have required governments to deploy an extremely wide range of conventional and nonconventional tools to attack the bay's pollution problems. These tools include identification of clear goals and benchmarks for bay restoration based on extensive scientific analysis, allocation of nutrient reduction responsibilities to each tributary of the bay and establishment of tributary strategies, imposition of new ENR standards for wastewater treatment facilities, development of a wide range of best management practices for agriculture and for development activity, establishing new taxes such as

⁶*Id.* at 54.

⁸*American Canoe Ass'n, Inc. v. U.S. E.P.A.*, 30 F. Supp. 2d 908, 29 Env'tl. L. Rep. 20383 (E.D. Va. 1998).

⁹*Id.* at 624-27.

¹⁰NAPA, *supra* note 48, at 160-61.

Maryland's flush tax¹¹ to support cleanup activity, raising funds through private philanthropy, social marketing campaigns to raise public awareness of problems, and to gain support for financing, the introduction of low-impact development concepts, and the use of collaborative decisionmaking.¹²

The complex and elaborate structure developed to attack pollution problems in the Chesapeake Bay reflects a broader trend in which governments have adopted a wide range of "indirect" mechanisms or tools to meet their strategic goals.

Lester Salamon observed that

[t]he heart of this revolution has been a fundamental transformation not just in the scope and scale of government action, but in its basic *forms*. A massive proliferation has occurred in the *tools* of public action, in the *instruments* or means to address public problems. Whereas earlier government activity was largely restricted to the direct delivery of goods or services by government bureaucrats, it now embraces a dizzying array of loans, loan guarantees, grants, contracts, social regulation, economic regulation, insurance, tax expenditures, vouchers and more.¹³

As Salamon suggests, and the Chesapeake Bay experience illustrates, important shifts have occurred in how government agencies must approach governance. These shifts include moving away from what an agency's programs require to what tools or instruments can best resolve a particular problem;¹⁴ from the role of agency hierarchies in directing environmental problem solving to the network of organizations that are needed to effectively implement environmental solutions;¹⁵ and shifting from the public sector *versus* the private sector to the public sector *plus* the private sector.¹⁶

This change is illustrated by contrasting NAPA's version of the logic model traditionally used by EPA for dealing with water quality issues with the logic model of the Chesapeake Bay Program.

NAPA Logic Model for Traditional Point Source Water Pollution Control¹⁷

¹¹The Maryland Chesapeake and Atlantic Coastal Bays Restoration Fund is supported by a \$2.50 a month fee on sewer bills and a \$30 annual fee on septic system owners.

¹²*See generally id.*

¹⁴*Id.* at 9.

¹⁵*Id.* at 11. Stephen Goldsmith and William D. Eggers point out that

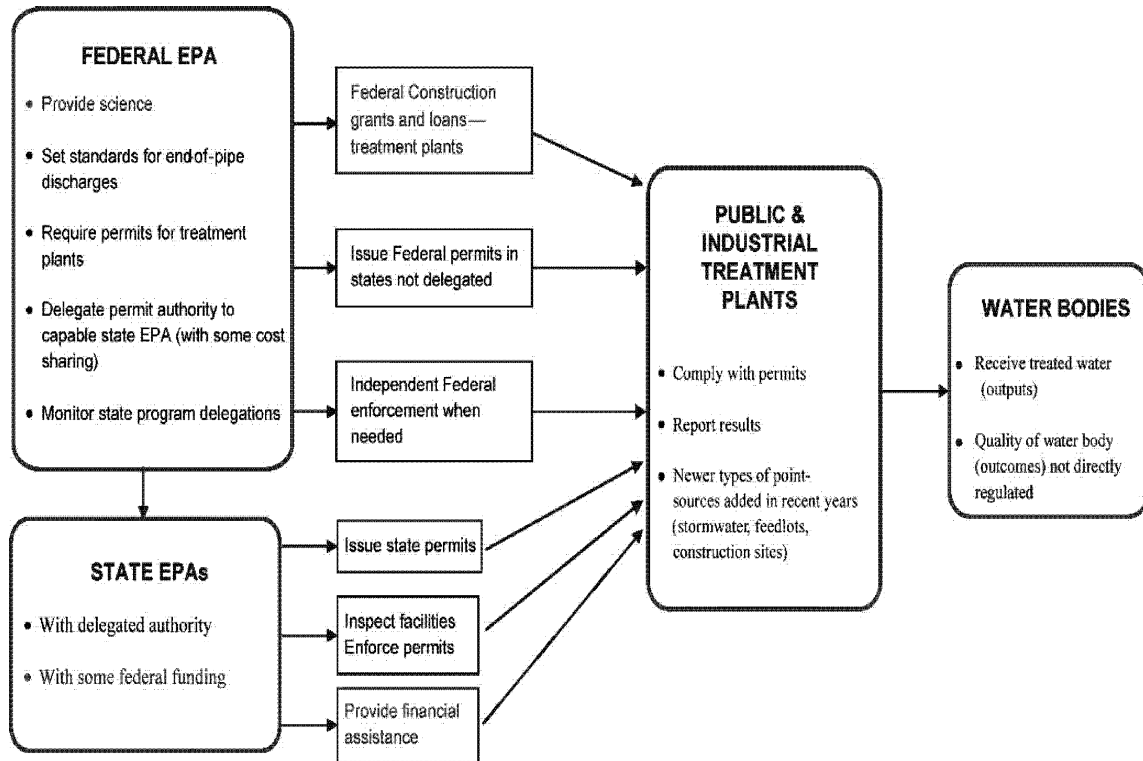

[i]n the twentieth century, hierarchical government bureaucracy was the predominant organizational model used to deliver public services and fulfill public policy

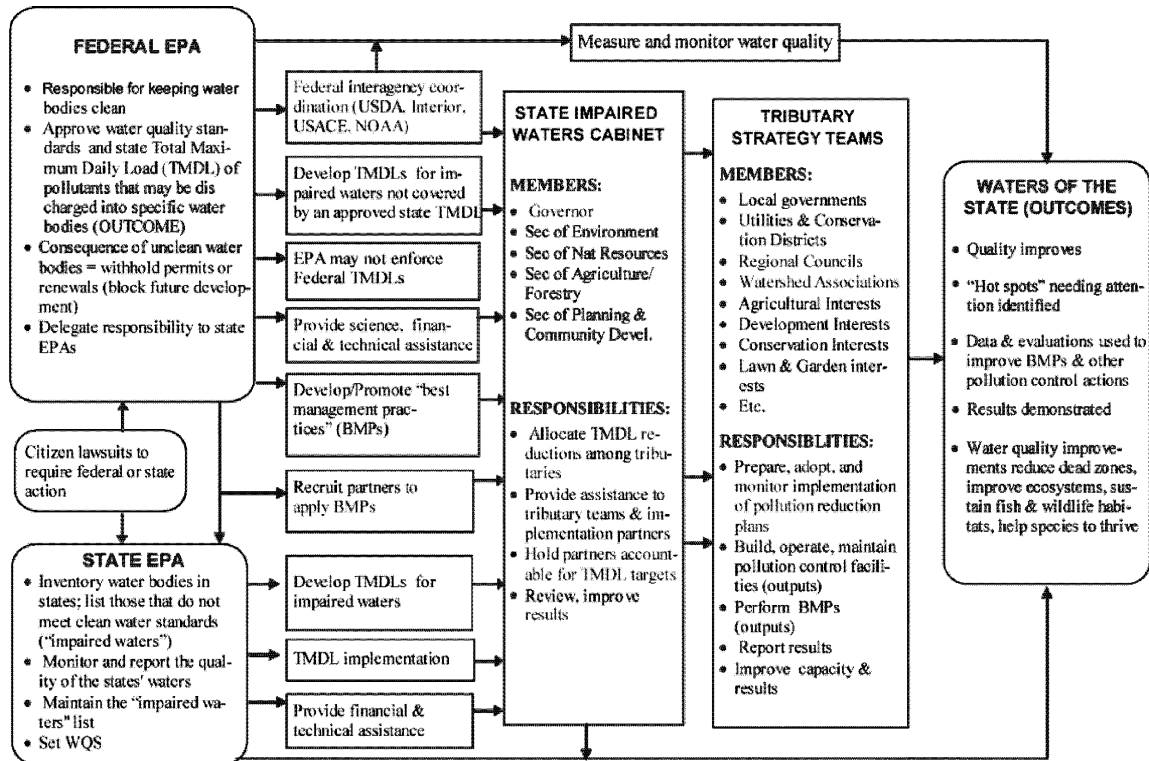

The hierarchical model of government persists, but its influence is steadily waning, pushed by government's appetite to solve ever more complicated problems and pulled by new tools that allow innovators to fashion creative responses. This push and pull is gradually producing a new model of government in which executive's core responsibilities no longer center on managing people and programs but on organizing resources, often belonging to others, to produce public value. Government agencies, bureaus, divisions, and offices are becoming less important as direct service providers, but more important as generators of public value within the web of multiorganizational, multigovernmental, and multisectoral relationships that increasingly characterize modern government.

Stephen Goldsmith & William D. Eggers, *Governing by Network: The New Shape of the Public Sector* 7–8 (2004).

¹⁶Salamon, *supra* note 67, at 14.

¹⁷NAPA, *supra* note 48, at 20.

NAPA Logic Model for Nonpoint Source Water Pollution Control¹⁸¹⁸*Id.* at 23.

Despite the large amount of money spent on Chesapeake Bay cleanup, the number of entities involved in the cleanup network and several innovative regulatory and voluntary programs, the bay will not meet water quality standards by 2010.¹⁹ The Chesapeake Bay Foundation's latest *State of the Bay* report rates progress on pollution issues either as a D or an F.²⁰ The scale of the nutrient reduction required (70%), the cost of the cleanup (estimated at over \$25 billion), the difficulty in finding politically acceptable and effective methods of dealing with agricultural runoff, and rapid development in the region²¹ all contribute to making it very difficult to restore the bay. Certainly going forward new regulatory tools will have to be part of the mix in dealing with agricultural runoff and problems related to development, but the scale and the cost of the problem, and the need to find politically acceptable solutions will continue to require a broad range of approaches to improving environmental outcomes.

Chesapeake Bay is only one of several major estuaries where ecosystem-scale restoration efforts are underway or planned. All of these restoration projects face similar challenges in establishing restoration goals, coordinating restoration activities, creating effective collaborative arrangements, funding, finding the right set of tools to solve problems, measuring progress, and involving the public.²²

§ 26:15 Impaired waters—Minnesota's response

The issue of impaired waters is not restricted to large, multistate estuaries. Each state in the country is struggling with how to restore its impaired waters. States have identified nearly 40,000 impaired water bodies.¹ Since many states have not yet assessed all of their water bodies—for example, Minnesota has only assessed about 8% of its river and stream miles and only 14% of its lakes²—the actual number of impaired waters in the country is much higher. In Minnesota, phosphorus, mercury, and turbidity are the principal sources of impairment. Only 14% of the impairment causing pollutants in Minnesota are discharged from point sources.³

The Minnesota response to impaired waters first required a new consensus on how to address the sources of impairment.⁴ Several local governments, burdened by the prospect of significant costs needed to upgrade wastewater infrastructure, had

¹⁹Office of the Inspector General, U.S. EPA, Development Growth Outpacing Progress in Watershed Efforts to Restore the Chesapeake Bay 8 (2007) (Report No. 2007-P-00031).

²⁰Chesapeake Bay Foundation, 2007 State of the Bay 3 (2007).

²¹EPA's Inspector General found that

[n]ew development is increasing nutrient and sediment loads at rates faster than loads are being reduced from developed lands. Little progress has been reported in reaching nutrient and sediment load reduction goals from developed lands. Judging just the load reductions from implementing the actions laid out in the tributary strategies, about 18 to 28 percent of each reduction goal was reported as being achieved in 2005 for developed lands. At this rate, full implementation of the developed land part of the strategies will not occur until 2028 at the earliest—many years after the 2010 goal.

³NAPA, *supra* note 48, at 101.

⁴Minn. Pollution Control Agency, Impaired Waters, <http://proteus.pca.state.mn.us/water/tmdl/tmdl-1-303dlist.html> (last visited July 30, 2008).

expressed concerns about tightening effluent standards to deal with impaired waters, particularly tighter phosphorus standards. Other interest groups including developers and agriculture were concerned about the prospect of new regulations. Businesses expressed frustration that they were too often the focus of the efforts to reduce pollutant loading through the CWA permitting process, often at very high costs, when the majority of the problem came from lightly regulated or unregulated nonpoint sources. The resulting stalemate over how to deal with impaired waters left the state with very serious water quality problems that affected the ability of cities to expand when their wastewater treatment facilities would contribute to further water quality impairment,⁵ affected the tourist industry that is critically important to the state's economy,⁶ and weighed heavily on public values in the "Land of 10,000 Lakes."

To bridge these gaps, the state Pollution Control Agency, working through a non-profit organization, the Minnesota Environmental Initiative,⁷ convened a very diverse stakeholder dialogue⁸ which, after two years of negotiations, developed a consensus approach for impaired waters. This was a historic alliance of parties that had traditionally held very disparate views on how to manage water quality issues in the state. The fact that such a wide range of interests could agree on the basic structure for a statewide impaired waters program resulted in broad bipartisan support⁹ for the legislation proposed by the coalition, the Clean Water Legacy Act.¹⁰ It is perhaps the most comprehensive approach to addressing impaired waters in the country.

The legislative findings in the Act reflect the consensus approach used in its development, noting that

- (2) achieving the state's water quality goals will require long-term commitment and cooperation by all state and local agencies, and public and private organizations and

⁵In 2005, a Minnesota Court of Appeals significantly limited the ability of expanding suburbs to obtain permits for new wastewater treatment facilities that discharge into an impaired water without fully offsetting any discharges that contribute to the impairment. The court of appeals held that the Clean Water Act prohibited the state from issuing a permit for a new discharge if that discharge would "cause or contribute to the violation of water quality standards." *In re Cities of Annandale and Maple Lake NPDES/SDS Permit Issuance for Discharge of Treated Wastewater*, 702 N.W.2d 768, 773 (Minn. Ct. App. 2005), rev'd, 731 N.W.2d 502 (Minn. 2007). The decision, rendered in the midst of the legislative debate over the Clean Water Legacy Act, provided additional incentive for passage of the Act. The Minnesota Supreme Court later reversed the decision in *In re Cities of Annandale and Maple Lake NPDES/SDS Permit Issuance for the Discharge of Treated Wastewater*, 731 N.W.2d 502 (Minn. 2007).

⁶Tourism supported approximately 126,360 jobs and contributed about \$4.6 billion to the state's gross regional product in 1999. Minn. Dep't of Emp. & Econ. Dev., *Economy, FAQs*, <http://www.deed.state.mn.us/faq/economy.htm#Economy19> (last visited July 30, 2008).

⁷The Minnesota Environmental Initiative (MEI) was formed in 1991 with the purpose of bringing professionals from business, government, and environmental communities together to work on partnership-based environmental projects. MEI, *Homepage*, <http://www.mn-ei.org> (last visited July 30, 2008). The initiative fosters "creative collaborations in the form of initial dialogues, policy forums and longer-term special projects." *Id.*

¹⁰S.F. 762, 84th Leg. Sess., codified as Minn. Stat. §§ 114D.05 to 114D.45 (2007).

individuals, with responsibility and authority for water management, planning, and protection; and

(3) all persons and organizations whose activities affect the quality of waters, including point and nonpoint sources of pollution, have a responsibility to participate in and support efforts to achieve the state's water quality goals.¹¹

This consensus-building approach is a markedly different path than the traditional regulate-permit-inspect-enforce paradigm.

The goals of the Act include assessing all waters of the state within 10 years, prioritizing and targeting restoration activities, using a combination of regulatory and nonregulatory approaches to restoration, and implementing measures that prevent future impairment.¹² The Act places special emphasis on public involvement:

Public agencies and private entities involved in the implementation of this chapter shall encourage participation by the public and stakeholders, including local citizens, landowners and managers, and public and private organizations, in the identification of impaired waters, in developing TMDLs, and in planning, priority setting, and implementing restoration of impaired waters. In particular, the Pollution Control Agency shall make reasonable efforts to provide timely information to the public and to stakeholders about impaired waters that have been identified by the agency. The agency shall seek broad and early stakeholder participation in scoping the activities necessary to develop a TMDL, including scientific models, methods, and approaches to be used in TMDL development, and to implement restoration.¹³

The emphasis on public and stakeholder involvement, including scientific stakeholders, is reinforced by other parts of the Act including: the creation of a multi-stakeholder Clean Water Legacy Council¹⁴ to oversee implementation of the Act; a requirement that the council and state agencies make use of available public and private expertise from educational, research, and technical organizations, including the University of Minnesota;¹⁵ and a requirement that the council develop educational strategies for “informing, educating, and encouraging the participation of citizens, stakeholders, and others regarding the identification of impaired waters, development of TMDLs, development of TMDL implementation plans, and implementation of restoration for impaired waters.”¹⁶ The Act places the burden of implementation on public agencies.¹⁷

§ 26:16 Impaired waters—Conclusions

Clearly, making progress on impaired waters will require a very broad approach to environmental governance. Traditional regulation and enforcement, including citizen suits, provides the essential context in which a wider range of creative approaches can be used. New effluent discharge limits for industrial sources is key to dealing with over 20% of the nutrient loading problem in Chesapeake Bay. And, the TMDL requirements in the Clean Water Act provide the backdrop against which all other efforts are measured in both the Chesapeake and in Minnesota. But these regulatory approaches cannot, by themselves, produce the dramatic reduction in

¹¹Minn. Stat. § 114D.10, subdiv. 2

nutrient loading needed to produce a healthy bay or a clean water legacy for an entire state. Instead, a range of other mechanisms—partnerships, collaboration, information, social marketing, new fees, private philanthropy, best management practices, etc.—must be strategically linked with regulation to have any hope that the desired end result will be achieved.

§ 26:17 Urban ozone and particulate pollution

Similar to the case of impaired waters, nitrogen oxides (NO_x), and volatile organic compounds (VOCs), the precursors of urban ozone, and particulate matter (PM) pollution are emitted by both point sources and nonpoint sources (referred to in air pollution language as area sources). Motor vehicles play a key role in both ozone and particulate pollution. Just as with impaired waters, it has become increasingly important to look to innovative ways of dealing with those diffuse pollution sources. Ozone and PM are two of the most important air pollutants from a public health perspective.¹

Ground-level ozone is formed when NO_x and VOCs react in the presence of sunlight.² The major anthropogenic source of NO_x is motor vehicles,³ accounting for 56% of the NO_x emissions in the United States.⁴ Other sources of NO_x include fuel combustion processes and utilities, which contribute 17% and 22%, respectively.⁵ Motor vehicles also make up 45% of total VOC emissions.⁶ Industrial and commercial processes account for almost all the rest of the VOC emissions at 50%, with the remaining 5% emitted by consumer solvents.⁷ A significant percentage of VOC emissions come from diffuse sources. For example, the top-10 sources of VOC in Baltimore include degreasing operations, pleasure craft, paints and coatings, portable fuel containers, consumer products, and lawn and garden machinery.⁸

PM is a term for air pollution composed of solid and liquid particles suspended in the air.⁹ Large, coarse particles with a diameter of 2.5 micrometers (m)—10 m are usually composed of soil particles, desiccated cellular debris, spores, and pollen.¹⁰ Uncovered soil, unpaved roads, mining operations, and agricultural processes all provide sources of wind-blown dust that constitute coarse particulates.¹¹

Fine particles with a diameter of less than 2.5 m are mainly composed of products

from coal and oil combustion, and can contain heavy metals.¹² They can be formed from gases, including sulfur dioxide (SO₂), NO_x, and VOCs.¹³ The NO_x and VOC sources listed above that contribute to ozone pollution also contribute to PM pollution.

Particulate emissions from diesel engines create particularly important health concerns. A study by the South Coast Air Quality Management District (SCAQMD) found that the air toxics carcinogenic risk in the Los Angeles Basin is as high as 1,400 per million people.¹⁴ Emissions from trucks, buses, cars, off-road vehicles, planes, and ships are the dominant source of the risk, with particulates from diesel engines making up 84% of the risk.¹⁵ In 2007, a new EPA rule required manufacturers to produce much cleaner diesel engines.¹⁶ However, diesel engines have a long life expectancy and many of the pre-2007 engines will be in use for 20 or more years.

Several organizations have pursued innovative approaches to deal with the diffuse sources of ozone and PM pollution, including diesel emissions.

§ 26:18 Urban ozone and particulate pollution—Clean Air Minnesota

The Minneapolis/St. Paul region is an attainment area for ozone but came close to exceeding ozone limits on several occasions beginning in the late 1990s. Recognizing this fact, the Minnesota Chamber of Commerce (the Chamber) commissioned a study in 1999 that found the cost to Minnesota businesses of meeting emissions regulations for ozone non-attainment areas under the Clean Air Act (CAA) would be between \$189 and \$266 million per year should the region slip into non-attainment status.¹

The Chamber pursued an unusual path in responding to these potential costs. The organization contacted the state's largest environmental advocacy organization, the Minnesota Center for Environmental Advocacy (MCEA), to discuss whether MCEA might be interested in developing a collaborative effort to reduce ozone-forming pollutants to reduce the possibility that the region would fall into non-attainment. No doubt, part of the motivation for this tactic was that many of the sources for ozone precursors were non-industrial, allowing at least some of the cost of dealing with ozone to be shifted to organizations other than those represented by the Chamber.² Still, the idea was intriguing enough that MCEA agreed to join in the effort.

The Chamber and MCEA began with feasibility meetings to which a broad spectrum of stakeholders were invited, including the Minnesota Pollution Control Agency, the American Lung Association of Minnesota, and Minnesota's largest oil

²Motor vehicle emissions are the largest source of ozone precursor emissions in the Twin Cities area followed by area sources. See Sonoma Technology, Inc., Preliminary Assessment of Ozone Air Quality Issues in the Minneapolis/St. Paul Region (2002), available at <http://www.pca.state.mn.us/publications/reports/ozonestudy2002.pdf>.

refinery.³ These meetings resulted in a consensus to pursue a collaborative approach to ozone reduction. Clean Air Minnesota (CAM) was created in 2002 to reduce ozone air pollution so that the Twin Cities metropolitan area remained in compliance with of federal air pollution regulations⁴ and was later expanded to incorporate particulate pollution.

The CAM facilitation process is also unique. The Chamber and MCEA decided to engage the Minnesota Environmental Initiative (MEI) to manage CAM. MEI works with nonprofit, business, and government partners to develop consensus on critical issues and move collectively toward action with positive environmental impacts.⁵ Both MCEA and the Chamber were members of MEI. Organizations that became a member of CAM⁶ agree to implement at least one long-term program designed to reduce air pollution emissions and to engage in education and outreach to employees.⁷

CAM developed a range of projects to reduce ozone precursors, including a lawn mower exchange program, a campaign to encourage businesses with large campuses to plant native grasses to reduce lawn mowing, and a public education campaign to dramatically raise awareness of ozone and particulate issues. The largest project, by far, has focused on retrofitting diesel school bus engines.

Project Green Fleet, through a combination of funding from companies and from EPA, retrofitted 500 school bus engines in its first two years of operation and now plans to retrofit a total of 4,000 buses, reducing particulate and other emissions by 30–40%.⁸ Project Green Fleet is now beginning to work with county governments to retrofit their diesel trucks and construction equipment.⁹ Overall, diesel engines account for only 10% of the vehicles in the state but more than 50% of air pollution from vehicles.¹⁰

§ 26:19 Urban ozone and particulate pollution—Other collaborative responses

Collaborative efforts have also been part of the response to ozone and PM pollution in non-attainment areas in a host of cities.

- Clean Air Counts in Chicago¹ is a collaborative effort among the Metropolitan Mayors Caucus, City of Chicago, U.S. EPA Region 5, Illinois Environmental

[Section 26:19]

¹Clean Air Counts began in 1999 as a response to the Chicago region's designation as a severe non-attainment area due to repeated violations of the national ambient air quality standards (NAAQS)

Protection Agency and almost 500 public, private and nonprofit partners.² This multiyear initiative is designed to achieve specific and significant reductions in targeted smog-forming pollutants and major reductions in energy consumption.³ Clean Air Counts established a goal of reducing polluting emissions by five tons per day through adoption of energy-efficient lighting; becoming an energy star partner; participating in a gas can replacement program; trading in gas-powered lawnmowers and leaf blowers for electric, battery-operated, or non-motorized models; using low-VOC building materials, cleaning supplies, and paint; using natural landscaping methods that minimize the use of mowing, fertilization, and pesticide treatments; participating in a diesel retrofit program; and reducing the number of employees who drive to work on a daily basis by offering alternatives and incentives.⁴

- The Clean Air Force in Austin⁵ recruits businesses in Central Texas to voluntarily join and commit to reducing emissions from their organization by 10% within three years. Clean Air Partners helps businesses do this by giving them ideas, including: (1) reducing the number of single-occupant vehicle trips made to the work place by setting up carpooling, vanpooling, public transportation options, bicycling, working from home, flex time, and compressed work weeks; (2) using clean energy and energy conservation strategies; and (3) using clean landscaping practices to avoid using fuel-powered landscaping equipment.⁶
- Clean Air Action in Houston⁷ focuses on encouraging ridesharing, using public transit and alternative transportation, and proper vehicle maintenance.⁸
- Spare the Air in San Francisco⁹ seeks to educate the public about air pollution and encourages individuals to help reduce air pollution. Spare the Air also has an employer program.¹⁰ Members of the program receive notice of high ozone one and one-half days in advance so that employers can try to reduce the number of employees that commute to work on the high ozone day. Strategies include offering employees the option to telecommute, subsidizing commutes via public transportation, offering free or preferential parking for car-pools/

for ground-level ozone. Clean Air Counts, *History*, <http://www.cleanaircounts.org/history.aspx> (last visited July 30, 2008). The program targets nonregulated sources of pollution, including: non-regulated businesses, industries, and institutions; municipal governments; developers; architectural services; property managers; households; and other governing and taxing bodies with a specific goal of reducing ozone pre-cursor emissions by five tons per day. Clean Air Counts, *Goals*, <http://www.cleanaircounts.org/goals.aspx> (last July 30, 2008). Clean Air Counts members employ numerous strategies to reduce emissions and conserve energy. vanpools, providing safe bicycling options (including showers and lockers at work), and allowing flexible work hours. Employers are also asked to find alternatives to using gas-powered lawn care equipment on ozone alert days. Over 2,000 businesses and government agencies have registered with Spare the Air.¹¹

- The Puget Sound Clean Air Agency (PSCAA) in Seattle¹² is a special purpose regional agency that works with EPA and the Washington State Department of Ecology to enforce air quality regulations, sponsor voluntary initiatives, and educate the public about clean air. Its Diesel Solutions program, started in 2001, works to reduce diesel emissions by retrofitting vehicles with pollution control equipment, using cleaner fuels, and promoting reduced idling. Transit agencies, school districts, cities and counties, ports, ferries, cruise lines, garbage haulers, and private businesses have all voluntarily joined the Diesel Solutions Program.¹³ Community initiatives sponsored by PSCAA include a program to subsidize a wood stove trade-out to reduce wintertime wood smoke pollution in the town of Darrington.¹⁴ PSCAA also encourages individuals and businesses to take measures to become more energy efficient.¹⁵
- Clean Air Campaign in Atlanta¹⁶ educates the public about air pollution and encourages voluntary efforts by individuals and businesses to improve the air quality in Georgia. Its efforts are focused on reducing the number of commuters traveling in the traditional one-car one-passenger way. Strategies for commuters include telework, carpooling/vanpooling, public transportation, bicycling, flexible work schedules, car sharing, and the guaranteed ride home program, which provide benefits for people who do not drive their car to work.¹⁷

§ 26:20 Urban ozone and particulate pollution—Conclusion

CAM is a dramatic example of a new approach to environmental governance. It is unique in many ways. It was imagined by a business trade association as a way of avoiding future regulatory costs and involved a partnership that is headed by the business organization and an environmental advocacy group. CAM is facilitated by another nonprofit organization and involves the state environmental agency as a participant in the collaborative. It relied on the state agency for the scientific information underlying the work of the collaborative, but has drawn funding from private organizations and foundations in addition to government financial resources. And it is safeguarded by the fact that if the effort fails to produce emissions reductions that keep the area in attainment, the government will step in and impose emissions reductions through a state implementation plan. The CAM example indicates that creative collaborations can produce important environmental results prior to the time that regulatory thresholds are triggered, creating early pollutant reductions, saving costs, building the public reputation of businesses, and creating a better

working relationship among communities, businesses and government agencies.

The other clean air programs incorporate a wide variety of approaches ranging from public education campaigns to voluntary emissions reduction programs to incentives for reducing commutes and trading in highly polluting equipment such as wood-burning stoves or lawn mowers for more efficient versions. Just as is the case for impaired waters, an important regulatory program underlies and provides the impetus for all of these efforts, but the regulatory program is only one part of a much larger effort to reduce urban ozone and particulate contamination.

§ 26:21 Brownfields rehabilitation

Brownfields rehabilitation is one of the first areas where significant rethinking about the role of government in leveraging private resources was critical to accomplishing public goals. Over the last few decades, many U.S. cities have undergone immense suburban development, pejoratively termed suburban sprawl by land use academics and city planners because of suburbia's often unorganized and expansive development patterns. Land use expert James A. Kushner describes America's subsidization of suburban development as an example of a centrifugal force that has driven metropolitan development farther and farther away from urban centers.¹ Critics argue that the consequences of unchecked suburban sprawl include vast degradation of green space, significant air and water pollution, increased commutes and congested traffic patterns, and increased CO₂ emissions, as well as diminished tax revenues for urban centers due to the loss of economic and residential development.² Reversing the negative effects of suburban sprawl requires public and private support for centripetal forces in metropolitan development that focus on urban and central city revitalization.³

EPA defines a brownfield as "real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant."⁴ The Agency estimates that there are more than 450,000 brownfield sites in the United States today.⁵ According to EPA, cleaning up and redeveloping brownfield sites in the United States "increases local tax bases, facilitates job growth, utilizes existing infrastructure, takes development pressures off of undeveloped, open land, and both improves and protects the environment."⁶ More than one-half of the 200 cities responding to a recent survey reported that if redeveloped, brownfield properties in their jurisdictions could yield an aggregate of \$958 million to \$2.2 billion in tax revenues annually.⁷ As part of the same survey, 91 of the cities responding estimated that up to 149,515 new jobs could be created if their brownfield sites were redeveloped.⁸ For environmental and public health purposes, the cleanup and redevelopment of brownfields "eliminates

the toxins and physical hazards brought on by idle and contaminated land.”⁹

Revitalization of brownfields is an essential element of urban revitalization plans.¹⁰ One study concluded that for every 1 acre of brownfields reused, 4.5 acres of green space is saved.¹¹

§ 26:22 Brownfields rehabilitation—Legal issues

Despite the fact that brownfields are usually found within the urban core, with access to public transportation, roads, and municipal services because of their previous industrial uses, redevelopment of brownfields has faced many significant obstacles. The most important factors hindering brownfields redevelopment are fears of environmental contamination and potential liability under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), also referred to as Superfund.¹ Ironically, although CERCLA was enacted to clean up the nation’s worst hazardous waste sites, it became “a barrier to the redevelopment of an astounding number of industrial sites that pose health and environmental hazards of their own.”² CERCLA’s complex liability provisions often encourage land-owners to choose to abandon or mothball their property rather than redevelop the property, and often drove development to occur on greenfields.³

§ 26:23 Brownfields rehabilitation—Minnesota’s Land Recycling Act¹

Beginning in the early 1990s, states responded to the growing inventory of brownfield sites by solving three critical problems using new tools that leveraged private interests and resources: (1) potential CERCLA liability associated with financing or undertaking redevelopment of potentially contaminated sites; (2) availability of funding to investigate potential contamination at the sites and to remediate that contamination if found; and (3) access to government staff to approve investigation and remediation plans.

Minnesota’s pioneering Land Recycling Act, passed in 1992, adopted a then very innovative approach to clarifying liability, leveraging private dollars for cleanup, and facilitating government review and approval. The Act provides that

[a] person who is not otherwise responsible [under the state Superfund law] for a release or a threatened release will not be responsible . . . for the release or threatened release if the person undertakes and completes response actions to remove or remedy all known releases and threatened releases at an identified area of real property in accordance with a voluntary response action plan approved by the commissioner [of the Pol-

¹Minn. Stat. § 115B.175.

lution Control Agency].²

This language made it very clear that a person intending to develop or finance the development of a site could do so without assuming the risk of unlimited CERCLA liability, the uncertainty that had previously prevented redevelopment of potentially contaminated property. The statutory change allowed the costs of redevelopment to be more clearly calculated once the extent of contamination was known thereby permitting the developer and financier to determine whether redevelopment was likely to be a profitable enterprise. Since contamination at many of these sites was not extensive and the value of the property for new development was often very high given their location, redevelopment of these properties significantly increased after the passage of the law, almost all supported by private funds. More than 1,200 voluntary cleanups have been completed under the Minnesota voluntary cleanup program.³

The Act also set up an important fee-for-services program that provided developers rapid access to state agency staff that could approve the developer's site investigation and cleanup plans. This arrangement allowed the agency to act quickly on the requests rather than putting these requests in the long queue of CERCLA cleanups, thereby accommodating the tight time schedules often associated with property transactions.

The basic model developed by Minnesota that relied on an understanding of the economics of urban redevelopment was subsequently adopted by most other states and, ultimately, by Congress.⁴

§ 26:24 Brownfields rehabilitation—Federal legislation

Following the lead of many states, Congress passed national brownfields legislation in the Small Business Liability Relief and Brownfields Revitalization Act (the Brownfields Act)¹ in 2002. The purpose of the new legislation was to “provide certain relief for small business from liability under [CERCLA], and to amend such Act to promote the cleanup and reuse of brownfields, to provide financial assistance for brownfields revitalization, to enhance State response programs, and for other purposes.”²

The Brownfields Act accomplishes this result by creating defenses to CERCLA liability including an Innocent Landowner Defense, a Contiguous Landowner Defense and a Bona Fide Prospective Purchaser Exemption. The Brownfields Act also provides public incentives to encourage brownfield redevelopment.³ The Act originally authorized \$200 million per year for an EPA-administered program to provide grants in order to assess and clean up abandoned or underutilized brownfields.⁴

The Brownfields Act also provides tax incentives for redevelopment. The federal brownfields tax incentive was originally passed as part of the Tax Relief Act of 1997.

⁴Tanck, *supra* note 149, at 1363.

This federal tax incentive allows a taxpayer to fully deduct expenses for environmental cleanup in the year the costs were incurred, rather than spreading them out over a period of years.⁵ To qualify for the incentive, a property must meet two main requirements. First, the property must either be held by the taxpayer incurring the eligible expenses for use in a trade or business or for the production of income or, it must be properly included in the taxpayer's inventory.⁶ Second, hazardous substances or petroleum must be present or potentially present on the property in question.⁷ This is known as the contamination requirement.⁸ These requirements essentially exclude properties owned for personal purposes. In December 2006, President George W. Bush signed the Tax Relief and Health Care Act of 2006,⁹ which extended the federal brownfields tax incentive through December 31, 2007, and also included petroleum products as eligible for expensing under the contamination requirement.¹⁰ The federal government estimates that the federal brownfields tax incentive would decrease tax revenue by \$300 million annually while returning up to 8,000 brownfields sites to productive use.¹¹

§ 26:25 Brownfields rehabilitation—Additional tools

The continued suburban expansion of many cities over the past 40-plus years has resulted in a variety of adverse side effects. Long commutes, high transportation costs, increased air pollution, and ever-worsening traffic have lead communities to consider smart growth programs that focus on revitalization of urban centers.¹ One of EPA's smart growth strategies has been to encourage brownfields redevelopment. In fact, EPA believes that "[b]rownfield redevelopment is an essential component of smart growth, as both seek to return abandoned and underutilized sites to their fullest potential as community and economic assets."² In 2002, 2003, and 2004, EPA awarded special grants to communities to incorporate smart growth into planning, revitalization, and redevelopment efforts, but the Agency has not offered any such grants under this program in the last three years.³

Portland, Oregon, is one of the most successful examples of smart growth development programs in practice. In Portland, a strict urban growth boundary (UGB) has generated high demand for inner-city and downtown redevelopment.⁴ Because Portland was home to a large number of brownfields sites, EPA selected the city in

1996 for a national brownfields pilot grant.⁵ Since then, Portland has become a model for brownfield revitalization. Much of Portland's success is due to the city's realization that brownfields and smart growth go hand-in-hand: "For every Brownfield redeveloped inside the [Urban Growth Boundary], sprawl to surrounding farm and forest land is reduced, air and water quality are improved, and jobs and income in the urban core area are increased."⁶

Environmental insurance is another interesting program that can shield developers from liability during cleanup and redevelopment of brownfields. The brownfields legislation has helped open the insurance market by allowing costs of cleaning up these sites to be more easily quantified and, therefore, the risk for insurers better understood. Environmental insurance in the brownfield context can be generally broken down into three types of policies: (1) cleanup cost cap; (2) pollution liability; and (3) secured creditor.⁷ Cleanup cost cap protects the developer from absorbing unforeseen cleanup costs that exceed original estimates.⁸ Pollution liability protection helps safeguard developers and long-term owners of revitalized brownfields from suits stemming from pollution on the property.⁹ Finally, secured creditor policies benefit lenders by guaranteeing loan repayments should a borrower default on loan payments because of a pollution condition.¹⁰

In the last decade, states began to institute their own environmental insurance programs. However, as of 2006, there were only four state environmental insurance programs in effect—(1) Connecticut; (2) Massachusetts; (3) New York; and (4) Wisconsin—although many other states were in the process of looking into setting up their own insurance programs in the future.¹¹ One major difficulty with environmental insurance programs for brownfields is that no two brownfields sites are the same, requiring each site to have a specifically tailored insurance policy. This reality prevents public and private insurers from forming generic insurance policies, an option that would reduce the cost of environmental insurance and make the insurance program more affordable for both providers and developers.¹² And, as a seminal U.S. Department of Housing and Urban Development (HUD) feasibility study on environmental insurance put it: "[S]o long as environmental insurance is not systematically included in the portfolio of tools strategically employed to promote brownfield redevelopment, neither large nor small [brownfields] will reach their full potential."¹³

§ 26:26 Brownfields rehabilitation—Example projects

Three brownfields initiatives provide an important perspective on the leveraging power resulting from thinking differently about how to create incentives to redevelop

urban property.

Atlantic Station

For the past century, the Atlantic Steel mill operated on a 130-acre tract located in downtown Atlanta.¹ The steel mill officially closed in 1998 and after three years of extensive cleanup efforts, EPA finally certified the site as safe for construction in December 2001.² After conducting a thorough investigation of the site, the property was remediated under a set of risk-based cleanup criteria tailored to site-specific future use.³ Following the cleanup and remediation of the site, and after another \$250 million was spent on investment in roads, sewers, and utility lines, construction on Atlantic Station finally began in 2002.⁴ Atlantic Station is said to be the largest remediation of a brownfield in the history of the United States.⁵

The idea for Atlantic Station was first conceived in 1996, and when completed it will include 5,000 residential units (including luxury condos as well as less-expensive townhouses and apartments), six million square feet of Class A office space, two million square feet of retail and entertainment space, 1,000 hotel rooms, and 11 acres of public parks.⁶ As of the summer of 2006 Atlantic Station's population was 3,000 and about 40% of the site redevelopment had been completed. The development has received brownfields redevelopment awards from both EPA and the Sierra Club. Atlantic Station has been cited as a national model for brownfield revitalization.⁷

Clearwater, Florida

The Clearwater Brownfields Area, home to the area's largest concentration of minority residents and once a thriving business center, had deteriorated over the last 30 years into place of abandoned land, gas stations, dry cleaning facilities, and print shops.⁸ With a current population of 109,000 residents, Clearwater used to be the center for canning, packing, and shipping citrus fruits grown in the region.⁹ Clearwater's brownfields revitalization efforts began in 1996 when Clearwater was awarded a \$100,000 pilot grant from EPA.¹⁰ After receiving an additional \$100,000 from EPA in 1998, Clearwater leveraged more than \$9 million in additional federal, state, and local funding by 2001.¹¹

Clearwater's focus on environmental justice has been one of the most unique aspects of its brownfields initiative. Rather than simply rehabilitate individual parcels of land, Clearwater used a communitywide planning process that engaged a

¹¹*Id.*

broad cross section of the community in thinking about how to rebuild. This plan developed in four phases:

- Phase 1: Conceptualizing, planning, and establishing principles and values that guide the project;
- Phase 2: Empowering and educating the community;
- Phase 3: Establishing economic, community, and land use strategies to address priorities developed by the community and the local government; and
- Phase 4: Bringing stakeholders together to work toward implementing the plan.¹²

Among the unique results of the Clearwater collaborative effort was building a health clinic as part of the brownfields rehabilitation to meet a critical community concern.¹³ Clearwater has remained a model for successful brownfields cleanup and redevelopment, and was awarded \$400,000 in Assessment Grants by EPA in 2007.¹⁴

Habitat for Humanity

In the mid-1990s one of Habitat for Humanity International's (Habitat's)¹⁵ most prolific chapters, the Twin Cities Chapter, found it increasingly difficult to acquire affordable building lots in Minneapolis and St. Paul. This led to an innovative alliance between a brownfields redevelopment program run by the MEI and Habitat. MEI's program, Resources for Redevelopment, links engineering firms with non-profit organizations seeking to develop brownfields site, and provides the NGOs with a volunteer consultant who can help access the necessity for, and cost of cleanup. The MEI/Habitat partnership, supported by EPA funding, allowed Habitat to expand the number of sites available to it for new homes, advanced the goal of infill development, and resulted in the removal of contaminated soils at several sites. This primarily private effort led by two NGOs with the assistance of engineering firms who volunteered their time is an important example of how government can leverage its influence through legislation providing needed liability protection (here state-level legislation) and targeted funding that primes the pump for significantly greater private sector funding.

The partnership that developed in Minnesota later became a nationwide program when Habitat officially partnered with EPA in 2002.¹⁶ The memorandum of understanding between EPA and Habitat is a general agreement on "coordinating policies to enact assessment and cleanup of brownfields, to promote community revitalization with residential energy efficiency, and to provide affordable housing for low-income people . . ."¹⁷ Beyond environmental benefits, Habitat's brownfields partnership with EPA is especially important for addressing the environmental justice consequences of abandoned or underutilized brownfield sites.

Habitat's brownfields initiative has spawned many success stories across the nation including Habitat East Bay in East Oakland, California.¹⁸ Before redevelopment, the site had been a former junk yard and gardening outlet, and had since

become contaminated with pesticides, lead, and petroleum.¹⁹ After an extensive three-year cleanup, Habitat East Bay was approved to begin building 26 single-family homes on the property.²⁰ In 2007, EPA approved a \$200,000 grant to Habitat East Bay to continue cleanup plans on different areas of the site.²¹ Other notable Habitat for Humanity affiliates pursuing brownfields redevelopment are located in Minneapolis/St. Paul, Minnesota; Washington, D.C.; Charlotte, North Carolina; Denver; and San Francisco.²²

§ 26:27 Brownfields rehabilitation—Conclusion

Solving the brownfields problem was essential for important policy reasons including revitalization of urban centers, limiting sprawl, and ultimately responding to important concerns like environmental justice and the need for affordable housing in areas with easy access to public transportation and jobs. The key to success for these programs was rethinking the role of government and building new collaborative programs. The CERCLA program and its accompanying liability standards are not only critical to ensuring that dangerous hazardous waste sites are cleaned up, but, perhaps more importantly, changing the hazardous waste management practices in the country to prevent future contamination. But CERCLA's side effects needed to be addressed to enable brownfields redevelopment. By better understanding the liability protections and the degree of certainty developers, banks, and insurers needed, new laws could be enacted that preserved the core purpose of CERCLA but provided the opportunity for private developers and their financiers to bring hundreds of millions of dollars in new financing to urban redevelopment projects.

§ 26:28 Managing nanotechnology development¹

Nanotechnology presents a very different challenge than the preceding case examples to the nation's traditional modes of regulation—the speed at which the technology is developing. Nanotechnology innovation is occurring very rapidly, with new products coming to the market monthly and whole new generations of technology expected within the span of a few years. The International Risk Governance Council (IRGC) notes that “innovation in the field of nanotechnology development is far ahead of the policy and regulatory environment, which is fragmented and incomplete at both the national and international levels.”² In its study, *Managing the Effects of Nanotechnology*, the Woodrow Wilson International Institute for Scholars pointed out that “[t]he rapid development of [nanotechnology] also means that government managers always will be operating with outdated information, and that data about [nanotechnology] effects will lag behind commercial applications.

[Section 26:28]

¹Parts of the discussion on Managing Nanotechnology Development are derived from Paddock, Keeping Pace with Nanotechnology: A Proposal for a New Approach to Environmental Accountability, 36 ELR 10943 (Dec. 2006), reprinted by permission.

²Int'l Risk Governance Council, Nanotechnology Risk Governance: Recommendations for a Global Coordinated Approach to the Governance of Potential Risks 13 (2007) [hereinafter Nanotechnology Risk Governance].

Priorities for research and for regulation will need to shift constantly.”³

The impact of rapid technology innovation is not an entirely new phenomenon for regulatory agencies. In the mid-1990s Intel became one of the early participants in EPA’s Project XL program to help develop a new approach to air permitting that could accommodate the rapid change in computer chip technology that might necessitate new industrial processes every 18-30 months.⁴ Standard government permitting processes often could not accommodate this short product cycle. As a result, Intel negotiated a more flexible plantwide limit for emissions for its facilities that allowed the company to change product lines and processes as long as it held total emissions below the plantwide cap.⁵ In return, Intel agreed to involve members of the surrounding community in discussions about the emissions limits, increased access to information about the performance of the facilities, and agreed to environmental performance standards beyond those that would otherwise be required by law.⁶ The XL agreement thus leveraged private economic incentives, here facilitating Intel’s need to move new products rapidly into production—to achieve better environmental results.

Nanotechnologies, however, present a more complex problem since there are literally hundreds of such technologies under development, little is known about the health and environmental impacts of nanomaterials, and new materials will be introduced to the market very quickly. While government will need to play an important role in health and environment research and through regulatory programs such as Toxic Substances Control Act (TSCA) and Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA), it is likely that government will have to use a variety of other governance tools to protect human health and the environment.

§ 26:29 Nanotechnology—Background

EPA defines nanotechnology in the following way:

[R]esearch and technology development at the atomic, molecular, or macromolecular levels using a length scale of approximately one to one hundred nanometers in any dimension; the creation and use of structures, devices and systems that have novel properties and functions because of their small size; and the ability to control or manipulate matter on an atomic scale.¹

A nanometer is one billionth of a meter. To put this into perspective, the diameter of a human hair is about 100,000 nanometers and a human red blood cell about 1,000 nanometers.² Nanoscale materials have physical, chemical and biological characteristics that differ fundamentally from larger particles, creating novel mechanical, optical, magnetic, and electronic properties.

The anticipated scale of the nanotechnology industry is exceptional. The IRGC notes that “[n]anotechnology has the potential to become one of the defining

²*Id.*

technologies of the 21st Century.”³ “Envisaged breakthroughs for nanotechnology include order-of-magnitude increases in computer efficiency, advanced pharmaceuticals, biocompatible materials, nerve and tissue repair, surface coatings, catalysts, sensors, telecommunications, and pollution control.”⁴

As of May 2007, 475 consumer products were using nanotechnology.⁵ This number had doubled from the 212 products counted only 14 months earlier.⁶ In 2005, nanotechnology was incorporated into more than \$30 billion in manufactured goods.⁷ It is estimated that this number will increase to \$2.6 trillion by 2014.⁸ On the international scale, the United States leads with 52% of the consumer products produced.⁹ Inside the United States, the top-four nanotechnology states are California, Massachusetts, New York, and Texas.¹⁰ Moreover, 47 of 50 states in the United States have at least one university, company, government lab, or organization working on nanotechnology.¹¹ In total, the U.S. government has invested around \$5.5 billion in nanotechnology through the year 2006, with an additional \$1.3 billion requested for 2007 alone.¹²

More than 30 countries have nanotechnology initiatives including many traditional industrial powers and less likely candidates such as Ukraine and Mexico. Research and development investments by industry worldwide are currently at about the same level as government investment but these private investments are increasing at a higher annual rate.¹³ Nanotechnology development appears to have become a race in which no nation, no state, and no major company wants to be left behind. For example, the United Kingdom’s Strategy for Nanotechnology concluded that “the field of nanotechnology and its applications is crucial to the future competitiveness and productivity of the UK economy, and to the well being and prosperity of its people.”¹⁴ And, the U.S.-based Nanotechnology Alliance observed:

[T]he countries that demonstrate the highest level of innovation and capture the most value from nanotech progress will exert a very significant level of influence on the global geopolitical landscape. For us to maintain our quality of life and global leadership position, the U.S. must play, not just to participate in, but to win the international nanotechnology race.¹⁵

State after state has enacted legislation trying to secure a competitive advantage

in the industry using tax credits,¹⁶ emerging technology funds,¹⁷ direct appropriation to university research centers,¹⁸ authorizing access to funding from Economic Development Banks,¹⁹ and creating cabinet-level positions to help the state cultivate and expand growth industries such as nanotechnology.²⁰

The dramatic investments in nanotechnology development reflect the potential benefits (and therefore the potential financial windfall) from nanotechnologies.

§ 26:30 Nanotechnology—Potential benefits

The development of nanotechnology will have significant effects on many facets of our lives including the environment, medicine, electronics, and an ever-expanding list of consumer products. Because fundamental life processes occur at the nanoscale, nanotechnology offers an ideal medium for fighting diseases.¹ Advanced drug-delivery systems incorporating nanotechnology would theoretically be able to direct drug molecules only to where they are needed in the body, a technique that would greatly reduce the side-effects of a treatment such as chemotherapy.²

Nanotechnology is also considered one of many tools that can help address the energy crisis. Nanotechnology will be used to enhance our abilities to capture, store, and distribute energy more efficiently.³ In the near-term, one of the most realistic uses of nanotechnology in the production of clean energy involves the development of more efficient solar panels.⁴ The company Nanosolar, which is engaged in perhaps the most ambitious private effort to enhance commercial solar technology through the use of nanotechnology, has attracted millions of dollars in grants and investments.⁵ Nanosolar's goal is to be able to mass produce its thin-film solar panels, which are not only 100 times thinner than traditional solar panels, but also significantly more efficient.⁶

Beyond solar panels, nanotechnology has also shown promise in significantly enhancing the storage capacity of batteries, a development that could make hybrid cars even more attractive in the future.⁷ Scientists are also looking into the possibility of improving energy transmission efficiency by applying nanocoating to wires to reduce lost energy as it moves down the line.⁸

Nanotechnology could also become an important part of the cleanup of contaminated and hazardous waste sites. EPA states that because of enhanced reactivity, surface area, subsurface transport, and/or sequestrian characteristics of nanomaterials, the benefits of nanotechnology could include more rapid or cost-effective cleanup

⁸*Id.*

of wastes.⁹ On a related point, nanotechnology is also being used to create more powerful sensors that can accurately detect contaminants in the environment at very low concentrations.¹⁰

While the potential societal benefits from nanotechnologies are profound, the risks associated with the technologies are also significant, especially in light of the fact we still know little about how exposure to nanomaterials may affect either health or the environment.

§ 26:31 Nanotechnology—Potential risks

Because nanomaterials are so small, they may have the ability to enter human cells and even alter biological processes on the cellular level.¹ Research has shown that nanomaterials can be hazardous to living organisms both because of their size and because of their toxicity.² However, it is still unknown exactly how nanomaterials may affect humans and other living organisms after long-term exposure. Even sunscreen, a popular nano-enhanced consumer product, has come under scrutiny as researchers are testing the long-term exposure to sunscreen to see if nanoparticles in the substance could enter the skin and possibly damage deoxyribonucleic acid (DNA) in human cells.³ Nanomaterials could also pose future danger to the environment. Because the toxicity of nanoparticles is not yet fully understood, serious environmental contamination could occur if nanoparticles are released into the environment without proper regulation and risk oversight governance.⁴ The IRGC recently observed: “We still have only a limited understanding of passive nanomaterials’ potential environmental, health and safety risks but active and more complex nanostructures require a far greater level of knowledge to assess potential risks.”⁵

§ 26:32 Nanotechnology—Governance considerations

Given the speed at which technology is developing and the pressure to be first to market, it seems clear that the regulatory system, by itself, cannot be relied upon to manage the environmental and public health consequences of nanotechnology or to create the level of public confidence needed to ensure the viability of the industry, even if the regulatory system were to be seen as the most desirable method for assuring environmental and health protection.

This is not just a problem for regulators and the public; it is also a problem for the industry. In addition to punishing wrongdoing, regulatory systems help build public confidence in an industry, especially an industry that may involve significant risks. Over the last decade, a number of industries have faced public confidence challenges with varying results. In the 1990s, the use of bovine growth hormones became a significant issue in the United States. While the controversy has largely subsided, a number of milk products are now labeled “BGH Free” to address

⁴Dennis, *supra* note 227, at 96.

⁵Nanotechnology Risk Governance, *supra* note 202, at 8.

concerns of some consumers.¹ Genetically modified organisms (GMOs), including such products as seed that can tolerate certain herbicides, have been similarly controversial. Concerns range from GMO “out crossing” in which GM crops cross-breed with non-GMO plants, changing the non-GMO plant’s characteristics, to fears about the potential affect of GMO foods on health, to the impact that patented GMO seeds may have on the cost of seed for farmers in developing countries.² Although GMO companies have overcome these concerns in the United States, public and political concerns resulted in a long delay in introducing GMO seeds in Europe.³ Nanotechnologies face a similar risk, at least in significant part because so little is known about the effects of these technologies.⁴

While a biotechnology type backlash has not yet affected nano-manufacturers, the level of uncertainty about the effects of some nanotechnologies, the fact the public knows little about nanotechnologies, the lack of a clear management approach that can allay public concerns, and the potential health and environmental effects of some nanomaterials all create the setting for a nano-backlash.⁵ It certainly appears to be in the best interest of the industry to work with government, NGOs, and others to create and implement a credible governance system that can build and maintain public confidence in the industry.

§ 26:33 Nanotechnology—Governance tools

Because of the speed at which the industry is growing and the range of materials and technologies that are part of the growing nano-revolution, a systematic approach to environmental governance is particularly important. If traditional government mechanisms cannot keep up with the industry, the environment and public health must be protected, and public confidence must be created through a more comprehensive approach.

§ 26:34 Nanotechnology—Governance tools—Government regulation

Government regulation must be part of the accountability system both to assure the environment and public health is protected and to build and maintain public confidence in the industry. Given the political stalemates that have occurred on environmental issues over the past few years, it is unlikely that major new legislation addressing nanotechnology will be adopted in the United States in the foreseeable future absent a dramatic incident involving nanomaterials.¹

Several environmental statutes, including the CWA, the CAA, TSCA, FIFRA, CERCLA, and the Resource Conservation and Recovery Act, may apply to nanomaterials, although each of the statutes has limitations in this context. The in-

ability to detect and monitor many nanoscale materials complicates the use of existing regulatory programs. And, given the pace at which the industry is evolving, reliance on traditional permitting approaches, which may take months or even years to complete for a new industrial process, could adversely affect competitiveness in the context of a rapidly developing global market and therefore may be strongly resisted.

The American Bar Association's Section on Energy, Environment, and Resources Law analysis of existing environmental statutes, as well as the analysis by other organizations such as the Environmental Law Institute,² indicates that these existing statutes are useful, but imprecise, mechanisms for dealing with various aspects of several nanotechnologies. Regulation of nanotechnology, given the rapid changes within the industry, is likely to be an ongoing process, with approaches evolving over time.³

EPA suggests a more product-oriented rather than emissions-related approach to managing the potential impacts of nanotechnologies:

Pollution prevention is a critical area to engage EPA resources and expertise as nanotechnology industries form and develop. It is critical that EPA apply the principles of green chemistry, green engineering, and environmentally benign manufacturing in EPA's approach to nanotechnology. EPA has the opportunity to work with stakeholders to apply approaches of pollution prevention and product stewardship to nanotechnology development, so that emissions and risks are reduced as productivity and the economy grow.⁴

§ 26:35 Nanotechnology—Governance tools—Public involvement and dialogue

If the nanotechnology industry does not address issues of public confidence in the technology, it may suffer the same fate as that of genetically modified seed crops in the European Union: rejection by the public as unsafe even though the scientific consensus identified little risk.¹ While regulatory schemes play a role in engendering public confidence, confidence is primarily an issue of values and of political and economic power. If opinion leaders view a product as antipathetic to the values they hold, products may either be banned from the market or may not survive, regardless of the actual risk involved. The specter of unfounded public rejection suggests that accountability tools must be identified that create public confidence in the industry.

A systematic approach to environmental governance for nanotechnologies requires constructive interaction among industry, government, advocacy organizations, and other public stakeholders. Prof. Gregory Mandel espouses a concept he calls dialogue and deliberation, in which representatives of all of the interest groups engage in a "culture-conscious" dialogue that focuses on values, not just competing scientific claims about benefits and risks.² The goal of the dialogue is "to help different groups learn about each other and each other's views, with a goal of cultural accommodation and understanding. Once these objectives have been achieved, a substantive policy deliberation can begin, aimed at developing widely acceptable policy

²Mandel, *supra* note 245, at 178.

solutions.”³

The Royal Society and Royal Academy of Engineering issued a similar call for public dialogue and debate on nanotechnology issues in its groundbreaking 2004 study of the industry:

The general case for wider societal dialogue about novel technologies, and with its greater openness about science policy, rests on three broad sets of argument The normative argument proposes that dialogue is a good thing in and of itself and as such forms a part of the wider democratic processes through which controversial decisions are made The instrumental argument suggests that dialogue, as one means of rendering decision-making more open and transparent, will increase the legitimacy of decisions and through this generate secondary effects such as greater trust in the policy-making process. . . . Finally, the substantive argument is that dialogue will help generate better quality outcomes. In the field of environmental risk, non-technical assessments and knowledge have been shown to provide useful commentary on the validity or otherwise on the assumption of experts.⁴

The Royal Society noted that with many mature technologies public dialogue has often arrived “too little too late” to be effective.⁵ With nanotechnology there is a unique opportunity to avoid the problem of too little, too late.

The IRGC has also suggested a stakeholder-based dialogue,⁶ and the Natural Resources Defense Council, Inc. (NRDC) and Environmental Defense have called upon both government and industry to do a better job of “engaging the broad array of stakeholders outside government and industry—labor, health organizations, consumer advocates and environmental NGOs—whose constituencies stand to be both beneficiaries of this new technology and those most likely to bear any risks that arise.”⁷

Dialogues engage surrogates for the general public, but it is also important to find ways to engage interested members of the general public directly. Better public education is an important element of a new public dialogue on nanotechnology. Education in this context cannot simply be a one-way effort to convince the public that nanotechnology has important societal benefits and is safe. Instead, the education process must be part of the dialogue, requiring “innovative approaches to information provision, ones that involve a genuine two-way engagement between scientists, stakeholders and the public.”⁸

Engaging a broad public in an esoteric issue like nanotechnology is difficult. Still, the Internet offers intriguing possibilities for a new form of two-way dialogue with the broader public. Such a dialogue could start with a web site on which the best and most credible information on the developments in nanotechnology is regularly posted. This could include up-to-date information on both the risks and benefits of nanotechnologies, information about developments in government regulations, and information about industry standards and self-regulation approaches. The broader public could then use the site to comment on proposed regulations or on issues that could be addressed by members of the industry.⁹

Assuring that adequate information is developed and disseminated on the health

and environmental impacts of nanotechnology is critical to public credibility and an essential element of environmental governance, as is better detection and monitoring technology.

§ 26:36 Nanotechnology—Governance tools—Voluntary programs

Industry leadership programs can play an important part in environmental governance for nanotechnologies. Recognizing that environmental behavior is driven by factors beyond command-and-control regulations, EPA and many states have developed voluntary environmental leadership programs. The incentives for participating in these programs may include public recognition, improved working relationships with government agencies, penalty avoidance through auditing and self-reporting, and regulatory flexibility. As an emerging industry, it may be useful for EPA, industry leaders, and NGOs to consider the role that leadership programs could play in motivating desired environmental behavior.

Programs such as Occupational Safety and Health Administration's (OSHA's) Star Program,¹ EPA's Performance Track,² the Green Tier³ in Wisconsin, and the Clean Corporate Citizen⁴ program in Michigan are examples of well-developed leadership programs. EPA's Energy Star[®]⁵ program is another example of a leadership program, although one that exists in an area entirely unregulated by EPA.

The IRGC suggests that "[i]ndustry, governments, and other stakeholders must collaborate now to lay the foundation for later regulatory action and to assess the potential for international voluntary agreements."⁶ In the United States, Environmental Defense and DuPont have led the way in creating a risk governance structure for nanotechnology development with their Nano Risk Framework.⁷

§ 26:37 Nanotechnology—Governance tools—Liability

Nanotechnologies will face the threat of legal liability under nuisance, negligence, or strict liability theories if their use causes harm to public health or the environment. The potential for civil liability is a key element of governance because government resources to deal with environmental problems are shrinking at the same time as environmental threats are increasing. The civil liability system plays a critical role in tempering corporate decisions to introduce potentially risky products into the market prematurely.

Liability can be mitigated by a robust regulatory regime that will encourage courts to view compliance with the regulatory scheme as establishing reasonable care on the part of the industry. The risks of civil liability can also be minimized by increased transparency.

The prospect of liability for harm to public health or the environment will be an

important governance tool for the nanotechnology industry. But, equally important, the industry has the opportunity to minimize that liability by employing mechanisms such as public reporting and early public involvement.

§ 26:38 Nanotechnology—Governance tools—Industry codes and self-regulation

Industries have increasingly turned to codes of conduct and industry self-regulation as a means of assuring compliance with environmental laws, maintaining their reputation, reducing the risk of legal liability, enhancing relationships with government agencies, minimizing exposure to penalties, and building public confidence. These codes and self-regulatory mechanisms are important accountability tools, especially if the codes or self-regulatory mechanisms increase the amount of information available to the public. Modern industry environmental codes trace their origin to the Coalition for Environmental Responsible Economies (CERES) and its CERES Principles adopted in response to the Exxon Valdez disaster.¹ The American Chemistry Council (ACC, then the Chemical Manufacturers Association) adopted its Responsible Care®² program at least in part to deal with increasing public concern about the chemical industry growing out of the disclosure of the role of discarded chemicals in groundwater contamination during the late 1980s. Responsible Care® is a mandatory program for all ACC members and is practiced in 52 countries.³ The Forest Stewardship Council, an NGO, developed a code for sustainable forestry practices and certifies compliance with its code to deal with the fact that forest management practices were often little regulated.⁴

Given the likely limitations on the government's ability to respond to nanotechnology, self-regulation is important to avoiding potential adverse impacts from nanotechnology and to build public confidence in the industry. Both the NRDC and Environmental Defense have recognized the importance of corporate standards of care:

Even under the most optimistic scenario, it appears unlikely that federal agencies will put into place adequate provisions for nanomaterials quickly enough to address the materials now entering or poised to enter the market. Out of enlightened self-interest, industry must take the lead in evaluating and managing nanomaterial risks for the near term, working with other stakeholders to quickly establish and implement life cycle-based "standards of care" for nanomaterials.

These standards should include a framework and a process by which to identify and manage nanomaterials' risks across the product's full life cycle, taking into account worker safety, manufacturing releases and wastes, product use, and product disposal Such standards should be developed and implemented in a transparent and accountable manner, including publicly disclosing the assumptions, processes, and results of risk identification and risk management systems.⁵

§ 26:39 Nanotechnology—Conclusion

The development of nanotechnologies presents a unique governance challenge in that the very diverse industry is likely to evolve faster than government is able to respond using its traditional regulatory tools. In addition, the industry's self-interest

⁵Balbus et al., *supra* note 257, at 70.

in preserving public confidence adds a different dimension to the governance discussion. Effective environmental governance for nanotechnology, and perhaps other new technologies in a world of fast moving and global technical innovation, likely will require a combination of government regulation, better information, new means of public involvement, voluntary programs, legal liability exposure, and corporate self-regulation to protect public health and the environment.

§ 26:40 Learning from the case examples

Each of the case studies demonstrates the importance of thinking about governance broadly and deploying a very wide range of approaches to help solve major environmental problems. For example, tougher regulation of point sources, new scientific research to help identify problems and to set clear goals, collaboration among a broad range of parties, new sources of funding, reliance on social marketing to change behavior by individuals and smaller organizations, and use of a number of innovative management tools are all essential to making progress on rehabilitating impaired waters over the expanse of an estuary or a state. Similarly, the response to urban ozone and particulate matter pollution has benefited from the prospect of stringent federal regulations related to non-attainment, partnerships, often initiated by parties other than government, new management tools such as voluntary diesel engine retrofits, and an engaged public.

The success of brownfields programs depended upon an accommodation of the needs of financiers and developers who were not responsible for the contamination, modest risk taking by government, a different relationship between the development community and government including the willingness to pay for government services that facilitated redevelopment, and bringing private dollars into the cleanup process. The unprecedented pace at which nanotechnologies are emerging requires a similarly multi-faceted approach to governance that includes traditional government regulation, but also includes information disclosure, public dialogue, corporate self-regulation, voluntary industry standards and exposure to legal liability.

Other critical issues of the day such as climate change will also require a diverse approach to governance. GHG emissions come from a variety of sources located in many different countries. While some classes of point sources such as coal-fired power plants are major sources of GHGs, contributing about 40% of all CO₂ emissions in the United States, reducing emissions from just one source or class of sources, or in just a few countries, will not produce the over 70% reduction in GHGs that leading scientists have estimated is needed to prevent the projected climate and accompanying changes from occurring. In fact, households in the United States are responsible for over 30% of CO₂ emissions—about 12.7 trillion tons of CO₂.¹

PART IV. RETHINKING THE GOVERNMENT'S ROLE IN ENVIRONMENTAL MANAGEMENT

§ 26:41 Government's role

Both the numerous reviews of the environmental regulatory system and the case examples explored above demonstrate that we must rethink environmental governance. In addition to restructuring some aspects of the environmental regulatory system to make it more flexible and performance-oriented, government must improve its capacity to function in at least five other areas:

- a. Utilizing and participating in partnerships, collaborative efforts and networks;

[Section 26:40]

¹Vandenbergh and Steinemann, *The Carbon-Neutral Individual*, 82 N.Y.U. L. Rev. 1673, 1694 (2007).

- b. Understanding and taking advantage of internal economic drivers of corporate behavior;
- c. Enabling the public to directly influence environmental decisionmaking;
- d. Providing information and education that helps build public environmental values; and
- e. Identifying and mainstreaming innovative environmental management tools.

Although several environmental programs already incorporate many of these elements, no government environmental program has explicitly recognized that all of these competencies are necessary for effective green governance and created a strategic approach to both developing the competencies and deploying them in a coordinated manner.

Unfortunately, we have been in a virtual stalemate at the federal level and in many states on how to reform our system of environmental governance for the last decade. The country can no longer afford deadlock. Small, behind-the-scenes, sporadic attempts at reform are not going to clean up Chesapeake Bay or resolve urban ozone issues. Nor will they be sufficient to deal with the rapidly growing nanotechnology industry or to tackle climate change. Solving these problems will require a societywide effort and a new conception of the role of government. In this new role, government will directly control polluting activity through its regulatory system and influence a wide range of other behavior by recognizing the influence of economics and values on environmental outcomes and leveraging the influences to achieve desired environmental outcomes through a broad network of organizations, activities, and sources of funding.

The need to leverage economic and values-based motivations for environmental improvement as part of a governance system that also relies on a reconceived regulatory approach fundamentally alters the role of government in environmental protection. Robert Klitgaard and Paul Light observe:

The circumstances of the market state will transform the role of government. The government of the territorial state was a doer; students of public administration and, later, public policy learned that government's choice was "make, buy, or regulate." For tomorrow's public managers, the choice will be "cajole, incentivize, or facilitate"—a very different task (one perhaps rendered in punchier prose as "carrots, sticks, and sermons").¹

Similarly, Chertow and Esty noted that

[o]ne of the central challenges for environmental policymakers is to keep pace with the important elements of institutional realignment that are occurring in society. Notably, the role of government is narrowing, the private sector's responsibilities are broadening, and nongovernmental organizations, from think tanks to activist groups, are increasingly important policy actors.

The corporate world is not monolithic with regard to environmental performance. Some companies take environmental stewardship very seriously and are among the most progressive forces for environmental progress in the world. Other companies continue to pollute with abandon and to seize public resources (water, air, land) as though they were free for the taking. If the next generation of environmental policies is to be successful, separating the leaders from the laggards in the business world will be essential. With limited resources available, governments must target their enforcement activities on those whose performance is not up to par.²

§ 26:42 The role of regulation

[Section 26:41]

¹Gregory F. Treverton, *Governing the Market State*, in *High Performance Government: Structure, Leadership, Incentives* 89, 101 (Robert Klitgaard & Paul C. Light eds., 2005).

²Daniel C. Esty & Marian R. Chertow, *Thinking Ecologically: An Introduction to Thinking Ecologically: The Next Generation of Environmental Policy*, *supra* note 2, at 6–7.

The role of regulation is discussed throughout this Article. Regulation has been an essential element of all of the case examples. In some cases it is needed to directly control polluting activities. In others, regulation provides the context in which many of the partnerships function. In still other cases, the public participation provisions of regulatory programs are the doors through which the public enters the environmental debate. And, regulation is a key stimulus of corporate responsibility and the starting point for innovation.

In some areas, such as the control of diffuse-source pollution, more regulation is needed. For example, Wisconsin developed an imaginative way of limiting agricultural runoff by using a soil erosion performance standard that includes cost-share incentives for existing activities but is purely regulatory for new activities.¹ Further, in contrast to the voluntary bus diesel emission reduction program in Minnesota, the California Air Resources Board is planning to regulate emissions from already in use heavy-duty diesel engines.²

Enforcement also remains essential. The experience with EPA's new source review program over the last decade is emblematic of the importance of enforcement. For decades, industrial sources had skirted the CAA requirement to upgrade air emission sources to install the best available control technology at the time an emission source is being upgraded even though the operators had made significant modifications to their facilities, resulting in excess emissions counted in the tens of thousands of tons.³ A sustained enforcement effort by both EPA and NGOs through the citizen suit provisions of the CAA has been required to ensure the facilities are outfitted with the appropriate control equipment. Similarly, government and NGO enforcement has been essential in making progress in dealing with a range of water pollution issues involving combined sewer overflow, stormwater management, and large animal feeding operations.

Informational regulation will also likely need to play a bigger role in the future. David Case defines informational regulation as "government mandated public disclosure of information on the environmental performance of regulated entities" for the purpose of enlisting the "aid of nongovernmental forces, particularly economic markets and public opinion, to either complement or substitute for traditional regulatory strategies of government standard setting and enforcement."⁴ For example information disclosure is likely to be a critical element in assuring proper development of nanotechnologies.

And, as the critiques reviewed earlier discussed in detail, regulation will also have to be more flexible. It must be able to accommodate rapidly changing industrial processes and rapidly emerging industries. It must differentiate among the best and worst performers so that government resources are allocated to higher priority problems and so that companies are given additional incentives to excel. It must rely more on performance standards than technology standards in order to stimulate innovation.

As important as regulation is, it is also essential for government agencies to fully develop other mechanisms that are able to play a major role in driving environmental improvement in the context of complex ecosystem problem solving.

§ 26:43 Utilizing partnerships, collaboration, and networks¹

One of the clear lessons from the critiques and case examples is that solving environmental problems today requires an extensive network of organizations and individuals and that government has an important role to play, although not always the lead role to play in organizing, supporting, and utilizing these networks. Networks express themselves in a variety of ways, sometimes in formal partnerships, other times in collaborations among several parties, and at still other times through a broader set of organizations that enable environmental service delivery. Stephen Goldsmith and William Eggers observed that

[a] complicated world, where individuals face highly complex, individualized problems, necessitates a new approach to delivering public services but also provides the necessary tools for the solution. Networked approaches produce both abundant opportunities for substantial improvements in public services and serious management challenges.²

The Chesapeake Bay program involves hundreds of organizations functioning in partnerships, through collaborations and as part of several networks. The Minnesota Clean Water Legacy Program and CAM relied on new forms of collaboration and stakeholder involvement. The brownfields programs have succeeded because they involve new forms of collaboration between government, developers, bankers and NGOs. These collaborative interactions are critical in building the political support for new programs, for finding the funding to support new programs, and for providing the field support to execute very large programs.

The question can no longer be whether we should partner, collaborate or rely on networks to help deliver environmental services, but how can partnering, collaboration, and networks work most effectively for all participants. Don Kettle observed that

[t]hese next-generation problems stretch the EPA far beyond its traditional ways of doing business into complex new partnerships—with other nations, state and local governments, private companies, and citizens. They pose daunting technology—and political—challenges. Most important, they focus as much on governance as management. They require the EPA to chart new relationships with those who share responsibility for environmental quality. Increasingly, that means building partnerships with everyone involved.³

Partnering, collaboration, and environmental service delivery networks do not operate in a vacuum. The regulatory system is an essential element of successful collaborations in getting the attention of potential partners, bringing them to the table, and maintaining their focus on reaching important ecosystem restoration goals. For example, the collaborative efforts to restore the Chesapeake Bay have been driven in significant part by the designation of the Chesapeake Bay as an impaired water, the TMDL lawsuit against Virginia and the resulting implementation deadline of 2010, and the implementation of MS4 stormwater requirements.⁴

EPA's regulatory role has also been important in ensuring the cleanup goals track with the TMDL requirements. When states completed the initial allocation of pollutant reductions required for tributary strategies to meet the 2010 Chesapeake Bay restoration goal, the total reductions fell well short of the reduction numbers

[Section 26:43]

⁴See <http://cfpub.epa.gov/npdes/stormwater/munic.cfm> (last visited July 30, 2008).

required to meet the goal. EPA was able to step in and allocate the remaining reductions to the states based on the formula that the Agency had helped develop through its work on the science related to nutrient reduction. Finally, EPA's point source regulatory program has allowed the Agency and the states to require wastewater treatment plants to meet more stringent effluent limits in the Bay region.

Regulatory authority is an essential backdrop for many of the other collaborations examined in this article. The Minnesota legislature, in adopting the Clean Water Legacy Act to deal with impaired waters, noted that the purpose of the Act is to "protect, restore, and preserve the quality of Minnesota's surface waters by providing authority, direction, and resources to achieve and maintain water quality standards for surface waters as required by § 303(d) of the CWA, and applicable federal regulations."⁵ Accomplishment of this goal "will require long-term commitment and cooperation by all state and local agencies, and other public and private organizations and individuals, with responsibility and authority for water management, planning and protection."⁶ The Great Lakes Collaboration operates against the zero-discharge goal for persistent, bio-accumulative toxics and the impaired waters requirements, and the Chamber and the Minnesota Center for Environmental Advocacy launched CAM to deal with the potential that the Twin Cities would become an ozone non-attainment area without prompt voluntary action.

The Chesapeake Bay restoration effort also points out another important role for government, especially in EPA collaborative efforts: providing the scientific foundation and other information that facilitates agreement in collaborative processes. Over a period of several years, EPA provided the support needed to understand the nature of the nutrient impairment on the Chesapeake Bay, identify the sources of the impairment, allocate nutrient loads among the Chesapeake Bay tributaries, and facilitate effluent trading by creating nonpoint source nutrient removal efficiencies for agricultural best management practices. Similarly, the ability of EPA and the Minnesota Pollution Control Agency to model ozone pollution for the Twin Cities was an essential element in the Clean Air Minnesota collaboration.

Partnerships and collaboration have become one of the key tools for environmental management that EPA will use over the next several years. At least in the context of nonpoint pollution from agriculture, airborne deposition, and land use where the solutions require a broad network of players, collaboration appears to be essential to the effective delivery of environmental services. One commentator noted this need and explained that collaboration is "a pattern of governance in which lines between public and private are blurred as the boundaries between them become fluid and permeable."⁷ In collaborative efforts:

Government acts less *on* other actors in a hierarchical relationship as it does *with* them in a more collaborative and communicative way; governing consists less of the state exerting control over others in society and more of an interaction among them. There is more shared responsibility and trust. The process of governing is seen as "the creation of learning processes within the interested actors or society in general."⁸

A significant portion of the government's work will continue to focus on specific facilities under specific media programs where collaboration may at times be useful but is not essential. The challenge for the agencies, though, as they increasingly deal with large-scale problem solving is to find ways to shift resources or develop new resources needed to support these major collaborative efforts. Agencies must

⁵Minn. Stat. § 114D.10, subdiv. 1 (2007).

⁶Minn. Stat. § 114D.10, subdiv. 2.

⁷Fiorino, *supra* note 2, at 19.

⁸*Id.* at 20.

also develop a work force that understands and is capable of effectively participating in collaborative problem solving efforts.

To more fully integrate partnering collaboration and networks into environmental governance systems, NAPA has recommended that EPA:

- Clearly identify the circumstances in which EPA must function as a “partnering” agency in order to meet national environmental goals, and widely communicate those circumstances both within and outside of the Agency.
- Explicitly reaffirm the role that both direct regulation and indirect leveraging of regulatory authority must play in meeting national environmental goals, and then widely communicate that role both within and outside of the Agency.
- Develop a strategy, based on experience from the Chesapeake Bay Program and other programs that involve a significant role for partnering in both regulatory and nonregulatory programs, showing specifically how EPA can simultaneously function in both a regulatory mode and clearly perceived nonregulatory mode.
- Develop skills within EPA, and among its partners, for organizing, empowering, and leading networks of partners.
- Continue the Agency’s efforts to more closely coordinate its work with other federal agencies, including those that function in a less regulatory mode.
- Build on the Agency’s work on Cooperative Conservation and collaborative decisionmaking to expand understanding of the value of collaboration in achieving environmental results, especially where the environmental problems involve diffuse sources of pollution and where regulatory authority is limited.
- Work with states to support partnering efforts where the efforts are helpful in solving important environmental problems.
- Incorporate the Academy’s “Principles of Effective Consultation” and “Principles for Federal Managers of Community-Based Programs” into the EPA’s partnering policies, communication strategies, interagency and intergovernmental coordination process, and training programs.⁹

NAPA’s work has highlighted both the difficulty and the importance of making partnering and collaboration an integral part of environmental governance. NAPA points out that

EPA’s primary historic mission to regulate pollution has resulted in an internal culture that emphasizes the Agency’s regulatory and enforcement roles above its other missions. This dominant culture is reflected in how EPA’s principal programs are delegated to and implemented by the states, and how regulated entities perceive the Agency

The Academy Panel’s current research and findings demonstrate two important facts related to addressing impaired waters, and they likely apply to many other environmental cleanup programs as well. First, the regulatory authority under the Clean Water Act and EPA’s use of that authority—both directly in permitting and indirectly through approaches such as the TMDL program—is essential to making progress toward clean and safe waters. Second, partnering with other federal agencies, states, local governments, NGOs and regulated entities is also essential in making progress toward clean and safe waters. *These facts require EPA to continue its efforts to build programs and a culture that allow it to function effectively as both a regulatory agency and a partnering agency, and to be clearly perceived as functioning in both ways.*¹⁰

It will not be easy for EPA, or for state environmental agencies to function both as serious regulatory agencies and at the same time function as, and be perceived as capable of functioning as a reliable partner in collaborative problem solving. The

⁹NAPA, *supra* note 48, at 163; *see also* NAPA, Rural Transportation Consultation Processes 59–60 (2000); NAPA, Principles for Federal Managers of Community-Based Programs (1997).

¹⁰NAPA, *supra* note 48, at 164 (emphasis added).

case examples indicate that this dual role is possible and the nature of the environmental problems confronting the country will require even more effort on the collaborative side of the equation in the future.

§ 26:44 Understanding and taking advantage of internal economic motivations driving corporate environmental behavior

Government controls the regulatory system, and is able to directly influence some of the economics that affect corporate environmental decisionmaking through regulatory programs. Governments now also use a variety of economic instruments such as taxes, fees, subsidies, trading systems, and even liability regimes to influence corporate environmental behavior. These economic drivers have an important impact on some sectors of the economy and some issues, but they are not the only economic factors that can encourage desirable environmental performance.

Government increasingly must take into account economic drivers other than those directly controlled by government. These internal corporate economic drivers include reputation, customer desires, insurance availability, license to operate, investor preferences, lender concerns, SEC reporting requirements, government and public relations, access to markets, product differentiation, green procurement standards, industry codes of conduct, international environmental standards such as International Organization for Standardization (ISO) 14000, supply chain requirements, employee morale and recruiting, and operational efficiency. All of these factors have economic implications for companies that may be affected by environmental performance. While government does not control these economic motivators, it may be able to exercise some influence over them, and can certainly take them into account in designing governance systems and setting priorities.

As Marc Allen Eisner pointed out:

Future gains in environmental quality may be impossible without a fundamental reconsideration of regulatory design. This reconsideration must take the form of incorporating advances in corporate self-regulation, associational regulation, and standards into the regulatory system and thinking creatively about how public policies can be used to reinforce incentives or compensate for their absence.¹

Companies increasingly see the advantages of environmentalism from the perspective of their bottom line. Research has suggested a positive correlation between corporate environmental responsibility and financial performance.² There are at least five reasons a company might voluntarily regulate its environmental practices to gain a competitive advantage:

1. Shrinking waste output and production inefficiencies can reduce environmental impacts and overall costs, and increase competitiveness.
2. Environmentally responsible companies attract and retain a higher quality work force and increased worker satisfaction leads to increased productivity.
3. Environmentally responsible companies have a better reputation in the community, which can lead to more brand loyalty. These companies also have a decreased risk of being targeted by environmental activists, which can tarnish the brand reputation.
4. Environmental responsibility reduces the risk of being exposed to risks like new regulations, pressure from investors to change policies, and increasing

[Section 26:44]

business costs.

5. Environmentalism may provide access to or create a completely new market with the potential for significant revenue growth.³

In short, “being more responsible may help corporations outcompete rivals by staying ahead of tightening regulations, reducing usage of increasingly costly inputs, and attracting investment dollars from concerned consumers.”⁴

Other researchers agree that a company can gain a serious advantage when they start taking the environment into consideration.⁵ In their four years of research, Esty and Andrew Winston found that companies who are successfully and profitably implementing environmental initiatives understand the interface between environmentalism and business.⁶ These companies started out implementing environmental management plans because they had to, but now see business opportunities in going beyond compliance.⁷ They have “evolved to the point where environmental *management* is second nature and their focus is now on mining the gold in environmental *strategy*.”⁸ This is in stark contrast to companies that “have not evolved in their thinking since the 1970s . . . and are still grouching about legislation and complying with it grudgingly.”⁹

A second factor in the evolution some companies have undergone is pressure from stakeholders, although the decision to implement environmental initiatives is ultimately linked to the bottom-line. The growing push from stakeholders has caused companies to consider building their reputation for corporate responsibility. In doing research for the book, Esty and Winston were surprised at how often executives said the reason for launching an environmental initiative was because it was the “right thing to do.”¹⁰ However, building a good reputation is not just the right thing to do, it is also a point of competitive advantage because “doing the right thing attracts the best people, enhances brand value, and builds trust with customers and other stakeholders.”¹¹ Esty and Winston conclude: “The logic of corporate environmental stewardship need not stem from a personal belief that caring for the natural world is the right thing to do. If critical stakeholders believe the environment matters, then it’s the right thing to do for your business.”¹²

Stakeholder pressure can be an important source of motivation to adopt environmentally friendly policies. An increasing number of stakeholders put pressure on companies to pay attention to these issues. Aside from the government and other regulators, the public, NGOs, customers, and employees have increasingly called for action.¹³ Perhaps the most important new set of stakeholders are banks and insurance companies, which may require environmental assessments for major

³Assadourian, *The State of Corporate Responsibility and the Environment*, 18 Geo. Int’l Envtl. L. Rev. 571 at 574–75. General Electric provides the best example of this last reason. It launched “Ecomagination,” which among other things includes putting new green products on the market that are expected to generate \$20 billion in revenues by 2010. *Id.*

loans and give lower lending rates to companies with carefully constructed environmental management plans.¹⁴

Community pressure is also an important force to be reckoned with. In their research on the pulp and paper industry, Neil Gunningham and colleagues found firms were motivated to go beyond compliance because of pressures from the “social license.”¹⁵ Firms are so motivated because the social license can be enforced in very real ways. It can be enforced by an enhancement or destruction of the firm’s reputation, by putting pressure on regulators to more vigilantly enforcing existing regulations, by the filing of citizen suits, by lobbying for tighter regulations, and by market pressures such as boycotts.¹⁶ The authors found that pulp and paper mill firms were generally highly motivated to stay ahead of environmental regulations so that they could remain in the public’s good graces.¹⁷

Another distinct benefit and competitive advantage to businesses that go beyond compliance is such a move could gain them “a seat at the table when regulations are designed.”¹⁸ Companies that foresee the business opportunities to be gained in influencing carbon-emissions regulations stand to benefit from becoming “green” now so that they can be seen as leaders and potentially help shape regulatory policy.¹⁹

The third variable in determining whether a company will be motivated to go beyond compliance is the attitude of the environmental manager. In a study of 14 pulp and paper manufacturing mills in Australia, British Columbia, Canada, New Zealand, and the states of Georgia and Washington, the researchers were focused on trying to understand the reasons for the wide variations in environmental performance.²⁰ One of the interesting observations of their work is “the influence of social pressures on environmental performance depends on an ‘intervening variable’—managerial attitudes.”²¹ In fact, in their analysis, “environmental management style was a much more powerful predictor of mill-level environmental performance than regulatory regime or corporate size and earnings.”²²

The factors that motivate large firms to go beyond compliance may not, however, have the same impact on smaller businesses. David Williamson and Gary Lynch-Wood found that the social license does not inspire small firms to go beyond compliance because the main motivations of the social license, stakeholder pressure and reputation, do not affect them in the same way they affect large firms and these factors therefore do not produce a response from them.²³ The authors identify five factors that influence a firm’s environmental behavior: (1) the environmental impact of the firm’s products and processes; (2) customer power; (3) customer interest; (4)

corporate/brand visibility; and (5) community pressure.²⁴ They found that two or more factors must have a “high pull rating” before a firm would be motivated to go beyond compliance.²⁵ These factors often are not significant enough to drive the behavior of small firms. Thus, it is important for government, in looking at the factors that motivate corporate behavior, to be thoughtful about whether particular companies or particular industries are more or less likely to be motivated to perform beyond what the law requires.

The case examples highlight several economic factors that have driven companies to perform beyond the minimum required by law. For the Chesapeake Bay, reputation, government relations, avoiding mandatory regulations, and customer pressure driven by social marketing were among the factors involved. For the Minnesota Clean Water Legacy Act, having a direct voice in the outcome of the legislation, shifting the focus of regulatory programs away from industrial facilities and the economic value of tourism all seemed to play a role. For CAM, avoiding the cost of non-attainment regulations was a prime motivator for businesses, along with the reputation of some of the major industrial facilities and the ability to focus more attention on diffuse sources. In the case of the brownfields programs, the key factors for business investment were making risk more quantifiable to facilitate investment decisions and developing an approval process that could accommodate the time frame of typical development deals.

In order to achieve optimum results with the limited resources available to them, government agencies must continue to develop their understanding of how these internal economic factors affect corporate environmental decisionmaking and take the factors in to account in designing management systems and setting priorities.

§ 26:45 Providing information and education to facilitate the development of public values

Whether viewed in terms of individual responsibility or ethics or stewardship, values must play a growing role in environmental governance. Aldo Leopold’s views have perhaps never been more relevant than they are today when we are faced with regional crises such as the deterioration of major estuaries, and international crises such as climate change. Leopold observed that

[w]e abuse the land because we regard it as a commodity belonging to us. When we see land as a community to which we belong, we may begin to use it with love and respect. There is no other way for land to survive the impact of mechanized man, nor for us to reap from it the aesthetic harvest it is capable, under science, of contributing to culture. That land is a community is the basic concept of ecology, but that land is to be loved and respected is an extension of ethics. That land yields a cultural harvest is a fact long known but latterly often forgotten.¹

In a similar vein, the Aspen Institute in its work on resource stewardship observed that

²⁴*Id.* at 331–32.

²⁵*Id.* at 332.

[Section 26:45]

¹Aldo Leopold, *A Sand County Almanac* 6 (1949). A similar approach is suggested by Robert Gordon.

The future of environmental law will involve the translation of the scientific principles of ecology and the ethical teaching of environmental ethics into positive law. As this positive law is applied to private land, the translation will necessarily involve an adjustment of the expectation of private landowners. This adjustment may be relatively insignificant as applied in many cases, but in theory, is nonetheless profound.

Robert Jay Gordon, *Ecology and Environmental Ethics: Green Wood in the Bundle of Sticks* 187 (2004).

[c]ontinued prosperity depends on our ability to protect natural heritage and learn to use it in ways that do not diminish it. Stewardship is at the core of this obligation. It calls upon everyone in society to assume responsibility for protecting the integrity of natural resources and ecosystems and, in so doing, safeguarding the interests of future generations. Without personal and collective commitment, without an ethic based on acceptance of personal responsibility, efforts to sustain natural resources protection and environmental quality cannot succeed.²

Similarly, the PCSD: “Stewardship is an essential concept that helps define appropriate human interaction with the natural world.”³

The question for government is what, if any, role could and should it have in value formation. Given that individual behavior is an inextricable element of many of our most important environmental challenges and the fact that we must increasingly rely on self-motivated behavior by organizations that are, after all, led by individuals, it is essential to seriously examine this question.

The most obvious role that government can play in value formation is providing more and better information to the public. By better understanding the nature of environmental problems, the cause of the problems, and what can be done to solve the problems, new public values can be created or existing public values strengthened. Government is statutorily obliged to provide a wide range of environmental information under both substantive environmental law and government data practices legislation. Government however, has significant freedom to go beyond the minimum requirements of statutes to provide additional information to the public that may assist with value formation. For example, EPA provides the public with information on a wide range of environmental issues such as wetlands,⁴ climate change,⁵ ground-level ozone,⁶ smart growth,⁷ and others. Providing information is not a particularly controversial idea. However, providing information with a clear purpose to promote value formation has been more controversial over the years within EPA and other environmental agencies. In 1981, the Reagan Administration eliminated the Office of Environmental Education that had been established in 1970 in the Department of Health, Education, and Welfare.⁸

But, governments have often been involved in large-scale public education campaigns. Among the many examples are Lady Bird Johnson’s Beautify America efforts,⁹ the U.S. Forest Service’s: “You can prevent forest fires” campaigns,¹⁰ Drug Abuse Resistance Education at the state and local level,¹¹ and sexual abstinence initiatives such as § 510 Social Security Act¹² that specifies, among other things, that a program must have, “as its exclusive purpose, teaching the social, psychological, and health gains to be realized by abstaining from sexual activity. . . .”¹³

The Dutch government in its National Environmental Policy Plan recognized the

importance of public education and explicitly incorporated it as a strategic element of their plan. The country's Future Environmental Agenda embraces a public education campaign as central to achieving its environmental objectives.¹⁴

Public education efforts, including social marketing efforts such as the: "Save the crabs, then eat them" campaign¹⁵ supported by EPA and many others bay organizations, are playing an increasingly important role in Chesapeake Bay restoration.¹⁶ A public education campaign was essential to producing the legislative consensus that resulted in overwhelming bi-partisan support for the Minnesota Clean Water Legacy Act and is a central strategy in CAM's ozone reduction strategy. Building societal values that support energy efficiency, conservation, and a lower carbon economy is likely to be critical in efforts to deal with climate change. These examples point out the important role of values in driving environmentally desirable conduct and the strategic importance for government in supporting values formation through information, education and social marketing campaigns.

With diffuse sources of pollution a critical element of many of our major environmental problems, societal values will be central to solving these problems. Government agencies cannot avoid considering how they should address the question of values if they are to succeed in achieving their environmental goals.

§ 26:46 Enabling the public to influence environmental decisionmaking directly¹

Governments have been rethinking the way they involve the public in environmental decisionmaking for some time. The challenge for government is to increasingly make public engagement a part of a strategic approach to green governance that helps produce better environmental results. To do this, they must view public engagement not simply as a method of complying with legal requirements in environmental laws and under administrative procedures acts but as a mechanism for creating pressure on sources of pollution to improve their conduct.

EPA's 2003 Public Involvement Policy² is an important advance in engaging the public in a more substantive way in environmental decision-making. The 2003 Policy notes that "[t]o achieve [EPA's] mission, EPA needs to continue to integrate, in a meaningful way, the knowledge and opinions of others into its decisionmaking processes. Effective public involvement can both improve the content of the Agency's decisions and enhance the deliberative process."³ While significant progress has been made in expanding public involvement, the idea still meets with resistance from some agencies since it departs from the classic model in which government personnel are seen as the experts who are in the best position to make decisions about what best serves the public interest. Further, public engagement is often viewed relatively narrowly as the opportunity to comment on agency decisions rather than more broadly as an opportunity to engage the public to directly influ-

³*Id.* at 1.

ence the conduct of sources of pollution.

Public engagement can have a significant impact on environmental outcomes by, among other things:

- Creating pressure on a project proposer to produce more information about the environmental impacts of a project;
- Generating information about a project based on local knowledge and expertise that may result in modifications of a project or improved operation;
- Driving modifications in a project to address environmental concerns that may not be subject to direct regulation such as wetlands preservation, habitat protection, noise, traffic, or hours of operation;
- Creating ongoing consultative relationships between members of the public and the facility proposer;
- Pushing government agencies to more carefully consider aspects of a proposed permit that may not be obvious on the face of a permit application including environmental justice concerns;
- Making a regulatory decision more acceptable to a community leading to fewer operational issues and facilitating future modifications or expansions; and
- Raising issues about past oversight of a facility owned by a project proposer that may drive improved compliance.⁴

Unfortunately, the principal public participation methods historically used by government agencies—public hearings, public meetings, and notice-and-comment rulemaking procedures—frequently do not serve well as methods for true public engagement in government decisionmaking. They do not create conditions necessary for effective, or “authentic”⁵ public participation. King and others found the following:

Although there is theoretical and practical recognition that the public must be more involved in public decisions, many administrators are, at best, ambivalent about public involvement or, at worst, they find it problematic. . . . As a result, although many public administrators view close relationships with citizens as both necessary and desirable, most of them do not actively seek public involvement. If they do seek it, they do not use public input in making administrative decisions (as indicated by a 1989 study conducted by the Kettering Foundation). These administrators believe that greater citizen participation creates delays and increases red tape.⁶

Citizens are increasingly reluctant to defer to expert administrators.⁷ Instead, as part of a broader movement toward popular democracy, citizens increasingly want earlier access to the decisionmaking process, more opportunities to be heard and to bring local knowledge to the table, and a clearer role in decisionmaking.⁸ This is a salutary trend and should be embraced by government as another strategic tool in

⁴See Thomas C. Beierle & Jerry Cayford, *Democracy in Practice: Public Participation in Environmental Decisions* 14–15 (2002).

⁵“Authentic” public participation “implies more than finding the right tools and techniques for increasing public involvement in public decisions.” King et al., *The Question of Participation: Toward Authentic Public Participation in Public Administration*, 58 *Pub. Admin. Rev.* 317, 317 (1998). Rather it is participation that “works for all parties and stimulates interest and investment in both administrators and citizens.” *Id.*

⁶King et al., *The Question of Participation: Toward Authentic Public Participation in Public Administration*, 58 *Pub. Admin. Rev.* 317 at 319.

pressuring sources of pollution to improve their performance.

Dewitt John observed:

[T]op-down regulation works best for large, clearly identifiable sources of pollution, like smokestacks, water treatment plants, and toxic waste dumps, rather than dispersed, small scale sources like individual homes. The command-and-control model is more difficult to implement when there are large numbers of polluters and when it is difficult to monitor what each polluter contributes to an environmental problem. It is simply too difficult for regulators to keep track of so many sources. As one Iowan put it: "It may take an occupying army to regulate the 100,000 farmers in our state."⁹

An informed and involved public, however, could be part of an occupying army of concerned citizens.

To more fully integrate public involvement as a strategic management tool and to enable the public to directly influence environmental decisionmaking government agencies need to do the following:

1. Recognize the limitations of the traditional public hearing, public meeting, and notice-and-comment procedures, routinely provide notice of a proposed project to the public as soon as a government agency has sufficient information to clearly define the nature and extent of the proposed project and consider adopting public participation policies that are similar to EPA's 2003 Public Involvement Policy.
2. Encourage project proposers to notify affected communities about proposed projects even before the projects are submitted to the government agency for review and holding preliminary discussions with the community to understand their concerns about the project.¹⁰
3. Set aside sufficient resources to assure that adequate information can be made available to the public about proposed projects, agency staff can regularly interact with members of the public, meetings can be held at times and in places that are convenient for the public to attend, third-party neutrals can be used in cases where third parties are needed to facilitate an effective dialogue among the parties, and communities have access to technical expertise when needed.¹¹
4. Provide staff with in-depth training on methods for effectively involving the public, the importance of taking local knowledge into account in their decisions, and how to use their expertise in a way that enables rather than deters public participation.¹²
5. Develop public participation decision trees for their staff that allow the staff to rapidly analyze which public participation technique would likely be most effective in different situations.¹³
6. Expand the use of collaborative decisionmaking processes.
7. Make information related to a proposed project, including historical information about related facilities and the facility operator, readily available to the public on the Internet or at local institutions such as libraries so that members

of the public have the information needed to effectively participate.¹⁴

8. Consider establishing ongoing relationships with some communities in which environmental permits are frequently issued or are routinely controversial based on the federal Superfund program's community liaison model.
9. Provide training programs for citizens and citizen organizations that help them better understand the government approval processes and how to most effectively participate in the process.

§ 26:47 Identifying and mainstreaming innovative environmental management approaches

Significant innovations have been a critical factor in each of the case studies. For the Chesapeake Bay, the innovations have included new intergovernmental arrangements, the development of tributary strategies, the introduction of low-impact development concepts, the enactment of the Maryland Flush Tax, the use of social marketing campaigns, and many others. In Minnesota, the ground-breaking collaboration among a wide range of interest groups and a public education campaign boosted the impaired waters issue to the top of the political agenda and opened the door for the passage of the Clean Water Legacy Act. Similarly, CAM relied on an unprecedented partnership between an environmental organization and the state Chamber of Commerce, and was facilitated by air quality modeling produced by the Minnesota Pollution Control Agency and a diverse set of new public and private resources and partnerships that is leading to retrofits for most of the state's school bus fleet. In the brownfields context, the willingness to consider the needs of bankers and developers in rehabilitating old industrial property has dramatically changed the landscape for urban redevelopment and has helped address one of the causes of sprawl. For nanotechnology and climate change, it appears clear that the complexity of the issues will require innovative new approaches to governance to avoid or minimize environmental threats.

EPA and many state agencies have innovation offices or programs that have developed important new approaches to environmental management. However, the process of integrating these innovations into line programs has often proven difficult and controversial. EPA's flagship innovation programs of the late 1990s—the Common Sense Initiative and Project XL—have long since died a quiet death.

Perhaps the most significant challenge to innovation is that simply running existing programs use much of the environmental agencies' limited financial and human resources. For many states, most federal funds are directed to support ongoing activities in the air, water and waste programs rather than innovation efforts. Further, long-standing programs with their established constituencies and budgets often resist shifting resources to new, untested programs.¹ Other problems associated with innovation efforts can be traced to the complexity of environmental legislation and the fact that EPA has no specific innovation authority. Part of the difficulty with Project XL was that EPA had to cobble together legal authority in the form of a site specific rule to grant the flexibility in facility permits that was at the heart of the program. This slowed experimentation and reduced the number and enthusiasm of program participants. While these are all understandable reasons why innovation programs often have to take a backseat to established air, water, and waste

¹⁴See *id.*

¹Cf. LeRoy Paddock & Suellen Keiner, *Mixing Management Metaphors: The Complexities of Introducing a Performance-Based State/EPA Partnership System Into an Activity-Based Management Culture* 11.32–11.33 and 11.45–11.46, in NAPA, Environment.gov: Transforming Environmental Protection for the 21st Century, Research Papers 11–17, Volume III (2000).

programs, this situation is increasingly problematic given the complexity of the problems discussed in this Article.

NGO acceptance of innovation efforts has also been an issue, especially for EPA. NGO concerns have often focused on priorities—asking whether innovative programs are solving important environmental problems or simply accommodating the economic interests of a few well-connected companies—and cost—asking whether these programs, which tend to be resource intensive in their start up phase, divert scarce resources away from important permitting and enforcement activities. These are important but solvable issues. Clearly, innovation should be focused on important problems and innovation programs should be cost-effective compared to other management approaches over the long run. NGOs have also been concerned about innovations being mainstreamed without adequate evaluation. Innovations should be subject to stakeholder-based evaluation before they are mainstreamed to assure that the programs have broad support among all relevant constituencies. EPA has historically not had a widely accepted stakeholder-based innovations evaluation process.

NAPA, in a recent review of EPA, observed that “most of these innovations [initiated by EPA] presently remain small and outside the mainstream of tools and coordinating mechanisms that are used to implement EPA’s primary programs.”² It found that innovation was essential to more effective environmental service delivery, noting:

Innovation programs that can have direct impact on environmental quality should be made readily available more quickly to policymakers, program directors, and implementation organizations. To accelerate innovation, EPA should place more emphasis on the importance of innovation for environmental problem solving, and on enhancing the culture of innovation within the agency.³

To accelerate innovation at EPA, NAPA recommended that EPA

- Recognize and value innovation,
- Regularly invest agency resources in innovation,
- Allow promising innovative ideas to be tested for a sufficient period of time to understand the effectiveness of the idea,
- Regularly evaluate, in consultation with key stakeholders, how innovative ideas are contributing to environmental outcomes,
- Aggressively mainstream innovations that have been demonstrated to produce results by incorporating them into the way the Agency operates, by funding them, and by helping to build capacity in implementing agencies to enable effective use of new tools,
- Seek legislative authorization for particularly promising innovations that have wide stakeholder support but that without specific legislative authorization, are unlikely to achieve desired results, and
- Assist development and promotion of model state legislation and model local ordinances needed to enable new implementation tools.⁴

Changes such as those proposed by NAPA at both the federal and state level would significantly enhance the ability of environmental agencies to develop and mainstream innovative approaches to environmental management, a process that is essential to effective green governance.

§ 26:48 Conclusion

²NAPA, *supra* note 48, at 179.

³*Id.* at 178.

⁴*Id.* at 179.

Ken Sexton in the book *Better Environmental Decisions* observed that “the major obstacle to better environmental decisions is not that we lack ideas, but rather that we have difficulty escaping from the old, familiar paradigms that have shaped our programs and policies for more than two decades. . . .”¹ Governments, businesses, and NGOs know the environmental regulatory system’s strengths and weaknesses, understand how the system functions, and have invested heavily in managing environmental problems under this system. Thus, it is not surprising that moving from a model where regulation plays the dominant role to a model in which regulation is one of several strategic approaches to improved environmental management is more than difficult. But, given the nature of the problems with which we are faced, not to adopt this new model of green governance is accepting failure.

Governments, working with NGOs and businesses, need to employ all of the drivers of environmental behavior—the regulatory system, economics and values—to achieve desired environmental results. The country needs a diverse and flexible regulatory tool box that can help solve environmental problems. It also needs a box of collaboration tools, a box of internal corporate economic tools, a box of public engagement tools, a box of public values tools, and we need inventors who will consistently test out and then replenish our tool boxes with new approaches.

Daniel Fiorino noted that the European literature on social-political governance is asking the question:

How can dynamic, complex, and diverse social-political systems be governed more democratically and effectively? Their answer is to think in terms of entirely new conceptions of governance, owing to the limits of traditional, hierarchical ideas about governance in a rapidly changing world. For these writers, “the growing complexity, dynamics, and diversity of our societies, as ‘caused by social, technological and scientific developments,’ puts governing systems under such new challenges that new conceptions of governance are needed.”

Social-political governance involves new patterns of interaction among government and others in society. These patterns are not temporary, but are built into the structures and processes of governance. Distinctions between the public (the state, regulatory agencies) and the private (society, markets) are blurred as the boundaries between them become more fluid and permeable. Government acts not *on* but *with* nongovernmental and commercial entities. There is a shift from governance as one-way traffic toward two-way traffic [if we are to expect people to take on responsibility they must know why, how, they must have information, they must have a role in design and oversight] in which “aspects, qualities, problems, and opportunities” of those governing and of those being governed are considered.²

Both the critiques and the case examples demonstrate that effective green governance must involve government acting with nongovernmental and commercial entities. This requires a different allocation of resources, new priorities, and new competencies. Ideally, new human and economic resources would be provided to allow agencies to enhance the ability of government to participate in partnerships and collaborations and operate through networks, understand and take advantage of internal corporate economic motivations, provide information and education that builds societal values, enable the public to directly influence public and private environmental decisionmaking, and identify and mainstream innovative environmental management approaches, rather than simply diverting the resources from the still critical functions of regulation and enforcement. However, even if new re-

²Fiorino, *supra* note 1, at 161–62 (internal citations omitted).

sources are not available, it is essential that environmental agencies at all levels incorporate these other methods of driving environmental behavior into their strategic approaches to environmental management.

Effective green governance requires that we re-craft our approach to environmental management if we are to make significant progress on some of the difficult environmental issues we face today.

PART I. WHAT IS SUSTAINABILITY?

§ 27:1 Introduction

Over the past several decades, we have made some progress toward sustainability but have also encountered major obstacles.¹ This chapter teases out those patterns that account for the progress, albeit modest, that we have made to date. Similarly, it describes the obstacles to sustainability. The chapter then outlines an approach for accelerating progress and overcoming obstacles.

Sustainable development—or sustainability for short—will make the United States more livable, healthy, secure, and prosperous. Policies that promote sustainability will reduce risks to our national security, improve our economic efficiency and productivity, enhance our health and communities, improve the lives of the poorest among us, and foster greater human well-being. Sustainability can provide these multiple benefits while protecting and restoring the environment for our generation and for generations that follow.

This chapter is premised on a fact that we have known for a long time, and which we ignore at our peril. The National Research Council opened its recent report on sustainability at the U.S. Environmental Protection Agency this way:

[Section 27:1]

¹See, e.g., Agenda for a Sustainable America (John C. Dernbach ed., ELI Press 2009); Stumbling Toward Sustainability (John C. Dernbach ed., ELI Press 2002).

Everything that humans require for their survival and well-being depends, directly or indirectly, on the natural environment. The environment provides the air we breathe, the water we drink, and the food we eat. It defines in fundamental ways the communities in which we live and is the source for renewable and nonrenewable resources on which civilization depends. Our health and well-being, our economy, and our security all require a high quality environment.²

Americans tend to trace such thoughts back to great conservationists, including George Perkins Marsh, John Muir, Aldo Leopold, and Theodore Roosevelt. But they actually go back further, to the founding of the nation. Our first four presidents—George Washington, John Adams, Thomas Jefferson, and James Madison—owned farms or plantations. They differed in many ways (three were slaveholders, and one, Adams, was not), yet all were convinced that the health of the soil is essential to the health of the nation.³ After James Madison's presidency, he was elected as first president of the Agriculture Society of Albemarle, Virginia. In 1818, he gave an address to the society in which he explained that preservation of adjoining forests and woodlands, use of manure as fertilizer, horizontal plowing on hill sides, and other conservation techniques were all essential to ensuring soil fertility. Failure to do these things, he emphasized, meant degraded soil, low yield, and a weaker nation. The "happiness of our country," he added, depends not just on its "soil and climate" and its "uncrowded situation" but also on actions that maintain and enhance soil fertility.⁴

It was just such thinking—applied to a broader set of problems—that motivated the United States and other countries at the 1992 U.N. Conference on Environment and Development (known widely as the Earth Summit) in Rio. The twin problems addressed at the Earth Summit were high levels of global poverty and increasing environmental degradation. It was widely recognized that each problem helped to make the other worse; environmental degradation makes it hard for people to stay healthy and earn a living, and poverty deprives individuals of the time and resources needed to protect the environment.

Twenty years later, these problems are no less pressing. Our actions as a species and as a nation are not sustainable. The situation we face at the global level is both simple and daunting: humans are making greater demands for natural resources and causing widespread environmental degradation on a planet with a finite capacity to meet those demands or absorb their effects. In addition, some people have access to abundant resources at an affordable price, and some do not. Sadly, many conditions, including climate change, are now worse than they were two decades ago.

At Rio the countries of the world, including the United States, under the farsighted leadership of President George H.W. Bush, endorsed a broad and ambitious plan to move toward sustainability (Agenda 21)⁵ and a set of principles to guide the effort (Rio Declaration).⁶ The United States endorsed this plan and these principles because, to a great degree, they were based on longstanding U.S. laws

and policies. Indeed, sustainability is anchored in conservation concepts that have been employed in the United States for more than a century to preserve forests, soil, fish, and game.

§ 27:2 Sustainability is . . .

We use the terms “sustainability” and “sustainable development” more now than we did two decades ago. Still, it is far from clear that most of us understand what sustainability and sustainable development mean. For many, perhaps most, these are just vague words in the “green” vocabulary. For more than a few others, sustainability means something negative, like tree hugging. Yet sustainability is distinctive—and positive—in at least seven ways.

First, sustainability provides a framework for humans to live and prosper in harmony with nature rather than, as we have tended to do for centuries, at nature’s expense. It is about finding ways to make our goals for environmental protection, economic growth, peace and security, and social well-being mutually reinforcing—rather than treating environmental degradation as the necessary price of progress. It is about quality of life and well-being. Although the terms *sustainability* and *sustainable development* were first used in an environmental context, they are not about the environment alone or the environment before everything else. The Venn diagram in Figure 27.1 is a common way of expressing the nexus of environmental, social, and economic goals. These are sometimes also called the three pillars of sustainability. Corporate sustainability efforts are often described in terms of a triple bottom line of, for example, “profit, people, and planet.”¹

The three pillars and triple bottom line are used so often that a fourth dimension—peace and security—is often omitted. Yet most activities are difficult or impossible in the absence of peace and security. As the Rio Declaration states, “Peace, development and environmental protection are interdependent and indivisible.”² Some sustainability issues more obviously involve security than others. The use of petroleum for transportation, for instance, involves foreign oil supplies, and thus has national security implications. In this book, we discuss security when it is appropriate to do so, but more often we refer to three goals or the triple bottom line.

Figure 27.1 Sustainability and Three Circles

[Section 27:2]

¹*Idea: Triple Bottom Line*, the Economist, Nov. 17, 2009, at <http://www.economist.com/node/14301663>.

²Rio Declaration, *supra* note 6, princ. 24.

As Figure 27.1 suggests, the object of sustainability is to maximize the positive contribution of human activities to the environment, the economy, and society at the same time. The reuse and recycling of materials provides an example. If we buy things and then throw them out, we contribute to economic growth and job creation but the environmental impact is negative. If nearly everything is recycled or reused, on the other hand, we not only contribute to economic growth but also create more jobs than if materials were simply landfilled, save energy used to make and refine those materials that would otherwise be lost, and have almost no negative environmental impact. If we mined existing disposal facilities for metal and other materials, and converted the land to park or other use, we would have a positive environmental impact. Sustainability is not just about minimizing environmental damage; it is also about the restoration of environmental quality.

Sustainability is thus about *integrating* environmental protection and restoration into economic, social, and national security decisions and goals. If the risks of environmental degradation are accounted for, sustainability will be more efficient and less costly than making a development decision first and then figuring out what to do about the environment afterward, or addressing the environment as a costly add-on to a development project or manufacturing process. In principle, a dollar spent on sustainability will yield more benefits—and a greater variety of benefits—than a dollar spent only on economic development or the environment. In fact, sustainability is consistent with the fiscal discipline that current economic circumstances require. And for energy efficiency and conservation in particular, sustainability can, and usually does, also mean lower economic costs.

Second, sustainability focuses on both the short-term and long-term effects of decisions. The most widely accepted definition of sustainable development—“development that meets the needs of the present without compromising the ability of future generations to meet their own needs”³—captures this point precisely. It is reinforced by one of the principles in the Rio Declaration—intergenerational equity. It is also consistent with much American political rhetoric that focuses on protecting the interests of our children and grandchildren. Sustainability is inconsistent with decisions that lead to long-term debts or problems that can only be resolved, if at all, by future generations—such as the federal budget deficit, climate change, overpopulation, depletion of resources, destruction of biodiversity, and the global accumulation of toxic materials.

Third, sustainability is about exercising precaution and making commonsense decisions in the face of known or likely risks. Sustainable development is not based on what we want to believe or not believe; it is anchored in reality and risk. Because sustainability is premised in part on avoiding or limiting risks, it does not require complete certainty before we act. That is how we ordinarily behave, and we should treat risks related to sustainability in the same way.

Fourth, sustainability is also a moral, ethical, and even a religious issue, not just a matter of policy or law. Environmental quality and the availability of natural resources directly affect human well-being; environmental damage hurts individuals, forcing them to breathe unhealthy air, drink filthy water, or ingest toxic chemicals. Environmental degradation also damages the vast ecological commons on which life depends. To address this problem, the Rio Declaration mirrors a basic principle of U.S. environmental law, stating that “the polluter should, in principle, bear the cost of pollution,” rather than imposing that cost on others or the

³World Commission on Environment and Development, *Our Common Future* 43 (1987), available at <http://www.un-documents.net/wced-ocf.htm>.

environment.⁴ For those who recognize the existence of God, or another deity or force larger than themselves, environmental degradation also can be an offense against God, creation, or the natural order.

Fifth, sustainability is not directed just to government or industry, but to all parts of society, all ages, and all economic sectors. The Rio Declaration identifies public participation, access to information, and access to justice—key principles of American governance—as essential to sustainability.⁵ It is also directed to individuals, not simply as participants in the development of government policy but also as consumers and users of goods and services. The problems are so large, and the opportunities so many, that virtually every individual, organization, institution, corporation, and government needs to contribute to a more-sustainable world.

Sixth, sustainability requires considerable innovation in all spheres of public and private life. Many of the legal, policy, and other tools we need to achieve sustainability do not yet exist, are only now being attempted, or have only been tried for a short time. Sustainability is an effort to change the environmental habits, scripts, and patterns that have dominated the American landscape over the past several decades, and even longer. Day after day, at home, at work, and in school, most of us act in many ways that are not environmentally sustainable. We will need to change those habits, either through the use of new technologies, new options for doing things, new or different infrastructure, new or modified laws, or changes in personal habits.

Seventh, sustainability's objectives are human freedom, opportunity, and quality of life in a world in which the environment is protected and restored and in which natural resources are readily available. The objectives of sustainable development are in many ways the same as those of conventional development. It is easy to forget that sustainable development is, after all, a form of development. In *Our Common Future*, a landmark report on sustainable development, the World Commission on Environment and Development stated: “The satisfaction of human needs and aspirations is the major objective of development.”⁶ International lawyer Rumu Sarkar explains that, “for most practitioners and theorists, the overall objectives of alleviating poverty and human suffering and of improving the human condition more generally are the desired end product of the development process.”⁷ She adds that, “development aims at enlarging the opportunities people have in their lives.”⁸ Amartya Sen, a professor of economics and philosophy at Harvard who has won the Nobel Prize in economics, describes development as a process that enlarges individual freedom.⁹

§ 27:3 Sustainability is not . . .

To be clear about what sustainability *is*, we also need to make clear what sustainability is *not*. This is particularly important because many people believe that sustainability does not fit into their own view of the world or personal values and aspirations. As John Maynard Keynes once said, “the difficulty lies not with the new ideas, but in escaping from the old ones.”

Sustainability is not about less freedom and opportunity. In fact, it is about

⁴Rio Declaration, *supra* note 6, princ. 16.

providing people choices they do not now have. In the broadest sense it includes the opportunity to enjoy a high quality of life regardless of income, without interference from environmental pollutants or climate change. On a more mundane level it includes the freedom to purchase affordably priced vehicles that obtain high gas mileage and the opportunity to get to school or work conveniently by walking, biking, or using mass transit. Or the ability to buy locally grown fruits and vegetables conveniently and for an affordable and fair price.

Sustainability is not about bigger government. While government needs to steer society in particular directions, sustainability cannot be accomplished by government or regulation alone. Government needs to repeal or modify laws that inhibit progress toward sustainability, and not simply adopt new laws. And while regulation has a role to play, sustainability is primarily about unleashing the creative energies of individuals, families, entrepreneurs, businesses, nongovernmental organizations, colleges and universities, and many others to make a contribution toward our collective present and future well-being.

Sustainability is not about mindless implementation of an international plan. As Agenda 21 made clear, sustainable development needs to be realized in the particular economic, natural, and historical settings of each country. The United States will not embrace sustainability because we agreed to it at an international conference or because we care about the environment. We will move toward sustainability only if it is more beneficial to us than conventional development. We will move toward sustainability only if—and then because—it makes both us and our descendants better off.

Sustainable development is not about economic development or economic growth for its own sake. Sustainability is also not the same thing as sustained economic growth, although sustainability and sustained economic growth can certainly occur at the same time. The ultimate objectives, again, involve human well-being and environmental quality. Economic development and economic growth are means to that end, but they are not ends in themselves. On the other hand, as already suggested, sustainable development does not mean a lower standard of living.

§ 27:4 A destination or a journey?

Is sustainability a destination, or is it a journey? In a sense, it is both. Its goal is a society in which the ordinary effects of human activity protect and restore the environment and minimize or eliminate large-scale poverty. That is plainly not the world we have today, and in that sense sustainability is a destination. To reach this destination, however, we must embark upon a long journey, one that is likely to take more than a generation.¹ While it is appropriate to focus our efforts on the journey, we should nonetheless not lose sight of the destination.

The destination-versus-journey question goes to the heart of what sustainability means. In a world where a great many of our activities cause some environmental damage, actions that merely reduce our negative environmental impacts are better—and could be labeled as steps toward sustainability. By themselves, however, those steps may not represent true sustainability. To make that distinction clear, this book uses the term “more-sustainable” to describe an alternative that is better than business as usual, but not necessarily “sustainable.” A building that uses 25% less energy is a more-sustainable building, for example, but not the same as a “net

[Section 27:4]

¹National Research Council, *Our Common Journey: a Transition Toward Sustainability* 7 (Nat'l Acad. Press 1999).

zero energy” building or a building that uses renewable energy to produce more power than it uses.

In a fully sustainable society, the ordinary effect of human behavior will be to protect and restore the environment. We know that human societies will never be fixed and unchanging, but we hope to reach a point where changes within human society will always occur within the boundaries of sustainability.

However, words like “journey” and “destination” mask a hard fact about sustainability that is more challenging. If the destination were a fixed point, any progress we made toward sustainability would put us closer to the target. But sustainability is not a fixed target because it is constantly moving—or, worse, in many respects we are actually moving *away* from the target. Continuing and growing damage to the environment increases the distance between where we are and the goal of a sustainable society. To reach the destination, we need to first slow down the rate at which things are getting worse, then start making things better. When the destination is moving away from us even as we make progress toward it, it is possible to be farther away after we have started than before we began.

On issues where unsustainable activities continue to accelerate—and climate change is the most important example—there is a discrete and real risk that we will never catch up. Positive feedback loops for greenhouse gas emissions (for example, warming in the Arctic leading to large methane releases, which create more warming and more methane releases) could cause climate change to accelerate even more rapidly. At some point, climate change *could* outpace human mitigation efforts even if human societies around the world are doing everything they can to reduce their emissions.

That is the real challenge of progress toward sustainability: to make sustainability happen on a scale large enough, and at a pace fast enough, to overtake the rate at which things are getting worse. When we describe progress in this book, we are describing it in this context.

§ 27:5 Sustainability embodies American values

The goals of sustainable development—human freedom, opportunity, and quality of life—are quintessential American goals. The American colonies sought independence for these purposes, and the new nation established a legal and economic system premised on their importance, endured a civil war to protect that system and expand its opportunities to others, and fought two world wars and numerous other conflicts to protect us and help make those same opportunities available to others. At Memorial Day ceremonies throughout the United States, veterans almost inevitably talk about preservation of freedom as a key reason they were proud to serve our country. In the decades ahead, with a growing global population and economy, and growing demands on our environment, sustainability can provide a foundation on which to base continued freedom, opportunity, and quality of life.

Sustainable development would lead to a stronger and more efficient America because we would be pursuing social, economic, environmental, and security goals in ways that are mutually reinforcing or supportive, not contradictory or antagonistic. The result would be a stronger, more efficient country that provides its citizens and their descendants increasingly more opportunities in a quality natural environment. In his 1818 address to the Agriculture Society of Albemarle, Virginia, James Madison described enhancement of soil fertility as a patriotic act. During World War II, the American public was encouraged to save energy and to recycle metal and rubber, so that these resources would be available for the war effort. In recent decades, Congress has adopted legislation to limit dependence on foreign oil and thus protect national security.

Sustainable development would also lead to a safer, more stable and secure world

outside American borders. The world is deeply divided between the wealthy and the desperately poor, and there is a real risk of evolving toward an unstable world of haves and have-nots, with a huge global underclass. Such a world would pose serious threats to our security. None of the goals that this country has pursued around the world—peace and stability, human rights and democracy, expansion of trade and markets, environmental protection, or putting an end to hunger and extreme deprivation—can be accomplished if the world is not on a path of sustainable development. We can be quite sure that unsustainable development will lead to a world with less freedom, fewer opportunities, and lower quality of life.

The ethical and religious concerns that characterize the sustainability movement are also quintessentially American. The country's history is full of circumstances that combined national self-interest with doing the right thing. The Civil War did not simply preserve the Union; it also ended slavery. We created the national parks because of pride in our natural heritage and also for the public's benefit. We led the effort to create the United Nations to make both our country and the rest of the world more secure. The challenges of sustainability require a response that is similarly motivated. Moreover, the texts and beliefs of each of the world's major religions teach responsibility toward other humans as well as the environment.

Because unsustainable actions adversely affect others, more-sustainable actions are not simply better for us; they reflect our ethical and religious values. Greenhouse gas emissions from the United States, for example, do not adversely affect us alone; they have an even greater impact on developing countries that lack the money and technology to cope with drought, famine, and other effects of climate change. What we do about sustainability, in other words, is not simply a policy question or a question of national self-interest. It is also—and more fundamentally—about who we are, what we value, and how we fulfill our obligations to others.

Finally, sustainable development is not just about us, the current generation of Americans. It is, in the Constitution's words, about "ourselves and our posterity," our children, grandchildren, nieces, nephews—all of those not yet born who will someday inhabit this country. We pride ourselves on providing our descendants greater opportunities and a better quality of life. Sustainable development will do precisely that. Without it, we cannot assure our children and grandchildren a better life, and are likely to leave them a poorer one.

The United States has survived and prospered only because each generation looked after the next. When John Dernbach's maternal grandparents died in the years after World War II, their children had these words put on their gravestone: "They gave their today for our tomorrow." Art and Clara Retzlaff were not reformers or activists; they were hardscrabble people who knew war, poverty, and unemployment first hand, and who worked hard for their children. These words may connote more sacrifice than we are comfortable with today. But there is a bigger problem. We say we care about tomorrow, yet all too often our actions tell a different story. This book's title captures both the dissonance and the challenge: acting as if tomorrow matters.

§ 27:6 Looking back, looking forward

The 1992 Earth Summit is both a reasonable and imperfect date for marking a review of U.S. activities on behalf of sustainable development. It is reasonable because the United States made an international commitment to sustainability at the conference, and because that conference represented an endorsement of sustainability by virtually every nation in the world. It is imperfect because, as the following sections describe, a great many steps toward sustainability in the United States were taken before the Earth Summit, and we need to acknowledge them. Across a broad range of topics—environmental and public health protection; population,

consumption, and technology; poverty, unemployment, and social equality; development of the built environment; governance; public education and engagement; and international activity—the United States has made *some* progress in the two decades since the Earth Summit.

Yet there is nonetheless an emerging sustainability movement in the United States. It includes dedicated practitioners in a wide variety of fields who have thought deeply about what sustainability means in different contexts and why it is attractive, and whose day-to-day job is to make it happen, fix what doesn't work, and improve results. They are engaged in a wide variety of fields, including agriculture, energy, manufacturing, technology, community planning and development, business and industry, government, education, building construction, engineering, and law.

They understand that the global economy, population, and environmental degradation are all growing, and that there are huge unmet human needs due to extreme poverty throughout the world. They all see that we have no choice but to make economic development, job creation, environmental protection, and national security work together rather than against each other. And they seek to translate those basic realities into reduced risks and greater opportunities in the work that they do and in the way they live.

Across their many and varying activities, there are three broad patterns. First, they have been supported and encouraged by citizens, consumers, investors, students, parents, and other stakeholders. There is also growing support from a wide variety of corporations and nongovernmental organizations, including the religious and ethical community. Second, more-sustainable decisions have become easier to make because of the growing availability of more-sustainable alternatives, and these alternatives are increasingly attractive. And third, government lawmaking for the past two decades has emphasized economic development on behalf of sustainability—renewable energy and energy efficiency, tax incentives, and a wide range of other laws—and has not been limited to environmental regulation.

To be very sure, there are also obstacles to greater progress. It is important to “call out” the forces and circumstances that stand in the way—partly to understand them, partly to recognize that legal and policy recommendations for environmental sustainability won't necessarily happen simply because they are based on good ideas. One set of practical obstacles is the sheer force of existing unsustainable habits—personal, social, organizational, and governmental—that are reinforced by both lack of urgency and uncertainty about what more-sustainable behavior would entail. Another set of obstacles are legal and policy impediments. They include laws and policies that support or encourage unsustainable development, and thus inhibit progress toward sustainability, as well as the lack of a bipartisan consensus about critical environmental issues. Finally, and perhaps most visibly, there are political obstacles—the direct opposition of influential economic interests and the growing economic and political influence of developing countries that are more interested in pursuing conventional development than sustainable development.

How do we build on the progress made to date, overcome these obstacles, and thus accelerate the transition to sustainability? Four broad approaches are needed. First, we need better sustainability choices—options that make even greater progress toward sustainability than currently available options, and more options and tools for a greater number and variety of activities. Second, the United States needs to move from an almost exclusive reliance on environmental regulation to a greater variety of legal and policy tools, including economic development, the repeal of laws that foster unsustainable development, and the like. In addition, the United States needs to adopt legislation that directly and fully addresses climate change. Visionary and pragmatic governance for sustainability is a third needed approach—at all

levels of government. This kind of governance requires a bipartisan national strategy that can guide the nation's sustainability efforts over a long period, an equally strong commitment to research and development of innovative technology, an intensified focus on public education, and greater public participation in decision-making for sustainability.

Finally, and perhaps most fundamentally, to achieve the kind of effort needed to create a sustainable America, we need a national movement that builds on the many local, state, organizational, and sector-specific movements described in this chapter. The businesses, religious organizations, educational institutions, communities, families, individuals, government agencies, and others who work for sustainability on particular issues in specific places all do so for their own reasons, responding to their particular constituents. The integration of economic, social, environmental, and security goals lends itself to partnerships or coalitions of organizations and individuals that otherwise would not likely work together. For those discouraged by the rancorous state of national politics, this movement—which appears to be growing—provides reason for hope.

These four approaches—more and better choices, law for sustainability, visionary and pragmatic governance, and an American movement for sustainability—reinforce each other. A sustainability movement makes it more likely that the needed legal and governance changes will happen and encourages the availability of more-sustainable options and greater use of those options. Public satisfaction with more-sustainable options would, in turn, lead to even more choices and greater support for changes in law and governance that would further contribute to sustainability. Taken together, these four approaches provide a way to build on our progress to date, overcome obstacles, and thus accelerate the transition to a sustainable America.

PART II. PROGRESS TOWARD SUSTAINABILITY

§ 27:7 Introduction

Environmental laws and policies are a key part of the foundation for sustainability. Many of these laws offer important public health benefits. Pollutants and wastes that damage the environment also tend to injure human health, and vice versa.¹ In general, our environmental and natural resource laws have provided a basic level of protection to human health and the environment; without them, we can be very sure that environmental quality—including the air we breathe and the water we drink—would be in much worse shape.

The past two decades have seen some steps forward and some steps back in environmental and public health protection. This chapter includes some good news. Particular areas of progress include improvements in air quality and reductions in pesticide use. The chapter also describes issues where less change in longstanding practices and laws (but often some progress nonetheless) has been made over the last two decades. These include agriculture, fresh water, hazardous waste and Superfund remediation, and oceans and estuaries.

There is also bad news. In some areas, especially climate change, we are moving in the wrong direction on emissions even as new information unfolds about the seriousness of the risks climate change presents and the fact that it is already occurring. There are also new challenges, where our activity has tended to get ahead of our ability to manage for sustainability. These include nanotechnology,

[Section 27:7]

¹National Research Council, Sustainability and The U.S. Environmental Protection Agency (Nat'l Acad. Press 2011).

corn ethanol, and hydraulic fracturing of shale for oil and gas.

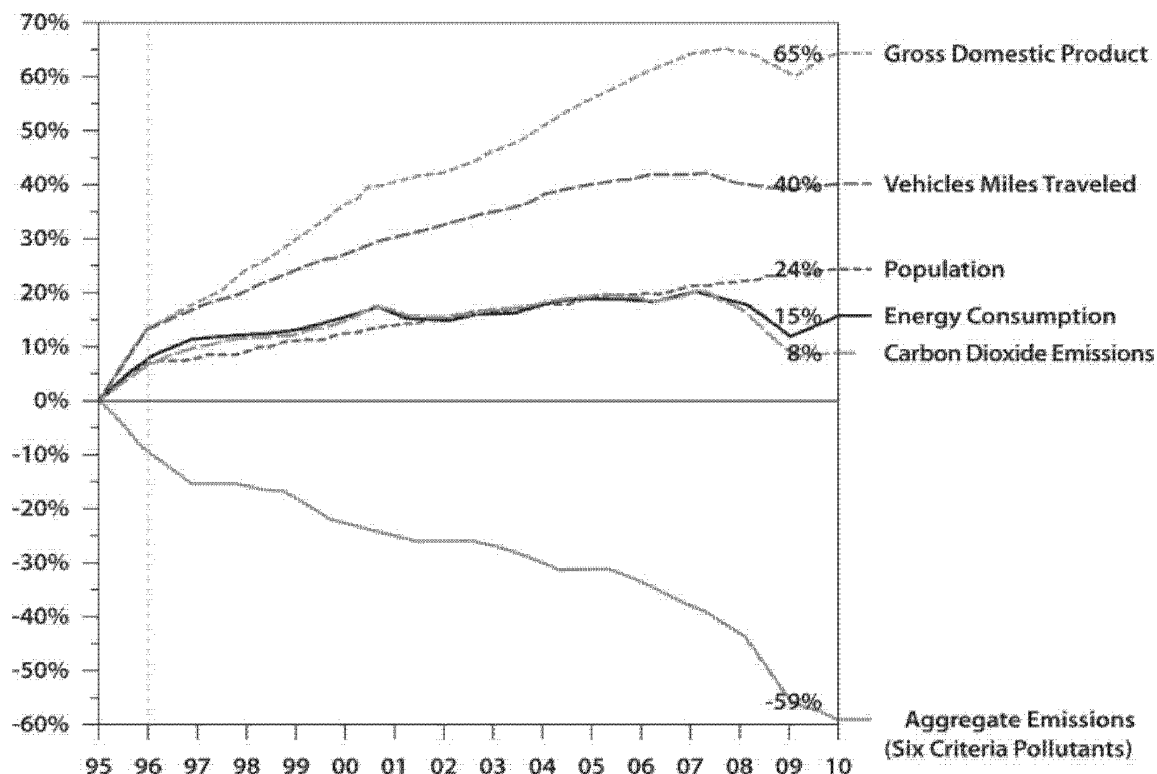

§ 27:8 Air quality

All too frequently, the quality of our air falls short of what is needed to protect public health and the environment. The 1970 Clean Air Act establishes a regulatory program to achieve these goals. Every pollutant regulated under the act is known to cause significant adverse effects to human health, the environment, or both, when present in excess concentrations. Ozone, for instance, not only injures public health but also damages crops, vegetation, and trees.

The basic accomplishment of the Clean Air Act, as shown in Figure 27.2, is both simple and fundamental: unhealthy air has substantially diminished over the past two decades, even as the economy has grown. The six criteria air pollutants—the pollutants primarily targeted by the act (sulfur dioxide, carbon monoxide, lead, ground-level ozone, particulate matter, and nitrogen dioxide)—declined by 59% while GDP grew 65%. What makes this reduction remarkable is that population, energy consumption, and vehicle miles traveled all increased during the same period. Only carbon dioxide emissions, which have only recently been regulated and not in a comprehensive manner, increased.

Figure 27.2

Comparison of Growth Measures and Air Emissions, 1990–2010¹

[Section 27:8]

¹U.S. EPA, *Our Nation's Air: Status and Trends Through 2010*, at 5 (2012), available at <http://www.epa.gov/airtrends/2011/report/fullreport.pdf>.

The United States has made a great deal of progress toward achieving air quality since 1970, when the basic framework of the Clean Air Act was first adopted, and particularly after the enactment in 1990 of comprehensive amendments to the Act. Carbon monoxide concentrations in the air have decreased significantly as cleaner cars have replaced older, more-polluting vehicles.² No areas in the country are currently classified as in violation of the air quality standards for carbon monoxide³—quite a contrast with 1990, when 30 million Americans lived in areas that exceeded the ambient air quality standards for carbon monoxide.⁴ The phaseout of leaded gasoline has caused a 99% reduction in total emissions of lead,⁵ lowering the risk of anemia and IQ loss in children. The control of lead in the air is truly one of the greatest, and most successful, public health measures of our time.

Progress also has been made in regulating stationary sources of air pollution (power plants and factories, primarily). Sulfur dioxide, which is emitted into the air mainly from the combustion of coal at electricity-generating units, decreased by nearly 50% between 1992 and 2008.⁶ These reductions are due in part to the acid deposition control program established by the 1990 amendments to the Clean Air Act.⁷ The amendments led to significant reductions in acid deposition, especially in Western Pennsylvania and the Ohio River valley, where the concentrations of sulfates and nitrates were the greatest. There has also been marked progress in the Northeast, where lakes were dying due to acid rain.⁸ Overall there appear to be no areas that are actually violating the ambient air quality standards for sulfur dioxide.⁹

The benefits from these improvements have far outstripped their costs. EPA has estimated that the benefits from 1970 to 1990 amounted to trillions of dollars.¹⁰ According to a 2011 EPA report required by Congress, in 2010 alone the Clean Air Act prevented more than 160,000 early deaths, 13 million lost work days, and 3.2 million lost school days. These benefits are projected to be even greater in 2020. In addition, the benefits of the legislation exceed its costs by a ratio of 30 to 1 (\$2 trillion in benefits to \$65 billion in costs). Apart from improved public health, benefits from the implementation of the Clean Air Act include improved agricultural productivity, higher visibility, greater quality of life, and healthier ecosystems.¹¹ Earlier studies drew similar conclusions—that the costs are frequently far less than initially estimated and the benefits of control often are orders of magnitude greater than the

costs.¹² These benefits have largely come from the regulation of particles and pollutants such as sulfur dioxide and nitrogen oxide that contribute to the formation of particles.

But there is still a long way to go. More than one-third of the nation's population live in areas where the air quality standards for ozone are violated.¹³ Areas in the Northeast and California will, under the most optimistic scenarios, need years, perhaps decades, to meet those standards. Worse, it appears that the present standards are inadequate. EPA's own scientific advisory board has said the standards are too lax to protect public health and the environment, and the agency has proposed that the standards be tightened.¹⁴ But after pressure from industry and states, President Obama, in 2011, vetoed efforts to tighten the standards for the time being.¹⁵

§ 27:9 Chemicals and pesticides

The management of chemicals is at the very heart of sustainable development because chemicals are responsible for both a great deal of our social and economic progress and much damage to human health and the environment. Principles of sustainable development that are particularly relevant to chemicals include the precautionary principle (willingness to take action in the face of uncertainty to avert irreversible and serious threats to health and the environment); intergenerational equity (avoiding the imposition of large costs for future generations); access to information; and integrated decisionmaking.

Progress over the past two decades has been based on a public-private partnership and a new statute, the 1996 Food Quality Protection Act. EPA's voluntary High Production Volume (HPV) Chemicals Program, begun in 1998 in partnership with the Environmental Defense Fund, the American Petroleum Institute, and the American Chemistry Council, has yielded an enormous amount of new information.¹ More than 2,200 HPV chemicals were "sponsored" by industry—which means that industry agreed to collect basic information about their risks—resulting in the submission of 6,500 published studies, 8,100 unpublished studies, and a large number of new tests conducted on existing high-volume chemicals. In 2010, companies that had not volunteered to provide data on HPV chemicals were directed to do so by regulation. In addition, the U.S. National Toxicology Program and EPA have collaborated to put forward the Tox 21 initiative, an effort to develop and deploy high-throughput in vitro methods (which involve many simultaneous tests on biological material) to reduce the costs and time required for assessing the hazards of the tens of thousands of chemicals about which we know very little.² Information generated from the HPV program is helping to support EPA's Enhancing Chemical Management Program, an effort launched by the agency in September 2009. The program has yielded EPA action plans, built on prior efforts, to address risks of a

number of high-priority chemicals. State laws had already achieved some regulation of certain high-priority chemicals, particularly polybrominated diphenyl ether flame retardants (PBDEs), which appear to reduce fertility in women.³ EPA worked with the only U.S. manufacturer of two PBDE commercial products (pentaBDE and octaBDE), and this manufacturer voluntarily agreed to phase out production by the end of 2004. States have also begun to regulate the polycarbonate polymer compound bisphenol A (BPA), which is widely used in making plastics. A variety of studies raise “questions about its potential impact, particularly on children’s health and the environment.”⁴ At the federal level, EPA took a number of steps to limit use of the persistent and toxic polyfluorinated compounds, most notably perfluorooctanoic acid (PFOA), which is used to make nonstick coatings and many other industrial products. EPA also prosecuted reported violations by the manufacturers of both PFOA and a related compound, perfluorooctyl sulfonate (PFOS), which was once used to make stain repellents.

For pesticides, there has been much more progress. In 2008, EPA completed the reregistration of pesticides already on the market, as required under the 1988 amendments to the Federal Insecticide, Fungicide, and Rodenticide Act. Reregistration was required for pesticides registered before 1984 to make sure they met current standards. EPA also reassessed pesticide food regulations as required under the Food Quality Protection Act (FQPA) of 1996. Registration renewal—a relicensing program established under the FQPA—now is underway. The FQPA resulted in many changes in U.S. pesticide use, the best-documented being reduced use of the very toxic organophosphate pesticides. Their production peaked at 131 million pounds per year in 1980. While use already had fallen to 80 million pounds per year by 1990, it did not continue to decline. After passage of the 1996 law and a 10-year period the government was given to fully implement that law, use fell to 33 million pounds per year in 2007 and may still be declining.⁵ Another significant change in pesticide usage has resulted from implementation of the 1990 Organic Foods Act and subsequent establishment of organic food standards.

§ 27:10 Prevention of lead poisoning

Lead impedes the neurological development of children—their readiness to learn, their intellectual potential, their ability to participate in society—and hence compromises society’s future, one of the driving concerns of sustainable development. Although no one is immune to lead poisoning by virtue of income and status, it disproportionately affects impoverished and minority communities. The control and elimination of the two primary sources of lead exposure (gas and paint) has resulted in a demonstrable decrease in the incidence of lead poisoning. Since the elimination of leaded gasoline, the decrease has reached the point where the median blood level in children is 1.4 micrograms per deciliter, below the Centers for Disease Control 10-micrograms-per-deciliter threshold of concern.¹

Public-awareness campaigns catalyzed by EPA’s prevention strategy and the Res-

idential Lead-Based Paint Hazard Reduction Act of 1992, which established a “hot line” for public inquiries, have increased public vigilance of potential lead hazards. Articles and alerts on a range of possible lead hazards continue to be prominently featured in U.S. media. Reflecting and reinforcing this heightened degree of public awareness, the Consumer Product Safety Commission continues to issue highly publicized recalls and warning notices for a range of lead-containing products, especially imported toys for infants and children. These ongoing consumer protection actions highlight both the momentum established for continued progress on the prevention of lead poisoning and the need to complete the job by continuing to identify and address new sources of lead exposure.

§ 27:11 Agriculture

If there is to be a sustainable form of agriculture in the United States, it will have to be embedded within a more-sustainable food system—one that will look dramatically different from the dominant food system of today. We must produce and distribute food in a way that preserves natural resources for the future production of food and does not exceed nature’s capacity to absorb our wastes. Although this chapter is focused primarily on environmental sustainability, it is important to recognize that sustainable agriculture would also sustain farmers economically by providing them with a fair share of the food dollar, and meet the standards of equity by providing living wages for farm workers as well as reasonable access to healthy food for all consumers.¹

Today, by contrast, we produce and distribute most of our food through an industrialized system of agriculture that uses large amounts of mostly nonrenewable inputs (pesticides, fertilizers, irrigation water, fossil fuels); relies on long-distance networks for distribution; and stresses high yields of commodity crops such as corn, soybeans, and wheat, grown in monoculture (one plant species per plot of land). Most of this output then becomes inputs to animal agriculture as animal feed, the processed food industry, or the biofuels industry.² The use of commodity grains as animal feed is inherently wasteful of resources: the feed-to-animal-weight ratio for beef is 7:1, for pork 4:1, and for poultry 2:1.³

One way to gauge our progress toward sustainable agriculture is to conduct an inventory of the resources we need for agriculture and determine how well we are conserving them. We should acknowledge the importance of farmers and their knowledge base, inputs to agriculture that are often overlooked when we discuss sustainability. The farming population in the United States has been dwindling as a consequence of the mechanization and industrialization of agriculture, which tends toward fewer farms with more acreage per farm and more animals per farm.⁴ The other main ingredients in agriculture include land, soil quality and quantity, water quality and quantity, energy, and biodiversity.

§ 27:12 Farmland

According to the Natural Resources Conservation Service, the United States lost

⁴U.S. EPA, Ag 101: Demographics, <http://www.epa.gov/agriculture/ag101/demographics.html>.

15% of its farmland between 1982 and 2007, although half of this loss was accounted for by environmentally sensitive cropland being enrolled in the federal Conservation Reserve Program.¹ This voluntary program for agricultural landowners, inaugurated in 1985, provides annual payments in return for growing specific plants that attract wildlife, reduce soil erosion, and improve water quality.²

§ 27:13 Soil quantity

The National Resources Inventory, conducted by the Natural Resources Conservation Service of the U.S. Department of Agriculture (USDA), reports both good news and bad news on soil erosion on U.S. cropland. The good news is that the rate at which we are losing topsoil in the United States has been declining; between 1982 and 2007 the rate decreased by 43%. The bad news is that we are still losing topsoil at a rate much faster than nature can replenish it; in 2007, U.S. cropland was still losing topsoil at an average rate of 4.8 tons per acre per year.¹

More U.S. farmers have been practicing conservation tillage (a system that leaves crop residues on the surface to control erosion); the percentage of planted acreage managed under the system increased from 26% to 41% between 1990 and 2004.² However, conservation tillage systems—which often mean a no-till approach—are often heavily dependent on herbicides for controlling weeds, where tillage (turning over the soil and burying weeds) was once used to control them. According to EPA, “Pesticides are used on the vast majority of U.S. cropland . . . [H]erbicides were applied to 98% of corn acreage and 96% of soybean acreage in 2001.”³

§ 27:14 Soil quality

A National Research Council report has described how industrialized agriculture affects the quality of soil:

Some modern agricultural practices adversely affect soil quality by affecting soil physical, chemical, and biological factors through erosion, compaction [by heavy machinery], acidification, and salinization. They also reduce biological activity as a result of pesticide applications, excessive fertilization, and loss of organic matter.¹

The report also points out that modern farming methods might be reducing the nutrient content of our soils: “The nutrient density of 43 garden crops (mostly

vegetables) has been shown to have declined between 1950 and 1999 in the United States, suggesting possible tradeoffs between yield and nutrient content.”²

Synthetic fertilizers are used as a substitute for natural fertility in the soil and are dependent on a fossil fuel (natural gas) as their feedstock. Based on these factors, synthetic fertilizers are not regarded as a long-term solution to soil fertility needs.

USDA’s Economic Research Service found that in 2006, about two-thirds of U.S. cropland was not meeting all three criteria for good nitrogen management, which are related to the rate, timing, and method of application.³

§ 27:15 Water quantity

Agriculture accounts for 80% of all water use in the United States, primarily through irrigation. Only 16% of U.S. cropland is irrigated, but that acreage accounts for nearly half of the value of all crops.¹ Most irrigation depends on groundwater withdrawals from aquifers such as the High Plains Aquifer (also known as the Ogallala Aquifer), which lies under eight U.S. states and provides water to more than 15 million irrigated acres, or about one-quarter of all irrigated acres in the United States.² Between 1950 and 2009, the aquifer was depleted by about 9%.³ The Texas portion of the aquifer had lost even more—nearly 1% of its water in storage each year between 1990 and 2004.⁴

On a more positive note, U.S. farmers have increased their adoption of pressurized irrigation systems, which usually achieve 75-85% efficiency in water use (compared to a typical 40-65% efficiency in gravity-flow systems). Between 1979 and 2003, acreage under pressurized systems increased from 37% to 57% of all irrigated acreage. Acreage using low-flow systems such as drip irrigation (which has an application efficiency of 95% or greater) increased tenfold, but it represented only 6% of all irrigated acreage.⁵

§ 27:16 Water quality

Water quality can be affected by soil erosion and the runoff of pesticides, excess fertilizer, and animal waste into watersheds. It has been estimated that crops only take up 30–50% of the nitrogen fertilizer applied to farm fields, and about 45% of applied phosphorus. Some of the excess is absorbed by soils, but some runs off the land and harms our watersheds.¹

[Section 27:16]

¹D. Tilman et al., *Agricultural Sustainability and Intensive Production Practices*, 418 *Nature* 671 (Aug. 8, 2002).

Between 1996 and 2008, an additional 383 million pounds of herbicides were used in the United States because of the widespread adoption of crops that are genetically engineered to tolerate herbicides; Monsanto's Roundup Ready soybean seeds, for example, now make up about 95% of commercial soybean plantings. By contrast, insecticide use decreased significantly during that same 13-year period because some major crops have been genetically engineered to produce their own insecticide, a toxin derived from *Bacillus thuringiensis* (Bt), a bacterium found in soil. These Bt crops present a serious danger, though, because their widespread use virtually ensures that insects will develop resistance to Bt, which has been a valuable tool in organic agriculture.²

Despite the successes of no-till farming in reducing soil loss, the system has not stemmed the tide of excess nutrients entering waterways and causing dead zones in water bodies, most prominently the Gulf of Mexico and the Chesapeake Bay. These dead zones are places where excess nutrients have caused blooms of algae, which as they die off and decompose, absorb most of the oxygen in the water and make it uninhabitable for aquatic life.³ As sustainable agriculture advocate Wes Jackson explains: "The water coming off a minimum-till or no-till field looks a lot better than the water coming off a conventional-till field. There's only one problem: The nitrogen level of the water from that no-till land is still three times above the acceptable level determined by the Environmental Protection Agency."⁴

The concentrated animal-feeding operations (CAFOs) that produce most of the nation's meat, milk, and eggs have severed the connection between animals and the land. Traditionally, animal manure was valuable fertilizer for farmers. Today, because so many animals are now produced in each CAFO and many CAFOs tend to be concentrated in certain areas of the country, animal manure often poses problems of air and water pollution—or, at the very least, a waste management problem. In 1997, 152 U.S. counties produced more phosphorus from animal manure than their cropland could absorb, and 68 counties produced more manure nitrogen than their land could absorb. The largest farms (more than 1,000 "animal units," each equal to 1,000 pounds of live weight) constituted only 2% of all farms but were responsible for half of the excess nutrients.⁵ Excess manure from CAFOs is stored in cesspits in the ground that the industry calls "lagoons." During heavy storms or floods, these storage pits can overflow or rupture and release excess nutrients into local waterways, killing fish and other aquatic life.⁶

§ 27:17 Energy

An estimated 7.3 units of energy are expended for every unit of food produced in

⁶Pew Commission on Industrial Farm Animal Production, Putting Meat on the Table: Industrial Farm Animal Production in America (2008), available at <http://www.ncifap.org/images/PCIFAPFin.pdf>.

the United States. Most of this energy input comes from nonrenewable fossil sources.¹ Fossil fuels are used in the production of pesticides and fertilizers; the pumping of irrigation water; the use of heavy machinery for tilling, planting, and harvesting; the processing of foods; and the shipping of raw materials and finished products, often across great distances. This industrialized food system cannot be sustained into the future using the same energy sources it now depends upon.

Although agriculture is still largely dependent on nonrenewable energy sources, it is using energy more efficiently. In 2004, the Congressional Research Service (CRS) reported that “since the late 1970s, the direct use of energy by agriculture has declined by 26%, while the energy used to produce fertilizers and pesticides has declined by 31%.” The CRS attributed these declines to improved energy efficiency inspired by the petroleum price shocks of the 1970s.² The Natural Resources Conservation Service adds: “Direct energy use has been reduced as a result of advances in equipment efficiency, irrigation efficiency, adoption of no-till or conservation tillage, and other practices and technologies.”³

§ 27:18 Biodiversity

Biodiversity can be defined as the “variety of life on Earth at all its levels, from genes to ecosystems, and the ecological and evolutionary processes that sustain it.”¹ Agriculture both depends on biodiversity and impacts it. Industrial agriculture, in particular, erodes biodiversity among domesticated plants because it relies on a small number of high-yielding crop varieties, to the exclusion of other varieties.

The United Nations Food & Agriculture Organization (FAO) points out that about three-quarters of the world’s plant genetic diversity was lost during the 20th century, “as farmers worldwide have left their multiple local varieties and landraces for genetically uniform, high-yielding varieties.” The FAO also reports that 30% of livestock breeds are threatened with extinction and that “75% of the world’s food is generated from only twelve plants and five animal species.” In addition, 60% of all the plant-based calories we eat come from just three crops—rice, corn, and wheat.² This uniformity in agriculture—and therefore our food supply—puts us at risk when there are disruptions such as extreme weather, insect infestations, or outbreaks of plant diseases.

On a brighter note, the U.S. Department of Agriculture’s Conservation Reserve Program (CRP), which has helped reduce soil loss, is also the major federal land conservation program that has a positive influence in the protection of biodiversity. Federal farm bills have been a major source of the dedication of land for biodiversity conservation purposes, through the CRP and several different programs. The 2002 Farm Bill continued the CRP and created the Wildlife Habitat Incentives Program, which pays farmers for biodiversity conservation on private land, primarily enhance-

ment and restoration of fish and wildlife habitat.³ The 2008 farm bill provided a total of \$733 million over five years for the Farm and Ranch Lands Protection Program, which pays for up to 50% of the price of acquiring conservation easements or other interests to preserve private agricultural land.⁴ The legislation also reestablished the Grassland Reserve Program, which supports “working grazing operations, enhancement of plant and animal biodiversity, and protection of grassland under threat of conversion to other uses,” and has a goal of protecting 1.22 million acres.⁵ However, the 2008 bill will expire in 2012, and all of these programs will be reviewed through the lens of the drive to reduce federal spending.

§ 27:19 Freshwater

In the interrelated fields of water quality/aquatic ecosystem health and water quantity/water resources management, some progress has been made over the past 20 years. The Clean Water Act, which established a permitting and regulatory program to protect water quality, continues to serve as a reasonably effective tool for reducing pollution from major sources such as factories and sewage treatment plants, and to a lesser degree for more difficult challenges such as urban stormwater and other sources of runoff pollution. Statutes such as the Resource Conservation and Recovery Act,¹ which regulates solid and hazardous waste, and the Safe Drinking Water Act also help to protect groundwater from new sources of pollution and to ensure the safety of the tap water consumed by most Americans. Especially when compared with much of the world, most of the United States is served by modern collection and treatment systems for sewage (at secondary treatment levels or higher), and by modern treatment and conveyance systems for drinking water.

Yet there is a long way to go. Surface water and groundwater pollution remains a significant problem. In urban areas, waterways remain impaired due to the physical and chemical effects of stormwater runoff, especially after intensive storms. Urban waters can also be severely impaired by combined sewer overflows and sanitary sewer overflows, which cause the discharge of untreated waste into waterways. Suburban watersheds are impaired by intensive sprawl development, which changes the flow characteristics of many streams in addition to generating pollution by nutrients, toxic metals, and organic chemicals. Surface water and groundwater in rural watersheds, especially those with intensive row-crop agriculture, continue to be polluted by pesticides and herbicides that can contaminate fish and wildlife or directly impair drinking water sources. In many coastal regions, saltwater intrusion is already impairing or threatening the utility of groundwater supplies for domestic and other use, or requiring expensive advanced treatment systems (such as reverse osmosis filtration) to make them potable; and rising sea levels may exacerbate those problems.

Even areas served by modern infrastructure face health risks from water pollution. On a national scale there are as many as 2.5 million cases of giardia and 300,000 cases of cryptosporidiosis each year, both of which are waterborne diseases. Warnings on fish consumption and beach closures continue to provide evidence that

¹42 U.S.C.A. §§ 6901 to 6992.

water pollution can cause significant threats to human health, from both pathogens and toxics. Despite massive investments in municipal sewerage and stormwater management facilities in recent decades, wastewater collection and treatment infrastructure in the United States faces tremendous challenges due to aging systems, urban and suburban growth, and new or strengthened water quality standards. EPA estimates it will cost almost \$300 billion to meet these needs over the next 20 years.²

The Clean Water Act and other tools to protect aquatic ecosystems, such as the Endangered Species Act, have also been less effective in protecting the biological integrity of aquatic ecosystems from threats such as the filling of wetlands, loss of riparian areas, stream channelization and diversion, and other kinds of habitat impairment. In the 1990s, the federal government adopted a “no net loss” policy for wetlands protection, reflecting a pledge to ensure that any future wetland loss or degradation be offset by equal or greater wetlands gains through wetland restoration or creation efforts. Wetlands improve water quality, help store flood waters, and are excellent wildlife habitat.³ Although this policy has slowed the rate of wetlands loss, there is considerable uncertainty about the effectiveness of wetlands restoration and creation, and therefore the success of the “no net loss” policy. Moreover, a series of judicial decisions has injected additional uncertainty about which waters are covered by the Clean Water Act program. Many other activities that result in aquatic ecosystem degradation, such as dam construction and operation, stream channelization, bank stabilization, and floodplain and watershed development, are not regulated directly by federal law. Intensification of this kind of land use change can lead to significant degradation of aquatic ecosystems due to the aggregate impacts of a large number of activities that are difficult to regulate or modify individually. Those kinds of pervasive impacts have presented significant barriers to even large, heavily funded, and well-designed aquatic ecosystem protection and restoration programs, such as the Chesapeake Bay Program.

Growth has also stressed water supplies in many parts of the United States, including in eastern states usually considered to have water. A protracted drought in the Southwest has left major reservoirs such as Lake Powell and Lake Mead half full, posing threats to water supplies from Denver to Los Angeles. While many have believed since the early 1990s that the era of large water projects was over, recent shortages have given rise to calls for renewed construction of storage reservoirs and other water-supply infrastructure, including some projects involving major water transfers from water-rich to arid regions. Climate change makes these challenges even harder.

§ 27:20 Hazardous and toxic wastes

A sustainable hazardous waste regime requires, if possible, that the use of chemicals that produce hazardous wastes be eliminated entirely. Where that is not possible, the use of such chemicals must be minimized, and a cycle of use and reuse must be created to minimize or eliminate their release. Hazardous wastes that were improperly disposed of in the past must be remediated in order to remove the dangers they may pose to human health, water resources, land, and wildlife. Sustainable management of hazardous waste creates genuine opportunities for industries to reduce the costs of purchasing raw materials, decrease workplace risks and accidents, minimize industrial liability, improve community relations, and ease

the costs of waste management.

Two major federal statutes govern this effort—the Resource Conservation and Recovery Act (RCRA), which established a regulatory program for the management of hazardous wastes, and the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA),¹ or Superfund law, which established a program for cleaning up contaminated sites. Over the past 20 years, progress toward sustainability under these two laws has been limited and inconsistent at best. Beginning in 2002, EPA created and promoted an entirely voluntary program designed to encourage industries to minimize their generation of hazardous wastes. This program achieved anecdotal progress in some areas. And in 2007, the U.S. Supreme Court handed down a decision that encouraged firms to be more proactive in cleaning up contaminated hazardous waste sites.² This ruling removed confusion over which parties engaging in a cleanup could recover some or all of their costs from other responsible parties.

These salutary developments aside, however, further necessary steps that would represent progress toward sustainability have been stalled, and in some cases, new measures have been adopted that move us away from a sustainable approach. In 1995, Congress ended the petroleum tax that had been the source of money for Superfund cleanups at sites where no solvent responsible party can be found. Since then, the Fund has been chronically underfinanced with general tax revenues. Moreover, in 1996, Congress took another step away from achieving sustainable development by removing a significant source of private financial pressure on hazardous waste site operators/debtors to manage their facilities in an environmentally sound fashion. It did so by expanding CERCLA's existing liability exemption for secured creditors (primarily banks) so long as they do not actively participate in facility operations and decisions.³

These and other statutes have not been amended in ways that would make them more sustainable. Although the EPA-sponsored voluntary hazardous waste minimization programs sparked some marginal advances, they are a far cry from new environmental legislation that would require industrial hazardous waste generators to decrease their generation of such wastes, in phased increments, by fixed dates. Between fiscal years 2007 and 2010, industrial, federal, state, and local sources reduced nearly 16 million pounds of 31 hazardous compounds and metals that EPA defines as “priority chemicals” from their waste streams—mostly by cutting releases of lead and lead compounds. Yet in 2007 (the latest year for which comparable statistics are available), those same sources continued to generate almost 85 million pounds of priority chemicals.⁴ In 2010, sources in the United States released into the environment more than 3.92 billion pounds of a more comprehensive set of toxic chemicals.⁵

RCRA has not been amended to include a consistent, straightforward, and comprehensive definition of hazardous waste. Longstanding exclusions from statu-

tory coverage—irrigation return flow waters containing pesticides and domestic sewage containing toxic chemicals—continue to exist. Similarly, while EPA continues efforts to make constructive use of the 1976 Toxic Substances Control Act to manage the introduction and use of new chemicals in the marketplace, the statute has not been amended since 1992, and there is an increasing consensus among many parties that reform is needed.⁶

§ 27:21 Oceans and estuaries

Sustainable use of the oceans requires that all human activities preserve water quality sufficient to support the biological, chemical, and physical processes of the oceans without stress, so that oceans can support a variety of healthy ecosystems; dissolve excess carbon dioxide from the atmosphere; and circulate in currents that aid human navigation, drive relatively predictable weather patterns, and cycle heat and nutrients throughout the depths and around the world. Sustainable development further requires that humans remove only the amount of biological resources—such as algae/seaweed, fish, marine mammals, and corals—that those species can comfortably replace between human harvests and that will not disrupt the greater food webs and ecosystems of which those species are a part.

The United States is not managing its oceans, coasts, and estuaries in a sustainable manner. One key stressor is overfishing, which not only removes target species in an unsustainable manner but also results in by-catch of nontarget species and in shifting food webs (that is, shifting predator-prey relationships, as target predator or prey fish are caught). As a result, overfishing can alter or destroy basic components of marine ecosystem functioning. Certain fishing methods, such as bottom trawling, can destroy marine habitat, further interfering with overall ecosystem function and productivity. In 2005, the National Oceanic and Atmospheric Administration (NOAA) instituted its Fish Stock Sustainability Index (FSSI), a performance measure for the sustainability of fish stocks selected for their importance to commercial and recreational fisheries.¹ The index provides valuable data about sustainable ocean fisheries. Although NOAA's reporting methodology has changed over time, its figures show only limited progress toward sustainability in fisheries management. Between 1997 and 2010 the number of stocks not overfished declined from 183 to 136. Yet in 2010, 43 fish stocks were considered overfished, and another 72 were considered not to be sustainable. Moreover, much remains unknown regarding

U.S. fish stocks, especially species that support only minor fisheries. In 2010, the sustainability status of 51 other major fish stocks was simply unknown.

While overfishing is one major challenge to the sustainability of oceans and estuaries, another is land-based marine pollution, which remains the last major category of marine pollution not subject to effective regulation, either in the United States or internationally. One of the most critical land-based contaminants of marine ecosystems is nutrient runoff from agricultural activities. For example, the Mississippi River drains more than two-thirds of the United States, and much of the runoff entering the river comes from farms. Nutrient runoff has been deemed a major cause of the hypoxic (low-oxygen) zone in the Gulf of Mexico. The U.S. Geological

²U.S. Geological Survey, The Gulf of Mexico Hypoxic Zone, http://toxics.usgs.gov/hypoxia/hypoxic_zone.html.

Area of Mid-Summer Bottom Water Hypoxia (Dissolved Oxygen < 2.0 mg/L).

Other forms of land-based marine pollution include run-off of toxics and fertilizers, intentional discharge and dumping of pollutants into the ocean, the accumulation of plastics into “garbage patches” at the gyres in the Pacific and Atlantic Oceans, and atmospheric deposition of mercury.

§ 27:22 Climate change

For some critical environmental issues, the problem is not that our progress has been too little or too slow. Rather, the problem is that we are moving in the wrong direction in spite of what we have learned in the past several decades about the magnitude of the damage being done, the risks we face, and the challenge to achieve sustainability. Climate change is the most pressing environmental, health, economic, social, and national security issue on which we are moving in the wrong direction.

Greenhouse gas pollution has steadily increased since 1990 despite U.S. agreement to the 1992 United Nations Framework Convention on Climate Change to avoid serious harm to human well-being and the environment. It is increasingly evident that climate change is having, and will continue to have, adverse effects not only on other countries but on the United States, including its biodiversity and water supplies. But the United States has not been able to adopt comprehensive national legislation to address climate change.

§ 27:23 Risks

As scientific information has developed over the past several decades, it is increasingly clear that humans are causing climate change and that climate change presents enormous risks to life, human health, property, biodiversity, plants, animals, species, and ecosystems.¹ It threatens people in the United States and around the world with rising seas, reduced agricultural production, lower water supply, drought, floods, lethal heat waves, and increases in vector-borne disease. It is also increasingly clear that climate change is already underway, as sea levels rise, growing seasons change, the number and scale of unusual weather events increases, and glaciers disappear.² And it is not just the environmental and human health risks of climate change that present sustainability challenges. Because most greenhouse gas emissions derive from the use of fossil fuels to produce energy, it is also important to be mindful of the economic costs and security risks inherent in supporting a global fossil fuel infrastructure.

Climate change is likely to have an adverse impact on biodiversity. If nothing is done to mitigate global climate change, impacts to biodiversity may include shifts in migration and breeding patterns of species; expansions or contractions of natural species ranges; a rise in sea level, water temperature, and acidity; increases in disease transmission and pest infestations; and unpredictable fluctuations in populations and habitat conditions. Climate change may also contribute to the proliferation of invasive nonnative species, which can lead to the endangerment and extinction of native species. The most immediate threat is that current habitats for species, including those protected by the Endangered Species Act, may become unsuitable and species will be forced to migrate or face increased stresses in their orig-

²National Research Council, *Adapting to the Impacts of Climate Change* (Nat'l Acad. Press 2011).

inal habitats.³ Thus existing reserves may no longer serve their intended purpose and new ones will have to be created.

Models suggest that climate disruption is likely to induce higher water demand due to rising temperatures, increased frequency and intensity of droughts in some parts of the United States, and more intensive rain leading to flooding in others. That will likely place significant additional stress on America's aquatic ecosystems, water supply, and water infrastructure.

Agriculture is also being increasingly impacted by climate change as droughts, floods, hurricanes, and tornadoes become more frequent and more severe. These extreme events diminish crop yields and damage our natural resource base. The Global Change Research Program has summed up some of the impacts to be expected:

- Many crops show positive responses to elevated carbon dioxide and low levels of warming, but higher levels of warming often negatively affect growth and yields.
- Extreme events such as heavy downpours and droughts are likely to reduce crop yields because excesses or deficits of water have negative impacts on plant growth.
- Weeds, diseases, and insect pests benefit from warming, and weeds also benefit from a higher carbon dioxide concentration, increasing stress on crop plants and requiring more attention to pest and weed control.
- Increased heat, disease, and weather extremes are likely to reduce live-stock productivity.⁴

The relatively stable climate that has existed on the planet for most of agriculture's history has been a key element of agriculture's success,⁵ even though a stable climate is not something we usually think of as an "input" to agriculture. In the coming decades, though, climate change will be the norm.

The United States also has not grappled with the fact that climate change will have a tremendous impact on marine resources as the oceans become warmer and chemically less basic (the result of dissolved carbon dioxide causing "ocean acidification") and as ocean current patterns change. Warmer oceans mean that species will shift poleward to cooler waters, a phenomenon that has already been documented for some fish species, such as Atlantic cod. Changing ocean temperatures also affect ocean current patterns, which can alter ocean nutrient upwellings and species patterns. For example, a hypoxic zone that appeared rather suddenly off the coast of Oregon has been attributed to changing current patterns. Finally, ocean acidification interferes with the basic chemistry of biological processes, such as shell-building, for many marine species.

§ 27:24 International agreements and U.S. emissions

Though most Americans are unaware of it, the United States ratified the United Nations Framework Convention on Climate Change in 1992.¹ The treaty provides an international framework for addressing climate change; it does not establish

¹United Nations Framework Convention on Climate Change, Status of Ratification of the Conven-

quantitative emissions reduction requirements. Yet the convention provides several ways to measure whether U.S. greenhouse gas emissions are moving toward or away from sustainability. Chief among them is Article 2, which establishes the convention's ultimate objective—"stabilization of greenhouse gas concentrations in the atmosphere at a level that would prevent dangerous anthropogenic [human] interference with the climate system."² As one of the parties to the convention, the United States also agreed to "protect the climate system for the benefit of present and future generations of humankind, on the basis of equity" and other factors.³ Developed countries such as the United States agreed to take the lead in reducing greenhouse gas emissions because of their greater technological and economic resources and because of their large historical contribution to higher atmospheric greenhouse gas levels.⁴ This promise entails addressing the global consequences of climate change in developing climate change policy, not just pursuing national interests, because climate change is a threat to people and ecological systems around the world.

The acknowledgement in the Framework Convention of historical responsibility has particular importance for the United States. Between 1857 and 2007, the United States emitted 28.77% of the entire world's greenhouse gas emissions, more than any other developed country, and far more than any other developing country.⁵ While China has today overtaken the United States as the world's greatest emitter of greenhouse gases in absolute quantity, about one-fourth of the overall increase in global greenhouse gas concentrations over the past century and a half is attributable to the United States.

It now appears that global emissions of greenhouse gases need to be reduced by as much as 80% by 2050 to achieve nondangerous levels.⁶ Because the United States remains one of the highest per capita emitters and some nations emit greenhouse gas emissions at levels significantly below average international per capita emissions, the United States will eventually need to reduce its greenhouse gas emissions by greater amounts than most of the rest of the globe in order to achieve "equity." Although the term "equity" in the Convention is without a precise legal definition, it is usually understood to connote an obligation to fairly share needed global greenhouse gas emissions reductions burdens.⁷

Because the convention did not contain enforceable national-reduction targets that would translate these general provisions into concrete numbers, the next major step was to negotiate a protocol to do just that. The Kyoto Protocol, named after the Japanese city in which it was negotiated, grew out of a conviction, underscored by the emerging science on climate change, that developed nations needed to be bound

by numerical emissions reductions targets.⁸ Under the Kyoto Protocol developed countries agreed to reduce their net greenhouse gas emissions by at least 5% from 1990 levels by 2008 to 2012; the European Union agreed to an 8% reduction, and the United States would have reduced its emissions by 7%.⁹ The protocol now has 193 parties,¹⁰ although it will end by its own terms at the end of 2012. The United States is the only developed country that did not ratify the Kyoto Protocol or adopt quantifiable greenhouse emissions targets (although Canada announced its withdrawal from the Protocol at the end of 2011).

Since ratifying the convention, the United States has failed to reduce emissions below levels that existed in 1990, the common measuring point for a country's progress. In 2009, total U.S. greenhouse gas emissions (including not only carbon dioxide but also methane, nitrous oxide, and other gases) were 6,633.2 teragrams (or million metric tons) of carbon dioxide equivalent. U.S. emissions increased by 7.3% between 1990 and 2009 (Figure 27.4). This overall increase occurred in spite of an emissions decrease from 2008 to 2009 by 6.1% (427.9 teragrams of carbon dioxide equivalent).¹¹ This recent dip in emissions was primarily due to a decrease in economic output resulting in reduced energy consumption across all sectors and a decrease in the carbon intensity of fuels used to generate electricity due to fuel switching as the price of coal increased and the price of natural gas declined.¹²

¹⁴*Id.*

¹⁵*Id.*

When President Obama was elected in 2008, there was widespread international hope that the United States would change course on climate change. Yet the United States approached international climate negotiations under the convention in Cancun in 2010 and the year before in Copenhagen by making a voluntary commitment only to reduce its greenhouse gas emissions by 17% below 2005 emissions levels by 2020. The U.S. promise is the weakest of all of the developed country promises, falls far short of what is required of global greenhouse gas emissions reductions necessary to prevent dangerous climate change, and is without any response to what equity would require for U.S. emissions reductions.¹⁶

§ 27:25 National measures

President Obama's commitment on greenhouse gas emissions was based upon the proposed American Clean Energy and Security Act (also known as the Waxman-Markey bill after its two primary House sponsors), comprehensive cap-and-trade legislation that passed the House of Representatives in 2010 but was not passed in the Senate.¹ In the 2010 mid-term elections, control of the House of Representatives passed to the Republicans, many of whom deny the scientific consensus that humans are contributing to climate change. As of this writing, it is unlikely in the near future that Congress will take action that achieves even the weak U.S. commitment made in Cancun.

Although Congress has failed to enact legislation directly limiting greenhouse gas emissions, the Obama Administration has taken action in response to the 2007 U.S. Supreme Court decision in *Massachusetts v. EPA*.² The case arose out of a petition to EPA to regulate greenhouse gas emissions from motor vehicles under the Clean Air Act. EPA refused, saying among other things that greenhouse gases are not pollutants under the Clean Air Act. The Court, in what is widely recognized as a landmark decision, held that greenhouse gases are air pollutants subject to regulation under the Clean Air Act. The Court also interpreted the act as requiring EPA to regulate greenhouse gases unless EPA determined that greenhouse gases are not endangering human health and the environment.³ The case means that new federal legislation is not required to regulate greenhouse gas emissions, even though many believe that new legislation more specifically tailored to greenhouse gases is preferable. Moreover, because an air pollutant under the Clean Air Act is an air pollutant for all purposes, the EPA's newly recognized authority is not limited to motor vehicles but also applies to factories, power plants, and other stationary sources.

In 2009, EPA found that greenhouse gases, including those emitted from new motor vehicles, endanger human health and the environment⁴ (and subsequently refused to reconsider that finding after petitioned to do so).⁵ Since then, EPA and the Department of Transportation have worked together to both reduce greenhouse

⁴Endangerment and Cause or Contribute Findings for Greenhouse Gases Under Section 202(a) of the Clean Air Act, 74 Fed. Reg. 66496 (Dec. 15, 2009).

⁵EPA's Denial of the Petitions to Reconsider the Endangerment and Cause or Contribute Findings for Greenhouse Gases Under Section 202(a) of the Clean Air Act, 75 Fed. Reg. 49556 (Aug. 13,

gases from motor vehicles and improve their fuel efficiency. The Department of Transportation has authority to establish corporate average fuel efficiency (CAFE) standards for motor vehicles under the Energy Policy and Conservation Act, which was adopted in 1975 in response to national security challenges raised by the 1973 and 1974 oil embargoes by the Organization of Petroleum Exporting Countries.⁶ Efficiency improvements lagged in the United States for many years, however, and the average fuel economy of new cars and trucks was higher for model year 1985 than 2005.⁷

Fuel efficiency for motor vehicles has begun to improve again, and new standards set by Congress and advanced by the Obama Administration for passenger cars and light-duty trucks will provide the biggest increase in efficiency in 30 years—and substantial cuts in emissions—by model year 2016.⁸ The Supreme Court's decision played a lead role in prompting these standards, as well as California's efforts to advance low- and zero-emission vehicles. An agreement between the federal government and 13 automakers will accomplish even more in future model years.⁹ The new proposal would increase the CAFE standard to 49.6 miles per gallon by model year 2025 on an average industry fleetwide basis, and the proposed greenhouse gas standards are projected to require vehicles to get 54.5 miles per gallon if the standards are met solely through improvements in fuel efficiency.¹⁰ These standards are expected to trim oil consumption by 4 billion barrels and greenhouse gas emissions by 2 billion metric tons over the life of vehicles sold in model years 2017 to 2025.¹¹ This approach harmonizes CAFE standards and limits on greenhouse gas emissions from motor vehicles to produce much cleaner, more efficient vehicles. Although the proposed standards would increase the purchase price of vehicles, they also would result in far greater savings in fuel costs, which should strengthen the competitive position of the U.S. auto industry. In addition to these provisions, EPA and the Department of Transportation in 2011 announced the first program to reduce greenhouse gas emissions and fuel use in heavy-duty trucks and buses. This program will also result in significant additional reductions in air pollution and oil consumption.¹²

Using its authority under *Massachusetts v. EPA*, EPA has also adopted greenhouse gas regulations based on the best available control technology for large stationary sources such as factories and power plants.¹³ Since January 2, 2011, some new stationary sources or modifications to those sources that increase greenhouse gas emissions have been subject to permitting.¹⁴ EPA has issued guidance emphasizing the importance of energy efficiency in meeting these best available control

technology requirements for greenhouse gases.¹⁵ EPA also agreed to adopt by 2012 new performance standards for greenhouse gas emissions from electricity-generating units¹⁶ and refineries.¹⁷ As part of that agreement, EPA proposed new source performance standards for electricity-generating units in March 2012.¹⁸

§ 27:26 New challenges

A major challenge to sustainability is the fact that new environmental issues continue to arise, and will always continue to arise. Prominent among the recent developments that present challenges to sustainability are nanotechnology, increased production of corn-based ethanol for fuel, and the use of hydraulic fracturing to extract natural gas or oil from shale.

The field of nanotechnology emerged over the last 20 years, and nanomaterials have now entered the market. Nanomaterials (materials made of particles with at least one dimension of 100 nanometers or less; a nanometer is one billionth of a meter) occur in nature. Engineered nanomaterials (those made by people) have a wide array of chemistries, including fullerenes (C60 or Bucky Balls, hollow carbon molecules that are unusually stable), carbon nanotubes, metal and metal oxide particles (such as the nanozinc sunscreens and nanosilver substances that kill or resist bacteria and other microorganisms), polymers, and quantum dots (nanoscale semiconductors). Such materials are used in industrial coatings, paints, fabric treatments, pharmaceutical delivery systems, sunscreens, and cosmetics. Rapid commercialization has occurred despite a lack of knowledge about how these materials move and transform in the environment, how they affect biological systems, and what their potential for harm to human health and ecosystems might be. The assessment, indeed even the identification, of these as unique materials pose challenges for safety evaluations. During the Bush Administration, the federal government opted to use only voluntary approaches for managing risks of nanomaterials, and did not think it necessary to consider their potential risks to health and the environment.¹ More recently, the EPA has announced steps to regulate nanotechnology under its chemicals program through a new rule under the Toxic Substances Control Act (TSCA), and as pesticides under the Federal Insecticide, Fungicide, and Rodenticide Act. The proposed TSCA rule was scheduled for release for comment at the end of 2010 but had not come forward by the time of writing.² The proposed new policies for pesticides were released for public comment in June 2011.³ Also in June 2011, the White House issued a memorandum to all government agencies emphasizing

ing the promise of nanotechnology to help address multiple societal needs, and the ability of the agencies to address nanotechnology risks using existing statutory authorities and “risk-based approaches.”⁴

Increased production of biofuels, particularly ethanol made from corn, is a second major issue that has emerged in recent years. Higher fuel prices have led to an increasing adoption of renewable energy technologies such as wind and solar. However, this has also led to expanded use of biofuels; their use grew at an annual average rate of 1.8% between 1992 and 2009.⁵ While biofuel energy use increased by more than a factor of 10 between 1992 and 2009, wood energy use declined by 19%.⁶ Of particular concern is the fact is the dramatic growth in corn-based ethanol production. The United States has been the world’s largest producer of ethanol fuels since 2005,⁷ with output nearly doubling between 2005 and 2009.⁸ The current high use of corn-based ethanol is of concern because of the low energy return on energy invested in making corn-based ethanol, the low energy density of ethanol, the inflationary impact on food and energy prices, and the ecological limitations of U.S. and global corn production.⁹ Despite these significant drawbacks, the 2007 Energy Independence and Security Act mandates that the United States annually produce a certain amount of corn-based ethanol into the next decade¹⁰—a goal that was supported until the end of 2011 with tax incentives.¹¹

The economic development of natural gas and oil from shale formations such as the Barnett in Texas and the Marcellus in the Appalachian Basin has been made possible by improved technologies in directional drilling and hydrofracturing, known as “fracking.” Gas production from shale predates the 1859 Drake oil well in Pennsylvania, which gave birth to the American oil industry, but deep targets such as the Marcellus were considered uneconomical. Hydraulic fracturing, using high water pressure to open cracks in reservoir rocks and sand to keep the fractures open when pressure is released, is a long-established technique. What is new is the way operators drill horizontally to expose more shale to the wellbore, use millions of gallons of water/fluids to perforate and stimulate the wells, complete several wells on a

given pad, and produce millions of cubic feet of gas per day.

This new “unconventional” gas play, as it is called, combines three distinctive and challenging features for sustainability: it has emerged with breathtaking speed, it has enormous economic potential, and it raises a host of environmental and social issues that are not yet resolved. No one knew for sure that gas development from Marcellus shale was even economically and technologically feasible until it was successfully attempted in western Pennsylvania in 2004. Already, billions of dollars have been invested, thousands of wells have been dug, and gas is already being sent to market in considerable volumes. The rapid development of shale gas is transforming the gas market by substantially increasing the gas supply. Nobuo Tanaka, executive director of the International Energy Agency, recently described “unconventional gas” as “unquestionably a game-changer in North America with potentially significant implications for the rest of the world.”¹²

The environmental and social effects of shale gas drilling are considerable. Water management is a key issue because of the large volumes required for drilling and hydraulic fracturing, and because most of the water is returned to the surface. This “spent frac water” contains dissolved solids from the rock and brines present at depth as well as any additives used to enhance fluid and sand penetration into fractures and control bacterial growth in the well. Finding sufficient supplies of water and disposing of or treating wastewater are both challenging. There is also considerable controversy over whether fracking can cause migration of drilling fluids into near-surface groundwater. The combination of bad casing installation, which can allow well fluids to migrate out of the wellbore, and naturally occurring gas and brine in near-surface rock, raise additional problems. These issues are addressed primarily through state regulations that vary considerably in their requirements and enforcement.¹³

While new domestic sources of energy are good for energy security, the overall effect on greenhouse gas emission is not clear. Increased gas production and lower gas prices could be damaging to the coal industry (thus reducing greenhouse gas emissions because coal produces more carbon dioxide than gas), the renewable energy industry (thus increasing greenhouse gas emissions), or both. In addition, although some shale gas exploration and development is occurring in areas with prior drilling, much of it is occurring in areas where residents and local government are not familiar with the petroleum industry. The learning curve for all of the steps—from leasing to drilling to production to transporting product, not to mention their environmental effects—can be steep. And an influx of transient workers requires difficult social adjustments for both the workers and the communities where they operate.¹⁴ Even newer development of oil from the Bakken and Three Forks shale formations in North Dakota raises similar environmental and social issues. More troubling, perhaps, is that few appear to be seriously asking what sustainable development of unconventional shale even means.

Environmental law and policy have played a significant role in moving the United States toward sustainability over the past two decades, although less through the adoption of new legislation than the administration of existing statutes. As a result, some significant improvements in environmental quality have occurred, particularly in air quality and reduced use of some toxic chemicals and pesticides. In many other areas, including agriculture, freshwater, oceans and estuaries, and hazardous and toxic chemicals, relatively little change in longstanding practices has occurred. In many cases, that means continued worsening conditions. Climate change is an especially important but controversial issue that requires a more substantial effort than the United States has been willing to muster. We have been moving away from sustainability in spite of growing scientific information about the severity and certainty of the risks of climate change. And new issues are arising—including nanotechnology, ethanol, and shale gas—before there is a policy or legal structure to address them.

PART III. SUSTAINABILITY GOVERNANCE

§ 27:28 Introduction

Sustainability raises a much bigger set of questions than those typically addressed by EPA or state environmental and natural resources regulatory agencies. Because sustainability would integrate our environmental, economic, security, and social goals, it raises questions that can be addressed only by government as a whole. This is not to say that sustainability is only about government or governance—far from it. But when issues do need to be addressed by government, one or two agencies with relatively limited cross-governmental responsibility will not be able to do the job.

Governance for sustainability is like all other governance in many respects. It requires effective governmental institutions and national laws, a favorable investment climate, public access to information, informed and science-based decisionmaking, and public participation. Yet governance for sustainability is also different from governance for other issues and purposes. It is directed at a broad, long-term goal—moving from the current condition of unsustainable development to a future condition of sustainable development. And it requires the deep integration of environment with development, and thus raises problems with which we have relatively little experience.¹

Achieving sustainability will likely take a long time. A 1999 report by the National Research Council (NRC), *Our Common Journey*, stated that “a successful transition toward sustainability is *possible* over the next two generations.”² The major climate change bills that Congress has considered (but has not passed) include goals for reducing greenhouse gas emissions to specified levels by 2050.³ Even this time horizon of 40 to 50 years falls short of the full length of the transition. The NRC report observed: “It is over this period that serious progress in a transition toward sustainability will need to take place if interactions between the earth’s human population and life support systems are not to significantly damage both.”⁴ The two-generation

⁴*Our Common Journey*, *supra* note 2, at 3.

time frame is also a feasible and imaginable planning and analysis period for individuals, governments, and other entities.⁵ Yet the actual length of the journey could even be longer.

Some scientists ask whether we have even that much time, emphasizing our limited understanding of how much stress physical and ecological systems can take without collapsing or changing in ways that would be disastrous to humans.⁶ They point out that we could overshoot the tolerance level of these systems without even knowing it, leading to irreversible outcomes. That story line, which does not contradict the magnitude of the required changes, nonetheless adds considerable urgency to the task.

Sustainable development requires that we reverse certain paths we have followed for decades and will likely take decades to overcome. For the United States, these include high consumption levels for materials, energy, and water—and land use that has encouraged sprawl and dependence on the automobile. We have little if any experience with law in conceiving and carrying out multigenerational projects of this scale. While the United States has considerable experience and success in maintaining policy goals over long periods of time in foreign policy (e.g., Monroe Doctrine against foreign colonization or intervention in Latin America) and domestic policy (e.g., reduction and prosecution of crime), few of our national goals involve a long-term project for moving from an unacceptable or less acceptable situation to an acceptable or more acceptable situation (balancing the budget may be an exception).

By contrast, political life in the United States is organized around two-, four-, and six-year election cycles.⁷ Sustainable development will not happen if every new president or congress starts all over again or revisits basic premises. We thus need to develop the capacity to set and achieve long-term objectives and create the institutions and political ownership necessary to realize them.

Sustainable development also requires the systematic integration of environmental concerns and goals into decisionmaking. Conventional development decisions by governments and private actors—transportation projects or economic development, for example—should include environmental considerations and result in environmental protection and even restoration.⁸ While these challenges are sometimes addressed in environmental law, they are broader. Environmental law tends to target a discrete set of problems—air and water pollution, waste management and remediation, and endangered species—with a set of legal tools that are primarily regulatory. But sustainability involves much more than regulation. “Environmental policy as a whole,” Professor Richard Andrews of the University of North Carolina explains, “includes all government actions that alter natural environmental conditions and processes, for whatever purpose and under whatever label.”⁹ This includes subsidies, economic development programs, international trade, land use, taxation, and other

policies and laws.

So sustainable development is different from ordinary governance issues in two profound ways—by looking ahead over a much longer period of time and by systematically integrating the environment into decisionmaking through the use of a wide variety of legal and policy tools. Yet governance for sustainability is not an entirely different form of governance; it is a set of perspectives that should inform all governance. It would provide tools, a legal structure, and support for more-sustainable alternatives.

Among the three levels of governance in the United States—local, state, and national—local governments have made the most progress toward sustainability. Many municipalities even have sustainability directors or coordinators. While many state governments have engaged in a variety of sustainability activities, only a few have made a systematic effort to address sustainability. Still, states have long been doing more to advance renewable energy, energy efficiency, and reduced greenhouse gas emissions than the federal government. While the federal government has used sustainability concepts in some strategic planning and has incorporated sustainability in the planning and operations of many agencies, it does not employ a strategic process for understanding threats to national sustainability or opportunities that sustainability might provide. In recent years, the federal government appears to be catching up to state and local governments, although it is unclear whether it will continue to do so. And one of the inherent challenges for sustainability governance continues to be the lack of coordination among different levels of government.

§ 27:29 Local governance

In the past 20 years, some communities have made great strides toward becoming more sustainable, growing their local economies while minimizing damage and maximizing access to their natural environments. This effort has been aided in large part by visionary mayors and by nonprofit organizations, funding foundations, and collaborative stakeholder networks that have sprung up to offer support to local governments.

Cities pursuing sustainability strive to bring together all three components of sustainability—environment, economics, and social equity—in an integrated decision making process in both internal operations and community initiatives.¹ Cities that are successful in this endeavor have found and speak the language of the sustainability component (social, economic, environmental) that resonates most with its leaders and populace. The message of improving the bottom line and growing the tax base, for example, is most powerful in conservative portions of the country. Showing energy reduction in dollars rather than carbon, or having a new company state it relocated to an area because of its commitment to sustainability, has a huge impact on otherwise skeptical leaders.

Other cities have taken only small steps or faced challenges that have made progress more difficult—lack of political will, chronic budget shortages, or an unclear understanding of what sustainability looks like in practical application. When a city is charged with providing key services such as garbage and trash collection, other items that deal with quality of life—greenway development or public transit, for example—are often the first to be cut when a tax base declines or doesn't grow with the rate of inflation.

Environmental Policy 4 (2d ed. 2006).

[Section 27:29]

¹Jonathan D. Weiss, *Local Governance and Sustainability*, in *Agenda for a Sustainable America* 43 (John C. Dernbach ed., 2009).

Sustainable communities are attractive because the mutually reinforcing policies that protect the environment, create jobs, and build social equity are most obvious at the local level, where people actually live, work, and play. Sustainable communities are “cities and towns that prosper because people work together to produce a high quality of life that they want to sustain and constantly improve. They are communities that flourish because they build a mutually supportive, dynamic balance between social well-being, economic opportunity, and environmental quality.”² Put differently, sustainable communities strive to have thriving inhabitants with sustainable livelihoods that fit into, rather than undermine, the local web of life; they achieve social equity and ecological integrity together, in ways that value both biological wealth and cultural wealth. A company recruiting top graduates is concerned about employee diversity and retention; its prospective employees can move anywhere, so locating the business in a city that provides a sustainable lifestyle—transit and housing options, local food, proximity to green space—is key for that company. The city in turn benefits from the company, whose employees give back through taxes and support of local charities and businesses.

To date, at least eight sustainability rankings have been issued for North American cities: Green Cities Index, Nalgene Least Wasteful Cities, Popular Science Greenest Cities, Price Waterhouse Cooper’s Cities of Opportunity, SustainLane, Our Green Cities, National Resource Defense Council Smart Cities, and Corporate Knights. Each ranking organization features different criteria, methodologies, categories, and weightings. Some are more quantitative than qualitative, some account for population size while others do not, and most ignore ready access to resources (such as hydropower) that would allow one city to prosper while others remain inherently unsustainable. Very few consider education as a tool to long-term sustainability, but many count categories not directly relevant to sustainable living, such as cultural events. This variety in evaluations can result in very different rankings for the same city. For example, New York City was recently ranked 39th in the nation in the “waste” category by SustainLane and 3rd in the same category by the Green Cities Index. None of these rankings is a definitive index to measure the progress cities have made toward sustainability, and there is no federal or accepted standard of measurement. Still, the existence of so many different rating systems indicates how much work to achieve sustainability is being done at the local level.

SustainLane has conducted research since 2005 to rank the 50 most populous cities in the United States. In its most recent ranking in 2008, cities were compared and ranked across 16 different indicators of sustainability. Success in sustainability, according to SustainLane, includes city leadership and commitment to sustainability initiatives, as well as consensus and buy-in from residents and the local business community.³ SustainLane and others have found that in recent years many cities have created environmental or sustainability offices or hired sustainability coordinators.

Larger cities that have made particular progress in advancing local sustainability include Chicago, Denver, Seattle, and Portland. Seattle and Chicago lead the nation in development of a climate action plan and have adopted a broad array of sustainability initiatives, including urban greening, energy efficiency, and private-sector engagement. King County in Washington State, Arlington County in Virginia, and Sarasota County in Florida have been recognized for their innovative sustainability efforts. Smaller, more progressive towns like Santa Monica, California, and Burlington, Vermont, have perhaps the longest history on sustainability among U.S.

localities, steadily building on their progress in the past two decades. In the Southeast, municipalities tend to be more active on sustainability and climate change than the states in which they are located.⁴

The most successful cities have viewed sustainability broadly, adopting policies, funding initiatives, partnering with other sectors, engaging their community members, setting specific targets and goals, and developing tracking metrics. Most important, they have tied sustainability to the community's economic and social health and have set up governing and community systems that affect everyone in the long term.⁵ Many of their stories are recounted throughout this book. Nonetheless, most localities have found it difficult to integrate the different aspects of sustainability, and many of the local initiatives are not broad enough or empowered to make a large difference. Best practices are often a combination of what is most commonly successful in other municipalities around the country adapted to local circumstances.

Two issues related to local sustainability have gained significant traction. The first, climate change, illustrates some of the challenges communities face as they try to reduce their city's carbon emissions. As noted earlier (Chapter 4), the fact that more than 1,000 mayors across the country have joined the Mayors' Climate Protection Agreement and committed to reducing their greenhouse gas emissions 7% below 1990 levels⁶ makes a strong political statement. The U.S. Conference of Mayors has recommended several policies to implement this commitment: conducting local greenhouse gas inventories, adopting anti-sprawl land-use regulations, encouraging alternative modes of transportation, promoting production of renewable energy, increasing the use of green building techniques for new construction as well as retrofits, purchasing fuel-efficient vehicles for municipal fleets, increasing the efficiency of water pumping systems, promoting the growth of urban forests, and educating the public about climate change and the need to reduce greenhouse gas pollution. Many cities have put action to words, making regulations, providing incentives, educating, collaborating, and improving their operations; these are the cities that are thriving even in difficult economic times, and capturing what remains of federal funds for sustainable initiatives. On the other hand, many of these cities have not actually made concrete steps toward reducing carbon emissions; nor have they undertaken broad sustainability measures.

The second issue is economic development, particularly in the areas of renewable energy, energy efficiency, recycling, and transportation. As Professor Joan Fitzgerald, an urban planner who directs the law and public policy program at Northeastern University, describes in her recent book, *Emerald Cities: Urban Sustainability and Economic Development*, municipalities across the country have begun to use economic development to improve quality of life, create jobs, and foster new technologies.⁷ Toledo, Ohio, which has long been a glass technology and manufacturing center, has begun to use this expertise to produce thin-film solar panels. These solar panels are made by placing a thin layer of photovoltaic material between two layers of glass. The city government is not alone in this effort; it is assisted by the Wright Center for Photovoltaics Innovation and Commercialization at

the University of Toledo, the Regional Growth Partnership (a nonprofit economic development organization), and the Ohio Department of Development's Green Places Initiative. As a result, First Solar, a leading thin-film solar panel manufacturer, is located in Toledo; more than 6,000 people are employed at First Solar and other solar-related businesses in the Toledo area.⁸

Much of the funding for staffing local sustainability initiatives, however, has been based on unreliable federal funding sources. City sustainability surveys have found that a significant portion of member offices have been originally staffed through grants. The most notable of these was the 2009 American Resource Recovery Act Energy Efficiency and Conservation Block Grants from the Department of Energy, which expire in 2012. Encouraging trends show more and more cities bringing these fledgling offices onto general funds as grants are expended.⁹

In addition, many cities have simply not developed the necessary comprehensive sustainability planning. One key challenge is that for all the progress being made in cities like Chicago and the increasing examples of energy-efficient and new urbanist development, sprawl in the largely auto-dependent suburbs in metropolitan areas has carried on. And almost every city making progress on sustainability still faces enormous social equity challenges. Of course, some of the challenges to advancing sustainability at the local level are inherently embedded in our governance system, as communities are often dependent on coordination with neighboring jurisdictions and other levels of government.¹⁰ While cities can accomplish much on their own, they are ultimately limited in achievement by the need for support from and coordination with the state and federal levels.

§ 27:30 State governance

Supportive state governance is essential to sustainability. As Professors Kirsten Engel and Marc Miller of the University of Arizona College of Law explain:

There is an almost total overlap between the major topics of sustainability discourse and the traditional functions of states in areas such as environmental protection, health, education, public safety, economic development, water policy, the provision or regulation of various natural monopolies, and social and public goods. States also continue to serve as policy innovators in our federal system. The uncertainties and variation involved in seeking a sustainable society (and even our conceptions of sustainability) counsel in favor of variation and experimentation. It is in the states where experimentation takes place—in, for example, environment, education, and health care.¹

A small yet growing number of states have moved toward sustainability by adopting a variety of green practices—to the point where there are now national sustainability rankings for states. For more than a decade, states have in many ways been a stronger force in advancing renewable energy and energy efficiency than the

federal government. Of perhaps equal importance, the states have provided a forum for experimentation and improvement, particularly for renewable energy and energy efficiency. States have also been active, to some degree, on a variety of other specific sustainability issues; the brownfields redevelopment and smart growth efforts described in Chapter 4 are based to a great extent on state laws. Yet on the broader question of sustainability in general, and not just energy policy, brownfields, or smart growth, only a handful of states have adopted systematic policies, and they have had to do so through executive orders rather than legislation.

Various nongovernmental organizations (NGOs) and media organizations rank states for their sustainable environmental practices. Greenopia, an online consumer's directory for "green, sustainability and socially conscious, daily purchase decisions" annually ranks states in terms of sustainability.² Using data from various federal and state government agencies and some NGOs, Greenopia compiles an index of sustainability based on air quality, water quality, recycling rate, number of green businesses, LEED buildings, per capita emissions, per capita energy consumption, per capita water consumption, per capita energy consumption, and per capita waste generation. Based on this index, Greenopia's 10 greenest states in 2011 were California, Maine, Massachusetts, Minnesota, Nevada, New Hampshire, New York, Oregon, Vermont, and Washington. The 10 least green states were Alabama, Alaska, Delaware, Indiana, Kentucky, Louisiana, Mississippi, North Dakota, West Virginia, and Wyoming.

In 2007 *Forbes Magazine* ranked states in terms of greenness using the six equally weighted indicators of air quality, carbon footprint, hazard waste management, energy consumption, policy initiatives, and water quality.³ The top-ranked states include Vermont, Oregon, and Washington (three states also identified as among the greenest states by Greenopia; see Table 27.1). These states, *Forbes* said, "have low carbon dioxide emissions per capita, strong policies to promote energy efficiency and air quality," and the highest number of LEED-certified buildings per capita. As with the Greenopia rankings, many southern states can be found in the lower half of the rankings. While there are striking differences in the rankings of some states, the existence of these two ranking systems indicates considerable activity at the state level.

Only four states—Minnesota, New Jersey, Oregon, and Washington—have addressed sustainability in a holistic fashion through the use of executive orders, plan-

ning, and periodic reporting on progress.⁴ Instead, states tend to be focusing principally on energy. Many of these states are focused entirely on promoting renewable energy and energy efficiency, with little or no emphasis on climate change. Other states include energy within an explicit commitment to address climate change.

For more than a decade, state governments have done more to foster renewable energy, increase energy efficiency, and reduce greenhouse gas emissions than the federal government, especially during the presidency of George W. Bush. In the Obama Administration, states still maintain their lead on many issues. As Magali Delmas, from the UCLA Institute of Environmental and Sustainability, and Maria Mones-Sancho, of the University of Madrid, Department of Business Administration, have argued:

While there are current debates about the implementation of federal renewable policy, U.S. states have taken the leading role in establishing renewable energy policies since the 1990s. These include Renewable Portfolio Standards, the requirement to sell green products, disclosure policies, and subsidies.⁵

The scope and intensity of state activity on energy efficiency, renewable energy, and climate change is so great that there are now at least two websites devoted to tracking and displaying this work: the Department of Energy's Database of State Incentives for Renewables & Efficiency (DSIRE)⁶ and the Center for Climate and Energy Solutions (C2ES) (formerly the Pew Center on Global Climate Change).⁷ The C2ES site, for example, describes 26 different kinds of state activities in four categories—climate action, energy, transportation, and buildings. For each of these, the site identifies the specific states that have taken action and the number of states that have acted. For each of these 26 categories of policy actions, at least 5 states, and as many as 45, have taken action.⁸ Several examples illustrate the range of state actions.

In the field of energy, one of the most common state actions is adoption of a renewable energy portfolio standard. According to the U.S. Department of Energy, 29 states and the District of Columbia have adopted a renewable portfolio standard (RPS).⁹ Seventeen of these states have an RPS of 20% or higher, with Maine having the highest at 40%. These states, in other words, are seeking to increase the percentage of their overall electricity that comes from renewable sources to at least 20% of their total portfolio. Southern states appear to be least likely to adopt an RPS (although Texas is a notable exception).

Another promising policy at the state level is energy efficiency resource standards, which are analogous to renewable portfolio standards. Energy efficiency standards require utilities to reduce their electricity use by a specified percentage by a specified year. So far, 27 states have adopted some form of energy efficiency resource standard, including not only most Midwestern, Northeastern, and West Coast states

but also Texas, Arkansas, Florida, North Carolina, Virginia, and Colorado.¹⁰ Some of these states have promulgated regulations to decouple utilities' earnings from electricity sales volume. Traditionally, utilities received profits based on the quantity of electricity or gas sold. Using their utility regulatory power, some states have ended this practice and instead have offered financial incentives to utilities that reduce sales (save energy).¹¹

Some states have taken the lead in developing energy-efficiency building codes and appliance standards. Since California implemented the nation's first building energy code, 35 states have mandated residential building codes and 36 have mandate commercial codes.¹²

California has long been a leader in implementing statewide efficiency standards for appliances such as refrigerators, influencing other states and national product suppliers to improve codes and performance. California initiated appliance standards in the mid-1970's (the first state to do so) and has continued to promulgate standards on some products in spite of the jurisdiction of the federal government in this policy area. California's standards, in fact, prompted the federal government to adopt energy efficiency standards for a wide range of household appliances as well as industrial equipment (such as pumps).

Oregon and many other states also subsidize energy efficiency through the use of public-benefit fund programs. These programs impose a small charge on the distribution cost in an electric bill, ranging from 0.03 to 3 mills per kilowatt hour. (A mill is one-tenth of a cent.). Revenue is then used for energy efficiency programs like building retrofits, codes and standards, research and development, and public awareness campaigns.¹³

States have also adopted tax policies that incentivize individuals and businesses to use renewable energy. This is a preferred policy for most states, with all but six states having some form of property, sales, business, or income tax incentive to encourage renewable energy development and use.¹⁴ Other states have successfully utilized tax credits for energy efficiency purchases and upgrades.¹⁵ Since 1979, Oregon's business energy tax credit has offered significant tax savings for purchases of products that meet minimum energy savings targets. In Oregon the tax credit (equal to 50% of eligible costs) is for those businesses, trade groups or rental property owners who invest in recycling, energy conservation, renewable energy resources, and less-polluting transportation fuels.

The effect of state programs that use multiple legal and policy tools can be quite dramatic. Since the early 1970s, per capita electricity consumption in California and New York has been relatively flat, even as per capita U.S. consumption has increased by about 50% (Figure 27.6). To accomplish that, California adopted stringent building and appliance standards, decoupled utility profits from sales of electricity, imposed a charge of 0.3 cents per kilowatt hour to fund energy efficiency and other public benefit activities, and established energy efficiency goals along

with incentives for utilities to achieve those goals.¹⁶ New York used a somewhat similar set of legal and policy tools that also includes considerable funding for research and development.¹⁷

Many states have also explicitly addressed climate change. In fact, observers have argued that state climate change efforts also far exceed those of the federal government. John Byrne, of the Center for Energy and Environmental Policy, wrote in 2007:

In contrast to mostly inaction at the national level, U.S. states and localities have crafted innovative, cooperative, and increasingly bold strategies to address climate change Their motivations and strategies vary, but together suggest a sizable and growing divergence from national policy, with significant implications for the country and for international strategy.¹⁹

The Center for Climate and Energy Solutions reports that 43 states have developed an inventory of their greenhouse gas emissions, 36 have developed or are developing climate action plans, 20 have set greenhouse gas reduction targets, and 15 have climate change adaptation plans.²⁰ Such plans help state policymakers plan for the future in ways that meet their own unique economic, resource, and social needs. The Center observes that over the last decade two trends are visible at the state level: more states are taking climate change seriously, and they continue to adopt more types of climate-change policies.²¹

California has the nation's most far-reaching climate change legislation. California's Global Warming Solutions Act of 2006 (known as AB 32, after its bill number in the legislature) requires the state to reduce its greenhouse gas emissions to 1990 levels by 2020.²² AB 32 assigns to the California Air Resources Board (CARB) the task of choosing legal and policy tools to meet that goal.²³ CARB has elected to proceed with an economy-wide cap-and-trade program.²⁴ California's program launched January 1, 2012.

The program caps overall greenhouse gas emissions, and then reduces the overall emissions limit annually until the 2020 goal is met. Sources covered under the cap—which emit 85% of California's greenhouse gas emissions—are each subject to their own declining emissions caps. For each budget year, the state will issue allowances equal to the state-wide cap. Each allowance represents one metric ton of carbon dioxide or its equivalent. Every year, covered sources will need to turn in allowances equal to their emissions. For 2013, CARB will allocate allowances to cover about 90% of emissions for free. Covered sources may then purchase additional allowances at auction. In addition, sources that achieve reductions in emissions beyond what is required by law can sell “offset credits” that represent those reductions. In theory, as the cap declines and the number of allowances decreases, the price of allowances will increase, and it will become more economical for sources to reduce emissions than to purchase additional allowances.

The cap-and-trade program is only part of California's comprehensive plan for achieving the maximum technologically feasible and cost-effective reductions in greenhouse gas emissions that AB 32 mandates.²⁵ For example, CARB developed low carbon fuel standards, which reduce greenhouse gas emissions by reducing the

carbon intensity of transportation fuels used in the state by at least 10% by 2020.²⁶ Implementation of the low carbon fuel standards is being delayed while a federal court decides whether the rule is unconstitutional on the ground that it discriminates against out-of-state ethanol producers and crude oil sources.²⁷ California also limits the carbon intensity of new long-term electricity supply agreements so that the supplier cannot generate emissions greater than a combined-cycle natural gas-fired power plant, which is approximately one-half the emissions of a coal-fired plant.²⁸

Some states have collaborated to develop regional climate action strategies. California is a member of the Western Climate Initiative, a collaboration of western states and Canadian provinces that is working to address climate change. In addition, nine states in the Mid-Atlantic and Northeast are members of the Regional Greenhouse Gas Initiative, the “first market-based regulatory program in the United States to reduce greenhouse gas emissions [It] will reduce CO₂ emissions from the power sector 10% by 2018.”²⁹ The states participating in this initiative are Connecticut, Delaware, Maine, Maryland, Massachusetts, New Hampshire, New York, Rhode Island, and Vermont.

In summary, many states have taken a leadership role—in comparison to the federal government—in the pursuit of sustainability in renewable energy, energy efficiency, and climate change policy. Vermont, Oregon, and Washington are noteworthy in their pursuit of sustainability. There also has been much progress in many other states in the West, Midwest, and East Coast. However, Southern states tend to be lagging far behind other regions.

§ 27:31 National governance

Whatever state and local governments do, effective and supportive national governance is an essential requirement for sustainable development. In the United States, none of the broad goals of sustainable development—environmental protection and restoration, economic development, and social development or human rights—can be achieved unless the federal government also works effectively to achieve those goals. Sustainability also requires the development and implementation of a national strategy that includes the articulation of goals and a planning process for defining and achieving them. A sustainable development strategy also requires bipartisan support by the country’s national leaders, a capable governmental implementing or coordinating agency or entity, sustainable development indicators to measure progress, and an effective means of involving and educating the public. More generally, a meaningful strategy requires a level of national effort and support, as well as international cooperation that corresponds to the problems and opportunities of sustainable development.¹

Over the last two decades, the United States has taken some modest steps toward sustainability—in strategic planning, in the incorporation of sustainability in agency missions and operations, and in environmental reporting and indicators. Energy efficiency and renewable energy legislation, and administrative efforts to reduce greenhouse gas emissions and implement the legislation, have increased in recent years. Still, the United States lags far behind most developed countries and a great

many developing countries in its sustainability efforts.

§ 27:32 Strategic planning

At the World Summit on Sustainable Development in Johannesburg in 2002, the United States and other countries agreed that nations should take “immediate steps to make progress in the formulation and elaboration of national strategies for sustainable development and begin their implementation by 2005.”¹ But the United States has never had an overall national strategy for sustainable development, and there appears to be no prospect for such a strategy in the near future.

The federal government engages in strategic planning on other issues, however, particularly for national security and defense. Congress requires the President to submit an annual report on the country’s national security strategy.² Congress also requires the preparation, every four years, of the Quadrennial Defense Review that sets out “the defense strategy of the United States” as well as “a defense program for the next 20 years.”³ The usefulness of the long-term, multi-year, nationwide scope of the Quadrennial Defense Review has led to proposals for such reviews in other areas. Though not required by law, quadrennial reviews were issued in 2010 for the first time by the Department of Homeland Security⁴ and the State Department/U.S. Agency for International Development,⁵ both modeled on the Department of Defense review.

Also in 2010, the President’s Council of Advisors on Science and Technology recommended the establishment of a quadrennial energy review to “establish government-wide goals, coordinate actions across agencies, and identify the resources needed for the invention, translation, adoption, and diffusion of energy technologies.”⁶ In response to that report, the Department of Energy in 2011 issued its first Quadrennial Technology Review, identifying six priority strategies to guide that agency’s work in developing and deploying new energy technologies over the next five years.⁷ The United States is thus moving in the direction of more comprehensive strategies. It is also beginning to link national defense with climate change. Congress recently required the national security strategy and the Quadrennial Defense Review to consider the effect of climate change on Defense Department

“facilities, capabilities, and missions.”⁸

But there is no strategic planning, risk assessment, or long-term review for the challenges and opportunities of sustainable development. This is also true on such issues as climate-change funding, where, according to a General Accountability Office report, the lack of a government-wide strategic planning process means that priorities are not articulated or understood across agencies, that there appear to be mismatches between funding levels and priorities, and that many existing programs are less effective than they could be.⁹

The closest the United States has come to a national sustainability strategy was the creation in 1993 of the President’s Council on Sustainable Development (PCSD), with the mandate to develop “bold, new approaches to achieve our economic, environmental, and equity goals.” The PCSD, which was terminated in 1999, brought together stakeholders and made many thoughtful recommendations in a series of reports.¹⁰ The Council was only an advisory body, however. It did not lead to a national strategic process, the use of sustainability goals or indicators, a governmental implementing or coordinating entity, or any corresponding changes in law.¹¹ Today, the work of the PCSD is barely remembered; in a recent survey conducted by the Woodrow Wilson International Center for Scholars and the Environmental Law Institute to list our greatest environmental policy accomplishments, the PCSD came out 26th in a list of 31 items.¹²

§ 27:33 Sustainability in agency missions

Some progress has nonetheless occurred at the federal agency level through the Government Performance and Results Act of 1993 (GPRA).¹ The GPRA obligates federal agencies to develop and implement multi-year strategic plans that include a mission statement, goals and objectives for major agency activities, a description of how those goals and objectives will be achieved, and an explanation of the evaluation method that will be used to assess the achievement of those goals and objectives.² The act also requires each agency, as part of its annual budget submission, to prepare and submit to the Office of Management and Budget a performance plan that is consistent with its strategic plan.³ In addition, the act requires agencies to publish a report after each fiscal year comparing the agency’s goals for that fiscal year with its actual achievements, evaluating successes in achieving goals, and where performance goals were not met, explaining why.⁴

In January 2011, President Obama signed into law the Government Performance and Results Modernization Act of 2010, which updated and refined the GPRA.⁵ The intent of the new legislation is to better define governance structures by integrating

and connecting the programs, plans, and outcomes of agencies across the federal government. The new law requires quarterly reports instead of annual reports and explicitly requires fact-based decisionmaking approaches for program implementation and management.

Environmental and sustainable development goals are contained in some, but not all, agency strategic plans under GPRA. At least half of the agencies identify environmental or natural resources protection, environmental stewardship, environmental responsibility, or sustainability as strategic goals. These agencies include the Departments of Agriculture, Commerce, Energy, Housing and Urban Development, the Interior, and Transportation, and EPA.⁶ Additionally, the State Department and U.S. Agency for International Development can be considered as an agency with some form of environmental sustainability goal. Their plans are prepared as a single report because, to some degree, the Agency for International Development operates under the umbrella of the State Department. The combined GPRA plan of the two agencies identifies promotion of economic growth and prosperity as a goal, and identifies energy security and environment as two of the strategic priorities for achieving that goal.⁷

Agencies that address sustainability tend to link environmental protection with economic development, job creation, and quality of life, both in the United States and in developing countries. Themes include sustainability and environmental protection as a way to provide opportunity to the poor (State/USAID); revitalize neighborhoods and create livable communities (EPA); sustain the economy, environment, and culture of the American West (Interior); provide economic benefits (Commerce); avoid congestion and improve motor vehicle fuel efficiency (Transportation); help farmers find new ways to make money by protecting the environment (Agriculture); and build a sustainable and competitive clean energy economy (Energy).

The question of how to institutionalize sustainability in an agency's mission was addressed in a 2011 report by the National Research Council. The report was in response to a request from EPA for recommendations on how the agency could more systematically integrate sustainability into its overall mission and programs.⁸ As the NRC recognized, EPA has for some years been applying specific sustainability concepts and tools in individual programs. The NRC recommended that EPA adopt an overall sustainability management system to guide agency priority setting and decisions. Under this management system, EPA would articulate specific sustain-

⁸Committee on Incorporating Sustainability in the U.S. Environmental Protection Agency, National Research Council, Sustainability and the U.S. Environmental Protection Agency (2011).

ability principles, develop a clear statement of the agency's sustainability vision, set short-term objectives and ways of measuring whether these objectives have been met, create a sustainability assessment process for new or priority issues, and conduct periodic evaluation and public reporting on how the system is working.⁹ Recognizing that the immediate adoption of such a system across the entire agency would be impossible, the NRC recommended that it be phased in as appropriate over time. The NRC also made clear that this management system could be implemented only to the extent that EPA had the statutory authority to do so; the NRC did not recommend any changes in law. Finally, the NRC suggested that this management system could be applied by other federal agencies as well.

§ 27:34 Sustainability in agency buildings and operations

The federal government has also taken steps toward sustainability in the operations of federal agencies. Executive Order 13514, signed by President Obama in fall 2009,¹ directs federal agencies to set sustainability goals for their buildings and operations. Among other things, the order requires agencies to set goals for reduction of greenhouse gases from sources they own or control by 2020; from electricity, steam, or heat they purchase; and from vendors, suppliers, and agency travel. Agencies are also required to set long-term goals (for 2015 or 2020) to reduce energy intensity, potable water intensity, and fleet petroleum use and to construct and use high-performance (green) buildings. The executive order requires each agency to “develop, implement, and annually update an integrated Strategic Sustainability Performance Plan that will prioritize agency actions based on lifecycle return on investment.”² These plans are to be integrated into agency GPRA plans and be publicly available.³ The Office of Management and Budget is required to periodically post agency performance scorecards on a website.⁴ The executive order also requires agencies to begin planning for climate change adaptation.⁵ Since the executive order was promulgated, the Council on Environmental Quality has issued instructions to federal agencies for incorporating climate change adaptation into their strategic planning, including their GPRA planning.⁶ In April 2011, OMB issued a summary of progress that each agency has made thus far in implementing the executive order.⁷

Periodic national reports on the state of the environment have made a comeback in recent years. The National Environmental Policy Act of 1969 required the Council on Environmental Quality to publish an annual report on the condition of the environment, but Congress repealed that requirement in 1995.¹ In 2003, EPA published a draft report on the environment,² and followed that with a final report in 2008.³ The report uses environmental indicators to assess the environmental and public health impacts of specific human activities and to describe general environmental conditions (air quality, water quality, waste, forest conditions). In addition to the full report, EPA's website enables users to find updated information.⁴

EPA is considering the use of sustainability indicators,⁵ which unlike environmental indicators, blend social, economic, and environmental information. For sustainable communities, such indicators might include the fraction of the population that is within walking distance of public transportation or progress toward a goal of reducing potable water consumption by a specific percentage.⁶

The federal government as a whole is also beginning to consider, once again, the use of sustainability indicators, or at least something akin to such indicators. An interagency work group published an experimental set of sustainability indicators in 1998,⁷ but nothing came of it. In the absence of governmental action, State of the USA (SUSA), a nonprofit organization advised by the National Academy of Sciences, began developing a set of key economic, social, and environmental indicators. SUSA's mission is "to help the American people better assess for themselves the progress of the United States, providing scientifically selected measures, supporting statistical data and appropriate editorial context."⁸ Over the same period, a series of General Accountability Office reports helped lead to bipartisan support for legislation that would create a key national indicator system.⁹ Because they address environmental, social, and quality of life measures, these indicators address a longstanding concern that one economic indicator—gross domestic product—"has become a singular measure of national performance."¹⁰ The Patient Care and Affordable Care Act, the comprehensive health care legislation which was signed into law in March 2010, created the Commission on Key National Indicators to work with the National

Academy of Sciences to create just such a system.¹¹ Appointments to the commission, which were made by majority and minority leaders in the House and the Senate, were completed at the end of 2010.¹² As anticipated and authorized in the legislation, the Academy is working with SUSA to develop proposed measures and a website for public access to the key indicators.¹³

§ 27:36 Energy and climate legislation

Recent congressional and administrative efforts on renewable energy and energy efficiency represent the most significant national movement toward energy sustainability that has occurred in the two decades since Rio. After a long period of little activity on energy efficiency and conservation, from 2007 to 2009 Congress adopted a series of tax incentives for energy efficiency and renewable energy and provided significant additional funding for both. As previously explained, the Obama Administration has used that and other legal authority to significantly improve fuel efficiency standards for cars and trucks. The Supreme Court's 2007 decision in *Massachusetts v. EPA* gave the agency explicit authority to regulate greenhouse gas emissions under the Clean Air Act—authority it has used for mobile sources as well as factories and power plants. Still, Congress has thus far failed to adopt comprehensive climate change legislation.

§ 27:37 Lack of international leadership

It is a truism that the United States can lead internationally only by what it does at home, that actions speak louder than words. There have been two comparative reviews of various countries' environmental performance that include the United States. Neither viewed the United States as having particularly impressive environmental or sustainability programs. They also pointed out our continued unwillingness to participate fully in international agreements.

The first review, by the Organization for Economic Cooperation and Development (OECD), is part of a periodic review of each member country's environmental performance. The most recent report for the United States was issued in 2005.¹ The OECD acknowledged that the United States has a robust and well-developed set of laws to protect the environment and natural resources. It also concluded that the United States had made some progress in reducing pesticide use and the emission of some toxic air pollutants, that GPRA has fostered cooperation among federal agencies, that many "federal agencies have points of contact on sustainability," and that the Office of the Federal Executive (which is part of the Council on Environmental Quality) provides coordination on sustainability.² Nonetheless, OECD asserted:

The pollution, energy, water and material intensities of the US economy remain high in OECD terms, and the fuel supply is still among the most carbon intensive. Neither municipal waste generation nor land conversion has been decoupled from population

²*Id.* at 25.

growth. The lack of full internalization of environmental costs in transport and energy pricing structures causes market distortions that undermine efforts to encourage energy conservation and enhance energy security through programs such as Energy Star and incentives for development of low-emission energy sources.³

The report added that integration of environmental concerns into tax policy was uneven, and that there continue to be environmentally damaging subsidies.⁴

The other report, the annual Environmental Performance Index, is a comparative global review of environmental performance by the Yale University Center for Environmental Law and Policy and the Columbia University Center for International Earth Science Information Network. In the most recent report,⁵ issued in 2011, the United States ranked 61 out of 163 countries, bracketed by Paraguay (60) and Brazil (62).⁶ Breaking down the overall ranking into specific components, the United States had comparatively good scores for forestry, fisheries, and the pollution effects on humans of air and water, but comparatively low scores for climate change and air pollution effects on ecosystems.⁷

Another measure of U.S. sustainability efforts is our willingness to ratify international treaties relating to the environment.⁸ The Framework Convention on Climate Change and the Convention on Biological Diversity—both of which were opened for signature at the 1992 Earth Summit, are suffused with sustainability principles and concepts. Treaties that have been negotiated since then also represent an effort to work out the meaning of sustainable development in specific contexts or on specific issues. It follows that ratification of these treaties, and full legal participation in the regimes they create, is an essential part of any serious U.S. sustainability effort. While the United States in 1992 was the fourth country in the world to ratify the Framework Convention on Climate Change, this country has failed to ratify a number of other international agreements that would provide greater protection of human health and the environment, or greater public access to information. These include:

- The Convention on Biological Diversity, which creates an international framework for protection of biodiversity.
- The Stockholm Convention on Persistent Organic Pollutants, which requires parties to reduce or eliminate long-lived pollutants that have significant adverse environmental and human health effects.
- The Rotterdam Convention on the Prior Informed Consent Procedure for Certain Hazardous Chemicals and Pesticides in International Trade, which bans the export of listed chemicals unless the importing country has consented.
- The Basel Convention on the Control of Transboundary Movements of Hazardous Wastes, which aims to prohibit the export of hazardous waste to (mostly developing) countries that lack the capacity to deal with those wastes

in an environmentally sound manner.

- The Aarhus Convention on Access to Information, Public Participation in Decision-making and Access to Justice in Environmental Matters, even though U.S. statutes served as a source of inspiration for its implementing guidelines.
- The 1997 Kyoto Protocol, which would have committed the U.S. to reducing its greenhouse gas emissions by 7% below 1990 levels by 2008–2012. The United States is the only developed country that never ratified the protocol.

§ 27:38 Conclusion

Governance for sustainability is a much bigger task than regulating environmental pollutants. It requires governments at all levels to encourage and foster an ongoing long-term reduction in our overall environmental footprint at the same time as they improve opportunities for greater quality of life. And it requires a much greater range of legal and policy tools than environmental regulation alone. The United States has made some progress toward governing for sustainability over the past two decades at the local, state, and national levels, though not to the extent needed. Local governments, which are closer to their citizens and see directly how the environmental, social, and economic impacts of specific problems are intertwined, have done the most. State governments have also been active, particularly on renewable energy, energy efficiency, and even climate change. The federal government has been more active in recent years, but not to the extent of many state and local governments, nor many other countries.

I. INTRODUCTION TO SPACE MINING

§ 28:1 In general

*By Scot W. Anderson, Korey J. Christensen, and Julia La Manna.

On New Year's Eve of 2018, a robot arrived at an asteroid. The Origins, Spectral Interpretation, Resource Identification and Security-Regolith Explorer ("OSIRIS-REx") made the two million kilometer journey to the asteroid known as 101955 Bennu.¹ After surveying the asteroid, OSIRIS-Rex landed in a crater 460 feet in diameter and scooped up about 60 grams of material.² As of this writing, that material is on its way back to Earth for further analysis, and should arrive in 2023.³ Bennu contains substantial carbon, and there is some evidence of water coursing over the parent asteroid that broke up to form Bennu.⁴ While the mission to Bennu was designed to help determine the origin of the universe, it turns out that the asteroid also contains an estimated \$670 million in gold.⁵

The trip to Bennu is not the first time humankind has reached out into the solar system and brought materials back to Earth. The Apollo astronauts brought back 842 pounds of samples from the Moon, with additional samples collected by several unmanned Russian missions. The Japan Aerospace Exploration Agency's Hayabusa expeditions collected material from the asteroids Itokawa and Ryugu in 2019.⁶ We are in the "golden age of space-sample returns."⁷

Humanity, then, has already started to mine the Moon and asteroids, albeit on a small, non-commercial scale. But the development of natural resources in outer space won't stop there. National governments and private enterprises are looking at ways to find and use these resources, as described below. While it may be hard to justify bringing these resources back to Earth, at least in the near term, natural resources can be developed and deployed in outer space.⁸

The Moon is the likely first stop for serious mining activities. Ice exists on the Moon, and the water extracted from this ice can be used to generate not just water for drinking, but oxygen to breath and hydrogen for rocket fuel. And the extraction and processing of ice on the Moon could be an economically viable enterprise.⁹ Moon miners could use robots and 3-D printers to convert other materials mined from the Moon into homes and vehicles, and form a base for further space exploration. Significantly, the Moon is loaded with helium-3, which can be used as fuel for fusion reactions. Not only could helium-3 be used for power on the Moon, helium-3 might be capable of economic exportation back to Earth as an energy source.¹⁰

Our imaginations run toward the human settlement of Mars, which will also

require the development of Martian resources. We might travel to Mars directly, or via the Moon or Earth orbit.¹¹ One privately-held company, SpaceX, has announced plans to develop a shuttle system between the Earth and Mars, with a target of undertaking initial steps by the mid-2020s.¹² As with the Moon, there is ice on Mars, and perhaps even liquid water.¹³ Mars also has useful minerals at or below its surface, capable of use in support of a human settlement.¹⁴ The Mars Society sponsored a contest to design a Martian colony capable of supporting 1000 people, resulting in a series of analyses showing how a colony may be able to support itself using ice and water and materials from Mars to be largely self-sustaining.¹⁵ In any design for Martian habitation, mining ice and minerals will be crucial for a sustainable presence on Mars.

Asteroids 101

Asteroids comprise three general classes: C-, S-, and M-types.¹⁶

- ▶ *C-type* asteroids are likely made up of clay and silicate rocks
- ▶ *S-types* consist of silicate rocks and nickel-iron
- ▶ *M-types* are composed of nickel-iron

Some asteroids contain platinum and other precious metals.¹⁷ The value of a single platinum-bearing asteroid could be between \$25 and \$50 billion.¹⁸ The website asterank.com provides valuation for over six hundred thousand asteroids.

Finally, asteroids have potential for mineral development. Over a million asteroids orbit the solar system in the main asteroid belt between Mars and Jupiter.¹⁹ While these asteroids are too far for commercial mining in the near term, opportunities exist to mine “near-Earth asteroids” (“NEAs”),²⁰ which are within about 120 million miles of the Earth.²¹ Scientists have documented about 18,000 NEAs, and that number is growing.²² Rather than bringing an asteroid back to earth, or near the earth, asteroids are more likely to be mined and developed in outer space. Robots can mine the asteroid, manufacture products in space, and even use ice from an

asteroid for fuel.²³ Asteroids could also support the human exploration of outer space: as one journalist put it, “[o]nce mined, asteroids could be turned into the equivalent of gas stations and lumberyards for outbound spacecraft.”²⁴

Lumberyards and gas stations are industrial facilities, and mining is an industrial activity. That is as true in outer space as it is on Earth. As a result, mining and manufacturing on the Moon, on Mars, or of an asteroid will have environmental impacts. As discussed in this Chapter, there is existing law concerning resource extraction in outer space, and the regulation of the effects of those activities. While that law remains fairly general, it does provide guidance to space miners. As the development of resources in outer space continues to expand, these existing laws will provide the foundation for more detailed laws and regulations into the future.

II. OVERVIEW OF ENVIRONMENTAL ISSUES THAT MAY ATTEND SPACE MINING

§ 28:2 Overview

In most jurisdictions on Earth, and certainly in the United States, mining requires extensive consideration and mitigation of the environmental impacts that attend such operations. Environmental impacts of terrestrial mining include air and water pollution and soil contamination. The primary environmental issues of concern arising from space mining are a bit different. They include: (1) debris; (2) pollution of Earth’s atmosphere; (3) contamination; and (4) nuclear contamination. This section provides a high-level introduction to each of these topics. Importantly, the issues discussed in this Chapter do not relate only to mining space resources. Rather, they are relevant to many different kinds of space activities, including scientific research missions, activities related to commercial satellite communications, and military activities.

§ 28:3 Debris

The UN Committee on the Peaceful Uses of Outer Space (“UN COPUOS”) was established in 1959 and is charged with promoting “international cooperation in peaceful uses of outer space, studying space-related activities that could be undertaken by the United Nations, encouraging space research programs, and studying legal problems arising from the exploration of outer space.”¹ UN COPUOS includes the management and mitigation of the effects of space debris within its scope of oversight. Consistent with this responsibility, the Scientific and Technical Subcommittee of the UN COPUOS developed, over the course of more than a decade, Space Debris Mitigation Guidelines (the “COPUOUS Guidelines”), which the UN General Assembly endorsed in 2007.² The COPUOUS Guidelines define space debris as “all man-made objects, including fragments and elements thereof, in Earth orbit or re-entering the atmosphere, that are non-functional.”³ In other words, space debris are objects that have been sent into space and that no longer serve a purpose.

Space debris is concerning to both governments and non-government entities. At

³*Id.* at 1.

present, there are more nonfunctional than functional satellites orbiting Earth—specifically, 3,000 nonfunctional and 2,000 active satellites.⁴ Additionally, there are about 34,000 pieces of space debris bigger than 10 centimeters and 128 million pieces of space debris larger than 1 millimeter.⁵

Space debris poses significant risks for space activities of all kinds, including space mining ventures. While relatively rare at present, the consequences of collisions with space debris can be dire, even incapacitating active spacecraft.⁶ Particles as small as 1 centimeter in size can cause significant property damage, and collisions with astronauts undertaking extra-vehicular missions can be fatal.⁷ Collisions can also release harmful substances such as radioactive material (discussed below in Section 28:6).⁸ Space debris also pose a threat to Earth if any debris reenter the atmosphere and crash to Earth's surface.⁹ There is further risk that the amount of debris will be self-propagating, as bits of debris collide with each other and form more, smaller bits of debris. This phenomenon, called the Kessler Syndrome, could render certain areas of space unusable for Earth orbit.¹⁰

The effects of space debris can be mitigated by: (1) curtailing or preventing the creation of new debris; (2) designing satellites to withstand impacts by small debris; and (3) conducting operations in areas of orbit with less debris.¹¹ There are also technologies that could collect and eliminate existing space debris, but the legal framework for “Active Debris Removal” is unsettled.¹²

§ 28:4 Pollution

Another environmental consideration that may arise in the context of space mining—and, indeed, in all space activities—is pollution. Of greatest concern is the depletion of the ozone layer caused by spacecraft launches. Launches deposit emissions directly into the stratosphere layer of Earth's atmosphere, which is the atmospheric layer that lies between the troposphere (the layer closest to Earth's surface) and the mesosphere.¹ The stratosphere contains the ozone layer, making it subject to regulation under the Montreal Protocol on Substances That Deplete the

¹Martin Ross and James A. Vedula, *The Policy and Science of Rocket Emissions*, CENTER FOR SPACE

Ozone Layer (the “Montreal Protocol”).² Depletion of the ozone allows harmful ultraviolet radiation from the Sun to reach Earth’s surface.³

Researchers Martin Ross and James Vedda explain that rocket emissions of concern are: (1) chlorine and alumina particles from solid rocket motors; and (2) soot particles, which are commonly referred to as “black carbon.”⁴ Black carbon particles accumulate in the stratosphere and form a “black umbrella” that intercepts sunlight, which results in the warming of the surrounding stratosphere and cooling of the Earth’s surface.⁵ Alumina particles do the inverse—they form a “white umbrella” that reflects sunlight back into the space.⁶ This compounds the cooling of the Earth’s surface.⁷ Cooling may at first appear to have the beneficial impact of offsetting the rise in global temperatures due to climate change. But, as Ross and Vedda explain, the black umbrella and white umbrella phenomena deplete the ozone layer of the atmosphere in two ways: “First, a slightly warmer stratosphere accelerates existing chemical reactions that reduce ozone levels. Second, chemical reactions on the collective surface area of the alumina particles also reduce ozone.”⁸ They note that the effect of rocket emissions on the ozone layer is “left . . . in a policy void”⁹—likening the current moment of rocket launch regulation to the early days of space debris when the problem that debris would become was underestimated¹⁰—and urge that more research is needed to fully understand the impacts of rocket emissions on Earth’s atmosphere.¹¹

§ 28:5 Contamination

Concerns about contamination, also known as *planetary protection*, fall into two categories: forward contamination and backward contamination.

NASA’s Planetary Protection Independent Review Board (“PPIRB”) explains these categories as follows: “In its essence, [p]lanetary protection . . . refers to (i) managing contact between terrestrial life forms and organic material from celestial bodies as it relates to adversely affecting the scientific study of these bodies, called forward contamination; and (ii) mitigating harmful contact between pathogens or biology from other celestial bodies and terrestrial biology, called backward contamination.”¹

As noted, preventing forward contamination is principally concerned with safeguarding the integrity of outer space environments for science research purposes.² The non-interference principle is well-established in international law,

POLICY AND STRATEGY, at 3-4 (April 2018).

[Section 28:5]

¹*Report to NASA/SMD, Final Report*, NASA PLANETARY PROTECTION INDEPENDENT REVIEW BOARD (PPIRB) (2019), at 4.

²It is also worth pointing out, however, that some in the scientific community advocate for broadening the scope of forward contamination to include ethical, not only scientific, considerations. See, e.g., Aaron Gronstal, *Putting the Ethics into Planetary Protection*, ASTROBIOLOGY AT NASA (Aug. 13,

and in science fiction related to the exploration of outer space.³ One scholar illustrates the concern as follows:

“[I]n mid-November 2014, scientists at the [European Space Agency] announced that Philae had discovered organic molecules on the surface of Comet 67P. [European Space Agency] researchers . . . concluded that some of the molecules are of types never previously observed on a comet. Had a mining craft without proper sterilization protocols touched down on the comet, thereby contaminating the comet’s environment with organic material from Earth, the possibility of deriving scientific knowledge from the asteroid would have been forever lost.”⁴

By contrast, preventing backward contamination is principally concerned with protecting Earth from foreign contaminants as a matter of global safety.⁵

As with all of the environmental impacts discussed in this Section, contamination is not unique to space mining. The example of forward contamination described above could be caused by any space activity that involves contact with celestial bodies. That said, the probability of such contamination necessarily increases with greater human presence in space, and the level of contact with celestial bodies necessary for space mining poses perhaps a greater risk of contamination than other space activities.

§ 28:6 Nuclear contamination

For all space activities, nuclear contamination is a significant safety and environmental hazard. The risk arises from the possibility that a spacecraft carrying a nuclear power source (“NPS”) may collide with another space object or with a piece of debris in space, or crash to Earth due to mechanical or operational malfunctions. NPSs are used in outer space missions where other power sources are not viable or not practicable. For example, NPSs have been used in place of solar panels for lengthy missions to the far reaches of the Solar System, because solar panels are unsuitable for such missions.¹

The risk to Earth posed by the use of NPSs in space was highlighted by the Cosmos-954 satellite crash. The Soviet Union launched Cosmos-954 in 1977.² After the satellite’s reactor core failed to boost it into safe orbit, the satellite fell to Earth, spreading radioactive debris over a large area of northwestern Canada.³

Cosmos-954

³See *id.*

The Soviet Union placed the Cosmos 954 satellite in orbit in 1977.⁴ Cosmos 954 carried a nuclear reactor. The satellite fell from orbit, and left radioactive debris in western Canada, including portions of the Northwest Territories, Alberta and Saskatchewan.⁵

The satellite was a spy satellite.⁶ That may explain why the Soviet Union did not inform Canada that the satellite might fall in Canada, and refused to provide information about the nature of the nuclear reaction on the satellite.⁷

Canada brought a claim against the Soviet Union under the Liability Convention, discussed below in Section 28.7, seeking reimbursement of cost incurred in remediating the contamination caused by the crash of Cosmos 954.⁸ Even though the total cost of remediation was CDN \$13,970,143.66, Canada only sought reimbursement of CDN \$6,041,174.70.⁹ Canada and the Soviet Union settled their dispute with a payment from the Soviet Union to Canada of CDN \$3,000,000.¹⁰

Again, concerns involving NPSs are not unique to space mining. And it does not appear that space mining would disproportionately increase the threat of nuclear contamination relative to other space activities. In any event, however, space miners will need to be aware of the regulatory requirements associated with NPSs before employing them in mining missions.

III. LEGAL FRAMEWORK

§ 28:7 Regulation of space mining generally

a. International Law

There are areas where humans are active, but which are not subject to the jurisdiction of any nation state: the deep sea, Antarctica (and perhaps the Arctic), and outer space. In these circumstances, nations tend to enter into international treaties to govern national and private actions. For example, activities in the deep seas—that area outside the territorial waters of any nation—are subject to the United Nations Convention on the Law of the Sea (or “UNCLOS”).¹ Similarly, there is a 1959 treaty setting aside Antarctica as “a natural reserve, devoted to peace and science.”² The status of the Arctic is less settled. It remains subject to UNCLOS, and to a number of competing and overlapping jurisdictional claims.³

But having a treaty in place does not provide clear and unequivocal resolution of

⁴Government of Canada, Government of the Union of Soviet Socialist Republics (1981). Cosmos 954 Satellite Claims Resolution. every dispute or issue that might arise in these areas beyond national jurisdiction. First, not every country active in one of these areas may sign or ratify a treaty. The United States, for example, is not a signatory to the Law of the Sea. The Antarctic Treaty was originally signed by only twelve countries, but now has 52 signatories.⁴ Second, treaties tend to state fairly broad principles, and leave room for interpretation.

Thus, even where a treaty exists, there may be a need to call on canons of construction and general principles of international law, especially customary international law. “Customary international law” is the general practice of States, which is in turn generally accepted as law by States.⁵ For example, the United States has accepted most of the key principles of UNCLOS as customary international law, and acts consistent with those principles.⁶ The United States does not, however, accept the provisions of UNCLOS related to seabed mining, and would likely argue that those provisions do not form part of customary international law.⁷

i. Outer Space Treaty

Outer space, like the deep sea and the South Pole, does not fall under the sovereignty of any earthly nation. Rather, space law “is usually defined as a branch of general (public) international law, a subset of rules, rights and obligations of states within [international law] specifically related to outer space and activities in or with respect to that realm.”⁸ And, as with the deep sea and Antarctica, there is an international treaty that provides the fundamental framework for activities in outer space, including mineral resource development.

The Outer Space Treaty, or the Treaty on Principles Governing the Activities of States in the Exploration and Use of Outer Space, Including the Moon and Other Celestial Bodies, is the fundamental treaty framing international space law.⁹ It entered into force in 1967, just prior to the Apollo 11 Moon landing, and fewer than 10 years after the launch of Sputnik.¹⁰ The Outer Space Treaty has been signed and ratified by over one hundred nations, including all space-faring nations—like the United States.

The Outer Space Treaty provides that “[t]he exploration and use of outer space, including the moon and other celestial bodies, shall be carried out for the benefit and in the interests of all countries . . . and shall be the province of all mankind. Outer space, including the moon and other celestial bodies, shall be free for exploration and use by all States without discrimination of any kind, on a basis of equality

⁹Treaty on Principles Governing the Activities of States in the Exploration and Use of Outer Space, Including the Moon and Other Celestial Bodies, Jan. 27, 1967, 18 U.S.T. 2410, 610 U.N.T.S. 205 [hereinafter “Outer Space Treaty”].

¹⁰Peter Jankowitsch, *The background and history of space law*, in HANDBOOK OF SPACE LAW, at 5 (F. von der Dunk, ed. 2015).

and in accordance with international law, and there shall be free access to all areas of celestial bodies.”¹¹ The Treaty also prohibits any nation from appropriating celestial bodies: “Outer space, including the moon and other celestial bodies, is not subject to national appropriation by claim of sovereignty, by means of use or occupation, or by any other means.”¹²

As we think about resource development in outer space, and responsibility for the environmental consequences of space mining, it is important to note that the Outer Space Treaty imposes supervisory obligations on *nation-states*. As stated in the Treaty: “State Parties to the Outer Space Treaty shall bear international responsibility for national activities in outer space, including the Moon and other celestial bodies, whether such activities are carried on by governmental agencies or by non-governmental entities, and for assuring that national activities are carried out in conformity with the provisions set forth in the present Outer Space Treaty. The activities of non-governmental entities in outer space . . . shall require authorization and continuing supervision by the appropriate State Party to the Treaty.”¹³ When nation states were the only organizations acting in space, this principle was not hard to apply, and was generally uncontroversial. As noted above, however, private parties are now present in outer space, and are leading the way on the utilization of natural resources in outer space. As a result, the supervisory role of States is more meaningful and more nuanced. In the words of two prominent legal scholars, it has become necessary “to find means to transform the international obligations imposed on States to obligations incumbent on private actors in order to ensure that private entities comply with international space law and its principles.”¹⁴

The Outer Space Treaty contains some ambiguities that might be read to limit natural resource development in outer space.¹⁵ On balance, however, the Outer Space Treaty states general principles and provides a framework that would allow nations and private parties to develop and use natural resources in outer space.

The Outer Space Treaty assures a right of free access to celestial bodies for all nations, even though it prohibits appropriation or national ownership of the bodies themselves. This principle of free access is consistent with the Treaty’s statement that the exploration and use of space “shall be carried out for the benefit and in the interests of all countries.”¹⁶ The prohibition on *national* appropriation does not, on its face, prohibit the exercise of *private* rights over extracted resources, or the ownership of extracted resources by governmental or private parties. Indeed, granting private property rights to asteroid *resources* does not conflict with the international prohibition on national appropriation of asteroid *bodies*. In fact, the Outer Space Treaty anticipates the development—and hence, ownership—of extracted resources. The Treaty includes the phrase “exploration and use” twice in its terms. The word “use” seems to indicate that the drafters of the Outer Space

¹¹Outer Space Treaty, *supra* note 9, Art. I (emphasis added).

¹²*Id.* Art. II (emphasis added). In 2001, a NASA spacecraft landed on the asteroid 433, known as Eros. Gregory Nemitz claimed he owned Eros, and brought an action in federal district court seeking parking and storage fees from the United States. *Nemitz v. U.S.*, 2004 WL 3167042 (D. Nev. 2004), *aff’d*, 126 Fed. Appx. 343 (9th Cir. 2005). Nemitz claimed ownership because he had registered the asteroid with the website of the Archimedes Institute, and files a security interest under the UCC. The court rejected his ownership claim, including his argument that the ratification of the Outer Space Treaty created a right for Nemitz to own Eros. *Id.* at *2.

¹⁵For an in-depth discussion of these ambiguities, see Scot Anderson, et al., *The development of natural resources in outer space*, J. OF ENERGY & NAT. RES., DOI: 10.1080/02646811.2018.1507343.

¹⁶Outer Space Treaty, *supra* note 9, Art. I.

Treaty expressly considered and authorized the development and deployment of space resources.¹⁷ The diplomatic history of the Treaty indicates that perhaps the tension between the Treaty's prohibition on the national appropriation of celestial bodies and its authorization of the use of space resources was left ambiguous to gain broader support for the Treaty.¹⁸

Notwithstanding these uncertainties, the United States State Department has consistently maintained that the Outer Space Treaty allows for commercial extraction and ownership of resources.¹⁹ It has been the State Department's position for several decades that the Treaty's non-appropriation principle applies to space resources only when such resources are "in place." This prohibition does not extend to governmental or private ownership of resources once they are removed from the celestial body.²⁰

This position of the United States is consistent with the majority view. The International Institute of Space Law, for example, takes the position that while the Outer Space Treaty does not create an express right to take and consume space resources, it also does not prohibit such action.²¹

ii. The Moon Agreement

A decade later saw an attempt to expand and recast the law of space, including principles relevant to the extraction of natural resources in outer space. In 1979, the United Nations promulgated the Moon Agreement, officially the Agreement Governing the Activities of States on the Moon and Other Celestial Bodies. The Moon Agreement affects more than the Moon; it also applies to asteroids.²² As noted above, the Outer Space Treaty declares that the Moon and other celestial bodies in the solar system, as well as their natural resources, are the "province of all mankind."²³ The Moon Agreement goes further, characterizing the bodies and their resources as being the "common heritage of all mankind,"²⁴ a phrase that some interpret to create a common interest in moon resources. UNCLOS also describes the deep sea as the common heritage of mankind, and this concept gave rise to an international regulatory body for the deep sea: The International Seabed Authority.²⁵

If the "common heritage" concept in the Moon Agreement were widely adopted,

²³Treaty on Principles Governing the Activities of States in the Exploration and Use of Outer Space, Including the Moon and Other Celestial Bodies, Jan. 27, 1967, 18 U.S.T. 2410, 610 U.N.T.S. 205, Art. I [hereinafter "Outer Space Treaty"].

²⁴Moon Agreement, *supra* note 22, Art. 11 § 1.

²⁵Dr. Betsy Baker and Catherine Danley, *Resource Rights in The Continental Shelf and Beyond: Why the Law of the Sea Convention Matters To Mineral Law*, 64 RMMLF-INST 2 (2018).

the development of natural resources in outer space might look more like the framework for mining in the deep sea. The Moon Agreement, however, has been signed by fewer than twenty countries and was not signed by any space-faring nation.²⁶ Moreover, the Trump Administration in 2020 issued an Executive Order stating explicitly that “the United States does not consider the Moon Agreement to be an effective or necessary instrument to guide nation states regarding the promotion of commercial participation in the long-term exploration, scientific discovery, and use of the Moon, Mars, or other celestial bodies,” and instructing the United States Secretary of State to “object to any attempt by any other state or international organization to treat the Moon Agreement as reflecting or otherwise expressing customary international law.”²⁷ This view reflects the majority view about the lack of efficacy of the Moon Agreement.

iii. Other international space law

The balance of space law comprises just three treaties: (1) the Convention on International Liability for Damage Caused by Space Objects (the “Liability Convention”);²⁸ (2) the Convention on Registration of Objects Launched into Outer Space (the “Registration Agreement”);²⁹ and (3) the Agreement on the Rescue of Astronauts, the Return of Astronauts and the Return of Objects Launched into Outer Space (the “Rescue Agreement”).³⁰

The Liability Convention—opened for signature in 1972—creates a liability framework for damage caused by spacecraft. Under the Liability Convention, liability attaches to “launching States,” defined as the state that launches or procures the launch of a space object, or the state from whose territory or facility a space object is launched.³¹ It sets a strict liability standard for accidents on the Earth’s surface, providing that a launching State is “absolutely liable” for damage caused to the surface of the Earth or an aircraft in flight.³² The launching State may be relieved of this absolute liability if the claiming state (or those claiming under its jurisdiction) acted with gross negligence, or with the intent to cause damage, and if the launching state was acting in compliance with international law.³³ Where the damage occurs somewhere other than Earth’s surface, a negligence standard applies: the launching State is liable only if the damage arises from the fault of either the launching State itself or the persons for whom it is responsible.³⁴ The Liability Convention also addresses joint liability. If one state causes damage to another, and that damage creates collateral damage to a third state, the first two states are jointly and severally liable to the third.³⁵ If the damage occurs on Earth’s surface, their liability is absolute; if it occurs somewhere else, their liability is based on fault.³⁶

The Registration Agreement requires signatories to register vehicles launched

²⁶See Roth, *supra* note 22, at 844.

³⁶*Id.*

into space and provide that information to the Secretary-General of the United Nations.³⁷ These requirements can enable the identification of the State or States that launched a certain space object. This would be relevant to determining the liable party under the Outer Space Treaty and the Liability Convention in the event of an accident or other damage, and to ensure that obligations under the Rescue Agreement are met.

The Rescue Agreement, in turn, sets out requirements related to and a process for the return of objects and people who land outside their national territory upon reentry to Earth.³⁸

b. Domestic law

The United States and Luxembourg have led the way in creating national laws designed to interpret the Outer Space Treaty consistent with the general view that the Treaty allows the extraction and utilization of resources in Outer Space.³⁹

The United States enacted the Commercial Space Launch Competitiveness Act.⁴⁰ Title IV of that Act provides a legal framework for mineral development and ownership in outer space.⁴¹

Title IV, the “Space Resource Exploration and Utilization Act” creates private property rights over resources extracted from space.⁴² It directs the president to: (1) facilitate the commercial exploration for and commercial recovery of space resources by United States citizens; (2) discourage government barriers to the development of such industries, in a manner consistent with United States international obligations; and (3) promote the right of United States citizens to engage in such industries free from harmful interference.⁴³ The president must also identify the authorities that will be responsible for overseeing space resource extraction missions.⁴⁴

As noted above, anyone acting in outer space does so under the supervision and responsibility of a government. Under the Act, “[a] United States citizen engaged in commercial recovery of an asteroid resource or a space resource under this chapter shall be entitled to any asteroid resource or space resource obtained, including to possess, own, transport, use, and sell the asteroid resource or space resource obtained in accordance with applicable law, including the international obligations of the United States.”⁴⁵ The Act defines “asteroid resource” as “a space resource

⁴⁰U.S. Commercial Space Launch Competitiveness Act, Pub. L. No. 114-90, 129 Stat. 704 (2015) [hereinafter “Space Launch Act”]. For a complete analysis of the Act, see Michael Dodge, *The U.S. Commercial Space Launch Competitiveness Act of 2015: Moving U.S. Space Activities Forward*, 29 No. 3 AIR & SPACE LAW. 4 (2016).

⁴¹The other parts of the Act include the following. Title I, the “Spurring Private Aerospace Competitiveness and Entrepreneurship Act,” (“SPACE Act”) updates requirements for the commercial launch industry. Space Launch Act at §§ 102-117, now codified at 51 U.S.C. §§ 50901-50923. Title II, “Commercial Remote Sensing,” affirms congressional oversight of the commercial space industry and requires additional executive branch reports regarding the licensing process for private space-based remote sensing systems. Space Launch Act at §§ 201-202, now codified at 51 U.S.C. §§ 60121-60126. Title III, “Office of Space Commerce,” renames the “Office of Space Commercialization” the “Office of Space Commerce,” and clarifies its functions. Space Launch Act at §§ 301-302, now codified at 51 U.S.C. §§ 50701-50703.

⁴²Space Launch Act §§ 402-403, now codified at 51 U.S.C. §§ 51301-51303.

⁴³51 U.S.C. § 51302(a).

⁴⁴51 U.S.C. § 51302(b).

⁴⁵51 U.S.C. § 51303.

found on or within a single asteroid,”⁴⁶ and defines “space resource” as “an abiotic resource in situ in outer space,” which includes water and minerals.⁴⁷ To allay any concerns that the statute is inconsistent with the prohibition of appropriation in the Outer Space Treaty, the Act states that “[i]t is the sense of Congress that by the enactment of this Act, the United States does not thereby assert sovereignty or sovereign or exclusive rights or jurisdiction over, or the ownership of, any celestial body.”⁴⁸ The table below summarizes the roles of various federal agencies over U.S. space activities.

Federal Agencies’ Roles in U.S. Space Activities⁴⁹

National Aeronautics and Space Administration (NASA) is an independent federal agency with primary oversight for US space flight and space operations, and related scientific research.

The U.S. Department of Commerce, through the National Oceanic and Atmospheric Administration (NOAA) includes the Office of Space Commerce, the National Environmental Satellite, Data, and Information Service, Commercial Remote Sensing Regulatory Affairs and the National Telecommunications and Information Administration.

Federal Communications Commission (FCC), an independent agency like NASA, regulates telecommunications satellites operated by the federal government and by private industry.

U.S. Department of Defense (DOD) includes oversight of the national security policy for outer space through the Assistant Secretary of Defense for Homeland Defense and Global Security. The ASD is responsible for formulating national security strategy for outer space, among other matters. DOD also includes the recently created U.S. Space Force.

U.S. Department of State includes the Office of Space and Advanced Technology and also addresses security issues related to outer space.

U.S. Department of Transportation Federal Aviation Administration (FAA) includes the Office of Commercial Space Transportation.

Note: Because space activities are under federal jurisdiction, even when conducted by private parties, those activities are subject to review under the National Environmental Policy Act (NEPA), which can require the engagement of other federal agencies. In the recent environmental analysis prepared for a Space X launch site in Texas, the FAA was the lead agency on the Environmental Impact Statement (EIS), and the cooperating agencies in the EIS were NASA, National Park Service, the U.S. Army White Sands Missile Range, and the U.S. Army Corps of Engineers. The FAA also consulted with the U.S. Fish and Wildlife Service.⁵⁰

⁴⁶51 U.S.C. § 51301(1).

⁴⁷51 U.S.C. § 51301(2).

⁴⁸51 U.S.C. § 51301(1).

⁵⁰Federal Aviation Administration, Office of Commercial Space Transportation: Final Environmen-

Building on the framework established by the Space Resource Exploration and Utilization Act, the United States developed in 2020 an international agreement designed to provide greater certainty for companies acting in space. The administrative action embodies the interpretation of the Outer Space Treaty favored by the United States, and represents movement toward solidifying that interpretation as customary international law. This agreement, called the “Artemis Accords,” relates to NASA’s Artemis program, which has targeted a return to the Moon by 2024 and, from there, further exploration on to Mars.⁵¹ Significantly, the Artemis Accords are not a unilateral action by the United States. NASA has executed the Artemis Accords with the national space agencies of Australia, Canada, Italy, Japan, Luxembourg, the United Arab Emirates, and the United Kingdom.⁵² Notably, “[t]he principles set out in the [Artemis] Accords are intended to apply to civil space activities conducted by the civil space agencies of each Signatory.”⁵³

The key points addressed include the following:

- The Artemis Accords create a system in which the parties agree that space resources can be extracted and used without violating the Outer Space Treaty, thereby further reinforcing the United State’s interpretation of the Treaty’s non-appropriation principal.⁵⁴ Parties will also implement a system to create “Safety Zones” around each country’s operations to avoid interference with one another’s space activities.⁵⁵
- Parties to the Artemis Accords commit to the Outer Space Treaty’s principle of using space for only peaceful purposes, as well as to the principles of the Rescue Agreement and Registration Agreement.⁵⁶
- Parties commit “to us[ing] reasonable efforts to utilize current interoperability standards for space-based infrastructure, to establish such standards when current standards do not exist or are inadequate, and to follow such standards.”⁵⁷
- The Accords recognize the need to manage space debris, and require signatories to “commit to plan for the mitigation of orbital debris, including the safe, timely, and efficient passivation and disposal of spacecraft at the end of their missions, when appropriate, as part of their mission planning process.”⁵⁸
- Partners have agreed that they “intend to preserve” historically significant sites, such as the Apollo 11 lunar landing location, pursuant to standards to be agreed upon amongst the parties.⁵⁹

The Hague International Space Resources Governance Working Group (“Working Group”)⁶⁰ undertook an effort to “assess, on a global scale, the need for a regulatory framework for space resource activities and to prepare the basis for such regulatory framework.”⁶¹ The Working Group prepared a draft set of “building blocks” for a regulatory framework for the development of resources in space, and circulated that draft for comment on September 17, 2017 (the “Building Blocks”).⁶² The Working Group then formally adopted the Building Blocks on November 12, 2019.⁶³ The objective of the Building Blocks is to “create an enabling environment for space resource activities that takes into account all interests and benefits all countries and humankind.”⁶⁴ Toward this end, the Working Group rests the Building Blocks on international law and the Outer Space Treaty, including the notion that the development of space resources should be exclusively for peaceful purposes, and for the benefit and in the interests of all countries and humankind irrespective of their degree of economic and scientific development.⁶⁵

The Building Blocks provide a comprehensive, albeit high-level, outline for a legal and regulatory framework for the development of natural resources in outer space. As such, the Building Blocks could form the basis for a future comprehensive treaty related to the mining of celestial bodies, or provide a thoughtful and well-reasoned resource for governments and private parties considering how best to operate in this industry. There are several provisions of the Building Blocks that illuminate how to work on resource development in outer space, and how to manage the environmental impacts of those activities.

The Building Blocks accept the requirement in the Outer Space Treaty that States supervise activities in outer space. The Working Group builds on that concept by recommending that States and intergovernmental organizations implement this responsibility by creating laws to authorize and regulate these activities, as well as the products generated by these activities, consistent with international legal principles.⁶⁶

More specifically, the Building Blocks recommend developing a process to allow space miners to register their mining rights.⁶⁷ The Working Group also recommends an international framework assuring that raw minerals, volatile materials, and the products from these items, can be lawfully acquired with mutual recognition of

⁶⁰The Working Group platform is a Consortium serviced by a Secretariat. The founding Consortium partner is the International Institute of Air and Space Law, Leiden Law School, Leiden University (the Netherlands). Members are major stakeholders from government, industry, universities, and research centers. The number of members to the Working Group is limited to 25, at which the number currently stands. ⁶⁶*Id.* ¶ 5.

⁶⁷*Id.* ¶ 7.

these property rights.⁶⁸

The Building Blocks provide not only a foundation for resource development, but also a conceptual framework for responsible space mining. The document lays out the following principles:

- *Due regard for interests of all countries and humankind*

The Working Group proposes that governments should give due regard to the interests of all countries and humankind.⁶⁹ The concept of “due regard” has its origins in UNCLOS. Article 87 of UNCLOS recognizes the freedom of the high seas, but the exercise of this freedom is to be exercised “with due regard for the interest of other States.”⁷⁰ According to the leading commentary on UNCLOS, “[t]he standard of ‘due regard’ requires all States, in exercising their high seas freedoms, to be aware of and consider the interests of other States in using the high seas, and to refrain from activities that interfere with the exercise by other States of the freedom of the high seas. . . . ‘States are bound to refrain from any acts that might adversely affect the use of the high seas by nationals of other States.’”⁷¹ Thus, this Building Block advocates for the free use of outer space, but with some recognition of the interest of other parties using outer space.

- *Avoidance of harmful impacts resulting from space resource activities*

This Building Block suggests that parties should act in a manner to guard against unknown or unquantified risks, including potential damage to the safety of persons, the environment, or property, and to prevent adverse changes in the environment of the Earth, harmful contamination of celestial bodies or outer space, and interference with space activities or scientific resources.⁷²

- *Monitoring and redressing harmful impacts resulting from space resource activities*

States and organizations should monitor whether any harmful impacts result from space resource activities authorized by them.⁷³ This Building Block also recommends developing a process to require redressing such impacts.

- *Liability in case of damage resulting from space resource activities*

This Building Block references existing treaties concerning damage in space,⁷⁴ and suggests that an international framework should encourage operators to provide, individually or collectively, compensation for damage resulting from their space resource activities.

⁷³*Id.* ¶ 12.

⁷⁴Specifically, it references Articles VI and VII of the Outer Space Treaty and the 1972 Convention on International Liability for Damage Caused by Space Objects.

i. International law and policy

1. Outer Space Treaty

The issue of space debris is not addressed directly in the Outer Space Treaty or the other treaties comprising international space law. However, as the Outer Space Treaty provides a broad framework for space activities, its provisions—especially Article IX—can be interpreted to impose some obligation to mitigate space debris.

Article IX requires that activities be conducted with “due regard to the corresponding interests of all other States parties to the Treaty.”¹ As discussed above, a “due regard” standard requires that States “be aware of and consider the interests of other States . . . and . . . refrain from activities that interfere” with the interests of other States.²

Article IX also requires that “States . . . conduct exploration of [the Moon and other celestial bodies] so as to avoid their harmful contamination and also adverse changes in the environment of the Earth resulting from the introduction of extraterrestrial matter, and, where necessary, shall adopt appropriate measures for this purpose.”³ Because space debris collisions can release harmful contaminants that may damage the Moon and other celestial bodies, Article IX arguably requires mitigation of space debris to prevent that injury. And, as noted above, the accumulation of debris orbiting the Earth could escalate and compound to the point that satellites can no longer orbit the Earth.⁴ But these general principles and duties do not provide clear direction as to when and how parties are to actively undertake the mitigation or remediation of space debris.⁵

Finally, Article IX imposes a duty on parties to the treaty to undertake international consultations if there is “reason to believe that a [proposed] activity . . . would cause potentially harmful interference with activities of other States parties in the peaceful exploration and use of outer space, including the Moon and other celestial bodies”⁶ In other words, a party that reasonably suspects that a planned activity of another party would cause potentially harmful interference may request consultation.⁷ Thus, Article IX could be read to require international consultations if a proposed mission may result in the creation of space debris that compromises the ability of other parties to the Outer Space Treaty to peacefully explore and use outer space. Of course, the consultation requirement simply promotes a conversation and does not empower one party to prevent another from pursuing a potentially hazardous activity.⁸

Despite the general nature of the provisions of the Outer Space Treaty, a party creating a hazard might face a claim for liability. Parties “bear international responsibility for national activities in outer space” and, as discussed above, govern-

ments must authorize and continually supervise the non-governmental entities in outer space subject to their jurisdiction.⁹ A party that launches an object or procures the launching of an object is “liable for damage to another State party to the Treaty or to its natural or juridical persons by such object or its component parts on the Earth”¹⁰ The Registration Convention might provide information that would help identify the responsible owner of a piece of debris in the event of a collision.¹¹

2. UN Committee on the Peaceful Uses of Outer Space, Space Debris Mitigation Guidelines

As noted above, the Scientific and Technical Sub-Committee of the UN COPUOS has developed the COPUOS Guidelines to address the problem of space debris accumulation. These guidelines are “the leading international arrangement to mitigate space debris.”¹² They consist of seven guidelines, which “should be considered for the mission planning, design, manufacture and operational (launch, mission and disposal) phases of spacecraft and launch vehicle orbital stages.”

UN Committee on the Peaceful Uses of Outer Space Space Debris Mitigation Guidelines¹³

The seven guidelines are:

1. Limit debris released during normal operations
2. Minimize the potential for break-ups during operational phases
3. Limit the probability of accidental collision in orbit
4. Avoid intentional destruction and other harmful activities
5. Minimize potential for post-mission break-ups resulting from stored energy
6. Limit the long-term presence of spacecraft and launch vehicle orbital stages in the low-Earth orbit . . . region after the end of their mission
7. Limit the long-term interference of spacecraft and launch vehicle orbital stages with the geosynchronous Earth orbit . . . region after the end of their mission

Though non-binding, the COPUOS Guidelines direct member states and international organizations to voluntarily implement the Guidelines through domestic law mechanisms.¹⁴ One scholar remarks that “the fact that all major spacefaring states take part in the work of the [Scientific and Technical Sub-Committee] . . . should facilitate the approval and implementation of the Guidelines on the national level.”¹⁵

There is also an Inter-Agency Space Debris Coordination Committee (“IADC”)

that includes NASA, the European Space Agency, and other national space agencies. The IADC issued a set of space debris mitigation standards that are similar to the U.S. Orbital Debris Mitigation Standard Practices discussed below.¹⁶

3. Hague International Space Resources Governance Working Group Building Blocks

The Working Group's Building Blocks, discussed above, envision a binding international framework that addresses the environmental consequences of space mining with far more specificity than is set out under existing international law. Under the Building Blocks, the international framework should provide for the "[a]voidance and mitigation of potentially harmful impacts resulting from space resource activities[.]"¹⁷

Hague International Space Resources Governance Working Group Building Blocks*

The Building Blocks state that responsible nations and international organizations should be required to adopt measures to avoid and mitigate a number of risks, spanning risk of harm to humans, environment, or property to harmful contamination of celestial bodies:

- a) Risks to the safety of persons, the environment, or property;
- b) Damage to persons, the environment, or property;
- c) Adverse changes in the environment of the Earth, taking into account internationally agreed-on planetary protection policies;
- d) Harmful contamination of celestial bodies, taking into account internationally agreed planetary protection policies;
- e) Harmful contamination of outer space;
- f) Harmful effects of the creation of space debris;
- g) Harmful interference with other on-going space activities, including other space resource activities;
- h) Changes to designated and internationally endorsed outer space natural or cultural heritage sites;
- i) Adverse changes to designated and internationally endorsed outer space sites of scientific interest.

* Building Blocks ¶ 10.

The Building Blocks expressly recognize space debris, and would require managing the risks that accompany the accumulation of space debris (*e.g.*, damage to persons, outer space and Earth environments, and property). Under the Building Blocks, the international framework envisioned would require nations and international organizations to implement an oversight process to ensure the avoidance of harmful impacts from space debris,¹⁸ and would require nations and international organizations to monitor and respond to such harmful impacts, including considering whether a specific resource activity—such as mining platinum from

an asteroid or ice from the Moon—should be adjusted or terminated.¹⁹

ii. Domestic Law and Policy

Recognizing the risk of space debris, in 1995, NASA developed orbital debris mitigation guidelines. The United States government adopted these guidelines two years later, titled the Orbital Debris Mitigation Standard Practices, which NASA subsequently updated in 2019.²⁰ These standards helped form the basis for related international standards.²¹ Congress also passed a statute requiring NASA to engage in international efforts to address space debris, and to coordinate with other United States agencies.²²

Orbital Debris Mitigation Standard Practices: Four Key Objectives

The Orbital Debris Mitigation Standard Practices state four key objectives and provide related standard practices to accomplish those objectives.²³ The objectives are:

- 1. Control of Debris Released During Normal Operations:** Programs and projects will assess and limit the amount of debris released in a planned manner during normal operations.
- 2. Minimizing Debris Generated by Accidental Explosions:** Programs and projects will assess and limit the probability of accidental explosion during and after completion of mission operations.
- 3. Selection of Safe Flight Profile and Operational Configuration:** Programs and projects will assess and limit the probability of operating space systems becoming a source of debris by collisions with man-made objects or meteoroids.
- 4. Post-mission Disposal of Space Structures:** Programs and projects will plan for, consistent with mission requirements, cost effective disposal procedures for launch vehicle components, upper stages, spacecraft, and other payloads at the end of mission life to minimize impact on future space operations.

There was a fifth objective added in the 2019 revision of the Standard Practices, which adds several new items, discussed below.

To accomplish these objectives, NASA and other federal agencies are to design spacecraft to eliminate or minimize debris.²⁴ If there is a planned release of debris, where the debris will be larger than 5 mm and which will be in orbit for more than 25 years, then the federal agency approving the mission (including missions conducted by private parties) must evaluate and justify that outcome, and the debris must remain in orbit for under 100 years.²⁵

To reduce the risk of explosion, United States agencies are to determine whether

¹⁹*Id.* ¶ 12.

²³U.S. Government Orbital Debris Mitigation Standard Practices, November 2019 Update, available at https://orbitaldebris.jsc.nasa.gov/library/usg_orbital_debris_mitigation_standard_practices_november_2019.pdf.

²⁴*Id.* at 1-1.

²⁵*Id.*

an explosion might result from spacecraft design, and adopt operational procedures.²⁶ The risk of an explosion must be less than 1 in 1,000.²⁷ The Standards require an analysis of the possibility of collisions, and spacecraft should be designed to reduce the chance of a collision with objects larger than 10 cm to less than 1 in 1,000 to mitigate the risk of a loss of control of the vehicle.²⁸

The Standard Practices provide more detailed guidance on how to dispose of a vehicle after its mission. The agency might design the vehicle to re-enter the atmosphere or perhaps in orbit around the sun.²⁹ If the object will re-enter the atmosphere, the risk of human casualty must be less than 1 in 10,000.³⁰ The vehicle could also place the object in a “storage orbit,” away from standard operational orbits.³¹ Finally, the space object (*i.e.*, the satellite, vehicle, or other object placed in orbit) might be placed in an eccentric orbit that would result in the eventual re-entry of the object into the atmosphere, or the vehicle might be retrieved within five years of the end of its mission.³² Tether systems—two space objects, such as satellites, connected by a wire—are subject to specialized rule due to their unusual properties.³³

The fifth objective, added in 2019, provides “Clarification and Additional Standard Practices for Certain Classes of Space Operations.”³⁴

Additional Standard Practices

Under these additional Standard Practices:

1. Large constellations of satellites (greater than 100 objects) should be disposed of by re-entry or heliocentric orbit, with a chance of success of at least 90%.³⁵
2. Small satellites should have a total orbit of less than 100 years, and less than 25 years after end of mission.³⁶
3. Satellite servicing and related operations should also be designed to minimize the risk of generating space debris.³⁷
4. Operations to remove debris should be designed to minimize the risk of generating additional debris.
5. Tethering systems require unique analysis.

²⁶*Id.* at 2-1, 2-2.

²⁷*Id.* at 2-1.

³³The tethering process can be used to launch an object into a high orbit from a lower-orbiting object, as well as other uses: “Tethered systems provide propellantless propulsion that can be used in attitude control, orbit transfers, momentum dumping, station-keeping, and a variety of other applications. A mechanical connection is established through the tether that enables the transfer of energy and momentum from one object to the other.” Brandon Copp, Systems in Spacecraft Propulsion, University of Colorado, ASEN 5053: Rocket Propulsion (2012). A conductive tether moving through the ionosphere could generate enough electrical current to provide propulsion for a satellite. Jeremy Hsu, Kilometer-Long Space Tether Tests Fuel-Free Propulsion: The U.S. space mission aims to demonstrate technology that could someday help clean up space junk, *Scientific American* (Nov. 2019).

³⁴*Id.* at 5.

³⁵U.S. Government Orbital Debris Mitigation Standard Practices, *supra* note 24, at 5-1.

³⁶*Id.* at 5-2.

³⁷*Id.* at 5-3.

In addition to the broad application of the Standard Practices to federal agencies, several agencies with regulatory supervision over activities in outer space have developed specific regulations relating to space debris.

The Federal Communications Commission (“FCC”) has promulgated regulations applicable to placing communication satellites in orbit since 2004.³⁸ For example, a party seeking to place a communications satellite in orbit is required to submit a debris mitigation plan to the FCC as part of its permit application.³⁹ FCC also established debris mitigation rules and broadened them in 2020. The 2020 FCC order requires “satellite operators to quantify their collision risk, probability of successfully disposing spacecraft, [and] the casualty risk associated with spacecraft that re-enter Earth’s atmosphere.”⁴⁰ The FCC order followed a public hearing on a Notice of Proposed Rulemaking first published in 2018.⁴¹ The 2018 Notice included more rigorous debris mitigation standards for consideration by the FCC, including a requirement that a satellite be maneuverable, and a requirement that satellite operators indemnify the United States government from collisions with their debris, and post a bond to back up that indemnity.⁴² Those proposals in the Notice, and others relating to risk quantification, were remanded by the FCC Commissioners for further study.⁴³

The Federal Aviation Administration (“FAA”) maintains regulatory jurisdiction over the launch of vehicles and objects into outer space. The FAA recently updated its space debris regulations.⁴⁴ The FAA currently requires a debris analysis as part of a space launch plan. The debris analysis will address: (1) each reasonably foreseeable cause of vehicle breakup and intact impact; (2) vehicle structural characteristics and materials; and (3) energetic effects during break-up or at impact.⁴⁵ The analysis must also include a debris risk analysis.⁴⁶ The debris risk calculates the predicted consequences of each reasonably foreseeable failure during the flight in terms of conditional expected casualties.⁴⁷

Finally, the National Oceanic and Atmospheric Administration (“NOAA”) licenses the operation of private remote sensing space systems under the Land Remote Sensing Policy Act of 1992.⁴⁸ NOAA’s licensing regime previously required a plan for disposal of remote sensing satellites. Given that these satellites will also require a license from the FCC, NOAA recently determined that it would remove its separate requirement and defer to the FCC regime.⁴⁹

i. International law and policy

The Outer Space Treaty does not directly address harm to Earth's atmosphere caused by space activities, including rocket emissions. And it does not include language that lends itself to providing even an indirect hook to regulate rocket emissions. Article IX sets out certain requirements designed to mitigate harmful interference with the activities of other State Parties, and could be interpreted to extend to harmful interference with a State's launch activities, which may, theoretically, be caused by ozone depletion or other Earth-based environmental harms.⁵⁰ But, Article IX restricts activities that take place *in outer space*.⁵¹ Because the commonly-accepted definition of "outer space" is that it begins at the edge of Earth's atmosphere, activities that take place elsewhere (e.g., within Earth's atmosphere itself) appear to be outside of Article IX's scope.⁵²

However, regulation of substances that damage the ozone layer are regulated at the international level by the Montreal Protocol.⁵³ The Montreal Protocol identifies substances that deplete the ozone layer, and limits the global permissible levels of production and consumption of those identified substances.⁵⁴

But the Montreal Protocol does not limit the production and consumption of the substances used to propel rockets during launch,⁵⁵ leaving rocket launches in the "policy void" described by Ross and Vedda.⁵⁶ Scholars in the field point out two factors that inhibit the application of the Montreal Protocol, in its present form, to rocket emissions. First, the metric used to identify compounds for phase-out—"Ozone Depleting Potential"—does not capture rocket emissions because that metric is assessed at Earth's surface; thus, compounds emitted directly into the stratosphere are not assessed.⁵⁷ Second, the definition of "production" would not apply to production of the substances that harm the ozone layer during rocket launches because those substances are the result of combusting rocket fuel, rather than the components of the fuel itself.⁵⁸ Thus, the Montreal Protocol would fail to curtail release of these compounds because the compounds are not "produced" within the

practices in this final rule, and Commerce licenses will not include any such condition.").

⁵⁰Treaty on Principles Governing the Activities of States in the Exploration and Use of Outer Space, Including the Moon and Other Celestial Bodies, Jan. 27, 1967, 18 U.S.T. 2410, 610 U.N.T.S. 205, Art. IX [hereinafter "Outer Space Treaty"]; Martin Ross and James A. Vedda, *The Policy and Science of Rocket Emissions*, CENTER FOR SPACE POLICY AND STRATEGY, at 7 (April 2018).

Protocol's definition; they are by-products generated during launch.⁵⁹

Accordingly, in the mandatory quadrennial Scientific Assessment of Ozone Depletion,⁶⁰ "the assessment [of rocket emissions] therefore regresses to subjective descriptions."⁶¹ For example, the 2018 Scientific Assessment of Ozone Depletion notes that "[r]ocket launches presently have a small effect on total stratospheric ozone (much less than 0.1%)."⁶² It recognizes, however, that "[s]pace industry developments indicate that rocket emissions may increase more significantly than reported in the previous Assessment."⁶³

In the context of ozone depletion caused by increasing numbers of rocket launches, it is worth mentioning the potential benefits that could be realized through space mining. If the Moon is used as a space base and refueling station—which would only be achievable by mining its resources—this would presumably result in fewer rocket launches from Earth's surface, thereby reducing emissions into the stratosphere. Notwithstanding the potential benefits that space mining could present related to mitigating harms from rocket launch emissions, Ross's and Vedda's cautionary point is well-taken: "[T]he launch community, in the U.S. and globally, should tackle the question of launch emissions while it is still manageable, and be prepared to respond to regulatory attention and inquiry."⁶⁴

ii. Domestic law and policy

At the domestic level, the environmental impacts of spacecraft launches are assessed under the National Environmental Policy Act ("NEPA").⁶⁵ The FAA is the agency charged with licensing United States commercial space launch activities, which is considered a major federal action under NEPA, and, therefore, conducts NEPA reviews for proposed launches.⁶⁶ As discussed in Chapter 10 of this treatise, the assessments that federal agencies produce under NEPA take one of three forms: (1) a categorical exclusion; (2) an environmental assessment; and (3) an environmen-

means the amount of controlled substances produced, minus the amount destroyed by technologies to be approved by the Parties and minus the amount entirely used as feedstock in the manufacture of other chemicals. . . . 'Consumption' means production plus imports minus exports of controlled substances.").

⁵⁹See Shapiro, *supra* note 54, at 759-60.

⁶⁰See Montreal Protocol, *supra* note 53, Art. 6.

⁶¹See Ross and Vedda, *supra* note 50, at 6.

⁶²2018 Scientific Assessment, *supra* note 55, at ES.50.

⁶³*Id.*

⁶⁴See Ross and Vedda, *supra* note 50, at 9. An interesting question exists about the interplay between "Space Law"—which is the body of law discussed in this Chapter—and "Air Law," comprising a number of conventions applicable to air space and aircraft that address, among other things, environmental impacts of aircraft. See Paul Dempsey & Maria Manoli, *Suborbital flights and the delineation of air space vis-à-vis outer space: functionalism, spatialism and state sovereignty*, COMMITTEE ON THE PEACEFUL USES OF OUTER SPACE, LEGAL SUBCOMMITTEE, FIFTY-SEVENTH SESSION (Apr. 9-20, 2018), at 10. We do not take up that topic in this chapter, but a thorough and insightful discussion of it is contained in Mr. Dempsey's and Ms. Manoli's submission to the UNCOPUOS. See generally *id.*

⁶⁵See 42 U.S.C. § 4321 et seq. NEPA requires that federal agencies evaluate the environmental impacts of major federal actions, specifically: "(i) the environmental impact of the proposed action, (ii) any adverse environmental effects which cannot be avoided should the proposal be implemented, (iii) alternatives to the proposed action, (iv) the relationship between local short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and (v) any irreversible and irretrievable commitments of resources which would be involved in the proposed action should it be implemented." 42 U.S.C. § 4332(C).

⁶⁶*Guidelines for Compliance with the National Environmental Policy Act and Related Environmental Review Statutes for the Licensing of Commercial Launches and Launch Sites*, FEDERAL AVIATION ADMINISTRATION OFFICE OF THE ASSOCIATE ADMINISTRATOR FOR COMMERCIAL SPACE TRANSPORTATION (Feb. 22, 2001), at 5 [hereinafter "FAA NEPA Guidelines"].

tal impact statement.⁶⁷ The level of review required for a proposed action will depend on the likelihood of environmental effects, and the significance of those effects.⁶⁸ In its NEPA guidelines for launches and launch sites, the FAA states that environmental impact statements should consider atmospheric impacts, including impacts to stratospheric ozone.⁶⁹

Environmental Assessment and SpaceX

One such example of an environmental assessment (“EA”) is that prepared in connection with SpaceX’s launch licenses at the Kennedy Space Center and Cape Canaveral Air Force Station, which includes discussion of ozone impacts.⁷⁰

In the EA, the FAA notes that the Clean Air Act—like the Montreal Protocol—does not regulate rocket engine emissions as ozone depleting substances.⁷¹ The FAA recognizes, however, that rocket emissions “produce gases and particles” that deplete the ozone layer.⁷² It concludes that “[t]hese emissions are a small fraction of the total emissions” and “are not expected to result in significant climate-related impacts.”⁷³

c. Contamination

i. International law and policy

Article IX of the Outer Space Treaty requires that States avoid both forward and backward contamination. It provides:

States Parties to the Treaty shall . . . conduct exploration of [the Moon and other celestial bodies] so as to avoid their harmful contamination and also adverse changes in the environment of the Earth resulting from the introduction of extraterrestrial matter, and, where necessary, shall adopt appropriate measures for this purpose.⁷⁴

To guide compliance with the general mandates of the Outer Space Treaty, the Committee on Space Research has developed a Planetary Protection Policy (the “COSPAR Planetary Protection Policy”), based on the following policy statement:

The conduct of scientific investigations of possible extraterrestrial life forms, precursors, and remnants must not be jeopardized. In addition, the Earth must be protected from the potential hazard posed by extraterrestrial matter carried by a spacecraft returning from an interplanetary mission. Therefore, for certain space mission/target planet combinations, controls on contamination shall be imposed in accordance with issuances implementing this policy.⁷⁵

The COSPAR Planetary Protection Policy sets out a sliding scale of recommended protective measures based on: (1) the degree to which the target body is of interest to understanding chemical evolution or the origin of life; and (2) the likelihood of

⁷⁵COSPAR Policy on Planetary Protection, at 1 (June 17, 2020).

contamination.⁷⁶ It also recommends highly protective standards for Earth-return missions, noting that the Moon “must [also] be protected from back contamination to retain freedom from planetary protection requirements on Earth-Moon travel.”⁷⁷

The international framework envisioned under the Building Blocks would also require the implementation of measures to prevent both forward and backward contamination. Section 10 provides that the international framework should require nations and international organizations to adopt measures to avoid and mitigate “[a]dverse changes in the environment of the Earth, taking into account internationally agreed planetary protection policies [*i.e.*, backward contamination]; [and] (d) Harmful contamination of celestial bodies, taking into account internationally agreed planetary protection policies [*i.e.*, forward contamination]”⁷⁸

ii. Domestic law and policy

Consistent with the vision of the Building Blocks, NASA has developed policies designed to comply with the Outer Space Treaty’s requirements related to planetary protection. NASA Policy Directive 8020.7G establishes that “[i]t is NASA’s policy to comply with planetary protection provisions in support of U.S. obligations under the 1967 Outer Space Treaty,”⁷⁹ and charges the Associate Administrator for the Science Mission Directorate, or its designee, with the administration of NASA’s planetary protection policy.⁸⁰ That policy includes, among other considerations, “[m]onitoring space flight missions as necessary to meet the requirements for planetary protection certification” by NASA.⁸¹ The policy further enumerates specific responsibilities of the Planetary Protection Officer, which include “[c]ertifying” prior to launch and prior to reentry, if applicable, that:

- a) All measures have been taken to assure meeting NASA policy objectives as established in this directive and all implementing procedures and guidelines.
- b) The recommendations, of relevant regulatory agencies with respect to planetary protection have been considered, and pertinent statutory requirements have been fulfilled.
- c) The international obligations assessed by the Office of the General Counsel and the Office of External Relations have been met, and international implications have been considered.⁸²

The specific requirements under Policy Directive 8020.7G are set out in: (1) NPR 8020.12D (Planetary Protection Provisions for Robotic Extraterrestrial Missions); and (2) NPD 8900.5B (NASA Health and Medical Policy for Human Space Exploration).

A key complication related to NASA’s planetary protection policies, however, is that they do not apply to private space missions that are unaffiliated with NASA. Policy Directive 8020.7G states that it applies to “all space flight missions, robotic and human, which may intentionally or unintentionally carry Earth organisms and organic constituents to the planets or other solar system bodies, and any mission

⁸²*Id.* § 5.b.

employing spacecraft which are intended to return to Earth and/or its biosphere from extraterrestrial targets of exploration.”⁸³ But, NASA is not a regulatory agency, and, therefore, appears to lack authority to require that private space missions that are wholly unaffiliated with it comply with its planetary protection policies.⁸⁴ This gap has led to the authorization of private space missions without planetary protection evaluation prior to launch.⁸⁵

This issue was taken up in a recent report by the NASA Planetary Protection Independent Review Board (“PPIRB”), which sets out how NASA’s existing planetary protection policies can be improved “in light of current plans for Mars sample return, emerging capabilities for private sector robotic missions, eventual human missions to Mars, and the exploration of the icy moons of the outer planets.”⁸⁶ While the PPIRB did not assess contamination issues specific to resource recovery,⁸⁷ it made several recommendations related to updating NASA’s planetary protection policies in light of increased private sector space activities.⁸⁸ For example, the report recommended that, “[Planetary protection] policy should also recognize that it is both a NASA and a national objective to encourage private sector space initiatives and commercial robotic and human planetary missions.”⁸⁹ Accordingly, it recommended that planetary protection governmental oversight should be “implemented in a transparent, timely, and predictable manner, minimizing costs and burdens on private sector activities where possible.”⁹⁰ And regarding implementation of these requirements, it notes that “[a]lthough NASA is not a regulatory agency, the [a]gency can likely affect control over non-NASA U.S. missions by linking [planetary protection] compliance to eligibility for current or future NASA business or NASA support.”⁹¹ The PPIRB also recommends that the federal government work to identify the appropriate agency to implement planetary protection requirements for missions not involving NASA.⁹²

In December 2020, the White House National Space Council issued a “National Strategy for Planetary Protection.”⁹³ A group of U.S. government representatives involved with the Planetary Protection Interagency Working Group, which convened earlier in the year to set the national agenda on planetary protection, developed the strategy.⁹⁴ Like the PPIRB report, development of the strategy was motivated by the changing landscape of space exploration, including the increasing role of the private sector.⁹⁵ The strategy sets out a number of objectives and action items summarized in the table below. Whether and how the Biden Administration will proceed with

these objectives remains to be seen.

National Strategy for Planetary Protection	
Objective 1—Forward Contamination <i>Avoid harmful forward contamination by developing and implementing risk assessment and science-based guidelines and updating the interagency payload review.</i>	
Objective 1.1 Develop a forward contamination risk assessment framework.	Near-term deliverable: Develop a forward contamination risk assessment framework within one year.
Objective 1.2 Develop flexible science-based forward contamination guidelines.	Near-term deliverables: Develop guidelines for forward contamination mitigation within nine months. Develop risk-informed decision-making implementation strategies for human missions within one year.
Objective 1.3 Assess the interagency aspects of the U.S. Government payload review process.	Near-term deliverable: Develop a report reviewing the United States Government payload review process within nine months.
Objective 2—Backward Contamination <i>Avoid backward contamination by developing a Restricted Return Program to protect against adverse effects on the Earth environment due to the potential return of extraterrestrial life.</i>	
Objective 2.1 Develop a risk assessment framework.	Near-term deliverable: Develop a backward contamination risk assessment framework within nine months.
Objective 2.2 Develop an approval framework.	Near-term deliverable: Develop an approval framework within nine months.
Objective 2.3 Develop a return procedures framework.	Near-term deliverable: Develop a return procedures framework within one year.
Objective 3—Private Sector Engagement <i>Incorporate the perspective and needs of the private sector by soliciting feedback and developing guidelines regarding private sector activities with potential planetary protection implications.</i>	
Objective 3.1 Engage with industry.	Near-term deliverable: Develop a report on industry feedback and R&D partnership opportunities within three months.
Objective 3.2 Develop guidelines for private sector activities.	Near-term deliverable: Develop guidelines on authorization and continuing supervision within six months.

d. Nuclear contamination

i. International law and policy

Though the Outer Space Treaty prohibits placing nuclear weapons into orbit, it does not address the use of NPSs.⁹⁶ To fill this gap, the UN has adopted nonbinding Principles Relevant to the Use of Nuclear Power Sources in Outer Space (the “Nuclear Power Source Principles”). These set out, among other things, safety guidelines for the use of NPSs in space, notice requirements in the event of malfunctioning space objects containing NPSs, and a liability and compensation framework for damage caused by NPS-bearing space objects.⁹⁷ Notably, the Nuclear Power Source Principles apply only to NPSs used for electric power generation, and not to NPSs used for propulsion.⁹⁸

⁹⁶Treaty on Principles Governing the Activities of States in the Exploration and Use of Outer Space, Including the Moon and Other Celestial Bodies, Jan. 27, 1967, 18 U.S.T. 2410, 610 U.N.T.S. 205, Art. IV [hereinafter “Outer Space Treaty”].

⁹⁷See Principles Relevant to the Use of Nuclear Power Sources in Outer Space, Adopted by the General Assembly, 14 December 1992 (Resolution 47/68), Principles 3, 5, 9.

⁹⁸See *id.* (“Affirming that this set of Principles applies to nuclear power sources in outer space

Jointly with the International Atomic Energy Agency, the Scientific and Technical Subcommittee of the UNCOPUOS has developed guidelines for the safe use of NPSs in space (the “NPS Safety Framework”).⁹⁹ The purpose of the NPS Safety Framework is to provide guidance to governments in developing their own safety frameworks, and for the development of international intergovernmental frameworks.¹⁰⁰ It sets out guidance for governments, including recommending that governments justify the use of NPSs in space at the authorization stage;¹⁰¹ guidance for management of organizations that conduct space missions involving NPSs, including that the operating organization should have primary responsibility for the safe use of such NPSs;¹⁰² and technical guidance.¹⁰³ The NPS Safety Framework is limited in scope to safety considerations for Earth’s environment, including Earth’s human population.¹⁰⁴ It does not consider the protection of humans in space or space environments, due to a dearth of scientific data available to inform such applications.¹⁰⁵

The Hague Building Blocks do not expressly address the use of NPS systems. However, Section 10 contains broad language regarding avoiding and mitigating the potential for harmful impacts, presumably including those associated with the use of NPSs.¹⁰⁶

ii. Domestic law and policy

On August 20, 2019, President Trump issued a Presidential Memorandum that “update[d] the process for launches of spacecraft containing space nuclear systems” (the “Space Nuclear Systems Memorandum”).¹⁰⁷ The Space Nuclear Systems Memorandum applies to radioisotope power systems, radioisotope thermoelectric generators and heater units, and fission reactors used for power and propulsion, and to both governmental and commercial launches.¹⁰⁸ It provides safety guidelines for launches involving nuclear systems, setting out probability thresholds of harm to the public that should not be exceeded for different levels of exposure.¹⁰⁹ It also directs NASA, in coordination with the Secretaries of Defense and Energy, to evaluate further safety guidelines that may be appropriate for the use of nuclear fission

devoted to the generation of electric power on board space objects for non-propulsive purposes, which have characteristics generally comparable to those of systems used and missions performed at the time of the adoption of the Principles[.]”.

¹⁰⁹See *id.* § 3.

reactors in space.¹¹⁰

The Space Nuclear Systems Memorandum sets out a three-tiered authorization process for launches containing nuclear systems, based on: (1) the system used; (2) “the level of potential hazard”; and (3) “national security considerations.”¹¹¹ It establishes a process for conducting safety analyses, requiring the preparation of a “mission Safety Analysis Report” for all tiers of federal government launches,¹¹² and directs the Secretary of Transportation to, “if necessary,” require Safety Analysis Reports for commercial launches following a rulemaking process.¹¹³

The memorandum also directs the NASA Administrator to establish an Inter-agency Nuclear Safety Review Board, consisting of representatives of “the Departments of State, Defense, Energy, and Transportation, the Environmental Protection Agency, NASA, and, as appropriate, the Nuclear Regulatory Commission,” and spells out the Review Board’s oversight role for Tier II and Tier III missions.¹¹⁴ It requires that the Secretary of Transportation issue guidance on the process to obtain a license for the launch or reentry of spacecraft using a nuclear system.¹¹⁵ It also requires annual reports of launches involving radioactive sources in quantities above a certain threshold (“1,000 times to 100,000 times the A2 value listed in Table 2 of the International Atomic Energy Agency’s Specific Safety Requirements No. SSR-6 (Rev.1)”).¹¹⁶

Relatedly, under regulations that took effect on March 10, 2021, the FAA will evaluate launches and reentries of radionuclides “on a case-by-case basis, and issue an approval if the FAA finds that the launch or reentry is consistent with public health and safety, safety of property, and national security and foreign policy interests of the United States.”¹¹⁷ The regulations set out the following requirements related to the radionuclide that the launch applicant must satisfy: “(i) [i]dentify the type and quantity [of the radionuclide]; (ii) [i]nclude a reference list of all documentation addressing the safety of its intended use; and (iii) [d]escribe all approvals by the Nuclear Regulatory Commission for pre-flight ground operations.”¹¹⁸

¹¹⁸*Id.*

that may attend space mining, the space mining industry may be affected by calls to withdraw portions of the Solar System for the purposes of conservation.

One such call is to limit areas open to exploitation of space resources by a “one-eighth principle.”¹ Authors Martin Elvis and Tony Milligan describe this principle as follows:

While economic growth remains exponential, we should regard as ours[, humanity’s,] to use no more than one-eighth of the exploitable materials of the Solar System. . . . The remaining seven-eighths of the exploitable Solar System should be left as space wilderness.²

Rather than invoking concepts of protection of nature, the one-eighth principle seeks to withdraw areas from exploitation in order to avoid depletion of the Solar System’s resources.³ Thus, the wilderness designation would prevent human use of the withdrawn areas, but would not necessarily prohibit all forms of human impact.⁴

Though they do not go so far as to specify a percentage of the Solar System to be withdrawn from resource utilization, the Building Blocks do contemplate the designation of internationally-protected areas in space. Section 18 provides for “[t]he establishment and maintenance of an international database . . . for making publicly available . . . iii. [t]he list of designated and internationally endorsed outer space natural and cultural heritage sites; and iv. [t]he list of designated and internationally endorsed sites of scientific interest”⁵ An international body would be charged with listing such sites.⁶ The international framework envisioned under the Building Blocks would also require responsible States and international organizations to implement measures designed to avoid and mitigate harm to such sites.⁷

At the international level, legal efforts to protect portions of Earth’s oceans that are not subject to any national jurisdiction may foreshadow similar efforts in outer space. For example, over the past few years, UN delegates have been negotiating a new legally-binding instrument—likely an extension of UNCLOS—to protect marine life in international waters.⁸ Further negotiations have been postponed, as of the time of this writing, due to COVID-19,⁹ but the success of the negotiations and the terms of any resulting instrument will likely inform outer space conservation efforts going forward.

b. Historic site preservation

Significant interest similarly exists in protecting sites of historic or cultural value in space. Existing protections for historical and cultural sites located in international waters could serve as an analogous legal framework to this end. The UNCLOS and the 2001 Convention for the Protection of Underwater Cultural Heritage (the “Underwater Cultural Heritage Convention”) protects valuable archaeological and historical sites located in the “Area,” defined as “the seabed and ocean floor and subsoil thereof, beyond the limits of national jurisdiction.”¹⁰ Specifically, the UNCLOS states that “[a]ll objects of an archaeological and historical nature found in the Area shall be preserved or disposed of for the benefit of mankind as a whole, particular regard being paid to the preferential rights of the State or country of origin, or the State of cultural origin, or the State of historical and archaeological origin.”¹¹ The Underwater Cultural Heritage Convention specifically protects “traces of human existence having a cultural, historical or archaeological character which have been partially or totally under water, periodically or continuously, for at least 100 years,” including such traces located in the Area.¹²

At the domestic level, NASA has set out recommendations to protect certain United States Government assets located on the Moon based on their historical and scientific value.¹³

NASA Recommendations to Protect Moon-based U.S. Government Assets

NASA’s recommendations apply to the following assets:

- A. Apollo lunar surface landing and roving hardware
- B. Unmanned lunar surface landing sites (e.g., Surveyor sites)
- C. Impact sites (e.g., Ranger, S-IVB, LCROSS, lunar module [LM] ascent stage)
- D. [U.S. Government] experiments left on the lunar surface, tools, equipment, miscellaneous EVA hardware
- E. Specific indicators of U.S. human, human-robotic lunar presence, including footprints, rover tracks, etc., although not all anthropogenic indicators are protected as identified in the recommendations.¹⁴

The Artemis Accords also address protection of certain historically significant sites in outer space. They provide that “[t]he Signatories intend to preserve outer space heritage, which they consider to comprise historically significant human or robotic landing sites, artifacts, spacecraft, and other evidence of activity on celestial bodies in accordance with mutually developed standards and practices.”¹⁵ The signatories further express an intention to contribute to efforts to establish practices and rules at the international level related to the goal of preserving outer space heritage.¹⁶

Civic society also plays a role regarding historic site preservation. An organiza-

¹⁶*Id.* § 9.2.

tion called “For All Moonkind” has worked with federal officials and appealed to the United Nations to declare that the Apollo 11 landing site and the Soviet Luna 2 spacecraft, which remains on the Moon’s surface 60 years after landing, deserve special recognition.¹⁷ These efforts, NASA’s recommendations, and the Artemis Accords may form the basis of United States law if Senator Gary Peters’ and Senator Ted Cruz’s bill—the One Small Step to Protect Human Heritage in Space Act—were to be enacted into law.¹⁸ The Act would require a commitment to abide by NASA’s requirements related to protecting U.S. Government lunar artifacts as a condition on a license to conduct lunar activities.¹⁹ It passed the Senate in July 2019.²⁰

The Outer Space Treaty presents a significant limitation on the ability of an individual nation to protect areas of concern to it. A nation would run afoul of the Outer Space Treaty’s prohibition on the national appropriation of outer space and its mandate of free access if it attempted to unilaterally protect a portion or all of outer space by excluding other states.²¹ Thus, while efforts like the United State’s to protect sites of interest located on celestial bodies through national legislation and other means are effective as applied to the missions of the enacting nation, some sort of international consensus would be necessary to enforce the protective requirements on an international basis.

IV. CONCLUSION

§ 28:10 In general

We are in the first phase of a second space age, building on the development of outer space exploration that led to the Outer Space Treaty in 1967. In 1967, there were 139 orbital launches, the high point in orbital space launches. The number dropped to a low of 51 in 2001 as space exploration lost its lustre. In 2020, however, there were 110 orbital launches, tied for the highest annual number since the low numbers in the early 2000s.¹ Humankind has again focused on outer space. But refocusing on outer space has brought new participants—private industry. In 2009, private capital invested less than \$500 million in the space industry. In 2019, that investment was just under \$6 billion, a record level of private investment.²

Renewed activity in outer space, and new sources of investment and technology, will magnify and accelerate the potential environmental effects of space activities. When the Outer Space Treaty was being negotiated, there were about 2,000 objects in orbit around the Earth. Today there are more than 25,000.³ And outer space, especially near earth orbit, will become more active, more crowded, and more regulated. Those venturing into space, or investing in those ventures, will need to

I. INTRODUCTION—REGULATION OF OIL AND GAS DEVELOPMENT

§ 29:1 General

Various statutes task state, federal, and tribal agencies and officials and local governments with protection of human health and the environment and with assuring the safe, efficient, and reasonable production and transportation of oil and gas.

The statutes that are the subject of most of this treatise relate to the regulation of oil and gas development on federal and private lands at every stage of the oil and gas development process—leasing, exploration, drilling, production, transportation, storage, refining, and marketing. Although some statutes, like the Oil Pollution Act and Natural Gas Act, relate specifically to oil and gas, many of the environmental statutes discussed herein were not specifically enacted for the purpose of regulating oil and gas. Rather, these statutes are unique in aspects of their application to oil and gas development. Even so, these statutes alone do not constitute the full extent of environmental governance of oil and gas development. Other sources of governance include obligations within contracts and encumbrances on land and common law rules related to trespass, waste, and nuisance.

The terms oil and gas, as referred to herein, refer to combustible hydrocarbons and, at times, other materials produced in association therewith. Oil and gas interests are classified as mineral interests and may be separately conveyed as an interest in real property. When produced, the oil or gas is severed from the realty and becomes personal property—which can be stored, transported, and marketed as either a gas or liquid and refined into a variety of consumer products. As the cases and laws described herein demonstrate, production of these valuable products also involves complex industrial processes with risks and environmental impacts. The land use and environmental statutes discussed herein at times provide regulators with tools to assess these risks and limit or prevent environmental harms and in others to promote and encourage new development in order to serve public demand for oil and gas and related products.

§ 29:2 History of Oil and Gas Development in the United States

Though oil seeps and hand dug wells had been discovered and produced small amounts of oil much earlier, most scholars cite Drake's discovery at Titusville Pennsylvania in 1859 as the first oil boom and the beginning of the American oil and gas industry.¹ The events that followed—land speculation, a feverish race to produce, over drilling and environmental damage, and the subsequent decline of production and economic collapse and bust of the nascent local industry—have been repeated numerous times in basins across the country. Though early wells were most often shallow, vertical wells, these trends have continued through discovery of new resource plays and following the application of new technologies.

The growth of the early oil and gas industry also precipitated legal changes throughout the late 19th and early 20th century: Courts were tasked with determining the law relative to the nature of property interests in minerals and the rights of parties within oil and gas reservoirs;² Congress, realizing that grants made pursuant to early land disposition laws had conveyed away tremendous mineral resources, passed new laws that reserved federal minerals and created split estates;³ To stem the land grab for placer-oil mining claims on public lands, President Taft withdrew lands in California and Wyoming, paving the way for the modern mineral leasing system;⁴ State legislatures, faced with high-risk technologies such as well shooting with nitroglycerine, passed laws limiting the quantities that could be brought into

and stored within city limits.⁵ These laws, and numerous others like them, established the balance between state and federal regulatory authority over oil and gas development and defined property interests in oil and gas, establishing precedents which have since given rise to the contemporary system of conservation regulation and administrative management.

In the last two decades, new technologies and concerns related to environmental impacts and climate have reshaped environmental regulation of the oil and gas industry. The successful application of horizontal drilling technology to unconventional “tight” formations in 2005 initiated a new drilling “boom” in shale formations across the United States which again reshaped the American energy landscape.⁶ Although horizontal and directional drilling had been used successfully in both North Dakota and Texas in the 1980’s, developers in the Barnett Shale in Texas found that, when combined with hydraulic fracturing technology, it opened up entirely new sources of natural gas.⁷ The resultant boom caused a dramatic increase in United States natural gas production and also an increase in production of associated fluids and brines, called “produced water.” This, in turn, gave rise to new environmental issues related to chemicals within fracturing fluids and to the seismic impacts resulting from injection of produced water.⁸ Additionally, courts, legislatures, and local governments were confronted with new legal issues related to fracturing across property lines,⁹ subsurface trespass from transboundary migration of injected wastewater,¹⁰ damage to vertical wells resulting from nearby hydraulic fracturing operations,¹¹ and impacts of shale exploration on surrounding communities.¹² In recent years, growing concerns about the environment and climate change have animated new debates over the regulation of oil and gas and the use of public lands for mineral development, and have encouraged states and Congress to create incentives such as the 45Q tax credit for lower carbon production techniques such as Carbon Dioxide Enhanced Oil Recovery (CO₂-EOR). The application of emergent technologies and rapidly evolving understandings related to the different attributes of unconventional resources raised questions relative to preemption, the application of environmental law statutes, and the proper scope of oil and gas regulation anew.

II. FEDERAL ONSHORE OIL AND GAS DEVELOPMENT

§ 29:3 Generally

Federal regulation of onshore oil and gas development primarily involves leasing of federal minerals and development activities on federal surface lands, and 710

million acres of the federal subsurface estate.¹ This section focuses on and provides a high level overview of the federal leasing process of oil and gas interests.² However, the life cycle of onshore oil and gas broadly encompasses development activities generally involving the following phases, which intersect with the other environmental and permitting requirements discussed in this chapter:³

- Exploration;⁴
- Seismic and planning operations to identify new oil and natural gas reservoirs (including obtaining site control and safety requirements);⁵
- Construction and drilling operations;
- Ongoing operations and midstream operations involving gathering, treatment, and transportation; and
- Final abandonment and reclamation of the well and location.

Although from a public policy and land management perspective there are differing views on whether to increase domestic energy supply, onshore production from federal lands continues to contribute to domestic production and revenues.⁶ The Annual Energy Outlook 2021 prepared by the U.S. Energy Information Administration reports that petroleum remains the most-consumed fuel in the United States, and that amid uncertainty, including the effects of Covid-19 and post-pandemic expectations, the United States continues to be an important global supplier of crude oil and natural gas. The 2021 Outlook predicts such production would continue to grow through 2030 with modest growth through 2051.⁷ Separately, based on an April 2021 short-term energy outlook, the U.S. Energy Information Administration projected that U.S. gasoline consumption in 2021 will average 8.6 million barrels per day, up from consumption in 2020 of 8.0 million barrels per day—but down from consumption in 2019 of 9.3 million barrels per day, based on changes and uncertainty surrounding the Covid-19 responses and related energy demand and supply patterns.⁸ The U.S. Department of the Interior estimates approximately 5.3 billion barrels of proved oil reserves located on federal onshore acreage and the Energy Information Administration estimates 69 trillion cubic feet of U.S. natural

gas reserves.⁹

In FY2019, crude oil produced on federal lands hit a record value. Domestic production from oil and natural gas from onshore federal lands totaled \$4.202 billion payable to the federal government, which represented 86% of total federal revenues from energy and mineral leases on onshore federal lands, including revenues from royalties, bonuses, interest payments, Application for Permit to Drill fees, rents, and other payments.¹⁰ These revenues benefit both federal and state coffers: revenues and disbursements received from onshore oil and gas development revenues, from oil and gas leases under the Mineral Leasing Act, for example, are generally distributed 50% to the states, 40% to the Reclamation Fund, and 10% to the U.S. Treasury.¹¹ However, revenue disbursements are subject to varying statutory authorities and may fluctuate based on commodity prices, demand, and other factors, which issues are not covered in this section.¹²

§ 29:4 Background

Historically, federal management of oil and gas resources has followed in line with the nation's development, technological advances, and needs. For example, when the General Mining Law was passed in 1872, in the middle of the gold rush, oil and gas or hydrocarbon interests were not a focus of Congress. However, as the country industrialized and the U.S. Navy shifted to oil-powered ships, the focus on federal oil and gas reserves sharpened. Congress initially tried to classify petroleum reserves as locatable placer deposits (i.e., a form of mining claim) under the Oil Placer Act of 1897, but this resulted in an inefficient “race to capture,” resulting in physical and economic waste.¹ Accordingly, Congress stepped in and passed the Mineral Leasing Act (MLA) in 1920, which expressly withdrew oil and gas from the availability for mineral location under the 1872 General Mining Law. Not only did Congress act to regulate oil and gas leasing on public lands through passage of the MLA; President Warren Harding issued an executive order on February 27, 1923, setting aside what is now the National Petroleum Reserve in Alaska, as a “Naval Petroleum Reserve” for a minimum of six years for “classification, examination, and preparation of plans for development and until otherwise ordered by Congress or the President.”²

Today, there are generally three broad categories of minerals on federal lands:

- (1) locatable minerals (i.e., hardrock minerals) managed under the General Min-

¹Act of Feb. 11, 1897, 29 Stat. 526.

²President Harding, Exec. Order No. 3797-A (Feb. 27, 1923) (on file with author).

ing Law of 1872,³ which covers certain valuable mineral deposits such as gold, silver, copper, and gemstones;

- (2) leasable minerals as defined by the Mineral Leasing Act of 1920,⁴ which include oil and gas, coal, phosphate, potassium, and sodium; and
- (3) salable minerals (or “common variety” minerals), such as sand and gravel, which are governed under the Materials Act of 1947.⁵

Federal onshore oil and gas interests are primarily governed under the MLA, and its subsequent amendments.

§ 29:5 BLM Management of Federal Oil and Gas Development

Under the Federal Land Policy and Management Act of 1976 (FLPMA) and the MLA, the Bureau of Land Management (BLM) is the main federal agency tasked with managing energy production and mineral development from federal subsurface lands, including mineral leasing of federal oil and gas mineral interests, and overseeing the exploration, development, and production operations for these resources on federal public lands.¹ As indicated, under the MLA, all federally owned oil, gas, coal, coalbed methane, and oil shale are considered “leasable” minerals.² Accordingly, BLM manages onshore oil and gas development under its leasing program and regulations.³ In addition to leasing, BLM’s regulations broadly cover operations associated with the exploration, permitting, development, and production of onshore oil and gas interests on federal leases.⁴

§ 29:6 Federal Land Policy and Management Act of 1976

As a high-level background, FLPMA sets up the statutory authority for the U.S. Department of the Interior and BLM to manage federal lands, including the federal mineral estate, which encompasses onshore oil and gas interests.¹ Specifically, FLPMA provides that the Secretary of the Interior “shall manage the public lands under principles of “multiple use” and “sustained yield” in accordance with land use plans developed by the agency or in accordance with any dedicated specific uses required by such law.² The term “multiple use” is broadly defined to mean:

the management of the public lands and their various resource values so that they are utilized in the combination that will best meet the present and future needs of the American people; making the most judicious use of the land for some or all of these resources or related services over areas large enough to provide sufficient latitude for periodic adjustments in use to conform to changing needs and conditions; the use of

some land for less than all of the resources; a combination of balanced and diverse resource uses that takes into account the long-term needs of future generations for renewable and nonrenewable resources, including, but not limited to, recreation, range, timber, minerals, watershed, wildlife and fish, and natural scenic, scientific and historical values; and harmonious and coordinated management of the various resources without permanent impairment of the productivity of the land and the quality of the environment with consideration being given to the relative values of the resources and not necessarily to the combination of uses that will give the greatest economic return or the greatest unit output.³

The FLPMA also defines “sustained yield” to mean “the achievement and maintenance in perpetuity of a high-level annual or regular period output of the various renewable resources of public lands consistent with multiple use.”⁴

Generally, through the land use planning process required under FLPMA, BLM determines which lands under its management are available for oil and gas leasing including the particular stipulations or conditions of approval applicable to such leases. For example, conditions of approval include consultation with other Federal regulatory agencies under the Endangered Species Act, National Historic Preservation Act, and Clean Water Act, among other statutory requirements. Such leasing decisions are typically analyzed in preparation of a land management plan and environmental impact statement under the National Environmental Policy Act (NEPA), which address cumulative impacts of leasing, exploration, and development. Development of these documents involves collaboration with local, state, and tribal governments, the general public, industry, and other stakeholders on how Federal lands will be used and protected during broader landscape-level approvals and site-specific projects.⁵ However, leases may also be reviewed under a programmatic NEPA evaluation of larger project proposals, or a site-specific NEPA analysis for an individual well. As part of this review, land approved for leasing or development takes into consideration BLM’s multiple-use purposes both during and after the term of the lease and site-specific mitigation.

Notably, although there are millions of acres of federal public lands, not all public lands are open to mineral development and subject to its multiple use mandate, BLM may also withdraw lands from mineral entry and prohibit new mining and development activities. For example, lands may be withdrawn from mineral entry by the President, executive branch agencies, or Congress subject to valid and existing rights, or Presidential monument designations under the Antiquities Act.⁶ To guide oil and gas leasing decisions and to determine which lands are open to oil and gas leasing, BLM field offices prepare comprehensive Resource Management Plans (RMPs).

§ 29:7 Mineral Leasing Act of 1920, and Amendments

Up until 1988, federal onshore oil and gas leasing was governed under a dual leasing system for future oil and gas exploration and development under the MLA. Specifically, the MLA provided that: (1) competitive bidding was required within known geological structures¹ and (2) noncompetitive leases could be issued for areas

³43 U.S.C. § 1702(c).

⁵See 43 C.F.R. § 1610 (2021) (BLM’s Resource Management Planning regulations).

⁶16 U.S.C. §§ 431 to 433.

[Section 29:7]

¹“Known geological structures” generally refer to lands within a structure where oil and gas production has been obtained. Originally, the regulations provided that the Director of the Geological Survey would determine the boundaries of known geologic structures of producing oil and gas fields,

not within known geological structures to the first qualified applicants.² Because noncompetitive leases had favorable lessee terms, many leases were acquired and lands were held only for speculation without completion of any drilling operations during the primary term. This resulted in a refiling competition at the end of the initial lease term to hold the same lands again. In order to address this result under the existing system, the Department of the Interior established a simultaneous lottery system, in which all interested persons could file an application for a new lease. The Department would draw the winning applicant from the lottery.³

§ 29:8 Mineral Leasing Act of 1920, and Amendments—The Federal Onshore Oil and Gas Leasing Reform Act of 1987

The Federal Onshore Oil and Gas Leasing Reform Act of 1987 (FOOGLRA) amended the MLA by instituting a new bidding and leasing system for oil and gas. Specifically, FOOGLRA abolished the simultaneous lottery and dual leasing procedure for known and unknown geological areas, and shifted the leasing program to a competitive bidding system.¹ Under FOOGLRA, the Secretary of the Interior may lease all lands “which are known or believe to contain oil or gas deposits,” with the exception of certain wilderness study lands.² Such authority, however, does not repeal or change other petroleum development bans (e.g., wilderness or parks),³ revoke preexisting withdrawals, or necessarily mandate that the Secretary lease any specific areas.

Except for lands within a special tar sand area,⁴ under FOOGLRA, federal lands offered for federal oil and gas leasing are leased to the highest responsible qualified bidder in a competitive bidding process at oral auction, held quarterly or according to another interval determined by the Secretary of the Interior, in units up to 2,560 acres (or 5,760 acres in Alaska).⁵ A 2014 amendment further authorizes internet-based onshore oil and gas lease sales.⁶ If lands are not leased through the competitive bidding process (e.g., no bids are received, tract of land did not receive an adequate bid), such lands are then available for noncompetitive leasing for a period of two years to the first qualified applicant.⁷

Land offered for a lease sale generally come from three sources: (1) lands identified by informal expressions of interest from the public; (2) lands included in offers for noncompetitive leases; or (3) lands identified by BLM. To be a qualified bidder,

but over time, this responsibility has been transferred to the Minerals Management Service, and now to the BLM. *See* The Story of BLM, BLM Consolidates Its Gains: The 1980s, *available at* https://www.nps.gov/parkhistory/online_books/blm/history/chap5.htm; Establishment of Organizations, 47 Fed. Reg. 4751 (Feb. 2, 1982); Transfer of Responsibility and Authority, 48 Fed. Reg. 8982 (March 2, 1983).

²30 U.S.C. § 226; 30 U.S.C. § 226-3(a).

³43 C.F.R. § 3100.0-3 (2021).

⁴A “tar sand area” means any consolidated or unconsolidated rock (other than coal, oil shale, or gilsonite) that either: (1) contains a hydrocarbonaceous material with a gas-free viscosity, at original reservoir temperature, greater than 10,000 centipoise, or (2) contains a hydrocarbonaceous material and is produced by mining or quarrying, 30 U.S.C. § 209.

⁵30 U.S.C. § 226(b)(1)(A).

⁶Pub. L. No. 113-291, div. B, title XXX, § 3022(a), Dec. 19, 2014, 128 Stat. 3762 (codified at 30 U.S.C. § 226(b)(1)(C)).

⁷30 U.S.C. § 226(c).

BLM regulations require that a party be a citizen of the United States (and cannot be a minor) and that the bidder must comply with: federal acreage limitations; the anti-fraud provisions of FOOGLRA; reclamation requirements; and diligent development of the leases issued to it.⁸

The Secretary is required to accept the highest bid from a responsible qualified bidder, “which is equal to or greater than the national minimum acceptable bid, without evaluation of the value of the lands proposed for lease” and must reject any bids for less.⁹ Lease of special tar sand areas are similarly leased to the highest responsible qualified bidder by competitive bidding, but for units of up to 5,760 acres, and the Secretary is authorized to lease additional lands to support any operations necessary for the recovery of tar sands.¹⁰ Following enactment of FOOGLRA, by statute the national minimum acceptable bid was \$2 per acre for a period of two years from December 22, 1987 and has remained at this rate since it was set.¹¹ Under the same provision, the Secretary may increase this minimum upon a finding that such action is necessary “(i) to enhance financial returns to the United States; and (ii) to promote more efficient management of oil and gas resources on Federal lands.” Such action is exempt from NEPA. FOOGLRA requires the Secretary to notify the Committee on Natural Resources of the United States House of Representatives and the Committee on Energy and Natural Resources of the United States Senate 90 days prior to making any change in the national minimum accepted bid.¹²

As a lease condition, there is a statutory minimum royalty of 12.5% on the production of oil and gas removed or sold from the lease. While the Secretary has authority to increase the royalty, the Secretary has not done so.¹³ Additionally, leases are subject to an annual rental of not less than \$1.50 per acre per year for the first five years of the lease term, and not less than \$2.00 per acre for each year thereafter.¹⁴ Both competitive and noncompetitive leases are issued for a primary term (i.e. or initial term) of 10 years, provided that each lease shall continue so long as oil and gas is produced in paying quantities (i.e. a habendum clause).¹⁵ If the Secretary suspends lease operations, a lease may be extended for the duration of the suspension.¹⁶ Similar to private leases, the federal leases have codified versions of standard oil and gas savings clauses to extend the duration of the lease in certain circumstances, and the Secretary may extend the lease if production continues.¹⁷ Federal leases may also be included in a pooling, unitization,¹⁸ or communitization

¹⁴30 U.S.C. § 226(d). In comparison to private oil and gas lease transactions in which failure to timely pay rentals or other payments can result in automatic termination of the lease, federal oil and gas leases provide lessees a reinstatement route. *See* 30 U.S.C. § 188(c) and (d); 43 U.S.C. § 3108.2-1(b).

¹⁵30 U.S.C. § 226(e); *see* 43 C.F.R. § 3160.0-5 (2021) (defining “production in paying quantities” to mean “production from a lease of oil and/or gas of sufficient value to exceed direct operating costs and the cost of lease rentals or minimum royalties”).

¹⁶30 U.S.C. § 209.

¹⁷30 U.S.C. § 226(e); 30 U.S.C. § 226(i) (if a well capable of producing has been completed or production has ceased, the lessee has 60 days to achieve production, or to commence reworking or drilling operations and if such work is completed, the statute provides that the lease shall not terminate).

¹⁸43 C.F.R. § 3161.2 (2021). Unitization generally provides for exploration and development of an

agreement,¹⁹ subject to approval by the Secretary.²⁰

While FOOGLRA set up a new system for future federal oil and gas leases, it did change the rules applicable to preexisting leases, rights, or law. As a result, any pre-1987 leases are governed under pre-FOOGLRA law as long as the earlier leases continue into their secondary terms from production. However, these provisions will likely become less applicable with the passage of time.

§ 29:9 Mineral Leasing Act of 1920, and Amendments—Regulation of Onshore Oil and Gas Operations

Generally, a federal lease provides the initial authorization to develop oil and gas on federal public lands. However, a lessee also needs to comply with other BLM requirements for exploration or drilling operations. This includes (without limitation) submission of drilling applications, notification requirements (e.g., Sundry Notices), records, reporting, monitoring, measurements and sampling, operator requirements, and permitting either under BLM requirements, or requirements of other agencies. On the flip side, a federal lessee is similarly subject to additional requirements before well abandonment and completion of reclamation.¹ As one example, BLM regulations establish procedures for conducting oil and gas geophysical exploration operations.² Likewise, before drilling operations can occur, an operator must obtain an approved application for a permit to drill (APD). An APD must contain a surface plan of operations, and is subject to NEPA review, although APDs for certain exploratory wells may qualify for an EIS categorical exclusion.³ Requirements related to drilling plans or surface plan of operations required for drilling, and reclamation and bonding requirements, can also depend on the ownership and management of the surface estate, and as a result, become more complicated.

While BLM is the primary mineral management agency over oil and gas leasing, under FOOGLRA there are additional requirements for surface operations, including providing authority to other land management agencies to control surface operations on their lands. Accordingly, where the surface lands over the federal mineral estate are not federally owned or under separate federal management, BLM works with the private surface owner, or other federal agencies to manage the federal mineral estate.⁴ If BLM manages the surface estate, operators are subject to BLM regulations governing surface operations. In comparison—and by way of example—

entire geologic structure or area by a single operator so that drilling and production may proceed in the most efficient and economic manner. BLM, Unitization, Communitization, Spacing, and Drainage, <https://www.blm.gov/programs/energy-and-production/oil-and-gas/operations-and-production/unitization-communitization> (last visited June 16, 2021).

¹⁹Communitization provides for the pooling of federal and/or Indian lands, with other lands, when separate tracts under such federal and Indian lands cannot be independently developed and operated in conformity with an established well-spacing program. *See, e.g.*, BLM, Unitization, Communitization, Spacing and Drainage, <https://www.blm.gov/programs/energy-and-production/oil-and-gas/operations-and-production/unitization-communitization> (last visited June 16, 2021); BLM Handbook, H-3160-9.

⁴*See, e.g.*, *Mountain States Legal Foundation v. Hodel*, 668 F. Supp. 1466, 1470, 18 Env'tl. L. Rep.

surface disturbing activities conducted pursuant to a federal oil and gas lease located on National Forest Service lands are subject to Forest Service regulations and could entail additional restrictions or requirements consistent with the relevant forest plan.⁵

As a brief note, while BLM issued regulations to regulate hydraulic fracturing on federal and Indian land in 2015 under the Obama Administration, the BLM rescinded those regulations in their entirety under the Trump Administration in 2017. The decision was upheld by a district court and a Wyoming District Court enjoined BLM's 2015 regulations before they went into effect.⁶

Similarly, BLM's November 18, 2016 final rule concerning, *inter alia*, the waste of Federal and Indian gas through venting, flaring, and leaks (2016 Waste Prevention Rule) that became effective January 17, 2017 was also mostly vacated as discussed below.⁷ The intent of the 2016 Waste Prevention Rule was to replace BLM's prior regulation, which generally prohibited venting and flaring of gas produced by oil wells, except when the gas is "unavoidably lost" and when the operator has sought and received BLM's approval to vent or flare.⁸ The 2016 Waste Prevention Rule was never fully implemented as a result of administrative and judicial interventions.⁹ In particular, industry groups and certain states filed petitions for judicial review in the U.S. District Court for the District of Wyoming, and the court stayed implementation of the rule pending finalization of BLM's voluntary revisions of the rule.¹⁰ BLM issued a final rule revising the 2016 Waste Prevention Rule on September 28, 2018 (2018 Revision Rule).¹¹ However, a coalition of environmental groups and states then filed a lawsuit challenging the 2018 Waste Prevention Rule and, on July 15, 2020, U.S. District Court for the Northern District of California ordered that the 2018 Revision Rule be vacated.¹² Thereafter, the U.S. District Court for the District of Wyoming lifted the stay challenging the 2016 Waste Prevention Rule, and ultimately found that BLM exceeded its statutory authority and acted arbitrarily in promulgating the 2016 Waste Prevention Rule.¹³ As a result, the district court decision vacated the 2016 Waste Prevention Rule, except revisions to: (1) 43 C.F.R. subpart 3178, pertaining to royalty-free use of production; and (2) the amendment of 43 C.F.R. § 3103.3-1, pertaining to royalty rates on competitive leases, which effectively reinstated the Notice to Lessees and Operators of Onshore

Federal and Indian Oil and Gas Leases (NTL-4A).¹⁴ It remains to be seen whether additional regulations will be promulgated under the Biden Administration under either situation.

As indicated above, given the numerous regulations and complexities associated with onshore oil and gas development operations, this section does not comprehensively cover oil and gas exploration, drilling, development, and production operations. Nevertheless, it is intended to provide a high-level overview and introduction to the field.

§ 29:10 FOGLRA Anti-Fraud Provisions

In addition to setting up a new leasing procedure, FOGLRA additionally enacted anti-fraud provisions to address fraud allegedly occurring under the prior provisions of the MLA.¹ Accordingly, it is now criminal to: (1) “organize or participate in any scheme, arrangement, plan, or agreement to circumvent or defeat the provisions of [the MLA] or its implementing regulations”; or (2) “to seek to obtain or to obtain any money or property by means of false statements of material facts or by failing to state material facts concerning”: (a) the value of any lease or portion thereof issued or to be issued; (b) the availability of any land for leasing; (c) the ability of any person to obtain leases; or (d) violation of any regulation implementing FOGLRA.²

A person that knowingly violates these provisions is subject to up to a \$500,000 fine and five years’ imprisonment, or both.³ The U.S. Attorney General may also institute a civil action “for a temporary restraining order, injunction, civil penalty of not more than \$100,000 for each violation, or other appropriate remedy, including but not limited to, a prohibition from participation in exploration, leasing, or development of any Federal mineral” for any violation under FOGLRA.⁴ In both a criminal and civil action, the provisions broadly apply not only to the corporation or other entity, but also to any officer, employee, or agent of the corporation or entity who knowingly authorized, ordered, or carried out the violation—unless it is shown the officer, employee, or agent, was acting without the knowledge or consent of the corporation or entity.⁵ There are similar provisions for a state to commence a civil action conducting activity within the state that violates this section after notice to the U.S. Attorney General.⁶

§ 29:11 BLM Enforcement Provisions

Separate from the anti-fraud provisions, BLM has further authority to bring enforcement actions and impose penalties against oil and gas lessees for any

noncompliance with BLM's regulations.¹ Under these provisions, major violations carry a potential penalty of \$1,000 per violation, per inspection, whereas minor violations could result in a penalty of \$250 per violation, per inspection.² Similar to other environmental protection statutes, in circumstances where operations could result in immediate, substantial, and adverse impacts on public health, and safety, the environment, production accountability, or royalty income, the agency may shut down operations.³ Noncompliance can also result in BLM actions to remedy the noncompliance at the operator's cost, and in some cases, cancellation and termination of the lease.

§ 29:12 Leasing Under Special Acts—National Petroleum Reserve in Alaska

The Naval Petroleum Reserves Production Act of 1976, as amended (NPRPA),¹ authorizes oil and gas leasing in the National Petroleum Reserve in Alaska (NPR-A). NPR-A encompasses approximately 23 million area acres on Alaska's North Slope, and significantly contributes to BLM's 25 million areas of federally managed mineral estate. As of 2019, NPR-A oil and gas lease revenue amounted to more than \$56 million.² The area was first designated by President Warren G. Harding as an area for emergency oil supply for the U.S. Navy under a 1923 executive order. Management of the reserve was then transferred, under the NPRPA, from the Secretary of the Navy to the Secretary of the Interior and BLM. Under the NPRPA, as amended, BLM is directed to carry out "an expeditious program of competitive leasing of oil and gas in the Reserve."³ Nevertheless, oil and gas leasing in the NPR-A should also be conducted in order to protect the surface values of the River, the Teshekpuk Lake areas, and other areas designated by the Secretary of the Interior as containing any significant subsistence, recreational, fish and wildlife, or historical or scenic value.⁴

Instead of being governed by the MLA and related implementing regulations, regulations for NPR-A oil and gas leasing, exploration and operations are separately set forth under 43 C.F.R. Parts 3130, 3150, and 3160. Generally, the NPRPA establishes a competitive leasing system with a bidding system based on bidding systems in the Outer Continental Shelf Lands Act Amendments of 1978.⁵ In comparison to MLA leases, leases may be up to 60,000 acres, and leases are issued for an initial period not to exceed 10 years, but may be extended for "so long thereafter as oil or gas is produced from the lease in paying quantities, oil or gas is capable of being produced in paying quantities, or drilling or reworking operations, as approved by the Secretary, are conducted on the leased land."⁶ A lease may also

be renewed for another 10-year period if certain terms and conditions are met.⁷ Similar to MLA leases, NPRPA leases may also be included in units, pools, or other joint development agreements, if the Secretary determines the action is in the public interest.⁸

Drilling within the NPR-A has been controversial, to say the least. In more recent times, the Trump Administration took action to expand leasing and development in the NPR-A; on June 26, 2020, BLM released a plan to allow leasing on approximately 18.7 million more acres of land (approximately 82% of the NPR-A).⁹ However, the Biden Administration temporarily suspended all onshore oil and gas leasing, including in the NPR-A for 60 days. It remains to be seen what, if any, further action the Biden Administration will take.¹⁰

Map of NPR-A¹¹

§ 29:13 Right of Way Leasing Act of 1930

A series of decisions rendered at the turn of the 20th century questioned whether or not a federal oil and gas lease could cover lands within a federal right-of-way, particularly rights-of-way previously granted to the railroads.¹ Congress, in re-

Ed. 836 (1942); *Solicitor Opinion*, 67 Pub. Lands Dec. 225 (1960) (clarifying the property interest under certain right-of-way statutes is an easement rather than a limited fee interest).

sponse, passed the Act of May 21, 1930 (the “Right-of-Way Leasing Act”).² Under the Right-of-Way Leasing Act, the Secretary of the Interior is authorized to “lease deposits of oil and gas in or under lands embraced in railroad or other rights of way acquired under any law of the United States, whether the same be a base fee or mere easement; Provided, That, . . . no lease shall be executed hereunder except to the . . . [owner] by whom such right of way was acquired, or to the lawful successor, assignee, or transferee of such [owner].”³ The original regulations mimicked the statutory language until the Department of the Interior amended the provisions in 1983, presumably to align with caselaw, to state:

This authority shall be exercised *only with respect to railroad rights-of-way* and easements issued pursuant either to the Act of March 3, 1875 (43 U.S.C. 934 *et seq.*), or pursuant to earlier railroad right-of-way statutes, and with respect to rights-of-way and easements issued pursuant to the Act of March 3, 1891 (43 U.S.C. 946 *et seq.*). The oil and gas underlying any other right-of-way or easement is included within any oil and gas lease issued pursuant to the Act which covers the lands within the right-of-way, subject to the limitations on use of the surface, if any, set out in the statute under which, or permit by which, the right-of-way or easement was issued, and such oil and gas shall not be leased under the Act of May 21, 1930.⁴

Although the amended regulation may conflict with the statutory provisions authorizing the right to lease “other rights of way acquired under any law of the United States,” this issue has largely been unchallenged in recent years. In any event, the Right-of-Way Leasing Act and its implementing regulations set forth a process for an owner of the right-of-way to apply for an oil and gas lease or assign its rights to apply for the lease to a third party, by submitting an application that details “the facts as to the ownership of the right-of-way, and of the transfer if the application is filed by a transferee; the development of oil or gas in adjacent or nearby lands, the location and depth of the wells, the production and the probability of drainage of the deposits in the right-of-way.”⁵ After BLM review and determination that a lease of the right-of-way is consistent with the public interest, notice is provided to the owner or lessee of the oil and gas in the adjoining lands, and such owner or lessee is provided an opportunity to submit a bid for a lease during the same timeframe as a third party lease applicant.⁶ Leases are awarded to the bidder whose offer is determined to be to the best advantage of the United States, considering the amount of royalty to be received and the better development under the respective means of production and operation. The lease is issued for a term no longer than 20 years.⁷

§ 29:14 Leasing of National Park System Units

Certain units with the National Park System shown on maps identified in 36 C.F.R. § 3109.2 may be leased for oil and gas development subject to BLM’s regulations under 43 C.F.R. Group 3100 and Parts 3160 and 3180.¹ Any lease or permit requires consent of the Regional Director of the National Park Service before issu-

ance or renewal.² Additionally, such consent shall only be granted “upon a determination by the Regional Director that the activity permitted under the lease or permit will not have significant adverse effect upon the resources or administration of the unit pursuant to the authorizing legislation of the unit.”³ The Regional Director can also include conditions “to protect the surface and significant resources of the unit, to preserve their use for public recreation, and to the condition that site specific approval of any activity on the lease will only be given upon concurrence by the Regional Director.”⁴ Despite this authorization, the National Park Service 2006 Management Policies, which are still in effect, provide that all National Park Service units are closed to new federal mineral leasing, with the exceptions of the Glen Canyon, Lake Mead, and Whiskeytown-Shasta-Trinity national recreation areas.⁵

§ 29:15 Mining and Minerals Policy of 1970

As an additional overlay to onshore oil and gas development, Congress passed the Mining and Minerals Policy Act of 1970. This statute declares that it is the continuing policy of the Federal Government, and in the national interest, “to foster and encourage private enterprise in

- (1) the development of economically sound and stable domestic mining, minerals, metal and mineral reclamation industries,
- (2) the orderly and economic development of domestic mineral resources, reserves, and reclamation of metals and minerals to help assure satisfaction of industrial, security and environmental needs,
- (3) mining, mineral, and metallurgical research, including the use and recycling of scrap to promote the wise and efficient use of our natural and reclaimable mineral resources, and
- (4) the study and development of methods for the disposal, control, and reclamation of mineral waste products, and the reclamation of mined land, so as to lessen any adverse impact of mineral extraction and processing upon the physical environment that may result from mining or mineral activities.”¹

The term “minerals” is broadly defined to include all minerals and mineral fuels including oil, gas, coal, oil shale, and uranium.² While the statute does not specify certain procedures outside of the policy goals above, the statute expressly provides that it “shall be the responsibility of the Secretary of the Interior to carry out this policy” when carrying out other related programs.³

Notably, the Mining and Minerals Policy Act was passed in response to the 1970s energy crisis, but this policy continues to add to the tension behind domestic oil and gas exploration, development, and production.

III. FEDERAL OUTER CONTINENTAL SHELF DEVELOPMENT

[Section 29:15]

¹30 U.S.C. § 21a.

²30 U.S.C. § 21a.

³30 U.S.C. § 21a.

Congress enacted the Outer Continental Shelf Lands Act (OCSLA)¹ in 1953 to authorize the Secretary of the Interior to administer the exploration, development, and production of minerals of the outer Continental Shelf (OCS). Over time, the Act has evolved far from its original “carte blanche delegation of authority”² to the Secretary of the Interior into a comprehensive, step-by-step process for issuing minerals leases in the OCS. Despite this overhaul, the basic purpose of OCSLA remains the same, and the statute achieves this purpose in two ways: (1) by establishing the jurisdiction of the United States over the OCS; and (2) by providing the framework by which the federal government opens up the OCS for resource development. This chapter provides a historical background of OCSLA, describes the current implementation of its statutory directives, and highlights some recent developments in caselaw and executive action under OCSLA.

§ 29:17 The History and Evolution of OCSLA

On September 28, 1945, in an effort to advance conservative and prudent offshore resource development, President Harry Truman issued a proclamation declaring that “the natural resources of the subsoil and sea bed [sic] of the continental shelf beneath the high seas but contiguous to the coasts of the United States” were subject to federal jurisdiction and control.¹ Jurisdictional disputes between coastal states and the federal government quickly followed, which culminated in a series of United States Supreme Court decisions holding that the federal government has exclusive jurisdiction over the entire continental shelf because it has “paramount” rights in ocean waters and submerged lands below the low water mark.² In effect, the Supreme Court ruled that coastal states had no title to submerged lands off of their respective coasts.³

In response to the U.S. Supreme Court decisions and to resolve the issue of federal-state control, Congress passed the Submerged Lands Act (SLA)⁴ and OCSLA in 1953.⁵ SLA gave coastal states exclusive jurisdiction over the submerged lands within three nautical miles offshore.⁶ OCSLA affirmed the United States’ exclusive jurisdiction lying seaward of state coastal waters and also established general directives for the Secretary in managing and leasing the OCS.⁷

Initially, OCSLA “provided essentially an open-ended grant of authority to the Secretary of the Interior to proceed with leasing on the outer Continental Shelf.”⁸ This broad discretion was due to an expectation that offshore production, a new and unproven technology, would only act as a small supplement to production from

onshore fields.⁹ Following passage of OCSLA and up until the late 1960s, the OCS leasing process proceeded at a relatively small scale and was subject to little national scrutiny.¹⁰ However, in 1969, a major blowout from an OCS drilling project in the Santa Barbara Channel caused what was the largest oil spill in United States history, prompting concerns about the environmental impacts of OCS operations.¹¹ The decline of domestic energy production and the Arab oil embargo of 1973 also led to the rapid acceleration of OCS development, in an effort to reduce dependence on foreign energy supplies.¹² This shift in national attention, coupled with new issues regarding the role of state and local governments in OCS leasing and management, culminated in growing concern over the direction of the OCS process under OCSLA.¹³

Congress sought to remedy these concerns with the OCSLA Amendments of 1978.¹⁴ These amendments were comprehensive and designed to provide a new statutory regime for OCS resource management, expedite the development of the OCS, and enhance environmental protections.¹⁵ While OCSLA has since been amended, the statute following the 1978 amendments has not been fundamentally changed, and those amendments remain the framework for current OCS leasing and management.

§ 29:18 Federal Jurisdiction under OCSLA, Applicability of Laws of Adjacent States, and Aboriginal Rights in the OCS

OCSLA extends exclusive federal jurisdiction to the subsoil and seabed of the OCS,¹ which is defined to include all submerged lands beyond state coastal waters but within the limits of U.S. jurisdiction (200 nautical miles offshore as established by the Exclusive Economic Zone of the United States).² Further, within the OCS, exclusive federal jurisdiction applies to all: (1) artificial islands; (2) installations and other devices permanently or temporarily attached to the seabed, which may be erected to explore, develop, or produce resources; and (3) installations or devices (other than a ship or vessel) used to transport resources.³

OCSLA also establishes that civil and criminal laws of adjacent states, “to the extent that they are applicable and not inconsistent” with federal law, are declared as surrogate federal law for the OCS.⁴ Determining when state law stands in as surrogate federal law has been contentious and was recently addressed by the United States Supreme Court in *Parker Drilling Management Services, Ltd. v. Newton*.⁵ In *Parker Drilling Management Services, Ltd.*, the plaintiff was an OCS drilling platform employee who had claimed that the defendant, his employer, had violated

California minimum wage and overtime laws.⁶ The parties agreed that OCSLA applied to the drilling platforms but disagreed on whether relevant California law could stand in as surrogate federal law under the statute.⁷ The district court, relying on Fifth Circuit precedent that held state law only stands in to the extent necessary to “fill a significant void or gap” in federal law,⁸ found that California law was inapplicable because the Fair Labor Standards Act of 1938⁹ (FLSA) comprehensively addressed the issue.¹⁰ On appeal, the Ninth Circuit rejected this approach, holding that a gap in federal law was not required to apply state law under OCSLA.¹¹ Acknowledging the resulting circuit split, the Supreme Court granted certiorari.¹²

The Supreme Court held similarly to the Fifth Circuit and found that “state laws can be ‘applicable and not inconsistent’ with federal law . . . only if federal law does not address the relevant issue.”¹³ The Supreme Court found this interpretation supported by the context of OCSLA, which provides for exclusive federal jurisdiction of the OCS rather than overlapping state and federal jurisdiction.¹⁴ The Supreme Court further justified its interpretation by reasoning that allowing adjacent state law to govern the OCS would make much of OCSLA unnecessary,¹⁵ that the interpretation is consistent with the federal-enclave model embodied by OCSLA,¹⁶ and that the interpretation aligns with past Supreme Court precedent.¹⁷

Ultimately, the Supreme Court held that the FLSA, rather than California law, applied and therefore declined to address the question of what would constitute a gap in federal law that would allow state law to stand in as surrogate federal law.¹⁸ Thus while *Parker Drilling Management Services, Ltd.* provides a degree of clarity as to when the laws of states adjacent to the OCS apply, it is anticipated that this jurisdictional issue will continue to be litigated moving forward.

¹⁸*Parker Drilling Mgmt. Servs., Ltd.*, 139 S. Ct. at 1893.

Another issue that has remains unsettled in the courts is whether Alaska Natives retain aboriginal title in the OCS. The concept of aboriginal title, which extends to the right to fish and hunt on aboriginal lands and waters, originates from early United States Supreme Court precedent concerning the relationship between the federal government and Indigenous tribes.¹⁹ In Alaska, two federal statutes have significantly shaped the aboriginal rights of Indigenous tribes. The Alaska Native Claims Settlement Act (ANCSA)²⁰ extinguished aboriginal land claims to federal and state lands and resources and state waters, including any hunting or fishing rights.²¹ In exchange, ANCSA created Native-owned corporations,²² conveyed roughly 45 million acres of select land to the Native corporations;²³ and created the Alaska Native Fund, into which the federal and state government deposited \$962.5 million to be distributed among the Native corporations.²⁴ To ensure that Alaska Native rights to natural resources used for subsistence were protected, Congress later passed the Alaska National Interest Lands Conservation Act (ANILCA).²⁵ ANILCA set aside over 100 million acres of land in Alaska as conservation system units, which included national parks, wildlife refuges, forests, and monuments,²⁶ and addressed the protection of rural Alaska residents' subsistence rights under Title VIII of the Act.²⁷ The scope of these statutes, and how they affect aboriginal rights of Alaska Natives in the OCS, have been subject to extended litigation over the past few decades.

In *Amoco Production Co. v. Village of Gambell (Gambell II)*,²⁸ the Alaska Native villages of Gambell and Stebbins brought suit to enjoin the Department of the Interior from proceeding with an OCS lease sale, claiming that it would adversely affect their aboriginal hunting and fishing rights on the OCS and that the Secretary had failed to comply with Title VIII of ANILCA.²⁹ The United States Supreme Court overturned the Ninth Circuit in finding that Title VIII of ANILCA does not apply to the OCS, as the statute only applies to public lands situated within Alaska.³⁰ Following vacatur and remand of the case, a subsequent appeal of the lawsuit to the Ninth Circuit applied the same statutory analysis to the scope of extinguished aboriginal rights under ANCSA in *People of Village of Gambell v. Hodel (Gambell III)*.³¹ In *Gambell III*, the Ninth Circuit held that ANCSA only extinguished claims within the boundaries of Alaska and not the OCS.³² The Ninth Circuit also acknowledged that aboriginal rights may exist in the OCS concurrently with and

despite the recognized paramount rights of the federal government in the OCS,³³ but left it to the district court on remand to determine whether the Alaska Native villages in fact possessed aboriginal rights in the OCS and whether OCSLA extinguishes subsistence rights in the OCS as a matter of law.³⁴ These issues were ultimately never addressed, however, as the district court granted summary judgment to the federal government because the plaintiffs did not produce enough evidence to support their claim that drilling and other activities would interfere with their exercise of aboriginal rights.³⁵

While the Ninth Circuit later clarified that Alaska Native villages do not retain exclusive rights to use or occupy the OCS based on aboriginal rights given the paramount rights of the federal government,³⁶ there still remains the possibility that non-exclusive aboriginal rights exist in the OCS. Recent efforts to establish these rights have required plaintiff villages to meet a high burden of providing sufficient evidence to demonstrate aboriginal title in federal waters and seabed,³⁷ and it remains to be seen to what extent aboriginal rights coincide with the exclusive federal jurisdiction in the OCS, particularly in the context of OCSLA.

§ 29:19 Regulatory Authority Under OCSLA

Responsibility over the regulatory regime established by OCSLA was originally designated to the former Minerals Management Service (MMS).¹ However, in 2010 the Secretary of the Interior reorganized MMS to improve management, oversight, and accountability of OCS activities.² This resulted in the creation of three separate administrative agencies: the Office of Natural Resources Revenue (ONRR), the Bureau of Safety and Environmental Enforcement (BSEE), and the Bureau of Ocean Energy Management (BOEM).³

§ 29:20 The Office of Natural Resources Revenue

Established within the Office of the Assistant Secretary for Policy, Management

and Budget, ONRR oversees revenue collection and disbursement from oil and gas production on the OCS.¹ Parties associated with OCS leases² are required to submit to ONRR monthly production and royalty reports,³ monthly royalty payments due for that month's production,⁴ and rental payments at a frequency specified by the terms of the OCS lease.⁵ ONRR has broad auditing authority in order to ensure compliance with reporting and payment requirements under OCS leases, as well as other applicable regulations and orders.⁶ Additionally, ONRR can effectuate debt collection by either referring debt to the U.S. Department of the Treasury or recommending revocation of a debtor's ability to engage in OCS leasing;⁷ ONRR may even assess civil penalties for a failure to make royalty payments or for other violations.⁸

ONRR's disbursement of revenue to the states is guided by multiple revenue sharing programs under OCSLA. Coastal states receive 27% of revenues generated from OCS oil and gas leases that are located within the first three nautical miles of the OCS seaward of their territorial limits (colloquially referred to as the "8(g) zone").⁹ Coastal states within 15 nautical miles of the center of an OCS renewable energy project, where the project is located at least partially in the state's "8(g) zone," share in a portion of 27% of generated revenues from that OCS lease.¹⁰ Finally, the four "Gulf producing States"—Alabama, Louisiana, Mississippi, and Texas¹¹—and their local governments are authorized to share 37.5% of qualified revenues from certain OCS leases in the Gulf of Mexico.¹²

§ 29:21 The Bureau of Safety and Environmental Enforcement

BSEE is authorized to regulate the exploration, development, and operations on the OCS,¹ ensuring that these practices are conducted in a manner that promotes human health, safety, and environmental protection.²

BSEE oversees the permitting program for OCS activities, which encompasses the drilling of wells;³ permits for the installation, modification, or repair of platforms;⁴

and pipeline right-of-way grants.⁵ BSEE also requires the creation and implementation of safety and environmental management system (SEMS) programs⁶ and Oil Spill Response Plans (OSRPs).⁷ SEMS programs are a compilation of policies and procedures that address the potential safety and environmental hazards that can arise from operations,⁸ including a demonstration that the program meets industry standards adopted by the American Petroleum Institute.⁹ An OSRP must demonstrate that OCS facility owners and/or operators have sufficient measures and resources in place to mitigate or prevent a release of oil from a facility.¹⁰ These measures and resources include an emergency response action plan, equipment inventory, relevant contractual agreements, training and drills, a dispersant use plan and *in situ* burning plan, and a worst case discharge scenario.¹¹ Facility owners and/or operators must follow an OSRP in the event of an oil spill.¹²

BSEE's oversight of OCS operations extends throughout the life of the well at an OCS facility, including the decommissioning of inactive wells.¹³ With this oversight comes necessary inspection and enforcement authority,¹⁴ and BSEE even has the ability to declare an OCS facility's operation as "unacceptable," which could prompt BOEM to disapprove or revoke a party's designation as operator of an OCS facility.¹⁵

§ 29:22 The Bureau of Ocean Energy Management

BOEM oversees all leasing activities on the OCS and ensures compliance with OCS lease terms and conditions.¹ The leasing program established by OCSLA consists of four primary procedural stages:² (1) preparation and maintenance of a five-year program of proposed lease sales;³ (2) issuance of leases in accordance with the five-year program;⁴ (3) review of lessees' plans for geological and geophysical exploration of the OCS pursuant to an issued lease;⁵ and (4) review of lessees' plans for the development and production of oil or gas from the lease area.⁶

§ 29:23 The Bureau of Ocean Energy Management—Five-Year Oil and Gas Leasing Program

OCSLA requires that the Secretary of the Interior prepare a five-year program.

The program must include a schedule of oil and gas lease sales and indicate the size, timing, and location of proposed leasing activity, as determined by the Secretary, to best meet national energy needs for the five-year period following its approval while also addressing a variety of economic, environmental, and social considerations.¹ BOEM is tasked with oversight of the five-year program.²

In developing the five-year program, BOEM must conduct a lengthy procedural process. BOEM first considers any nominations for areas to be included or excluded from OCS leasing—this includes consulting with the U.S. Department of Energy; requesting governors of affected states to identify laws, goals, and policies to be considered; and publishing a Request for Information (RFI) in the Federal Register.³ The information collected during this process is used by BOEM to create a proposed five-year program that establishes a schedule it will use as a basis for considering where and when leasing might be appropriate over a five-year period.⁴ BOEM then issues a Draft Proposed Program (DPP) to governors of affected states for review and comment 60 days before publishing the Proposed Program (PP).⁵ The PP is then issued with a 90-day public commenting period.⁶ A Proposed Final Program (PFP) is then published and transmitted to Congress and the President.⁷ The PFP becomes the Final Program 60 days after it has been presented to Congress.⁸

The current Final Program for 2017-2022 scheduled 11 potential lease sales in two program areas: 10 sales in the combined Gulf of Mexico (GOM) Program Area, and one sale in the Cook Inlet Program Area in offshore Alaska.⁹ Eight of the 11 potential lease sales have already occurred.¹⁰ The ninth scheduled lease sale, Sale 258, was scheduled to take place in the Cook Inlet Planning Area in 2021.¹¹ On January 13, 2021, BOEM released an Area Identification Decision and draft Environmental Impact Statement (EIS) analyzing the potential environmental impacts of holding the proposed sale. A Notice of Availability of these documents was published in the Federal Register on January 15, 2021, with a public comment period set to run from January 16 to March 1, 2021.¹² But on February 4, 2021, BOEM canceled the public comment period and virtual public hearings after newly inaugurated President Joe Biden issued Executive Order 14008 directing the Secretary of the Interior to pause new oil and gas leases in offshore waters pending

review of federal oil and gas permitting and leasing policies.¹³ The executive order requires the Secretary to reconsider these practices in light of its stewardship responsibilities, “including potential climate and other impacts associated with oil and gas activities.”¹⁴ The Secretary of the Interior is also required to consider whether to adjust royalties associated with OCS resources to account for corresponding climate costs.¹⁵

§ 29:24 The Bureau of Ocean Energy Management—Leasing

With a five-year program established, BOEM can begin OCS leasing. The lease sale process is initiated with a Call for Information and Nomination that is published in the Federal Register, which requests information on areas of interest, including potential multiple uses and other socioeconomic, biological, and environmental information.¹ Considering this input and other relevant information, BOEM develops a recommendation of areas proposed for leasing for the Secretary of the Interior.² Areas approved by the Secretary of the Interior are identified and announced in the Federal Register, and BOEM evaluates these areas for further consideration of potential human and environmental impacts, in some cases developing measures (including lease stipulations) to mitigate these impacts.³

BOEM then develops a proposed notice of sale that, once approved by the Secretary of the Interior, is sent to the governor of any affected state for comments and published in the Federal Register.⁴ After consideration of any comments received in response to the proposed notice of sale,⁵ BOEM will publish final notice of a lease sale in the Federal Register at least 30 days before the date of the sale.⁶

Lease sales are conducted by competitive sealed bidding.⁷ BOEM requires formal qualification in order to bid on or to be approved as an assignee of an OCS lease;⁸ even if an entity meets qualification requirements, BOEM has the discretion to disqualify that entity if they fail to meet due diligence requirements or have an unacceptable operating performance.⁹ Further, BOEM retains the discretion to reject any bid.¹⁰ Once BOEM accepts a bid, the winning bidder is required to execute the lease documents and make all remaining payments (including the first year’s rent) within 11 days of acceptance.¹¹ The lease is effective beginning the month following

the date that BOEM executes the lease.¹²

§ 29:25 The Bureau of Ocean Energy Management—Plans Required for Exploration, Production, and Development

Once an OCS lease is issued, the operator may not begin exploration, development, or production until submission and approval of an Exploration Plan (EP) and a Development and Production Plan (DPP) or Development Operations Coordination Document (DOCD).¹ Generally, all of these plans must demonstrate that the proposed activities conform with OCSLA, are safe, do not reasonably interfere with other OCS uses, and adequately protect human health and the environment.²

An EP must include a description and schedule of the proposed exploration activity from start to completion that includes the locations of proposed wells as well as descriptions of drilling units and any other equipment to be used.³ Further, BOEM regulations require a significant amount of information to accompany any submitted EP.⁴ General information that needs to accompany the EP includes a listing of approvals and permits that must be obtained for exploration activities; information on drilling fluids, chemical products, and “new and unusual technology”⁵ that will be used during exploration activities; bonds, oil spill financial responsibility, and well control statements; a discussion on suspension of operations; a blowout scenario; and relevant contact information.⁶ While the general information alone seems comprehensive, this category pales in comparison to the more specific required information related to environmental protection, human health and safety, resources, and planning listed at length in BOEM regulations.⁷ Once an EP is properly submitted, BOEM, while coordinating with affected states, will review the EP to determine compliance with OCSLA, BOEM regulations, and other applicable law.⁸ BOEM has 30 days to approve, disapprove, or require modification of the EP.⁹

The requirements for what must be included in a DPP or DOCD,¹⁰ as well the information to accompany either plan,¹¹ are substantially similar to EP requirements. Once a DPP or DOCD has been properly submitted, however, BOEM consults with affected states and local governments, and issues a copy for public review and comment when determining whether the plans comply with all applicable requirements.¹² As with an EP, BOEM has 30 days to approve, disapprove, or require modification

of a DPP or DOCD.¹³

Failure to conduct OCS lease activities according to an approved EP, DPP, or DOCD can result in a BOEM enforcement action, which may include civil penalties.¹⁴ BOEM also has the authority to forfeit or cancel an OCS lease for failure to follow an approved plan.¹⁵

IV. PRESIDENTIAL WITHDRAWAL AUTHORITY UNDER OCSLA AND LEAGUE OF CONSERVATION VOTERS

§ 29:26 Generally

OCSLA provides that the President “may, from time to time, withdraw from disposition any of the unleased lands of the outer Continental Shelf.”¹ This broad authority allows the President to withdraw any area of the OCS, either temporarily or permanently, for any public purpose. Since passage of OCSLA in 1953, six presidents have used this executive authority.² In 2015, President Barack Obama withdrew coastal areas in the Arctic’s Beaufort and Chukchi Seas, citing the importance of these areas to Alaska Natives’ subsistence as well as wildlife protection.³ In 2016, President Obama withdrew more areas from the U.S. Arctic Ocean and areas of the Atlantic Ocean, citing similar reasons concerning conservation and environmental protection.⁴ The combined withdrawals from 2015 and 2016 totaled 128 million acres.⁵

In 2017, in an unprecedented move, President Donald Trump purported to revoke these withdrawals with the issuance of Executive Order 13795,⁶ which prompted a lawsuit in the United States District Court for the District of Alaska.⁷ In *League of Conservation Voters v. Trump*, the plaintiffs, various environmental groups, alleged that the President’s revocation violated the Property Clause of the U.S. Constitution⁸ and the withdrawal authority under OCSLA.⁹

The U.S. District Court for the District of Alaska resolved the issue by means of statutory interpretation.¹⁰ First, the court found that OCSLA’s text was ambiguous

and could be interpreted to permit the President to revoke prior withdrawals.¹¹ However, considering the context of OCSLA, the court found that interpreting the language concerning withdrawal authority as “entirely protective” gives best effect to all of the statute’s provisions.¹² The court also acknowledged the general principle that, “had Congress intended to grant the President revocation authority, it could have done so explicitly.”¹³ For these and other reasons, the court held that OCSLA did not grant a president the authority to revoke prior withdrawals of unleased land and that President Trump’s executive order was unlawful because it exceeded the executive authority under the statute.¹⁴

The court’s decision has since been appealed to the Ninth Circuit.¹⁵ However, on January 20, 2021, President Biden issued Executive Order 13990, which, among other executive actions, reinstated President Obama’s withdrawals and revoked President’s Trump’s Executive Order 13795.¹⁶ Thus it is unclear whether the Ninth Circuit will fully address the limits of the President’s withdrawal authority under OCSLA, as it appears for the time being that the current administration has returned to the traditional exercise of executive power under the statute.

V. DEVELOPMENT ON TRIBAL LANDS

§ 29:27 Introduction

Indian lands in the United States are commonly comprised of a combination of fee,¹ tribal,² and allotted lands.³ This fragmented ownership creates unique issues not normally encountered outside of an Indian reservation.⁴ This situation is particularly relevant for oil and gas development because Indian lands are estimated to contain 3-4% of the known oil and gas reserves in the United States.⁵

Any oil and gas company contemplating development on Indian lands must be aware of a few basic principles of Indian law: (1) the federal government has jurisdiction over Indian trust lands;⁶ (2) Congress has plenary power over Indian affairs and lands, subject only to constitutional limitations;⁷ and (3) no interest in trust lands, whether beneficially owned by a tribe or by an individual allottee, may be

[Section 29:27]

¹“Fee lands,” as used in this paper, mean privately-owned lands.

²“Tribal lands,” as used in this paper, mean lands owned by the United States in trust for an Indian tribe, or owned by the tribe itself, subject to Federal restrictions on alienation or encumbrance.

³“Allotted lands” as used in this paper, mean lands owned by the United States in trust for individual Indian owners, or owned by individual Indian owners themselves, subject to Federal restraints on alienation or encumbrance.

⁴See COLBY L. BRANCH AND ALAN C. BRYAN, *Indian Lands Right-of-Way*, Energy and Mineral Development in Indian County (Rocky Mt. Min. L. Fdn. 2014) (Hereinafter “Branch”).

⁵See Felix S. Cohen’s Handbook of Federal Indian Law, § 7.03[1] (Nell Jessup Newton ed., 2017) (Hereinafter “COHEN”).

⁶The term “trust lands” is used in this paper to collectively refer to tribal and allotted lands.

⁷*Delaware Tribal Business Committee v. Weeks*, 430 U.S. 73, 84, 97 S. Ct. 911, 51 L. Ed. 2d 173 (1977).

transferred or conveyed absent congressional approval.⁸

This discussion is intended to provide useful background information for anyone interested in oil and gas development on Indian lands. An exhaustive review of statutory or regulatory procedure is not attempted. Issues specific to particular reservations or to particular applications are not discussed.

A. APPLICABLE LAW

1. Federal Jurisdiction

§ 29:28 Background on Federal Indian Policy

During the early 19th century, the rapid growth of the United States created a demand for territorial expansion into the American West. Through conquest, treaties, and purchases, the United States acquired numerous Indian homelands. As settlement encroached on Indian lands, the Federal Government entered into treaties with Indian tribes which recognized the tribes' aboriginal right to occupy certain lands in exchange for cession of other lands.¹ National policy then shifted from removal of Indians to concentration on fixed reservations.² Therefore, certain lands were "reserved" from the public domain for the sole use and benefit of individual tribes.³ Legal title to the reserved tribal lands remained in the United States, but beneficial title vested with the tribe, to be held in common for the benefit of all living members of the tribe.⁴ This arrangement laid the foundation for the Federal Trust Doctrine.

§ 29:29 Federal Trust Obligation

As a general matter, the federal government has plenary power over Indian trust lands. The most basic cornerstone of Indian law is the federal government's long-established trust responsibility over Indian lands. The United States Supreme Court has long recognized "the distinctive obligation of trust incumbent upon the United States Government" with regards to matters affecting Indian tribes.¹ As the trustee of federal Indian lands, the government is held to the "most exacting fiduciary standards" in protecting the interests of Indian beneficial owners.² This trust obligation extends to all government officials, whether they are merely local federal employees or national decision-makers directing federal policy.³

As the legal title holder to tribal and individually allotted trust lands, the federal

³*Seminole Nation*, 316 U.S. at 297; *Coast Indian Cmty.*, 550 F.2d at 653.

government's trust obligations are vast.⁴ Federal statutes and regulations give the government full responsibility to manage trust resources and land for the benefit of Indian owners.⁵ This responsibility includes the management of mineral resources. In fact, based on its statutory delegations, the federal government has developed a regulatory scheme that addresses all aspects of oil and gas development on trust lands.⁶ The Secretary of the Interior (Secretary), through the Bureau of Indian Affairs (BIA), is obligated to maximize consideration and protect Indian payments under such leases.⁷ In accordance with this regulatory scheme, there exist areas of exclusive federal jurisdiction where the Secretary or its federal agencies hold sole authority to address certain issues.⁸ Whether the federal government holds exclusive authority or shares concurrent authority with state or tribal governments will depend on the nature of the dispute and the potential occupation of the issue by the federal agency. To the extent a company commences any development involving tribal or individually allotted trust lands, the federal government, mainly through the BIA, will have a significant role in reviewing and approving these transactions.

a. Trust Lands and Allotments

§ 29:30 General Allotment Act

Throughout the nineteenth century, Congress entered into various treaties and agreements, whereby tribal land was allotted to individual Indians in fee, subject to restrictions on alienation.¹ In 1887, Congress passed the General Allotment Act, also known as the "Dawes Act," to break apart tribal lands into separate tracts, which would then be allotted to individual tribal members or allottees.² Any lands remaining after each eligible tribal member received his or her allotment were considered "surplus lands," which were then "disposed of" to the public at large under the existing homestead laws.³ As originally contemplated under the General Allotment Act, title to each allotment was to be held in trust by the United States for the individual Indian owner for a period of 25 years.⁴ The purpose of this provision was to allow the Indian owner time to become "competent" to manage his or her affairs.⁵ After such time, a patent was to issue to the Indian owner in fee simple, thereby terminating the United States' ownership and control over the land.

§ 29:31 Burke Act

In 1906, Congress enacted the Burke Act, which amended the General Allotment Act to eliminate all trust restrictions on allotments and authorized the Secretary to issue a fee patent to an allottee before expiration of the 25-year trust period established by the General Allotment Act, upon a conclusion that the allottee was

²General Allotment Act, 24 Stat. 388 (1887).

³COHEN, § 1.04.

⁴General Allotment Act, ch. 119, § 5, 24 Stat. 388.

⁵General Allotment Act, ch. 119, § 5, 24 Stat. 388.

“competent and capable of managing his or her affairs.”¹ The Burke Act led to the increased alienation of Indian lands.² Notably, the Act did not require an allottee’s approval prior to the issuance of a fee patent and the Secretary of the Interior granted fee patents both to willing allottees and to a large numbers of Indians that did not seek fee title to the land.³

§ 29:32 Indian Reorganization Act

As a result of the United States’ allotment policy, many Indians received a fee patent, and some sold their land to non-Indians. Significant “surplus lands” within the Reservation were also sold to non-Indians.¹ The policy of allotment effectively transformed large portions of tribal lands into a checkerboard of allotted and fee lands. By 1934, nearly 27 million acres of the land allotted to tribal members had transferred from Indian ownership into non-Indian fee ownership.² In response to this and other matters, Congress passed the Indian Reorganization Act of 1934.³ This Act halted the practice of allotment, restored undisposed-of “surplus lands” to tribal trust ownership, and indefinitely extended the trust period over allotted lands.⁴ Consequently, most allotments that had not been transferred to fee ownership by 1934 remain held by the United States in trust today, with the beneficial ownership held by the heirs and successors of the original allottees.⁵

§ 29:33 Statutory Authority

The Constitution vests in Congress broad authority to regulate commerce with the Indian tribes.¹ Pursuant to this authority, Congress may authorize the non-Indian leasing of trust lands for oil and gas development. In 1891, Congress passed the first general leasing act which authorized the leasing of Indian lands for grazing and mining purposes.² The Act of 1891 was amended several times. Unfortunately, each amendment added another layer of confusion to the existing leasing process.³

§ 29:34 Indian Mineral Leasing Act

In 1938, Congress enacted the Indian Mineral Leasing Act (IMLA) in order to cre-

⁵See COHEN, § 16.03[2][b].

[Section 29:33]

¹U.S. CONST., art. I, § 2, cl. 3.

²See 25 U.S.C. § 397.

³COHEN, § 17.03[2][a]. The existing leasing structure had no uniformity concerning tribal consent, state taxation, or lease duration. 25 U.S.C. § 397.

ate a uniform process for leasing tribal minerals.¹ The stated purposes of the IMLA included: (1) to achieve uniformity in mineral leasing laws governing Indian lands; (2) to help achieve the goal of the Indian Reorganization Act to revitalize Indian tribal governments; and (3) to promote tribal economic development by ensuring the greatest return on tribal minerals.² Tribal leases could only be granted upon the consent of the Tribe and the approval of the Secretary.³ The duration of IMLA leases were “not to exceed 10 years and so long thereafter as minerals are produced in paying quantities.”⁴ The IMLA also included a public notice and competitive bidding process for leases, but the Secretary retained the authority to reject bids and re-advertise the lease when a bid was not in the best interest of the Tribe.⁵ The standard for “best interest” of a tribe is found in BIA’s regulations implementing the IMLA:

In considering whether it is “in the best interest of the Indian mineral owner” to take a certain action (such as approval of a lease, permit, unitization or communitization agreement), the Secretary shall consider any relevant factor, including, but not limited to: economic considerations, such as date of lease expiration; probable financial effect on the Indian mineral owner; leasability of land concerned; need for change in the terms of the existing lease; marketability; and potential environmental, social, and cultural effects.⁶

While the IMLA clarified the oil and gas leasing process, it was not ideal for all situations. Namely, the IMLA did not apply to leases of allotted lands.⁷ Also, from the Indian mineral owners’ perspective, leases provided no mechanism that would enable tribes to share in the profits generated from the minerals.⁸ For example, bonuses, rents, and royalties were claimed to be lower than warranted by market conditions.⁹ In addition, Indian tribes had limited authority to participate in development and management decisions, to bargain for lease terms,¹⁰ or to provide environmental and cultural protections.¹¹ As a result of these issues, several tribes began to negotiate oil and gas leases on their own outside the scope of IMLA. Although the Secretary approved several of these non-IMLA leases, in 1980 it determined that it had no such authority, raising doubts on the legality of the existing negotiated leases.¹²

§ 29:35 Allotted Lands Leasing Act

In 1909, Congress enacted the Allotted Lands Leasing Act (Act of 1909) in order

[Section 29:34]

¹Act of May 11, 1938, 52. Stat. 347 (codified at 25 U.S.C. §§ 396a to 396g).

⁸COHEN, § 17.03[2][a].

⁹COHEN, § 17.03[2][a].

¹⁰If the bid received in the public notice and competitive bidding process was not in the best interest of the tribe, the Secretary could enter into negotiations on behalf of the tribe. 25 U.S.C. § 396b.

¹¹COHEN, § 17.03[2][a].

¹²COHEN, § 17.03[2][a].

to authorize the general leasing of allotted lands for mining purposes.¹ The Act specifically authorized the Secretary to make all such rules and regulations as may be necessary to carry out the purposes of the Act.² BIA Regulations implementing the Allotted Lands Leasing Act in 25 C.F.R. part 212 generally incorporate by reference the corresponding IMLA tribal lands regulations in 25 C.F.R. part 211. Pursuant to the Act of 1909, the Secretary may issue a lease, based on the best interest of the allottees, upon the consent of a majority of the allottees owning an interest in the tract.³

§ 29:36 Indian Mineral Development Act

In 1982, Congress passed the Indian Mineral Development Act (IMDA) in an effort to further the United States' new policy of Indian self-determination.¹ The IMDA authorized Indian mineral owners to negotiate and enter into mineral development agreements. The term "Minerals Agreement" is flexible and includes:

Any joint venture, operating, production sharing, service, managerial, lease . . . contract, or other minerals agreement; or any amendment, supplement or other modification of such minerals agreement, providing for the exploration for, or extraction, processing, or other development of minerals in which an Indian mineral owner owns a beneficial or restricted interest, or providing for the sale or other disposition of the production or products of such minerals.²

A Minerals Agreement is still subject to approval by the Secretary.³ Therefore, while the IMDA does not require any particular form of Minerals Agreement, the Secretary's approval of a Minerals Agreement will be affected by the agreement's terms and whether the agreement is "in the best interest of the Indian tribe."⁴ In approving or disapproving a Mineral Agreement, the Secretary must consider "the potential economic return to the tribe; the potential environmental, social, and cultural effects on the tribe; and provisions for resolving disputes that may arise between the parties to the agreement."⁵ After the Secretary approves a Minerals Agreement under the provisions of the IMDA, the United States is shielded from liability for losses sustained by a tribe under a Minerals Agreement, but will still protect the tribe or individual Indian against a violation by the mineral development company.⁶

§ 29:37 Indian Tribal Energy Development and Self-Determination Act

Consistent with the policy of tribal self-determination, Congress enacted the Indian Tribal Energy Development and Self-Determination Act of 2005 (Act of 2005) which authorized tribes to develop their own economic and environmental review

[Section 29:35]

¹Act of March 3, 1909, 35 Stat. 783 (codified at 25 U.S.C. § 396).

²Act of March 3, 1909, 35 Stat. 783 (codified at 25 U.S.C. § 396).

³25 C.F.R. § 212.20 (2021); 25 U.S.C. § 2218(b).

[Section 29:36]

¹Act of December 22, 1982, Pub. L. No. 97-382, 96 Stat. 1938 (codified at 25 U.S.C. §§ 2101 to 2108). The IMDA was intended "first, to further the policy of self-determination and second, to maximize the financial return tribes can expect for their valuable mineral resources." *Quantum Exploration, Inc. v. Clark*, 780 F.2d 1457, 1458 (9th Cir. 1986).

²25 C.F.R. § 225.3 (2021).

³25 U.S.C. § 2102(a).

⁴25 U.S.C. § 2103(b).

⁵25 U.S.C. § 2103(b).

⁶25 U.S.C. § 2103(e).

capabilities and secure secretarial approval to review and approve certain agreements, eliminating the need for BIA approval.¹ Specifically, the Act of 2005 authorizes tribes and the Secretary to enter into Tribal Energy Resource Agreements (TERAs) pursuant to which a tribal agency may alone review, approve, and regulate energy resource development.² The TERA process allows the Secretary to pre-approve certain mineral development agreements. Under Section 3504, an approved TERA may allow the tribe to enter into a lease or business agreement for the “exploration for, extraction of, processing of, or other development of energy mineral resources of the Indian tribe located on tribal land.”³ The Act of 2005 also authorizes the pooling, unitization, or communitization of tribal minerals located on trust land.⁴

A TERA may also authorize a tribe to grant rights-of-way over trust land if the right-of-way serves any of the following:

- (A) an electric production, generation, transmission, or distribution facility (including a facility that produces electricity from renewable energy resources) located on tribal land;
- (B) a facility located on tribal land that extracts, produces, processes, or refines energy resources; or
- (C) the purposes, or facilitates in carrying out the purposes, of any lease or agreement entered into for energy resource development on tribal land.⁵

The regulations implementing the Act of 2005 contain a detailed process for approving a TERA.⁶ The Act of 2005 appears to be underutilized. Although several tribes initiated the TERA process, no tribe has yet entered into a TERA.⁷ This may be due to the complexity of the Act of 2005 regulations, as well as the anticipated cost and time involved in creating and administering such an agreement.

b. Agency roles in Oil and Gas Development on Indian Lands

§ 29:38 Bureau of Indian Affairs

Congress delegated substantial authority to the Secretary for the implementation of the laws which apply to the development of oil and gas on trust lands.¹ The Sec-

[Section 29:37]

¹42 U.S.C. §§ 7144e & 16001 (Title V of the Energy Policy Act of 2005, Pub. L. No. 109-58, 119 Stat. 594).

²25 U.S.C. § 3504.

³25 U.S.C. § 3504(a)(1)(A).

⁴25 U.S.C. § 3504(a)(1)(C).

⁵25 U.S.C. § 3504(b)(1). The Act of 2005 originally did not authorize rights-of-way for roads or other non-pipeline, non-transmission access or other facilities often required for energy development. The Act of 2005 was amended by Act of Dec. 18, 2018, P.L. 115-325, Title I, §§ 103(a), 105(d), 132 Stat. 4447, 4456 to include subsection C. Subsection C is on its face broad enough to include rights-of-way for roads or other facilities.

⁶See 25 C.F.R. pt. 224 (2021).

⁷TANA FITZPATRICK, *Tribal Energy Resource Agreements (TERAs): Approval Process and Selected Issues for Congress*, Congressional Research Service (July 9, 2020).

[Section 29:38]

¹In 25 U.S.C. § 2, Congress specifically provided that “[t]he Commissioner of Indian Affairs shall, under the direction of the Secretary of the Interior, and agreeably with such regulations as the President may prescribe, have the management of all Indian Affairs and all matters arising out of Indian relations.” See also 25 U.S.C. § 13 (“[T]he Bureau of Indian Affairs, under the supervision of the Secretary of the Interior, shall direct, supervise, and expend such moneys as Congress may from time to time appropriate, for the benefit, care, and assistance of the Indians throughout the United States.”).

retary of the Interior has further delegated this authority to the BIA.² Consequently, the BIA has the authority to promulgate regulations necessary to implement its statutory obligations and duties related to the management of Indian trust lands.³ Most relevant for oil and gas operations, BIA's responsibilities include the negotiation, approval, and cancellation of oil and gas leases;⁴ the management of leasing of oil and gas resources;⁵ the environmental review of proposed operations;⁶ and the acquisition of land in trust status for the benefit of individual Indians and Indian tribes.⁷

§ 29:39 Bureau of Land Management

The Bureau of Land Management (BLM)'s regulations govern oil and gas operations on "restricted Indian land leases," as well as leases under the jurisdiction of the Secretary.¹ BLM's responsibilities on Indian lands include "resource evaluation, approval of drilling permits, mining and reclamation, production plans, mineral appraisals, inspection and enforcement, and production verification."² BLM's oil and gas regulations apply to leases that are approved under the IMLA and the IMDA, as well as leases of allotted lands.³ BLM has general authority over Applications for Permits to Drill (APDs) for wells drilled on Indian Lands, but will consult with BIA as part of the APD process.⁴ BLM also has responsibility of split estate lands when federal minerals are beneath tribal surface.⁵

§ 29:40 Office of Natural Resources Revenue

In 1982, Congress enacted the Federal Oil and Gas Royalty Management Act (FOGRMA) to improve royalty collection, management, and enforcement.¹ The Office of Natural Resources Revenue (ONRR) is the federal agency responsible for the collection and disbursement of royalties paid on production from leases on Indian lands.² ONRR's responsibilities include the collection of certain rents, royalties, and other payments; the receipt of sales and production reports; determining royalty liability; maintaining accounting records; auditing royalty payments and obligations; and for any and all other functions relating to royalty management on Indian oil

2. Other Federal Delegations

§ 29:41 Environmental Compliance

Most major federal environmental laws are relevant to oil and gas operations in Indian country.¹ For example, oil and gas development on Indian lands will generally be subject to the National Environmental Policy Act's (NEPA)² requirement that an environmental impact statement be prepared for all "major Federal actions significantly affecting the quality of the human environment."³ Secretarial approval of tribal and allotted leases constitutes a major federal action; therefore, the Secretary must comply with NEPA in the approval process.⁴ The Secretary must also determine whether an IMDA agreement does not have an adverse environmental impact before granting approval.⁵ In addition, the Surface Mining Control and Reclamation Act of 1977 (SMCRA) governs the environmental aspects of surface exploration, drilling, and reclamation on Indian lands.⁶

Federal environmental laws operate under the principle of cooperative federalism, whereby the federal government establishes minimum standards and encourages state or local governments to implement and administer these federal minimums.⁷ As a general rule, the United States Environmental Protection Agency (EPA) has primary environmental regulatory authority over operations within Indian reservations.⁸ For purposes of enforcing applicable federal environmental laws, Indian reservations are considered "single administrative units."⁹ State governments generally do not have environmental regulatory authority on Indian reservations absent a specific delegation from the EPA. With regard to Indian reservation lands (including non-Indian fee lands), a local tribe may receive delegations of environmental regulatory authority from the EPA, similar to those received by state governments outside the reservation, but only if that tribe meets certain conditions.¹⁰ Specifically, the tribe must apply for Treatment as a State (TAS) status and be approved by the EPA in order to administer federal environmental standards.¹¹ Once a tribe has obtained TAS status for one environmental statute, it is much easier for the tribe to apply and have the status granted for another statute.

Even when a tribe has not obtained TAS status, the EPA and other federal agencies are required to consult with the tribes with respect to historic preservation

¹¹See, e.g., 33 U.S.C. § 1377(e) (Clean Water Act); 42 U.S.C. § 7601 (Clean Air Act); 42 U.S.C. § 300j-11(a) (Safe Drinking Water Act).

prior to the issuance of any oil and gas lease as discussed below.¹² From an environmental standpoint, any activity causing significant surface disturbance, in need of a federal permit, is likely to also trigger these consultation requirements.

§ 29:42 Historic Preservation

Congress has determined that it is in the public's best interest to preserve the historical heritage of this country. In furtherance of this policy, Congress enacted the National Historic Preservation Act (NHPA)¹ which affirmatively requires all federal agencies approving any federal undertaking and prior to the issuance of any license to "take into account the effect of the undertaking on the district, site, building, structure, or object that is included in or eligible for inclusion in a national register (i.e. historic resources) and shall provide the advisory counsel on historic preservation a reasonable opportunity to comment with regard to the undertaking."² Tribes typically each have their own Tribal Historic Preservation Officer (THPO) whose mission is to integrate cultural resource compliance into a comprehensive planning process.³ The THPO coordinates and consults with other state-specific historical agencies, and may assume the functions of the State Historic Preservation Officer (SHPO) with respect to trust land, if certain qualifications are met.⁴ The tribes' THPO agency will require strict compliance with the Native American Graves Protection and Act (NAGPRA),⁵ NHPA, and NEPA, and will likely require operators to pay for a cultural resource inventory along any ground disturbance routes.

Under NHPA, the federal government is required to consult with federally recognized Indian tribes whenever an undertaking has the potential to cause adverse effects to culturally or religiously significant properties.⁶ Because the consultation requirements are government-to-government, oil and gas developers do not consult with the tribe directly. Consultations with the THPO and conducting an archeological resource survey will likely be required prior to commencing operations under any lease or right-of-way on tribal or individually allotted trust lands.⁷ Therefore, an oil and gas company should communicate with federal agencies directly to determine whether consultation has occurred or whether site visits/consultation should be set up with the THPO and SHPO. A company should keep thorough records of any attempt to consult with a tribe.

B. TRIBAL JURISDICTION

§ 29:43 *Montana* line of cases determining jurisdiction

"Tribal jurisdiction" refers to the ability of a tribal government to exercise authority over a person or entity; generally speaking, this includes the power of a tribe to tax, regulate, or subject a person or entity to adjudication in its courts. Questions of tribal jurisdiction can be very complicated and have been the subject of many papers,

⁷*See* 36 C.F.R. § 800.16 (2021). An undertaking, as defined as "a project, activity, or program funded in whole or in part under the direct or indirect jurisdiction of a Federal agency, including those carried out by or on behalf of a Federal agency; those carried out with Federal financial assistance; and those requiring a Federal permit, license or approval." 36 C.F.R. § 800.16 (2021).

presentations, and publications.¹ Tribal jurisdiction is determined by federal case law. While the United States Supreme Court has plainly stated that there is no tribal criminal jurisdiction over non-Indians,² determinations of civil jurisdiction require a complex analysis of multiple factors, including land status and contractual relationships with tribal members. The scope of any tribe's jurisdiction is limited by federal law.³

With respect to a tribe's civil and regulatory jurisdiction, the general rule established by the United States Supreme Court is that Indian tribes lack jurisdiction over non-Indians who come within their borders.⁴ There are two exceptions to this general rule. First, "a tribe may regulate, through taxation, licensing, or other means, the activities of nonmembers who enter consensual relationships with the tribe or its members, through commercial dealings, contracts, leases, or other arrangements."⁵ Second, "a tribe may . . . exercise civil authority over the conduct of non-Indians on fee lands within its reservation when that conduct threatens or has some direct effect on the political integrity, the economic security, or the health or welfare of the tribe."⁶ Federal courts apply the first exception only where a sufficient nexus exists between the relationship and the conduct over which the tribe seeks to exercise jurisdiction. The second exception is limited to those circumstances directly impacting the tribe's ability to govern itself, or directly affecting the health and welfare of the tribe.

The question of whether a tribe may exercise civil jurisdiction over a non-Indian is a question of fact in each case. There are very few certainties in this analysis. One must start with the presumption that the tribe has no civil jurisdiction, and thereafter examine the specific facts of each case to determine whether tribal jurisdiction is warranted. The most common method by which non-Indians subject themselves to tribal jurisdiction is by entering into a consensual relationship (a contract) with a tribe or its members.⁷

Another key factor in determining the extent of tribal jurisdiction is land ownership. Federal courts are more likely to find tribal jurisdiction if the events at issue occurred on tribal or allotted trust lands. In many cases, this is due to the reasoning that the tribe's power to exclude a person from trust lands necessarily includes the lesser power to regulate a non-Indian's activities while on those lands. In general, a tribe's ability to regulate or tax non-Indian activities is most limited when the activities at issue are restricted to non-Indian owned fee lands.⁸ On the other hand, non-Indian companies are most likely to be subject to tribal jurisdiction

[Section 29:43]

when they conduct activities on tribal trust or individually allotted trust lands.⁹

Although land status is not purely dispositive, it often makes the difference in a federal court's determination between tribal jurisdiction and state or federal jurisdiction. Because of the General Allotment Act of 1887,¹⁰ there are many acres of fee lands located within the boundaries of Indian reservations.¹¹ "[U.S. Supreme Court] cases have made it clear that once tribal land is converted into fee simple, the tribe loses plenary jurisdiction over it."¹² For example, based on the General Allotment Act, courts have stated that county and local governments may impose ad valorem taxes on fee lands within a reservation.¹³

Given this background, tribal attempts to regulate and tax operations limited to non-Indian fee lands or fee interests may be subject to challenge. The inclusion of tribal or individually allotted trust lands in oil and gas operations, however, would likely result in tribal jurisdiction over at least part of the oil and gas development. Whether the tribes' resulting power to regulate would extend to the entire development due to the partial inclusion of tribal or allotted trust tracts is an open question.

§ 29:44 *Montana* line of cases determining jurisdiction—Employment Requirements

In contemplating development on Indian lands, it is important to keep in mind that the tribes have enacted, and will enforce, many tribal laws relevant to operations within their boundaries. Oil and gas development on a reservation would likely be subject to a tribe's Tribal Employment Rights Office (TERO) requirements.¹ TERO primarily deals with tribal hiring preferences and fees. It may also address matters of business licensing and require nonmember companies to register with the agency prior to commencing operations on the reservation. TERO agencies often require initial license filings and compliance plans, and may impose fees on an operator's construction activities, in addition to preferential treatment for hiring of tribal contractors and tribal employees. Federal courts have upheld the establishment of tribal employment preferences based on the operator's consensual relationship with the tribe.² Questions have been raised, however, regarding the extent to which TERO regulations apply to non-Indian activities on non-Indian fee lands.³ The *Montana* analysis, discussed above, is applicable to any such analysis. The applicability of TERO laws as well as other tribal agency requirements can be negoti-

ated with a tribe as part of the lease acquisition process.

§ 29:45 *Montana* line of cases determining jurisdiction—Taxation

Assessing whether tribes or states have a right to tax oil and gas operations on Indian land is a complex issue and answers may vary based on land status, tribal status, or the extent to which the operator has subjected itself to tribal contracts. In general, tribes may tax severance of minerals under tribal leases.¹ A state may also tax severance of minerals under tribal leases when the state is providing services in the area.² This results in a “dual taxation” situation, where an operator is being taxed twice for the same activity.³ Dual taxation can be fairly common when operating on trust lands and most courts will uphold the state’s severance tax so long as the economic burden falls on the nonmember developer instead of the tribe.⁴ Due to potential dual taxation liability, a prudent operator should consider alternatives to minimize overall tax burdens, including tax credits or other incentives for energy and mineral development on trust lands.⁵

When operating on fee lands within a reservation, tribal taxes can likely be avoided. Tribes commonly rely on the *Montana* exceptions to assert broad claims of authority across their reservation. Nevertheless, as demonstrated in *Big Horn Electric v. Adams*, federal courts are reluctant to allow tribes to tax non-Indian fee lands or rights of way, even when tribes assert that these exceptions are present.⁶ The federal courts’ reluctance to allow tribal taxation on non-Indian fee lands would likely extend to oil and gas operations.⁷

C. STATE AND LOCAL AUTHORITY

§ 29:46 Generally

In general, a state may not regulate property or conduct of tribes or Indian mineral owners within a reservation.¹ State conservation boards can generally regulate the development of minerals on fee lands within Indian reservations. These regulatory agencies have little, if any, authority over trust lands, and may not enforce state spacing or pooling orders as to included trust lands.² The exercise of state authority may also be barred to the extent that it imposes an undue burden on

tribal government, or, in the Supreme Court's words, "unlawfully infringes on the right of reservation Indians to make their own laws and be ruled by them."³ Absent explicit congressional authorization, a state or local regulation is categorically preempted by federal law if the legal incidence of the regulation falls upon an Indian tribe or an individual Indian with respect to income arising, property located, or a transaction occurring within Indian country.⁴ Where the legal incidence of a state or local regulation falls on non-Indian persons or entities, however, federal law does not categorically preempt the regulation. Instead, courts apply a flexible analysis that makes "a particularized inquiry must be made into the nature of the state, federal and tribal interests at stake, an inquiry designed to determine whether, in the specific context, the exercise of state authority would violate federal law."⁵

D. LEASING, EXPLORATION, DEVELOPMENT, PRODUCTION

1. Leasing

§ 29:47 Standard Form Leases

The leasing process for tribal and allotted minerals is found in 25 C.F.R. Parts 211 and 212.¹ An oil and gas company seeking to lease tribal minerals should request that BIA offer an identified tract for leasing. Tribal leases for oil and gas must first be offered for sale at a public auction.² After consultation with the tribe, the Secretary will advertise the lease for sale at an appropriate rental rate and royalty.³ The advertisement for public auction must provide that the "Secretary reserves the right to reject any and all bids."⁴ If no satisfactory bid is received at the auction, then the company may enter into private negotiation with the Secretary.⁵ Allotted leases for oil and gas can also be offered for sale at a public auction, or an individual allottee can request that the Secretary negotiate the lease on behalf of the allottee(s).⁶ However, the lessee must receive consent from the majority of the allottees in each tract.⁷ Once a company is awarded the lease, it has the option to post one bond for each lease, a \$75,000 bond for all oil and gas leases in each state, or a \$150,000 bond for full nationwide coverage of oil and gas leases.⁸ While a practitioner should conduct careful review of the form lease and applicable regulations, there are several lease regulations that a potential lessee of trust minerals should be aware of:

²25 U.S.C. § 396b; 25 C.F.R. § 211.20(a) (2021).

³25 C.F.R. § 211.20(b) (2021).

⁴25 C.F.R. § 211.20(b)(2). The secretary will reject the highest bid if it is not "in the best interest of the tribe." 25 C.F.R. § 211.20(b)(6) (2021).

⁵25 U.S.C. § 396b.

⁶25 C.F.R. § 212.20(b) (2021). If the allotted lease is offered for public sale, the auction process is identical to that of the tribal lease. 25 C.F.R. § 212.20(b) (2021).

⁷25 U.S.C. § 2218(b).

⁸25 C.F.R. § 211.24 (2021); 25 C.F.R. § 212.24 (2021).

- (1) BIA has set the minimum royalty rate at 16 $\frac{2}{3}\%$ and requires the lessee to pay an annual rental of at least \$2.00 per acre.⁹
- (2) A lease may not exceed 640 acres.¹⁰
- (3) The standard lease term is for 10 years and so long thereafter as the oil and gas are produced in paying quantities.¹¹ A standard form lease does not contain a savings clause.¹² To halt production from the lease, a lessee should obtain a suspension of operations from BIA.¹³
- (4) The lease will be segregated into separate leases when a portion of the lease is committed to a communitization agreement.¹⁴
- (5) To assign the lease, the lessee must obtain BIA consent. An allotted lease may also contain consent-to-assign language.¹⁵

§ 29:48 Standard Form Leases—IMDA Minerals Agreements

The IMDA authorized tribes to enter into Minerals Agreements providing for “the exploration for, or extraction, processing, of, oil, gas . . . or other energy or nonenergy mineral resources . . . in which such Indian tribe owns a beneficial or restricted interest.”¹ The regulations governing Minerals Agreements are found at 25 C.F.R. Part 225.² There is no form agreement or required terms, but a Minerals Agreement shall address 21 specified provisions, including, but not limited to: (1) duration of the agreement; (2) indemnity of the Indian Mineral Owner; (3) valuation, reporting, and accounting procedures; (4) bonding and insurance; (5) reclamation; and (6) dispute resolution.³ The Indian mineral owner may seek assistance from the Secretary in negotiating the Minerals Agreement, but assistance is not required.⁴ Allottees can also become parties to a tribal IMDA agreement.⁵ After the parties submit an agreement to the Secretary, the Secretary must generally approve or disapprove the agreement within 180 days of submission or 60 days after compliance with federal environmental laws.⁶ The tribe may withdraw its consent at any time prior to final approval from the Secretary.

2. Exploration, Development and Production

§ 29:49 Surface Use and Access Issues

Any company planning oil and gas operations within an Indian reservation must ensure access to and from the leasehold. This can be accomplished through several means, including statutory rights-of-way, public roads and highways, BIA roads, IMDA Agreements, and, in some circumstances, condemnation.

¹⁵25 C.F.R. § 211.53 (2021); 25 C.F.R. § 212.53 (2021).

[Section 29:48]

¹25 U.S.C. § 2102(a).

²25 C.F.R. §§ 225.20 to 225.40 (2021).

³See 25 C.F.R. § 225.21(b) (2021) for the full list of necessary provisions.

⁴25 C.F.R. § 225.21(a) (2021).

⁵25 U.S.C. § 2102(b); 25 C.F.R. § 225.20(b) (2021).

⁶25 C.F.R. § 225.22(a) (2021).

The process for obtaining a statutory right of way can be found in 25 C.F.R. part 169.¹ A right-of-way applicant must obtain both tribal consent and the consent of individual landowners.² However, rights-of-way may be granted without landowner consent in the following circumstances: (1) the land is owned by more than one person, and the owners of a majority interest consent; (2) one or more owners are unlocatable but a majority of the owners that are locatable consent; (3) the heirs or devisees of the Landowner have not been determined; or (4) the owners are so numerous that it would be impracticable to obtain their consent.³ The right-of-way application must also include a bond, insurance, or other form a security to cover annual rentals, damages, remediation costs, and other fees.⁴

The compensation paid for a right-of-way must be “not less than Fair Market value.”⁵ The BIA defers to the tribes in determining the fair market value of trust land.⁶ Rights-of-way for oil and gas operations are granted for an initial term of 20 years and can be renewed up to a maximum term of 50 years.⁷ If an operator goes beyond the scope of the right-of-way, it may be liable for trespass.⁸

An operator can also utilize state highways, local roads, and BIA roads to access the leasehold. State highways and local roads properly opened and established in Indian reservations may be used by the general public in the same manner as any other public road.⁹ While BIA roads are owned and maintained by the BIA, they are also open for general public use.¹⁰ However, public use of BIA roads may be restricted for certain public safety reasons.¹¹

Another way to obtain access is through an IMDA Minerals Agreement. If an operator enters a Minerals Agreement with the tribe, the operator can negotiate surface access and use to the particular leasehold, including across adjacent land.¹² A Minerals Agreement can also apply to allotted lands and minerals if all landowners consent to the agreement.¹³ However, if none of the other measures are available, an operator could seek condemnation of a right-of-way. Congressional authorization is necessary to exercise eminent domain over tribal trust lands.¹⁴ This process involves Congress demonstrating an intent to abrogate applicable treaty rights and

[Section 29:49]

¹The regulations were “modernized” in 2016 through a Final Rule entitled Rights-of-Way on Indian Land, 81 Fed. Reg. 14976 (March 21, 2016).

²25 U.S.C. § 324; 25 C.F.R. § 169.107 (2021). In addition, a grantee must obtain landowner consent it can assign a right-of-way. 25 C.F.R. § 169.207 (2021).

³25 U.S.C. § 324; 25 C.F.R. § 169.107 (2021). In addition, a grantee must obtain landowner consent it can assign a right-of-way. 25 C.F.R. § 169.207 (2021).

authorize suits against the United States.¹⁵ Condemnation of allotted lands has been specifically authorized “for any public purpose.”¹⁶ Allotted lands are to be condemned under the laws of the state in which the land is located, but the action must be filed in federal district court because state and tribal courts do not have jurisdiction over such actions.¹⁷

§ 29:50 Surface Use and Access Issues—Royalty Reporting and Valuation

FOGROMA requires ONRR to develop “enforcement practices that ensure the prompt and proper collection and disbursement of oil and gas revenues to Indian lessors.”¹ In 1988, ONRR promulgated the current Indian oil and gas valuation regulations.²

§ 29:51 Surface Use and Access Issues—Reporting

Each month, for oil and gas production on Indian lands, an operator must submit an Oil and Gas Operations Report (the “OGOR Report”), Form 4054, and the Report of Sales and Royalty Remittance, Form ONRR-2014 (the “Form ONRR-2014”).¹ It is the responsibility of the operator to ensure that all of the information in the reports is accurate and, if an error is discovered in a previous report, to file an amended report within 30 days of discovery.² Failure to submit accurate reports or update inaccurate reports could result in ONRR assessing up to \$1,288 per day in civil penalties.³

§ 29:52 Surface Use and Access Issues—Valuation

The Indian oil valuation regulations are codified at 30 C.F.R. Part 1206—Subpart B.¹ The key factor in determining the value of the oil is whether it is sold under an arm’s length transaction. Most Indian leases contain a “major portion provision” that provides that the lessee must determine the value of oil based on the highest price paid or offered at the time of production “for the major portion of oil produced

[Section 29:52]

¹30 C.F.R. §§ 1206.50 to 1206.65 (2021). These regulations apply to all gas produced from tribal and allotted oil and gas leases, except for leases located on the Osage Indian Reservation. See 25 C.F.R. pt. 226 (2021)—Leasing of Osage Reservation Lands for Oil and Gas Mining.

from the same designated area for the same type of crude.”² When oil is sold pursuant to an arm’s length transaction, the value for royalty purposes is the higher of the gross proceeds or the Index-Based Major Portion (IBMP) value determined under 30 C.F.R. § 1206.54.³ When oil is not sold under an arm’s length transaction, the value is the greater of the proceeds received or paid in sales and purchases of like-quality oil produced in the same field or area or the IBMP price.⁴ The regulations provide allowances for transportation costs incurred under arm’s-length contracts.⁵

The Indian gas valuation regulations are codified at 30 C.F.R. Part 1206—Subpart E.⁶ When gas is produced from a lease located in an index zone, the operator must pay royalty based on the Index price assigned to the specific area.⁷ If an index-based method cannot be used, the royalty value is determined using the gross proceeds less any applicable allowances.⁸ For processed gas, ONRR employs a “Dual Accounting” of tribal leases whereby royalty is to be paid on the greater of the value of the gas or the value of the products derived from gas.⁹ In general, if gas from an Indian lease is processed, even when the gas is processed after it is sold, the lessee is required to calculate both the unprocessed and processed value of the gas, and to pay royalties based on the greater of the two values.¹⁰ For unprocessed gas, ONRR may use the major portion price for gas in the same designated area to determine the value of the gas.¹¹ The lessee must bear all costs which are necessary to place the gas into a “marketable condition.”¹² After the gas reaches a “marketable condition,” a lessee may take allowances for transportation costs incurred under arm’s-length contracts.¹³

E. CONCLUSION

§ 29:53 Generally

This section has provided an overview of oil and gas development on tribal lands. The area is extremely complicated and a prudent developer must exercise the utmost caution in operating on any particular Indian reservation. Indian nations are independent sovereigns. Each reservation has its own history, codes, and conventions. The field of law governing legal relations on Indian reservations is never static, and rarely settled. Therefore, when contemplating oil and gas development on tribal lands, a developer must examine the law under each particular set of circumstances and should never assume rights not clearly granted by law or enforceable contract.

VI. STATE AND LOCAL GOVERNMENT REGULATION OF OIL AND GAS

A. STATE REGULATION—IN GENERAL

§ 29:54 Early Era of Regulation

Although comprehensive federal environmental laws and land management laws govern certain aspects of oil and gas development, for the most part, state regulation controls the time, place, intensity, and manner of development on private lands. State conservation laws regulate oil and gas development activities to assure responsible production of oil and gas and to prevent the waste and environmental degradation that resulted from the unconstrained application of the *rule of capture*, and which characterized the oil and gas industry's early years. Today, expansive state regulatory frameworks control numerous aspects of oil and gas development which continue to evolve in response to new technologies, production techniques, and evolving public policies.

The rule of capture provides that “[t]he owner of a tract of land acquires title to the oil and gas which he produces from wells drilled thereon, though it may be proved that part of such oil or gas migrated from adjoining lands.”¹ In its most absolute form, the rule allowed an owner to take any lawful means, whether or not motivated by malice, to increase its share from the common source of supply without fear of injunction or liability for conversion.² Although, in the most extreme cases of purposeless production, other mineral owners in the common pool successfully sued for common law waste,³ for the most part the rule of capture left mineral owners in the same reservoir with only one remedy: to drill.⁴ Thus, the rule of capture incentivizes a mineral owner of a tract of land, however small, to drill anywhere on the tract and in the maximum density in order to capture as much of the common resource as possible.⁵ Relatively unconstrained by common law rules and unregulated, scholars at the time characterized the early era of oil and gas development as a period of “profligate drilling and tremendous physical waste.”⁶

An early Supreme Court precedent established the constitutionality of state laws regulating production. In 1893, the Indiana General Assembly enacted a statute that made it unlawful to “allow or permit the flow of gas or oil . . . into the open air” for more than two days after “gas or oil shall have been struck in such well.”⁷ Following allegations that it had violated the statute, Ohio Oil Co. argued that enforcement of the statute unconstitutionally deprived Ohio Oil Co. of its right to produce oil, thus amounting to a denial of its Fourteenth Amendment due process.⁸ On appeal, the Supreme Court of the United States upheld the Indiana statute,

holding that “a lessee’s or landowner’s right to capture oil or gas from the property is restricted by the duty to exercise that right without waste or negligence.”⁹ Consistent with this holding, a number of states enacted early conservation legislation to prevent spillage or venting into the atmosphere and to require the proper plugging of abandoned wells.¹⁰

By 1920, it was quickly becoming apparent to lawmakers that a piecemeal approach would be insufficient to prevent concerns such as depletion and the exhaustion of oil and gas resources, thus prompting the need for a more coordinated approach to these issues facing the industry.¹¹ President Calvin Coolidge’s created the cabinet-level Federal Oil Conservation Board (FOCB) in 1924, to study problems in the oil industry.¹² Following months of deliberations, the FOCB concluded that overproduction was preventing the conservation of the nation’s wasting oil reserves by promoting inefficient uses and by dissipating reservoir pressure.¹³ Around the same time, legal, professional, and industry associations advocated for the use of federal unitization laws to promote the conservation of these oil reserves.¹⁴ Although initially unreceptive, in 1929 the FOCB and other notable organizations endorsed federal unitization.¹⁵ This prompted Governor William H. Murray of Oklahoma to call on other oil-producing states in 1931 to form the Oil States Advisory Committee (OSAC) in order to keep regulation of the petroleum industry at the state level.¹⁶ In 1932, the OSAC formulated a bill that called for the formation of an interstate oil compact.¹⁷ However, compact plans, as well as the OSAC itself, were halted by the passage of the National Industrial Recovery Act of 1933 (NIRA).¹⁸ NIRA imposed “hot oil” laws which prohibited the production of oil in violation of a state’s prorationing rules and implemented state-by-state quotas on monthly oil production.¹⁹ In 1935, however, the Supreme Court of the United States invalidated NIRA as “an unconstitutional delegation of legislative power,” reopening a pathway for a compact and for state regulation.²⁰ Despite this, by the conclusion of the 1930s, only Arkansas, California, Louisiana, Oklahoma, and Texas had enacted legislation to create oil and gas conservation agencies or delegate authority to existing agencies to

regulate the industry and oil and gas production and exploration activities.²¹

§ 29:55 Interstate Oil and Gas Compact Commission

In 1935, Congress approved the creation of the Interstate Compact to Conserve Oil and Gas (IOC) for the purpose of “conserv[ing] oil and gas by the prevention of physical waste. . . from any cause.”¹ The compact required signatory states to enact or continue enforcing conservation laws addressing wasteful practices and to enact stringent penalties for the waste of oil or gas, including denied access to commerce for violators.² In addition to coordinating state legislative efforts, the IOC also created a transboundary governing body comprised of one representative from each member state.³ This group, originally designated as the Interstate Oil Compact Commission and now termed the Interstate Oil and Gas Compact Commission (IOGCC), ascertains and reports on “methods, practices, circumstances and conditions . . . for bringing about conservation and prevention of physical waste of oil and gas.”⁴ The compact vests the IOGCC with rulemaking powers and empowers it to make recommendations to the states regarding coordination of the states’ respective police powers “to promote the maximum ultimate recovery from the petroleum reserves.”⁵ Since its creation, the IOGCC has drafted a number of model statutes,⁶ including one in 1949 which first authorized creation of drilling units and require cost sharing.⁷ This precipitated a wave of state legislative action to enact oil and gas conservation laws and marked the beginning of the modern conservation period.⁸ Although initially only ratified by six states,⁹ the compact now includes 31 member states encompassing nearly all domestic oil and gas production.¹⁰

Today, every oil and gas producing state has some form of conservation law.¹ These closely mirror the model act proposed by the IOC and are consistent with the public purposes first established in *Ohio Oil*: the prevention of waste and the protection of correlative rights.² Despite some variation on specific conservation regulations over the years, “the basic pattern is essentially the same.”³ These statutes create or designate an agency for administration of state conservation programs and establish the powers and duties of the agency to prevent waste, including underground waste, surface waste, economic waste, and the waste that results from production exceeding the current demand or the capacities of transportation or marketing facilities.⁴

Over time, the tactics employed by conservation agencies to prevent waste and protect correlative rights have undergone substantial change.⁵ Early state conservation efforts focused on surface waste limitations, such as those addressing spillage,⁶ flaring,⁷ and manufacture of carbon black,⁸ and economic waste restrictions, such as prorationing,⁹ common purchase orders requiring ratable take, and, at times, minimum wellhead pricing.¹⁰ Subsequent regulations, including those for setbacks, spacing, and pooling, focused more directly on underground waste.¹¹ Recently, a number of state legislatures have authorized their respective agencies to consider public safety, health, welfare, and environmental concerns in exercising their delegated authority.¹²

§ 29:57 Interstate Oil and Gas Compact Commission—Conservation Agencies

Thirty-eight states currently have some form of agency responsible for regulating

⁶See REVISED MODEL STATE ADMIN. PROCEDURE ACT (NAT'L CONFERENCE OF COMM'RS ON UNIF. STATE LAWS 2010). Pursuant to its own terms, the APA does not apply to state administrative agencies. Thus, a

deferential standard of review commonly provides that a reviewing court may set aside an agency decision only upon a finding that: the decision is arbitrary, capricious, or not in accordance with law; the agency has exceeded the scope of its statutory authority; the agency decision violates the state or federal constitution or denies a person of constitutional rights; or the agency decision was made upon unlawful procedure.⁷

§ 29:58 Interstate Oil and Gas Compact Commission—Spacing & Density

Prior to enactment of spacing and density regulations, wasteful and dangerous practices related to overdrilling proliferated throughout the oil and gas industry.¹ These practices depleted reservoir energy through over-production and contributed to safety concerns regarding the increased danger of fire or blowout due to the close spacing of wells.² In response, state legislatures enacted legislation regulating spacing between wells, setbacks from property lines, and authorizing conservation agencies to establish drilling density within fields.

One such rule, Rule 37 in Texas, demonstrates the function of spacing requirements and the balance between limiting over drilling while still protecting the property rights of mineral owners. As early as 1919, the Texas state legislature enacted waste prevention legislation, prompting the Railroad Commission of Texas (RRC) to promulgate the first statewide spacing regulation, Rule 37.³ At the time of its passage, Rule 37 implemented a prohibition against drilling oil or gas wells closer than 300 feet apart and fewer than 150 feet from property lines.⁴ These distances have been increased a number of times throughout the course of Rule 37's more than one hundred year history,⁵ and the current version of this rule provides for a setback of 1200 feet between wells and 467 feet from any property line.⁶ Since its amendment in 1933,⁷ the rule has authorized the RRC to grant exceptions "where necessary either to prevent waste or to prevent the confiscation of property."⁸ The Supreme Court of Texas has noted that the dominant purpose of this exception is to protect property rights by "guarantee[ing] the opportunity in each owner to recover his oil by providing an exception to a uniform spacing regulation that would otherwise prevent him from doing so."⁹

Today, 38 states have some form of state-wide spacing regulations in place to

state agency's obligation to respond to a petition for rulemaking is governed by each state's respective administrative procedure act. 5 U.S.C. § 701(b)(1).

conserve oil or gas and protect the correlative rights of adjacent landowners through the establishment of optimal well patterns.¹⁰ Nevertheless, there is considerable variation among the optimal spacing patterns adopted by states.¹¹ Setbacks, those which specify the minimum distance that an oil or gas well may be drilled from a property boundary, are the most common of these requirements. Of the 38 states applying some type of spacing requirements, Idaho is the only state that does not specify a minimum distance from which a well can be drilled along property lines.¹² Oregon applies its property boundary setback requirements only to gas wells.¹³ Comparatively, the number of states applying spacing rules to regulate the minimum distance between wells is considerably lower.¹⁴ Only 23 of these states apply well spacing regulations to oil wells; in addition, Pennsylvania and Oregon apply their requirements only to gas wells.¹⁵ The application and specified distance of setbacks in many states vary between oil and gas wells,¹⁶ based on the depth,¹⁷ and in rarer circumstances may establish separate setbacks from exploration (wildcat) wells¹⁸ in untested formations or those associated with enhanced recovery operations.¹⁹

In addition to these setback requirements, most state conservation statutes impose density regulations that set standards for establishing drilling and spacing units.²⁰ In most states, units are limited to “the maximum area that may be economically and efficiently drained by one well.”²¹ These too vary between states.²² Some states merely require that the parcel encompass more than one acre of land before certain wells may produce,²³ whereas others require as much as 640 acres.²⁴ Most states require somewhere in between.²⁵ Density requirements may also vary based

¹⁰See Sylvester & Malsheimer, *supra* note 235, at 55–57 (providing a table that illustrates the requirements imposed by well spacing rules on a state-by-state basis); see also 055-3 WYO. CODE R. § 3 (LexisNexis 2020).

on the depth of the well,²⁶ the substance produced from said well,²⁷ or for enhanced recovery projects.²⁸

In response to the proliferation of hydraulic fracturing and horizontal drilling, many state conservation agencies have increased both the size of spacing unit and density within the spacing units. Depending on the language of the conservation statutes, increases in density or the size of drilling units may require additional legislative approval. For instance, Louisiana's statutes formerly defined a drilling unit as "the maximum area which may be efficiently and economically drained by one well."²⁹ In *Gatti v. State Department of Conservation*, the Louisiana Court of Appeals found that the drilling statute did not authorize the State Department of Conservation's practice of approving multi-well drilling units for both conventional and unconventional development.³⁰ Although the opinion was later reversed on jurisdictional grounds,³¹ the Louisiana Legislature then amended the statute to redefine a drilling unit as "the maximum area which may be efficiently drained by the well or wells designated to serve the drilling unit."³² Other states have similarly adapted through approval of larger units to accommodate longer laterals,³³ development of specific rules—such as Colorado's special rules of the greater Wattenburg area³⁴—and comprehensive drilling plans,³⁵ creation of overlying horizontal and vertical spacing units for in-fill development,³⁶ approval of stacked laterals,³⁷ and Texas' allocation well policy.³⁸

State oil and gas conservation agencies have also enacted setbacks from occupied structures. Unlike well spacing rules designed to protect correlative rights, conservation agencies enact setback restrictions for the purpose of protecting the health, safety, and welfare of landowners and communities by establishing minimum distances between development and areas of human habitation such as homes and schools.³⁹ Like spacing rules, these vary significantly between states—with a minority of states like Montana having no setbacks, others establishing shorter setbacks of 500 feet,⁴⁰ and among the longest, in Colorado, creating setbacks of 2,000 feet.⁴¹

Conservation agencies may also grant variances in order to accommodate new

development techniques and to prevent waste and protect correlative rights where development within standard drilling, setback, or density rules would be impracticable. All conservation statutes provide a process by which the applicable conservation agency, after notice and hearing, may grant exceptions to distance and density regulations on an individual or field-wide basis.⁴² Although requirements vary, at a minimum most state conservation statutes require a showing that an exception is necessary to prevent waste or protect correlative rights.⁴³ In some states, the conservation agency is specifically authorized to grant an exception for purposes of environmental protection.⁴⁴ Among other considerations, state agencies may be authorized to consider, *inter alia*, the increase in burden or hazard involved with a properly spaced well,⁴⁵ the ability of that well to produce in paying quantities,⁴⁶ written consent from affected landowners,⁴⁷ or other “good cause” that may warrant an exception.⁴⁸

§ 29:59 Interstate Oil and Gas Compact Commission—Pooling & Unitization

“Pooling” and “unitization” are perhaps the most significant tool conservation

agencies use to protect correlative rights.¹ “Pooling” refers to “the bringing together of two or more small or irregularly shaped tracts of land to form a drill site in connection with a program of uniform well spacing,” while “unitization” typically involves “a consolidation of a sufficient majority of the royalty and working interests in a geological pool that permits the reservoir engineers to plan operation of the pool as a natural energy mechanism.”² Once combined, pooling or unitization permits operation of the pool or unit without regards to individual property boundaries and fractional interests, and establishes a method for allocation of production and costs associated with development.

Without pooling, density and spacing requirements would render many parcels undevelopable. Individual tracts may alone be smaller than the state’s minimum acreage requirement for a spacing unit, but pooling allows an operator to combine interests within two or more tracts, or portions thereof, within a spacing unit to meet this requirement.³ Owners within a pool equitably share expenses and production.⁴ As a result, pooling prevents the drilling of unnecessary wells and protects the correlative rights of the owners of small tracks or portions thereof which would otherwise be undevelopable alone without a variance.⁵ Spacing and pooling requirements are so linked that many conservation agencies will not issue a permit to drill unless interests within the spacing unit have been pooled.

A conservation agency may order pooling as part of either “voluntary pooling” or “compulsory pooling” processes.⁶ In voluntary pooling, the owner of a mineral interest or its lessee, relying on authority within the oil and gas lease, voluntarily reaches agreement to pool the interest with the owners of other interests or tracts. If the parties do not reach a voluntary agreement to pool, the conservation agency may be able to force pool. Under compulsory pooling statutes, a state’s conservation agency may,⁷ or in some states must,⁸ issue a pooling order at the request of an interested party for the purpose of preventing waste or protecting correlative rights. Notable outliers include Texas, which does not have compulsory pooling,⁹ Pennsylvania, which allows compulsory pooling without a commission order,¹⁰ and

Mississippi, which applies “judicial” or “equitable pooling.”¹¹ Under Mississippi’s “judicial pooling” regime, the land within a unit is pooled as a matter of law when a well is drilled within an existing spacing unit.¹²

Unitization involves field-wide, or partially field-wide, cooperation to promote efficient development of the underlying common reservoir.¹³ Unitization has been characterized as “the ultimate conservation tool,” because of its propensity to encourage the use of enhanced recovery methods and thereby increase the ultimate recovery that may be had from a particular reservoir.¹⁴ Though more common on federal lands, a minority of states also authorize exploratory unitization to encourage orderly development in “one or more pools.”¹⁵ The 2004 Model Oil and Gas Conservation Act, developed by the IOGCC, includes provisions for exploratory unitization; however, it has not been adopted by all states.¹⁶

Like pooling, unitization may also occur on either a voluntary or compulsory basis.¹⁷ In the context of voluntary unitization, working-interest and nonworking-interest owners must reach a unit operating agreement.¹⁸ These agreements establish governance mechanisms and allocation formulas to equitably distribute production and costs within the unit.¹⁹ Frequently, however, it is not possible to obtain unanimous consent to the unit operating agreement.²⁰ In these instances, many state statutes authorize the conservation agency to compel unitization, provided that a threshold percentage of interest owners—usually around 80%, consent.²¹ When a field is compulsorily unitized, the state’s conservation agency makes allocational and operational determinations after considering the correlative rights of owners within the unit.²²

Courts have routinely upheld pooling and unitization statutes against constitutional challenges.²³ In one of the first cases, *Marrs v. City of Oxford*, the Eighth Circuit upheld local location, density, and pooling requirements as a constitutional exercise of police power concerning public safety and necessary to protect correlative

rights.²⁴ Shortly thereafter, in *Patterson v. Stanolind Oil & Gas Co.*, the Supreme Court upheld a similar compulsory pooling law promulgated by Oklahoma's Corporation Commission.²⁵ Rejecting challenges based on the Due Process and Equal Protection Clauses of the Fourteenth Amendment, as well as under the Constitution's Contracts Clause, the Court upheld the Corporation Commission's use of statewide compulsory unitization statutes to effect proper drainage, achieve the greatest ultimate recovery of oil, conserve reservoir energy, and protect correlative rights.²⁶ In 1952, the Supreme Court rejected similar challenges to Oklahoma's 1941 statute authorizing the Corporation Commission to approve unitization plans.²⁷ Relying on its past decisions and the lack of a federal question, the court rejected arguments that the pooling statute was an unreasonable exercise of police power, an unreasonable delegation of legislative and judicial power, and the statute was too vague to provide guidance to the Commission's decisions.²⁸ A federal court in Colorado recently rejected a constitutional challenge to Colorado's forced pooling law on the basis that it violated owners due process rights, thus strengthening precedent on force pooling.²⁹

§ 29:60 Interstate Oil and Gas Compact Commission—Economic Waste Restrictions

State conservation regulations may also limit economic waste.¹ Some of the earliest conservation efforts were aimed at preventing the unnecessary, inefficient, reckless, or uneconomic waste of oil and gas resources.² Indiana's 1893 law limiting venting of oil and gas was the first of these economic waste restrictions implemented by a state legislature, paving the way for future economic waste restrictions on useless or low value uses of production.³ These included use of oil in inefficient manufacturing processes, for example the production of carbon black or lampblack, among others.⁴ Today, some states' conservation statutes continue to prohibit excessive venting and flaring as the waste of gas.⁵ In addition to preventing physical waste without a corresponding economic benefit, venting and flaring restrictions can also be environmentally beneficial by limiting the emissions of greenhouse gases (GHGs) and volatile organic compounds (VOCs) associated with oil and gas

Corporation Com'n of State of Oklahoma*, 1924 OK 217, 101 Okla. 164, 224 P. 156 (1924) (holding that the State of Oklahoma may prohibit the use of natural gas for the manufacture of carbon black under Okla. Stat. Ann. tit. 52, § 237 when deemed a "wasteful utilization" of the resource).

⁵See, e.g., 225 Ill. Comp. Stat. Ann. 732/1-75(d)(4) (West 2020); N.D. Cent. Code Ann. § 38-08-06.4 (West 2019); see also Cal. Pub. Res. Code § 3300 (West 2020) ("[T]he blowing, release, or escape of gas into the air shall be prima facie evidence of unreasonable waste").

operations.⁶

Some conservation agencies are also authorized to use “proration units” to set “production allowables” to curtail economic waste by limiting production in excess of market demand and curtailing production rates.⁷ In 1913, Oklahoma introduced the first laws limiting production to no more than “25% of the daily natural flow” and requiring wellhead metering of production for monitoring purposes.⁸ Over the years, states have taken a variety of approaches to implement similar policies within their jurisdictions. Examples include laws designed to limit production to reasonable market demand, which require the state conservation agency to: (1) determine maximum allowable production at a statewide level; (2) determine each field’s share of that production; and (3) establish an allocational formula that distributes this field allowable amongst the various owners.⁹ Although some states do not explicitly recognize market-demand prorationing, at least once a court has found that the agency had implied authority and upheld prorationing in the name of waste prevention.¹⁰ In contrast, however, many state legislatures have explicitly prohibited the use of market-demand prorationing.¹¹

The Supreme Court has upheld state and proration statutes against constitutional challenges. In *Champlin Refining Co. v. Corp. Comm’n of State of Oklahoma*, the plaintiff argued that Oklahoma’s proration statute constituted a violation of the Due Process and Equal Protection Clauses of the Fourteenth Amendment and it “operates to burden interstate commerce” in violation of the Commerce Clause.¹² Rejecting both arguments, the court found that the right to take oil is “subject to the reasonable exertion of the power of the state to prevent unnecessary loss, destruction, or waste.”¹³ The Court further held that prorationing laws “apply only to production and not to sales or transportation of crude oil or its products” and therefore do not affect interstate commerce, even if the products are actually shipped in such commerce.¹⁴

§ 29:61 Regulating to Prevent Environmental Damage

In recent years, some states and courts have begun to shift oil and gas conservation law towards assuring environmental and wildlife protection, providing conser-

vation agencies with greater authority to consider environmental.¹ Colorado is the most explicit in this mandate. Colorado's 1994 amendments added numerous usages of the words "environment" and "environmental" to the state's Oil and Gas Conservation Act,² and limited to the Colorado Oil and Gas Conservation Commission's use of the Oil and Gas Environmental Response Fund to conditions causing "a significant adverse environmental impact on any air, water, soil, or biological resource."³ The state's Oil and Gas Conservation Act was amended once again in 2007 to further require the commission to consider the impact of oil and gas operations on wildlife resources and to allow production within the state insofar as it is "consistent with the protection of public health, safety, and welfare, including protection of the environment and wildlife resources."⁴ This Act was most recently amended in 2019, when language was added to require the promulgation of emissions control regulation by the Colorado Air Quality Control Commission "to minimize emissions of methane and other hydrocarbons, volatile organic compounds, and oxides of nitrogen from oil and gas exploration and production"⁵ Moreover, the 2019 legislative changes explicitly pivoted the mission of the Colorado's Oil and Gas Conservation Commission towards one of environmental production, directing the agency to regulate, rather than promote, oil and gas production. In so doing, the amended Oil and Gas Conservation Act authorized the commission to consider cumulative and landscape scale environmental impacts, provided new opportunities for public input and consultation with other agencies, and redefined waste to exclude non-production where necessary to prevent damage to the environment.⁶ Although no other state has yet pursued legislative amendments to this extent, Colorado may indicate an alternative direction for conservation law.

C. OTHER STATE REGULATION

§ 29:62 Split Estate/Surface Damage Acts

In situations where the mineral estate is severed from the surface estate, otherwise known as a split estate, the mineral owner enjoys an implied right to use the surface to the extent reasonably necessary to develop the underlying minerals.¹ At common law, the mineral owner had no obligation to compensate the surface owner for damage or disruption resulting from its enjoyment of the dominant estate. Perhaps unsurprisingly, disputes frequently arise regarding access and use of the surface estate amongst the various owners.² State legislatures in a majority of oil and gas producing states have enacted statutes to address split estate disputes and

allocate liability for certain categories of surface damages sustained in the course of oil and gas operations on split estates.³ Even in states that have not enacted split-estate legislation requiring compensation, courts have developed doctrines requiring accommodation or otherwise limiting the scope of the mineral owners use.⁴

Split estate or surface-damage statutes, as they are often informally called, most often include provisions relative to notice, compensation, reclamation, surveying, and dispute resolution. Many of these statutes require the mineral developer to provide notice to the surface owner prior to commencing drilling operations, and the procedures for providing such notice varies from state to state.⁵ Typically, either in conjunction with this notice requirement or separately, these statutes require good faith negotiations between the surface owner and the mineral owner to reach a surface use agreement.⁶ Often times, these statutes explicitly enumerate damages that obligate a developer to tender compensation to the surface owner.⁷ Furthermore, these statutes commonly impose surface restoration obligations on the mineral developer.⁸ Split-estate statutes often delegate enforcement to the oil and gas conservation agency in the state, which may integrate compliance with the statutes into permitting procedures.⁹ For instance, in Wyoming a proposed operator must certify its compliance with the split estate statute as part of submitting an Application for Permit to Drill to the conservation agency.¹⁰ Although the agency does not review surface use agreements or independently verify that the act's requirements have been met, incorporation of that requirement provides an avenue for surface owners and other mineral owners to protest the application and to later challenge issuance of the permit. Where surface and mineral owners cannot agree to damages, some states will allow the surface owner to bring a suit for compensation in court,¹¹ while others will allow such a determination through binding arbitration.¹² In addition, some states also provide a similar framework that a mineral owner must

comply with before conducting geophysical exploration on a split estate.¹³

§ 29:63 Industrial Siting

Authority for siting oil and gas and other energy operations may also be subject to industrial siting requirements. Some states have authorized a new or existing board, agency, or commission to be responsible for industrial siting,¹ while others have directly conferred authority to the state's oil and gas conservation agency.² Industrial siting regimes vary significantly between states. For instance, in Wyoming, the Wyoming Oil and Gas Conservation Commission regulates most oil and gas drilling locations; however, a permit from the state's Industrial Siting Council is required for projects exceeding a certain monetary amount, waste facilities, and any commercial wind or solar electric generation facilities regardless of size.³ In contrast, West Virginia's industrial siting laws apply only to solid waste facilities and include siting, location, design, construction, installation, establishment, financial assurance, permitting, modification, operating, groundwater monitoring, and closure and post-closure care.⁴

§ 29:64 Induced Seismicity and Chemical Disclosure

State legislatures have also enacted laws and regulations to address issues related to hydraulic fracturing and fluid disposal, including induced seismicity and chemical disclosure regulations.¹ Induced seismicity statutes and regulations allow regulatory agencies to respond to earthquakes attributed to underground injection activities.² Subsurface injection activities can contribute to an increase in seismic events. For instance, Oklahoma historically averaged about 1.6 earthquakes of magnitude 3.0 or greater, but this number dramatically rose to 584 by 2015.³ The Oklahoma Geological Survey has attributed this increase in seismic activity to subsurface injections of produced water.⁴ In response to the increase in seismic activity, the Oklahoma Corporation Commission promulgated a regulation that imposes monitoring and reporting obligations regarding induced seismicity upon Class II wells within the state.⁵ Other states have enacted similar laws and regulations which apply to wells regulated pursuant to Class II of the Underground Injec-

tion Control (UIC) program, which regulates oil and gas fluid injection wells.⁶ Some states only impose monitoring and reporting requirements,⁷ while others authorize state regulatory agencies to deny, modify, suspend, or terminate injection permits if the proposed injection is likely to or found to induce seismicity.⁸ Another type of induced seismicity mitigation measure comes in the form of using so-called “traffic light systems,” which involves monitoring injection rates and pressures, as well as the surrounding area for evidence of seismic activity.⁹ An operator will be given a “green light” to continue injecting if no seismic activity is detected, or if only low magnitude events are detected.¹⁰ However, if seismic events of a higher magnitude are detected, the operator will be given a “yellow light,” which allows injection to continue but the operator must take the necessary precautions to mitigate these risks.¹¹ Furthermore, if seismic events above an even greater threshold are detected, the operator will be given a “red light” and operations will be required to cease.¹²

Chemical disclosure statutes and regulations require operators to disclose certain chemicals used in the hydraulic fracturing process.¹³ Requirements among chemical disclosure laws vary. Many states chemical disclosure regulations refer to the Occupational Safety and Health Administration (OSHA) material safety data sheets for minimum quantities required to be disclosed.¹⁴ In addition, all states with chemical disclosure laws allow for exemptions to protect trade secrets when the chemicals are considered “confidential business information.”¹⁵ Some states require that additive volume and concentration be disclosed, and, in some case, operators must categorize their disclosures by additive type.¹⁶ Wyoming’s regulations also require prior approval from the State Oil and Gas Supervisor for the use of VOCs, such as benzene, toluene, ethylbenzene, and xylene, and the same regulation expressly prohibits the injection of these VOCs into groundwater.¹⁷ Fifteen states imposed requirements on chemical disclosure between 2010 and 2012, exemplifying the rapid pace at which this area of law is evolving.¹⁸

the regulation of oil and gas operations,¹ conferring certain oil and gas regulatory authority to the state's Department of Environmental Quality (DEQ) or wildlife agency.² In 2007, Colorado passed the Colorado Habitat Stewardship Act of 2007 for the purpose of minimizing adverse impacts to wildlife resources that are affected by oil and gas operations.³ Under this Act, the COGCC is required to consult with the Parks and Wildlife Commission and Division of Parks and Wildlife on decisions that impacts wildlife resources.⁴ This consultation also involves the implementation of "best management practices and other reasonable measures to conserve wildlife resources."⁵ Additionally, rulemaking powers having been conferred to the COGCC, which again must be accompanied by consultation with the Parks and Wildlife Commission, to establish standards for minimizing adverse impacts and to ensure for the proper reclamation of wildlife habitat during and following oil and gas operations.⁶ Similarly, in Wyoming, executive orders have required agencies, including the Wyoming Oil and Gas Conservation Commission, to "prioritize the maintenance and enhancement" of sage grouse habitat consistent with the Greater Sage Grouse Management Plan through permit stipulations and changes to drilling and spacing units, among other measures.⁷

D. COUNTY REGULATION

§ 29:66 Generally

Under local land use laws generally, counties have various types of authority to control or guide industrial activities. However, such control and guidance must be compliant with the respective enabling act standard and statutory allowance.¹ The lines get blurred when legislative actions result in co-existing dual, yet independent, authority by state conservation agencies and local governments as such authority relates to oil and gas operations.² This Section provides a general background on the applicability of county regulations to oil and gas operations as well as a specific look at Colorado Senate Bill 19-181, a national precedent-setting law governing county authority over oil and gas locations and siting within local government boundaries.³

§ 29:67 County Authority and Governance of Oil and Gas Operations

Local land use authority is typically derived from a state constitution or statutory enabling act that outlines the extent and scope of county authority.¹ It is important to understand how a county's jurisdiction over land use, and therefore oil and gas

[Section 29:67]

¹To the extent "home rule powers" may relate to a County, please see § 29:77. The state legal

operations generally, is derived.

Upon review of several state constitutions and statutes, it is helpful to point out the differences in the establishment of county authority as it applies to oil and gas operations. In Wyoming, for example, the state distinguishes between municipal corporations and corporations of a public charter, such as counties, townships, and school districts.² Cities and counties in Wyoming differ in the way they are created, the authority they possess, and in the functions they perform.³ Under the Wyoming Constitution, “[a]ll cities and towns are . . . empowered to determine their local affairs and government as established by ordinance passed by the governing body, . . . subject . . . to statutes uniformly applicable to all cities and towns”⁴ Since Wyoming’s statehood, the legislature has controlled municipalities, granting whatever powers they have.⁵ Wyoming municipalities are “creatures of the state” having no inherent powers and possessing only the powers granted to them by the legislature.⁶ Counties, however, are a “political subdivision of the state,” created to aid in the administration of government by enforcing state statutes and laws—and *not* enacting them.⁷ “As an arm of the state, the county has only those powers expressly granted by the constitution or statutory law or reasonably implied from powers granted.”⁸ Unlike municipalities, the Wyoming Constitution does not grant counties the power to establish ordinances.⁹ “Counties being created for purposes of government, and authorized to exercise to a limited extent a portion of the power of the state government, have always been held to act strictly within the powers granted by the legislative act establishing them.” Accordingly, the statute is to them their fundamental law, and their power is only coextensive with the power thereby expressly granted, or necessarily or reasonably implied from its granted powers.¹⁰

Based on the foregoing, very few counties in Wyoming have regulations that apply to oil and gas. Johnson County, however, adopted a comprehensive land use plan in 2005 identifying oil and gas development as an industrial use.¹¹ The plan sets some general development criteria for future oil and gas exploration and production activities and establishes issues to address reasonable development criteria.¹² Douglas County’s Unified Land Development Code has an “Oil and Gas Operations” section to “ensure the safety, preserve the health, promote the prosperity and improve the morals, order, comfort and convenience of the present and future residents of the City” and “to facilitate the development of oil and gas resources within the City, while mitigating potential land use conflicts between such develop-

environment: home rule, preemption, and interpretation; *see also* Colo. Const., Art. XX and Art. XIV. Municipalities and counties that are not classified as “home rule” must abide by the authority granted through state statutes.

ment and existing, as well as planned, land uses.”¹³

Under the Utah Constitution, counties are recognized as subdivisions of the state and their powers are not enumerated.¹⁴ The Constitution states that “[t]he Legislature shall by statute provide for optional forms of county government.”¹⁵ Section 17-53-223 of the Utah Code grants broad authority to counties to enact ordinances and make regulations “necessary for carrying into effect or discharging the powers and duties conferred by this title, and as are necessary and proper to provide for the safety, and preserve the health, promote the prosperity, improve the morals, peace, and good order, comfort, and convenience of the county and its inhabitants, and for the protection of property in the county,” so long as they are not “repugnant to law.”¹⁶ Utah’s Land Use, Development, and Management Act was modified in 2005 with the following additions in bold and deletions stricken: “municipalities may enact all ordinances, resolutions, and rules and may enter into other forms of land use controls and development agreements that they consider necessary or appropriate for the use and development of land within the municipality, including ordinances, resolutions, rules, restrictive covenants, easements, and development agreements governing uses, density, open spaces, structures, buildings, energy efficiency, light and air, air quality, transportation and public or alternative transportation, infrastructure, street and building orientation and width requirements, public facilities, and height and location of vegetation, trees, and landscaping, unless expressly prohibited by law.”¹⁷ As such, Uintah County ordinances provide that “gas and oil wells shall not be located closer than one thousand (1,000) feet to any dwelling unit, unless written permission is given by the owner of such dwelling unit.”¹⁸ The County also puts the “burden to provide sufficient evidence to the satisfaction of the county legislative body that the proposed activity will not pollute, clog, alter, impair, or diminish water flow through the Ashley Springs system” on any proponent of oil and gas excavation.¹⁹ Davis County requires a permit to excavate natural resources.²⁰ Duchesne County has an ordinance addressing oil and gas drilling facilities and production with sundry provisions.²¹

In New Mexico, the Constitution grants broad authority to municipalities, including counties, stating, “[a] municipality which adopts a charter may exercise all legislative powers and perform all functions not expressly denied by general law or charter The purpose of this section is to provide for maximum local self-government. A liberal construction shall be given to the powers of municipalities.”²² Cities and counties “shall have and enjoy all rights, powers and privileges asserted in its charter not inconsistent with its general laws, and, in addition thereto, such rights, powers and privileges as may be granted to it, or possessed and enjoyed by cities and counties of like population separately organized.”²³ “An incorporated

county may exercise . . . all powers granted to municipalities by statute.”²⁴

The governing body of a municipality and, by virtue of Article X § 5 of the New Mexico Constitution, incorporated counties may adopt regulations that are not inconsistent with the laws of New Mexico to effect or discharge the powers and duties conferred by law upon the municipality, and provide for the safety, preserve the health, promote the prosperity and improve the “morals, order, comfort and convenience” of its inhabitants.²⁵ Under this authority, Farmington’s municipal code, for example, states, “[a]ll proposals for oil, gas, or thermal drilling shall be referred to the oil and gas and geologic and engineering hazards advisory commission for recommendation in accordance with the provisions of the Municipal Code.”²⁶ Silver City requires that at the conclusion of drilling, sites “shall be restored in accordance with a restoration plan approved by the Community Development Director and designed to minimize adverse impacts to neighboring properties.”²⁷

§ 29:68 Oil and Gas Location and Siting Authority—Case Study: Colorado

In Colorado, a self-proclaimed “home rule” state, the legislature expressly provided that most land use decisions are driven by local governments and not the State:

- (1) The general assembly hereby finds and declares that to provide for planned and orderly development within Colorado and a balancing of basic human needs of a changing population with legitimate environmental concerns, the policy of this state is to clarify and provide broad authority to local governments to plan for and regulate the use of land within their respective jurisdictions. Nothing in this article shall serve to diminish the planning functions of the state or the duties of the division of planning.
- (2) The general assembly further finds and declares that local governments will be better able to properly plan for growth and serve new residents if they are authorized to impose impact fees as a condition of approval of development permits. However, impact fees and other development charges can affect growth and development patterns outside a local government’s jurisdiction, and uniform impact fee authority among local governments will encourage proper growth management.¹

As such, Colorado designates land use authority to local governments through various laws.² Counties are authorized to prepare master plans (or comprehensive plans) in order to prepare and plan for the physical surface development within their respective jurisdictions, including oil and gas operations.³ Counties are also authorized to adopt local zoning regulations to promote the public health, safety, and welfare of residents.⁴ County zoning is commonly used to ensure development does not occur in sensitive, highly populated or hazardous areas.⁵ Counties can also identify, designate, and regulate areas and activities of statewide impacts such as

natural resource development areas and development of new communities.⁶ If such areas are identified, then the county is allowed to control and require permits for development within such areas.⁷

On April 16, 2019, Senate Bill 19-181 “Concerning Additional Public Welfare Protections Regarding the Conduct of Oil and Gas Operations, and, in connection therewith, Making an Appropriation” was made effective and applied to oil and gas operations in Colorado “occurring on or after the effective date of this act, including determinations of applications pending on the effective date.”⁸ The adoption of Senate Bill 19-181 substantially changed the historic separate authority of the Colorado Oil and Gas Conservation Commission (“Commission”), the state conservation agency, and County governance to a co-existing, dual authority over oil and gas operations—meaning that both the County and the Commission must issue an operator a permit prior to any conduct of oil and gas operations on a proposed location.⁹ This the new law received national attention and has been heralded as one for the current federal administration to review and utilize as an example of a successful regulatory regime.

Senate Bill 19-181 changed the Commission’s mission from one of “fostering” oil and gas development to one that mandates that the Commission “regulate development and production of the natural resources of oil and gas in the state of Colorado in a manner that protects public health, safety, and welfare, including protection of the environment and wildlife resources.”¹⁰ This change from “foster” to “regulate” has resulted in years of lengthy rulemaking proceedings by the Commission and Colorado Department of Public Health and Environment, as well as new regulations and ordinances at a County level.¹¹

Senate Bill 19-181 also changed the governing authority over oil and gas operations to expressly allow local governments, including Counties, to regulate the use of the surface within its boundaries as such regulation relates to oil and gas operations.¹² Specifically, § 29-20-104(1)(g) and (h), C.R.S. provide:

- (1) . . . Each local government within its respective jurisdiction has the authority to plan for and regulate use of land by:
 - (g) Regulating the use of land on the basis of the impact of the use on the community or surrounding areas;
 - (h) Regulating the surface impacts of oil and gas operations in a reasonable manner to address matters specified in this subsection (1)(h) and to protect and minimize adverse impacts to public health, safety, and welfare and the environment For purposes of this subsection (1)(h), “Minimize adverse impacts” means, to the extent necessary and reasonable, to protect public health, safety, and welfare and environment by avoiding adverse impacts from oil and gas operations and minimizing and mitigating the extent and severity of those impacts that cannot be avoided. The following matters are covered by this subsection (1)(h):
 - (I) Land use;
 - (II) The location and siting of oil and gas facilities and oil and gas

⁷C.R.S. § 24-65.1-101.

⁸S.B. 19-181, § 19.

⁹S.B. 19-181, §§ 3, 4 and 6.

¹⁰C.R.S. § 34-60-102(1)(a)(I).

¹¹C.R.S. § 34-60-102(1)(a)(I).

¹²C.R.S. § 29-20-104(1)(h).

- locations, as those terms are defined in section 34-60-103(6.2) and (6.4);
- (III) Impacts to public facilities and services;
 - (IV) Water quality and source, noise, vibration, odor, light, dust, air emissions and air quality, land disturbance, reclamation procedures, cultural resources, emergency preparedness and coordination with first responders, security and traffic and transportation impacts;
 - (V) Financial securities, indemnification, and insurance as appropriate to ensure compliance with the regulations of the local government; and
 - (VI) All other nuisance-type effects of oil and gas development; and
- (i) Otherwise planning for and regulating the use of land so as to provide planned and orderly use of land and protection of the environment in a manner consistent with constitutional rights.”¹³

Under this provision, a County now has the ability to regulate any oil and gas operation that affects the surface of land within its jurisdiction.¹⁴ The County, however, must ensure that such regulations are “necessary and reasonable” under the legislative standard set forth in Senate Bill 19-181.¹⁵ If the County’s regulation of oil and gas operations fall outside of the mandates provided in § 29-20-104(1)(h) or the regulations are deemed by an applicable court of law to be unnecessary or unreasonable, then the County will have exceeded the scope of its authority under Senate Bill 19-181 and the enacted regulations will not apply.¹⁶ In order for a County to implement the powers and authority granted by Senate Bill 19-181 under § 29-20-104(1)(h), the County has authority to: (a) inspect all facilities subject to local government regulations; (b) impose fines for leaks, spills and emissions, and (c) impose fees on operators or owners to cover the reasonably foreseeable direct and indirect costs of permitting and regulation and the costs of any monitoring and inspection program necessary to address the impacts of development and to enforce local government requirements.¹⁷ Each of these sections in Senate Bill 19-181 work in tandem to provide Colorado counties with the newly allowed, express authority over locating and siting new oil and gas operations within their respective jurisdiction.¹⁸

E. MUNICIPAL REGULATION

¹⁸As of the date of this publication, at least six Colorado Counties have either adopted new ordinances and regulations, or have revised existing regulations, to allow for the inclusion of Senate Bill 19-181’s express local government authority over oil and gas operations into their respective codes. *See generally*, Adams County—<https://www.adcogov.org/oil-and-gas-information>; Arapahoe County—<https://www.arapahoe.gov/597/Oil-and-Gas>; Boulder County—<https://www.bouldercounty.org/property-and-land/land-use/planning/oil-gas-development/>; Broomfield County—<https://broomfield.org/1820/Oil-and-Gas>; Larimer County—<https://www.larimer.org/planning/phase-ii-larimer-county-land-use-code/oil-gas-regulations-phase-ii-update>; and Weld County—<https://www.weldgov.com/Government/Departments/Oil-and-Gas-Energy>. There have also been over 15 Colorado towns, cities or municipalities adopt new ordinances or revise existing oil and gas regulations.

§ 29:69 Municipal Regulation—Introduction

This Section explains why municipal governments often seek to regulate or otherwise control or influence oil and gas-related activities within their jurisdictions. It describes the potentially negative impacts municipal governments and their citizens confront with the introduction of oil and gas-related activities, and the methods municipal governments use to control or influence those activities to address their concerns. It also addresses some of the obstacles municipal governments confront that limit or thwart their efforts.

Some municipal governments hope to use their limited authority to attract oil and gas-related activities for the jobs and tax revenue they believe will follow. Others hope to control or influence oil and gas-related activities to protect their communities from the environmental and other harms that may accompany them. Either way, it is clear that municipal governments often seek to exert some measure of control or influence over the oil and gas-related activities that either seek to operate in their jurisdictions or are already operating there.

The methods or legal tools municipal governments might use to address their concerns vary according to the legal environment of the state, particularly the home rule and preemption environments, discussed below. They also may vary according to the focus of control over which the municipality seeks to exert authority. For example, the focus of control may be on the locations within a jurisdiction where oil and gas-related activities will (or will not) take place, or it may be on the safety or manner in which those activities may be conducted. It might also focus on issues not directly related to place or safety but pertaining instead to the local economy or the ability of the local government to carry out essential services.

Some local governments have enacted total bans on the use of hydraulic fracturing technology, while others have enacted bans on all fossil-fuel development.¹ If a local government cannot, or does not, ban either the use of hydraulic fracturing technology or the development of hydrocarbons, it may still attempt to control the location in which it finds oil and gas activities to be most appropriate; for example, in an industrial zone rather than a residential zone. A local government might use its traditional power of land use control to exclude oil and gas activities from land use zones in which they would be inappropriate, or confine them to occur in zones for which they are better suited.² Some local governments may allow these activities only with conditional use permits.³

In addition to using zoning authority to control the location of oil and gas activities, municipal governments may use ordinances to control how close oil and gas-related activities may be to potentially vulnerable locations.⁴ Municipal governments might impose setback requirements to protect their citizens in schools and other buildings the municipal government deems vulnerable or at-risk from proxim-

²See *In Re Morrison, Ohio*, where, while striking down Munroe Falls, Ohio's attempt to impose a local permit and other controls, a concurring Ohio Supreme Court Justice suggested that the proper local authority for local governments seeking to influence or control oil and gas-related decisions lay in the city's power over traditional land use controls.

³See, e.g. COUNTY OF VENTURA RESOURCE MANAGEMENT AGENCY, *Oil and Gas Program*, <https://www.vcrma.org/oil-and-gas-program> (last visited June 22, 2021); see, e.g. MUNICIPALITY OF MURRYSVILLE, PA. MUN. CODE § 220-28 (2010), <https://ecode360.com/11539700>.

⁴See, e.g., *Natale v. Everflow E., Inc.*, 195 Ohio App. 3d 270, 2011-Ohio-4304, 959 N.E.2d 602, 180 O.G.R. 202 (11th Dist. Trumbull County 2011) (analyzing a nuisance claim for placing an offensive and odorous oil and gas tank on a property adjacent to the plaintiff's).

ity to oil and gas-related activities.⁵ Municipal governments may also use setbacks to protect rivers, lakes, or other environmentally vulnerable locations.⁶ Municipal governments may attempt to exercise many of these controls by enforcing their own local permit or hearing requirements on oil and gas-related activities.⁷ For example, although the Supreme Court of Ohio ultimately rejected this effort, Monroe Falls, Ohio used its ordinance authority to attempt to control oil and gas activities within municipal limits.⁸ Other cities attempt to use zoning authority to accomplish similar goals.⁹

In addition to using their regulatory authority to control the location and manner of oil and gas activities, some municipal governments may choose to address other potentially negative impacts of oil and gas-related activities; for example, noise and traffic concerns. Most municipal governments already have either specific noise level ordinances or nuisance ordinances that can serve a similar, but broader purpose.¹⁰ To enforce those in a manner that does not discriminate against incoming or existing oil and gas-related activities could be an effective means of control.¹¹ Certainly, if these ordinances existed prior to the arrival of the oil and gas-related activities, the case for upholding them is strong.

With respect to traffic controls, local governments have authority to set and enforce speed limits and other traffic-related controls. Some local governments have entered into agreements, called Road Use and Maintenance Agreements, with incoming oil and gas developers to pay for new and improved roads built according to the needs of the incoming industry.¹²

§ 29:70 Impacts of Oil and Gas Activities on Local Jurisdictions

Local governments hope to be involved in decision-making regarding incoming or existing oil and gas-related activities because their communities and constituents feel the effects of these activities. Some communities are new to oil and gas develop-

ment, and the technologies required for shale development differ substantially from those used in the communities in which conventional oil and gas extraction has occurred.¹ These new technologies allow development to move from rural areas, which are accustomed to it, to some suburban and ex-urban communities, which are not.²

Regardless of whether local governments seek to promote, control, or limit incoming or existing oil and gas-related activities, there are several issues they face when these activities ultimately arrive. These issues fall broadly into the categories of environmental law, and also in the related areas of traffic, infrastructure, employment, housing, and social and economic concerns.³ Some argue that municipal governments seek involvement in oil and gas-related decision-making, at least in part, because they are dissatisfied with the protections afforded by state and federal legal controls.⁴

§ 29:71 Impacts of Oil and Gas Activities on Local Jurisdictions—Environmental

With the coming of oil and gas-related activities, municipal governments face environmental concerns of various kinds, most pointedly regarding air pollution, and water use and pollution.

§ 29:72 Impacts of Oil and Gas Activities on Local Jurisdictions—Air pollution concerns

Air pollution concerns arise from various aspects of facility construction and facility operations. The types of facilities related to oil and gas production vary. For example, truck traffic, engines and compressors that run drilling rigs and other equipment, and flaring of excess gasses are all sources of air pollution. The air pollutants they emit varies, too, including volatile organic compounds, dust, methane, sulfur dioxide and nitrogen oxides.¹ Particulate air pollution—meaning various sizes of dust—can increase in the ambient air during the construction of the facility and also during its operation, especially deriving from traffic over local roads.² Increased truck traffic due to a new facility can also lead to increase exhaust emissions.³ Methane emissions can occur at wellhead sites and during materials transfers, all concerning to local governments. Even the outflow of brine can cause air pollutant emissions due to the nature of the brine itself and the pollutants it collects on its journey into and out of fractured wells.⁴ For example, engines, compressors, venting,

⁴Mary Kang, *CO₂, Methane, and Brine Leakage Through Subsurface Pathways: Exploring Modeling, Measurement, and Policy Options* (2014) (Ph.D. Dissertation, Princeton University).

and flaring all emit air pollutants which may be concerning for local governments.⁵

§ 29:73 Impacts of Oil and Gas Activities on Local Jurisdictions—Water-related concerns

Water-related concerns are multifaceted for local governments. They might be concerned about the volume of water necessary for hydraulic fracturing operations and/or with the method of disposal of the large amounts of used fracturing fluid, or the brine these operations generate. Fracturing operations use an enormous amount of clean, fresh water—millions of gallons for every fractured well.¹ Local governments may not want these large quantities drawn from local sources for fear they would quickly diminish them or divert them from local uses.

Shale oil and gas facility operators mix fresh water with chemicals and proppants to prepare it for effective use as injection fluid to fracture the shale and stimulate production at the well. Operators inject the fracturing fluid into the well at high pressure to create fissures in the shale rock layer that allow oil and gas to escape. The fluid, or brine, then reemerges from the well along with naturally occurring pollutants it collected on its journey, such as salts, metals, and radioactive materials.² How and where safely to dispose of the resulting fluid has long been a concern. Because it is no longer clean water, it cannot be discharged from whence it came. Operators have been working on developing and improving methods for cleaning and re-using the brine it in future fracturing operations,³ but still often send it wastewater treatment facilities,⁴ or to deep well injection disposal locations as allowed in some states.⁵ Sometimes, when a well casing is not as it should be, it can crack or leak and cause oil, gas, or fracturing fluid to leak into groundwater.⁶

§ 29:74 Impacts of Oil and Gas Activities on Local Jurisdictions—Other concerns facing municipal governments

Noise is also a concern for municipal governments and their citizens at both the construction and operation stages of oil and gas operations.¹ They may seek to use regulatory authority to control it. Another area of concern is the potential negative impact oil and gas operations may have on the conditions of local roads. Increased road use due to construction and operation could cause deterioration of local roadways, which may not have been constructed to bear increased loads. There might be increased traffic congestion due to oil and gas facilities business operations

and worker ingress and egress. There may be concerns surrounding enforcement of traffic laws.

Although employment-related concerns are not always the first to come to mind when oil and gas-related activities are coming to town, these issues are real. Incoming oil and gas industry jobs may take employees away from local employers. The added oil and gas industry jobs may be a net-positive for the area, if they pay well and if they stay. But, if they do not—both pay well and remain in the area, the ultimate situation is less positive. When non-oil and gas-related local employers lose employees, they may not survive, and when the oil and gas facilities leave, the other employers may no longer be in the area to re-hire the employees they lost. When industry, such as that related to oil and gas development, overtakes a local economy, it becomes more difficult for that economy to recover in the face of its eventual absence.²

Local jurisdictions may face upward pressure on housing costs resulting from the influx of temporary oil and gas industry workers.³ Local governments, therefore, may be concerned about the ability of their permanent residents to find and retain reasonably priced housing. The increased temporary population may also cause concerns related to emergency response and social service loads.⁴

§ 29:75 Law-based obstacles to municipal control or influence of oil and gas-related decisions

Municipal governments face numerous barriers to their ability to influence or control oil and gas-related activities. This section will describe some of those barriers and the legal environments in which they operate. In particular, although many municipal governments appear to have authority to act on local concerns under the ‘home rule’ provisions in their state constitutions or enabling statutes, some state courts have interpreted these provisions in ways that prevent local jurisdictions from regulating in areas related to oil and gas-activities. The fundamental question here is whether a municipal government may enact and enforce ordinances that attempt to control or influence oil and gas-related activities, or the state has taken away that authority.

§ 29:76 The state legal environment: home rule, preemption, and interpretation

Many states include ‘home rule’ provisions in their state constitutions.¹ These provisions generally grant authority to municipal governments to enact ordinances on issues of local concern, particularly in the areas of public safety and welfare and local self-governance.² Some states grant home rule by statute rather than through

their constitutions.³ This section does not attempt to catalog state constitutions' home rule provisions or grants of home rule authority by state legislation. Instead, it describes some examples of the circumstances municipal governments face when attempting to use regulatory authority to address the environmental and related concerns described above.

§ 29:77 State constitution-based home rule authority

An example of constitution-based home rule authority, the Ohio Constitution provides that “[m]unicipalities shall have authority to exercise all powers of local self-government and to adopt and enforce within their limits such local police, sanitary and other similar regulations, as are not in conflict with general laws.”¹ This suggests that municipal governments should be able to enact ordinances to address the local concerns set forth above. But that is not the case in Ohio. The problem for Ohio municipal governments comes both in the form of state legislation and state court interpretation of its constitution's home rule amendment.

§ 29:78 Preemption by a general law of the state

Explaining its position, the Supreme Court of Ohio considered a municipal ordinance in which “the city of Canton . . . prohibited the placement or use of mobile homes as principal or accessory structures for residential use”¹ then amended its ordinances to include “manufactured homes” within the definition of “mobile homes,” thus prohibiting their residential use.² Concurrently, the Ohio General Assembly enacted a statute purporting to preclude political subdivisions from “prohibiting or restricting the location of permanently sited manufactured homes in any zone or district in which a single-family home is permitted.”³ Canton challenged the state legislature's authority arguing that the state law was unconstitutional because it encroached on municipality home-rule power.⁴

The Supreme Court of Ohio established a three-part test to determine when state legislation takes precedence over a municipal ordinance.⁵ “A state statute takes precedence over a local ordinance when (1) the ordinance is in conflict with the statute, (2) the ordinance is an exercise of police power, rather than of local self-government, and (3) the statute is a general law.”⁶ While the first two prongs of the test were not contested in the *Canton* case, under the third prong, the Court found this state statute was not a general law. The Court explained that “[t]o constitute a general law for purposes of home-rule analysis, a statute must (1) be part of a statewide and comprehensive legislative enactment, (2) apply to all parts of the state alike and operate uniformly throughout the state, (3) set forth police, sanitary, or similar regulations, rather than purport only to grant or limit legislative power of a munic-

⁶See *Canton v. State*, 95 Ohio St. 3d 149, 2002-Ohio-2005, 766 N.E.2d 963, 966 (2002) (holding modified by, *Mendenhall v. Akron*, 117 Ohio St. 3d 33, 2008-Ohio-270, 881 N.E.2d 255 (2008)).

ipal corporation to set forth police, sanitary, or similar regulations, and (4) prescribe a rule of conduct upon citizens generally.” The Ohio Supreme Court held that the applicable sections of the state law violated the Ohio Constitution’s home rule amendment because it was an improper attempt to limit Canton’s home-rule powers.⁷ So, in the *Canton* case, the Court upheld the local action because the state law did not qualify as a general law such that it could preempt the local action. This appears initially hopeful for the prospects of municipal home rule.

Still, even when it appears that local governments have home rule authority through a state constitution, interpretation of the state’s home rule provision and state legislatures’ commitment to enacting statutes that qualify as ‘general laws’ can prevent municipal governments from regulating in the area of oil and gas regulation. For example, addressing home rule, conflict with state law, and express state preemption of local authority in the context of municipal regulation of oil and gas-related activities, the Ohio Supreme Court held Ohio’s oil and law to be a general law preempting municipal regulatory authority. In *State ex rel. Morrison v. Beck Energy Corp.*,⁸ Beck Energy Corporation (Beck Energy), an oil and gas developer, secured the state-required permit from Ohio’s Department of Natural Resources to drill on private property in Munroe Falls, Ohio.⁹ After Beck Energy had begun drilling, Munroe Falls issued a Stop Work Order as authorized under an existing ordinance and sought an injunction arguing that Beck Energy failed to comply with Munroe Falls’ drilling, zoning, and construction ordinances. The Supreme Court of Ohio affirmed the judgment of the appellate court, which held that because the ordinances were in direct conflict with several sections of the *Ohio Revised Code*, a general law under the *Canton* test,¹⁰ the state law preempted the local ordinances, which Munroe Fall could not enforce against Beck Energy.¹¹

§ 29:79 Express preemption by state law

State statutes may preempt local control by expressly preempting the activities the local government hopes to control.¹ For example, in Ohio, the Ohio oil and gas law grants ‘sole and exclusive’ authority over all aspects of the locating, drilling, and operating of oil and gas wells to the Ohio DNR.² Because the local ordinance purported to act in an area over which the state statute explicitly exerted control for

⁷*Canton*, 766 N.E.2d at 965.

⁸*State ex rel. Morrison v. Beck Energy Corp.*, 143 Ohio St. 3d 271, 2015-Ohio-485, 37 N.E.3d 128 (2015) (holding that the ordinance was preempted by state law).

⁹*State ex rel. Morrison v. Beck Energy Corp.*, 143 Ohio St. 3d 271, 273, 2015-Ohio-485, 37 N.E.3d 128 (2015).

¹⁰Under *Canton*, “[T]o constitute a general law for purposes of home-rule analysis, a statute must (1) be part of a statewide and comprehensive legislative enactment, (2) apply to all parts of the state alike and operate uniformly throughout the state, (3) set forth police, sanitary, or similar regulations, rather than purport only to grant or limit legislative power of a municipal corporation to set forth police, sanitary, or similar regulations, and (4) prescribe a rule of conduct upon citizens generally.” 766 N.E.2d at 968.

¹¹*Beck Energy*, 989 N.E.2d at 280.

[Section 29:79]

¹*Natale v. Everflow E., Inc.*, 195 Ohio App. 3d 270, 2011-Ohio-4304, 959 N.E.2d 602, 605, 180 O.G.R. 202 (11th Dist. Trumbull County 2011) (holding that the ordinance in question was preempted by state law because it dealt with the “location and operation of the oil and gas well,” which was explicitly reserved for the Ohio Department of Natural Resources in the state statute).

²“The regulation of oil and gas activities is a matter of general statewide interest that requires uniform statewide regulation, and this chapter and rules adopted under it constitute a comprehensive plan with respect to all aspects of the locating, drilling, well stimulation, completing, and operating of oil and gas wells within this state, including site construction and restoration, permitting related to those activities, and the disposal of wastes from those wells.” Ohio Rev. Code. § 15.09.02.

itself, the state statute preempted the local ordinance.³ One example is supplied by a Warren, Ohio ordinance that prohibited oil and gas well storage tanks from being located within two hundred feet of any building or structure without a local waiver. The Eleventh District Court of Appeals (Ohio) held that the preemption provision in Ohio's oil and gas law, Ohio Rev. Code § 1509.02 preempted Warren's ordinance because the ordinance purports to act on an issue the statute explicitly prohibits.⁴

§ 29:80 Operational conflict with state law

Colorado provides home rule authority by statute, rather than by Constitutional provision. The Colorado home rule statute states that “[e]ach local government within its respective jurisdiction has the authority to plan for and regulate the use of land”¹ However, the state also employs an operational conflict test which would void any local action that would materially impede or destroy a state interest.² For example, La Plata County, Colorado, enacted an ordinance that authorized the creation of a county planning commission to enact local zoning plans for unincorporated territory. Four years prior, Colorado had passed the Oil and Gas Conservation Act creating a state Oil and Gas Commission with jurisdiction over all persons and property in enforcing the rules and regulations set forth under the Act.³ Oil and gas firms sued La Plata County. The Supreme Court of Colorado relied on *Ray v. City & County of Denver*, where it had held that while a county cannot adopt an ordinance that is in conflict with any state statute, stating that “an ordinance and a statute may both remain effective and enforceable as long as they do not contain express or implied conditions that are irreconcilably in conflict with each other.” The Court considered the purpose of the ordinance at issue and found it to align with the state's interests, rather than impeding it.⁴ Therefore, the Court concluded that there was no operational conflict between the state statute and the local ordinance.⁵ Although the case illustrating the concept of operational conflict pertained to a county ordinance, the principles would likely hold true for conflict in municipal ordinances as well.

For example, and pertaining to oil and gas regulation, the Colorado Supreme Court held a city's hydraulic fracturing ban “[to be preempted because it] . . . materially impeded the effectuation of the state's interest” because it prohibited all fracking, including procedures allowed by the Colorado Oil and Gas Commission's

⁴*Smith Family Trust v. Hudson Bd. of Zoning & Bldg. Appeals*, 2009-Ohio-2557, at ¶ 10, 2009 WL 1539065 (Ohio Ct. App. 9th Dist. Summit County 2009) (“[T]he test is whether the ordinance permits or licenses that which the statute forbids and prohibits, and vice versa.”).

[Section 29:80]

¹C.R.S.A. § 29-20-104.

²*See Board of County Com'rs, La Plata County v. Bowen/Edwards Associates, Inc.*, 830 P.2d 1045, 1058 (Colo. 1992).

³The declared purposes of the Oil and Gas Conservation Act are as follows: to promote the development, production, and utilization of the natural resources of oil and gas in the state; to protect public and private interests against the evils of waste; to safeguard and enforce the coequal and correlative rights of owners and producers in a common source or pool of oil and gas so that each may obtain a just and reasonable share of production therefrom; and to permit each oil and gas pool to produce up to its maximum efficient rate of production subject to the prohibition of waste and subject further to the enforcement of the coequal and correlative rights of common-source owners and producers to a just and equitable share of profits.

⁴“The purpose of the county regulations is to ‘facilitate the development of oil and gas resources within the unincorporated area of La Plata County while mitigating potential land-use conflicts between such development and existing, as well as planned, land uses.’”

⁵The Court stated that it was unable to make a determination given the record before them.

regulations.⁶ In Colorado, each local government has the authority to reasonably plan for and regulate the use of land by regulating many functions, including the “surface impacts of oil and gas operations” to best protect and serve public health, safety, welfare, and the environment.⁷ This statute is not meant to limit, alter, or expand any power already granted to local governments. In *City of Longmont*, Longmont added an article to its home-rule charter, prohibiting fracking,⁸ and the Colorado Oil and Gas Association sued Longmont to invalidate it. Granting summary judgment for the Oil and Gas Association, the trial court found the amendment preempted by the Oil and Gas Conservation Act.⁹ The Colorado Supreme Court of Colorado agreed and further found fracking to be exceptionally important in the production of oil and gas.¹⁰ Because hydraulic fracturing is a commonly used technology in oil and gas extraction, banning it could lead to an extreme decrease in extraction efficiency across Colorado, making this local amendment a matter of statewide concern.¹¹ The Court did not want this one local charter amendment to create a “ripple effect” and influence other municipalities to ban the extraction method, because that would cause a drift away from statewide uniformity.¹²

Like Colorado, many states consider whether the municipal ordinance and state statute work together in supporting similar goals, or are in conflict. For example, in Pennsylvania, oil and gas operators, Huntley and Huntley (Huntley),¹³ sought to operate a natural gas well on residential properties in “the Borough.”¹⁴ Huntley entered into commercial lease agreements with the affected property owners and obtained the required permit from the state. Later, however, the Borough Council and the municipal zoning officer directed Huntley to cease operations on the well because it violated the Borough’s zoning ordinance.¹⁵ In accordance with the local ordinance, Huntley then submitted a conditional use application. The Council conducted a standard hearing to consider the application, then it denied the application. The Council found, in part, that state law did not preempt its restriction.¹⁶ In *Huntley & Huntley*, however, the Supreme Court of Pennsylvania cited *United Tavern Owners*, which said “[e]ven where the state has granted power to act in a particular field, . . . such powers do not exist if the Commonwealth preempts the field.”¹⁷ The Court looked to the purposes of both the local ordinance and Pennsylvania’s Oil and Gas Statute. The main purpose of the Borough’s ordinance was to protect and preserve the character of residential areas, whereas the state legislature’s main purposes in the Oil and Gas Act were public health and

⁶See *City of Longmont v. Colorado Oil and Gas Association*, 2016 CO 29, 369 P.3d 573, 586, 82 Env’t. Rep. Cas. (BNA) 1509, 182 O.G.R. 210 (Colo. 2016) (holding that a city’s fracking ban [to be preempted because it] . . . materially impeded the effectuation of the state’s interest).

safety.¹⁸ So, the purposes were different, and not in support of similar goals. Although the ordinance likely also responded to some public health concerns, its main purposes did not align with the main purposes of the Act. Thus, the Court held that the statute preempted the local ordinance.¹⁹

Although local governments may enact local regulations enacted pursuant to state law, a local government cannot enact a regulatory scheme that presents an obstacle to the purposes behind state law.²⁰ In *Range Res.—Appalachia v. Salem Twp. (Range Resources)*, Salem Township, Pennsylvania, enacted an ordinance regulating surface and land development associated with oil and gas drilling.²¹ In response, several oil and gas producers sued, arguing that Pennsylvania’s Oil and Gas Act preempted this ordinance.²² The trial court held that Pennsylvania’s Oil and Gas Act had addressed the alleged purposes behind the ordinance and that once the state has acted pursuant to such purposes, municipalities are prohibited from exercising police power to accomplish the same.²³ Both the Commonwealth and Supreme Courts of Pennsylvania affirmed stating that “[t]he comprehensive and restrictive nature of [the ordinance’s] regulatory scheme represents an obstacle to the legislative purposes underlying the Act, thus implicating principles of conflict preemption.”²⁴

§ 29:81 Dillon’s rule

Some states apply Dillon’s Rule to the scope of local regulatory authority. Dillon’s Rule provides that non-home rule governmental units possess only those powers specifically granted to them by the state’s constitution or by the state legislature.¹ Therefore, municipal government units subject to Dillon’s Rule, may regulate in a field occupied by state legislation, sometimes oil and gas activities, only when the state’s constitution or state legislation specifically granted that authority.² In Illinois, for example, a place is a non-home-rule unit if it has fewer than 25,000 inhabitants and has not elected by referendum to become a home rule unit of government.³

In *Village of Sugar Grove v. Rich*, a resident received citations for violating several ordinances within the village of Sugar Grove, Illinois. Following his conviction on several of the violations, he appealed others arguing, for example, that the noise ordinances were preempted by state law.⁴ Although the court found that Sugar Grove’s population was not sufficient to exercise home rule power, the court held that the Illinois Environmental Protection Act did not reserve noise regulation to

⁴*Rich* cites the Environmental Protection Act.

only the state. Further, the court held that the purpose of the ordinance harmonizes well with the statute. Therefore, because they could coexist peacefully, the statute did not preempt the ordinance.⁵

In the realm of oil and gas regulation, an Illinois court has held that a non-home-rule unit of government may prohibit the drilling or operation of an oil or gas well within its municipal limits.⁶ In *Tri Power Resources v. City of Carlyle*, a developer entered into an oil and gas lease and obtained the required drilling permit from Illinois's Department of Natural Resources.⁷ Three months later, the City of Carlyle annexed the land, deeming it a residential district under its zoning ordinance.⁸ Because of this new zoning classification, there could be no drilling or operating oil and gas wells on the parcel. The developer sued Carlisle, seeking a declaration that the new zoning ordinance was preempted by state law.⁹ The court, citing *Rich*, first determined that Carlyle is a non-home rule municipality, so Dillon's Rule governs. The court then looked at the language of Illinois's Oil and Gas Act. Under § 13 of the state law, corporate authorities of each municipality have the authority to issue permits for the oil and gas mining to protect property. Here, Carlyle acted within the parameters of its powers under the state law; thus, the state law did not preempt Carlisle's ordinance.¹⁰

§ 29:82 State constitution and statute-based home rule

New York has witnessed more local governments move to ban or control oil and gas-related activities than any other state.¹ These local efforts have been effective for two primary reasons. First, New York's constitution contains a home rule provision—similar to other states—granting local government the power to adopt and amend local laws not inconsistent with the state constitution or any general law of the state.² Second, New York has enacted legislation to further buttress home rule powers of local jurisdictions. In support of the constitutional provision, the New York legislature has adopted the Municipal Home Rule Law, empowering local governments to pass laws for the “protection and enhancements of their physical and visual environment” and the health and well-being of persons and property in a local jurisdiction.³ Additionally, the legislature enacted the Town Law, which authorizes towns to enact zoning laws to effectuate local police powers, and the

Statute of Local Governments—granting towns the power to shape zoning regulations.⁴

In *City of Dryden*, Dryden, New York amended its Zoning Ordinance to prohibit all activities related to exploration for, production of, and storage of natural gas and petroleum.⁵ Anschutz Exploration, an oil and gas developer, owned gas leases throughout Dryden and had invested millions of dollars into those operations. The developer sued Dryden, arguing that the charter amendment was preempted by New York's Oil, Gas and Solution Mining Law (OGSML).⁶ The Supreme Court of Tompkins County, New York, citing *Matter of Frew Run*, analyzed preemption under New York's Mined Land Reclamation Law (MLRL). Similar to the OGSML, the MLRL includes a supersedure clause. The court reasoned that neither state law explicitly preempted local zoning authority. Further, the OGSML's purpose was to regulate all production and development of oil and gas, not to maximize the development of the oil and gas resources in New York. Therefore, the Court held that this purpose does not abridge local power to regulate delegated powers, meaning there was no preemption.

Similarly, Texas employs a home rule system based both in statute and its constitution⁷ stating that, “absent an express limitation, if the general law and local regulation can coexist peacefully without stepping on each other's toes, both will be given effect, or the latter will be invalid only to the extent of any inconsistency.”⁸ Texas applies an analysis that is similar to that of *Bowen/Edwards*.⁹ In *City of Laredo v. Laredo Merchs. Ass'n*, Laredo enacted an ordinance banning the use of certain plastic checkout bags by commercial establishments. Its declared purpose was to reduce litter. The Laredo Merchants Association sued the City of Laredo, arguing that the Texas Health and Safety Code preempted the ordinance.¹⁰ The trial court held that the ordinance and the state law could exist without encroaching on one another. The Supreme Court of Texas agreed that general laws and local regulations could coexist peacefully; however, the Court also stated that the Texas legislature clearly intended to preempt municipalities from exercising its police powers in this particular area of governance. On this point, it said “[the statute] describes a state interest in ‘controlling the management of solid waste’ that is plenary.”¹¹ Finally, the Court held that the home-rule provision did not authorize Laredo's regulatory method. Therefore, the state law preempted the municipal

ordinance.

§ 29:83 Explicit statutory preemption of oil and gas activities

Some state statutes explicitly prohibit municipal regulation of oil and gas activities. For example, like many states, North Carolina's legislature seeks to maintain a uniform system of oil and gas regulation (among other things) and prohibits local governments from restricting or conditioning oil and gas exploration, development, and production, including the use of drilling and hydraulic fracturing to achieve those purposes.¹ Similarly, in Ohio, the legislature has adopted a uniform system of comprehensive statewide legislation that has been recognized as a general law by the Ohio Supreme Court for purposes of oil and gas regulation.² Pursuant to this general law, local governments may not interfere with the state regulation of any oil and gas activities covered by the legislation and any local ordinance which conflicts with the general law is preempted.³ Louisiana has also adopted express state preemption statutes concerning the grant of oil and gas well permits.⁴ Pursuant to Louisiana Revised Statute 30:28, no person may drill an oil or gas well without first obtaining a drilling permit from the Office of Conservation, and no local ordinance or zoning authority may interfere with a permit so obtained.⁵

Other states' legislatures specifically allow local regulation of oil and gas activities. For example, Oklahoma allows for municipalities, counties, or other political subdivisions to enact reasonable ordinances concerning oil and gas operations, so long as those ordinances are not inconsistent with any state statutes.⁶ The statute further explains that political subdivisions may not explicitly or effectively prohibit oil and gas operations.⁷ Pennsylvania allows municipalities permitting authority over oil and gas activities.⁸ As discussed above, New York municipalities may utilize zoning authority to regulate oil and gas activities.⁹

§ 29:84 Zoning

As discussed, municipal governments still seek influence over the oil and gas-related activities within their jurisdictions. Some have turned to ordinance-based zoning approaches; that is, using their traditional zoning authority to regulate oil

⁹See *Anschutz Exploration Corp. v. Town of Dryden*, 35 Misc. 3d 450, 469, 940 N.Y.S.2d 458, 181 O.G.R. 1127 (Sup 2012), judgment aff'd, 108 A.D.3d 25, 964 N.Y.S.2d 714, 181 O.G.R. 1143 (3d Dep't 2013), order aff'd, 23 N.Y.3d 728, 992 N.Y.S.2d 710, 16 N.E.3d 1188, 181 O.G.R. 1166 (2014).

and gas or prohibit related activities in specific land use zones.¹ For example, in New York State, the Town of Dryden enacted a zoning ordinance that would control certain oil and gas-related activities. In *Norse Energy Corp. USA v. Town of Dryden*,² the court found Dryden's use of its zoning authority to be a permissible use of the home-rule power. In *Norse*, an oil and gas developer sued Dryden, arguing that the OGSML preempted Dryden's ordinance.³ The court followed the *Anschutz* analysis due to factual similarities and found the ordinance not preempted by the state statute. Similarly, in *Cooperstown Holstein Corp. v. Town of Middlefield*,⁴ the Town of Middlefield, New York banned oil, gas, and solution mining and drilling within the town. A holder of oil and gas leases in the town sued Middlefield arguing, again, that New York's OGSML preempted Middlefield's ordinance. Relying on *Norse*,⁵ the court disagreed and upheld the ordinance.⁶ In Pennsylvania, too, municipalities have used their zoning authority as allowed under that state's constitution.⁷

§ 29:85 Related obstacles to municipal authority

In some states, corporate influence has an outsized impact on state legislatures and pushes to increase state preemption of local control in the purported interest of a state-controlled unified system of regulation. For example, Florida SB 712—an amendment to Florida's Environmental Protection Act—passed in 2020 and was billed largely as a landmark environmental bill for the state envisioned as restoring water treatment standards and environmental protections for water systems in the state.¹ However, buried in the large regulatory bill was a late-stage amendment establishing state preemption of local rights based ordinances and charter amendments, such as the local laws discussed throughout this writing.² Following SB 712's adoption, environmentalists in the state filed numerous federal lawsuits challenging this state level preemption of local protection efforts.³

In Ohio, the state legislature included an effort to enact a statewide preemption of local environmental protection in an omnibus budget bill in 2019.⁴ Emails obtained in a FOIA request show that, weeks before a vote on the budget bill, Ohio Chamber of Commerce Director of Energy and Environmental Policy, Zack Frymier,

requested a meeting with Chairman Hoops of the Ohio House Finance Subcommittee on Agriculture, Development, and Natural Resources to discuss inclusion of preemption language in the final bill.⁵ Some activists have viewed this as a direct response to the Lake Erie Bill of Rights and related local ordinances throughout Ohio which seek to establish local control over natural resources.⁶

Additionally, Ohio recently faced a widely publicized legislative scandal—the Householder scandal—in which the Speaker of the Ohio House of Delegates, Larry Householder, and other state house members accepted bribes from energy corporations and lobbyists to pass favorable energy legislation.⁷ Although the FBI has arrested and is currently investigating Householder,⁸ he remains in the Ohio legislature.⁹

VII. ENVIRONMENTAL LAWS AND OIL AND GAS

A. NATIONAL ENVIRONMENTAL POLICY ACT

§ 29:86 Introduction

The National Environmental Policy Act (NEPA) applies to projects and other activities undertaken by private oil and gas companies in the United States in much the same way the law applies to the development of other private infrastructure, agriculture, and similar activity that qualifies as a “major federal action.”¹ Common examples of industry activity subject to NEPA include exploration and production of oil and gas resources on Federal lands and the Outer Continental Shelf, construction of interstate natural gas pipelines and oil and natural gas pipelines that cross Federal lands or international borders, and construction and operation of petroleum refineries and liquefied natural gas (LNG)² terminals. Accordingly, industry operations are subject to NEPA review decisions and consultations made by the Bureau of Land Management (BLM), the Bureau of Ocean Energy Management, the Department of Energy (DOE), the Environmental Protection Agency, the Federal Energy Regulatory Commission (FERC), the Department of State (DOS), the U.S. Fish and Wildlife Service, the National Marine Fisheries Service, the U.S. Army Corps of Engineers, and the U.S. Forest Service, among others.

Given the size and complexity of many industry activities, discrete projects may require multiple permits or authorizations from several federal agencies that would be subject to NEPA review, in addition to any required authorizations from state

[Section 29:86]

¹42 U.S.C. § 4332(2)(C); 40 C.F.R. § 1508.1(q) (2021); §§ 10:13 to 10:18 of this treatise.

²LNG is natural gas that has been cooled to -260° Fahrenheit, after which large-scale export facilities can load it into specialized tank vessels for overseas transport.

and local agencies.³ For example, the construction and operation of an LNG export facility may require, at a minimum, authorization from FERC to site and construct the facility,⁴ as well as authorization from DOE to export the LNG commodity,⁵ both of which may be subject to separate NEPA reviews. Depending on the type of project and whether it can rely on existing permitted infrastructure, such an export facility may also require NEPA-triggering permits to construct and operate interstate natural gas pipelines feeding the facility, permits under the Clean Water Act to dredge and fill waterways, and potentially many others.

The NEPA process to permit large infrastructure projects, including oil and gas projects, has had the potential to be complex and lengthy since the law's inception. In recent years, the process has grown even more complicated, owing to, among other factors, evolving regulations and guidance documents implementing NEPA issued by federal agencies that oversee oil and gas permitting, increased opposition to oil and gas projects nationwide, and increased litigation or the threat of litigation regarding the scope and adequacy of NEPA review.⁶ As a result, NEPA can present significant procedural hurdles to private companies in the form of lengthy permitting times at agencies, additional mitigation measures or other conditions placed on projects by agencies conducting NEPA reviews, and, in extreme cases, vacatur of permits, leases, or other authorizations by courts.

Part of the problem may be that NEPA, as currently drafted, is ill-equipped to properly address the nature of modern oil and gas projects in the 21st century. The text of the NEPA statute has not been amended since 1970, and its application to increasingly complex projects deploying new technologies and generating potentially adverse effects not foreseen by Congress has arguably grown more difficult for implementing agencies, the regulated community, affected stakeholders, and courts. In particular, whether the scope of NEPA reviews should include assessments of greenhouse gas emissions related to oil and gas projects has been a major source of uncertainty for over a decade.

§ 29:87 Role of White House Council on Environmental Quality in Oil and Gas Projects

As a formal matter, the Council on Environmental Quality (CEQ) established by NEPA has no specific role with respect to oil and gas projects. CEQ's original 1978 regulations and its recent 2020 amendments do not mention oil and gas, and the details of how to conduct NEPA reviews of proposed industry activity have been left to individual permitting agencies such as BLM and FERC. However, many of CEQ's guidance documents hold significance for certain oil and gas activities. For example, CEQ's 2014 "Effective Use of Programmatic NEPA Reviews" was intended to "address the general environmental issues relating to broad decisions, such as those establishing policies, plans, programs, or suite of projects [P]rogrammatic NEPA review provides the basis for decisions to approve such broad or high-level decisions such as identifying geographically bounded areas within which future proposed activities can be taken or identifying broad mitigation and conservation

³Several states have also enacted NEPA-like statutes applicable to industry activity, such as exploration and production, on state and private lands or that requires state authorization. *See, e.g.*, Cal. Pub. Res. Code §§ 21000, et seq. (California Environmental Quality Act); N.Y. Env'tl. Conserv. Law §§ 8 et seq. (New York State Environmental Quality Review Act); § 7:12 of this treatise.

⁴15 U.S.C. § 717b(e).

⁵15 U.S.C. § 717b(a) to (c).

⁶According to CEQ, from 2001 through 2013 alone, 1,499 actions raising NEPA claims were filed in federal courts. CEQ, "NEPA LITIGATION SURVEYS: 2001-2013," available at <https://ceq.doe.gov/docs/ceq-reports/nepa-litigation-surveys-2001-2013.pdf>.

measures that can be applied to subsequent tiered reviews.”¹ The guidance could apply to resource management planning decisions by BLM that govern the disposition of millions of acres of public lands under a single NEPA document, and increased use of high-level programmatic reviews in place of individual site-specific reviews could foreclose or limit disposition for oil and gas leases on individual parcels.²

In addition, CEQ has also grappled with how to address assessments of greenhouse gas emissions under NEPA in several guidance documents. A 2016 guidance document,³ originally proposed in 2010,⁴ provided information to agencies on quantification tools and how to weigh the impact of emissions when considering alternatives. This guidance was revoked in 2017.⁵ In 2019, CEQ issued a new, less-detailed guidance document addressing some of the same issues,⁶ but it was never finalized, and that too was revoked in early 2021.⁷ In the absence of coherent guidance from CEQ, individual agencies have been left to consider questions related to greenhouse gas emission assessments in NEPA reviews on their own, with the potential for conflicting answers for combusive or emitting oil and gas projects.

§ 29:88 Process overview for oil and gas projects

The first question in determining whether NEPA review is required for a proposed industry action is whether the authorization required for the action under other applicable statutes is a “major federal action.” While there is no specific test for oil and gas projects, as a practical matter, most new industry infrastructure development with a federal nexus (such as whether the activity occurs on Federal lands or waters or requires a permit or authorization from a Federal agency) will qualify. For example, if an oil and gas developer seeks to acquire a lease on onshore Federal lands to explore and drill for oil and gas deposits in the future, it typically must

[Section 29:87]

¹CEQ, “EFFECTIVE USE OF PROGRAMMATIC NEPA REVIEWS,” at 9–10 (Dec. 18, 2014), *available at* http://ceq.doe.gov/docs/ceq-regulations-and-guidance/Effective_Use_of_Programmatic_NEPA_Reviews_Final_Dec2014_searchable.pdf.

²The U.S. Supreme Court has favored limiting programmatic NEPA requirements even in the context of fossil fuel extraction on large swaths of Federal lands. For example, in *Kleppe v. Sierra Club*, 427 U.S. 390, 96 S. Ct. 2718, 49 L. Ed. 2d 576, 8 Env’t. Rep. Cas. (BNA) 2169, 6 Env’tl. L. Rep. 20532 (1976), the Court held that the Department of the Interior and other federal agencies “responsible for issuing coal leases, approving mining plans, and taking other actions to enable private companies and public to develop coal reserves on Federally owned or controlled land” were not required to issue a programmatic EIS for the entire Northern Great Plains region. *Kleppe v. Sierra Club*, 427 U.S. 390, 393, 96 S. Ct. 2718, 49 L. Ed. 2d 576, 8 Env’t. Rep. Cas. (BNA) 2169, 6 Env’tl. L. Rep. 20532 (1976). *Kleppe* reflects skepticism by the Court regarding programmatic reviews even for projects that share a number of factors in common, including location and type of activity. *See also* National Wildlife Federation v. Appalachian Regional Commission, 677 F.2d 883, 15 Env’t. Rep. Cas. (BNA) 1945, 11 Env’tl. L. Rep. 20386 (D.C. Cir. 1981) (promulgating factors for consideration of programmatic assessment).

purchase a lease from BLM. In order to dispose of leases, BLM must conduct a lease sale pursuant to the Mineral Leasing Act.¹ Lease sales are usually considered a “major federal action,” and BLM will determine what level of NEPA review applies to a particular proposed sale. In most cases, potential lease sales to oil and gas companies have been considered under a BLM Resource Management Plan (RMP), a land use planning document also subject to NEPA review, usually in the form of an Environmental Impact Statement (EIS). The specific lease sale under consideration is generally limited to a portion of the acreage that is part of the larger RMP, and may consist of dozens or even hundreds of individual leases.

The next step is for an agency to determine if any applicable categorical exclusions apply to the action under review.² Categorical exclusions are set by individual agencies. In the example of leasing public lands for oil and gas development, it is unlikely that any categorical exclusions would apply to any of the major steps in the process—development of the RMP, conducting a lease sale, and ultimately issuing a permit to drill.³ But BLM and other agencies have developed categorical exclusions applicable to industry activity for various reasons. DOE has promulgated categorical exclusions for LNG export authorizations,⁴ on the basis that approval of the export of the LNG commodity alone would only entail environmental impacts in the form of marine transportation, which DOE has historically found to be not significant.⁵ Other potential impacts related to LNG exports—such as those associated with the construction of new export facilities or combustion of LNG overseas—are outside of DOE’s authority to prevent.⁶

If no categorical exclusion applies to the proposed action, an agency will next determine whether to conduct a shorter, more concise Environmental Assessment (EA), or to proceed to a longer detailed EIS. Like with categorical exclusions, many agencies herd particular types of actions into one of these groups under regulations and guidance.⁷ As with any other action subject to NEPA review, the relevant agency determination at this stage is a Finding of No Significant Impact (FONSI). Actions for which a FONSI is issued conclude with an EA; otherwise, a complete EIS is conducted. For federal onshore oil and gas lease sales, BLM usually conducts an EA which can be “tiered” from the EIS accompanying the relevant RMP.

For larger and more complex oil and gas projects, many agencies may be involved in permitting different aspects of the project or consulting with permitting agencies on particular effects. When such projects require an EIS, practical and efficiency concerns may arise when determining which agency is in charge of preparing the EIS, as well as sequencing the timing of individual authorizations in a logical fashion to facilitate safe operations. In some cases, Congress has addressed this issue. For example, FERC has been statutorily designated as the “lead agency” for

⁷See, e.g., BUREAU OF LAND MGMT., NEPA HANDBOOK 70 (2008) (listing BLM actions that normally require an EIS).

such in-depth and interlocking reviews under its jurisdiction. FERC prepares the EIS for jurisdictional projects like interstate natural gas pipelines, and coordinates with other state and federal permitting agencies to the extent practicable.⁸ Historically, not every agency has been able to replicate this model due to statutory constraints, lack of interagency cooperation, or other reasons. To address these challenges (which are not exclusive to oil and gas projects), a 2017 Executive Order⁹ requires agencies to conduct reviews and issue decisions for “major infrastructure projects”¹⁰ under “One Federal Decision,” with a goal of reducing average NEPA review and permitting timelines to two years from the date of publication of a notice of intent to prepare an EIS.

Last, final agency actions related to oil and gas projects are subject to judicial review. For decades, challenges to oil and gas projects have focused on the adequacy of NEPA review accompanying a permit or authorization. Plaintiffs may challenge an agency EA on grounds that the agency should not have issued a FONSI and instead conducted a full EIS. They may also challenge the substance of an EA or EIS on grounds that it failed to consider certain environmental impacts or alternatives to the authorized action, including the “no action” alternative. A major theme of NEPA litigation challenging oil and gas projects in recent years is whether and to what extent the agency considered the effects of greenhouse gas emissions related to the project.

§ 29:89 Major NEPA issues for oil and gas projects

Oil and gas projects can encounter any number of changes, setbacks, and other issues throughout the review process—including after judicial review, where NEPA defects may be remanded to agencies to correct or, in some instances, provide grounds for vacatur. Some of the biggest hurdles encountered by project sponsors in recent years include the proper scope of consideration of environmental “effects,” the adequacy of alternatives considered, and agency mitigation measures imposed as a condition of authorization.

Effects Generally.¹ The U.S. Supreme Court has compared the relevant test for “effects” that must be considered in all NEPA reviews to the tort principle of “proximate cause.”² Further, the action under review must be “the legally relevant cause” of such effects.³ Thus, for example, an agency need not consider environmental effects of actions over which the agency has no control.⁴ In its original 1978 NEPA regulations, which were not significantly amended until 2020, CEQ directed agen-

⁴Pub. Citizen, 541 U.S. at 770 (“We hold that where an agency has no ability to prevent a certain effect due to its limited statutory authority over the relevant actions, the agency cannot be considered a legally relevant ‘cause’ of the effect.”); National Ass’n of Home Builders v. Defenders of Wildlife, 551

cies to consider three major categories of environmental effects in their NEPA reviews: (1) direct effects; (2) indirect effects; and (3) cumulative effects. The terms “direct,” “indirect,” and “cumulative” do not appear in the text of the relevant provisions of NEPA, which refer only to “environmental impact[s]” and “adverse environmental effects” generally.⁵ The 2020 CEQ regulations eliminate these three categories, and direct agencies to consider only those effects that are proximately caused by the action under review *and* for which the agency action is the legally relevant cause.⁶

Prior to the 2020 regulations entering into effect, a significant body of case law had considered the proper scope of assessing the direct, indirect, and cumulative effects of oil and gas projects, and many cases concerning projects reviewed under the 1978 regulations are still awaiting decision.⁷ In addition, the durability of the 2020 regulations, particularly the changes to the definition of “effects,” is in some doubt. The regulations were challenged in five separate cases pending in four federal courts, although only one court reached a decision dismissing a challenge for lack of justiciability.⁸ The Biden Administration also announced that it would revisit the 2020 regulations.⁹ For these reasons, an examination of major NEPA cases involving oil and gas infrastructure under the 1978 regulations remains instructive.

Direct vs. Indirect Effects: Some NEPA challenges to oil and gas infrastructure, such as oil and natural gas pipelines and LNG export facilities, have asserted that FERC must consider the “indirect” effects of permitting such a project in the form of emissions and other impacts of hydrocarbon extraction “upstream,” and combustion “downstream,” of the project under review—*i.e.*, the environmental effects of drilling wells feeding into the pipeline or export facility, as well as combustion of the product after transmission or export. As the Supreme Court has explained, the concept of causation is central to understanding an agency’s obligation under NEPA to consider any effect, regardless of whether it is deemed direct or indirect. While an effect may bear some relationship to a Federal action, that is not the test for inclusion in a NEPA review. Effects must only be considered when there is a “reasonably

U.S. 644, 667, 127 S. Ct. 2518, 168 L. Ed. 2d 467, 64 Env’t. Rep. Cas. (BNA) 1513 (2007) (same).

⁵42 U.S.C. § 4332(2)(C)(i) to (ii).

⁶Both elements of this test must be satisfied, and CEQ’s 2020 definitional changes codify earlier case law on the issue. *See, e.g.*, *City of Shoreacres v. Waterworth*, 420 F.3d 440, 452–54, 60 Env’t. Rep. Cas. (BNA) 2068, 35 Env’t. L. Rep. 20162 (5th Cir. 2005) (explaining that it does not reach the issue of whether the agency’s action is the legally relevant cause of the effect because the relevant effect is not reasonably foreseeable); *Border Power Plant Working Group v. Department of Energy*, 260 F. Supp. 2d 997, 1016–17 (S.D. Cal. 2003) (finding that although it was reasonably foreseeable that two turbines would use transmission line at issue, only one turbine was the effect of DOE’s approval of the transmission line and, therefore, DOE only was required to evaluate the environmental effects of that turbine in its NEPA analysis).

⁷For pending NEPA cases concerning the assessment of indirect effects of Federal oil and gas leases, *see, e.g.*, *WildEarth Guardians v. Bernhardt*, No. 20-56 (D.D.C.) (challenge to approval of 2,067 oil and gas leases across five western states); *WildEarth Guardians v. Bernhardt*, No. 19-505 (D.N.M.) (challenge to 210 federal oil and gas leases); *Diné Citizens Against Ruining our Environment v. Bernhardt*, No. 19-703 (D.N.M.) (alleged NEPA violations in approving 255 APDs authorizing hydraulic fracturing in the Mancos Shale formation in the San Juan Basin); *Ctr. for Biological Diversity v. BLM*, No. 19-2869 (D. Colo.) (challenge to Grand Junction Field Office’s RMP and accompanying EIS under NEPA for allegedly failing to consider GHG emission-related impacts and alternatives); *Rocky Mtn. Wild v. Bernhardt*, No. 18-2468 (D. Colo.) and *Rocky Mtn. Wild v. Bernhardt*, No. 19-929 (D. Utah) (challenge to 121 federal oil and gas leases, severed into two cases); *WildEarth Guardians v. Bernhardt*, No. 16-1724 (D.D.C.) (challenge to 397 federal oil and gas leases for allegedly failing to consider emission-related impacts).

⁸*Wild Virginia v. Council on Environmental Quality*, 2021 WL 2521561 (W.D. Va. 2021).

⁹“Deadline for Agencies To Propose Updates to National Environmental Policy Act Procedures,” 86 Fed. Reg. 34154, 34156 (June 29, 2021) (“CEQ will initiate further rulemaking to propose amendments to the 2020 Rule to revise the NEPA implementing regulations . . .”).

close causal relationship” that would satisfy a proximate cause analysis under tort law. While some commentators have argued for broader consideration of indirect effects under NEPA,¹⁰ without some rational boundary, it would be possible to say that there are an infinite number of indirect effects from an action by an agency, making it impossible to consider all such effects and for the applicant to mitigate all such effects. A boundary must be set, and the Supreme Court has said that boundary is proximate cause.

For “upstream” effects, litigants challenging pipeline and export projects have argued that the development of oil and gas resources feeding into an infrastructure project must be considered in permitting decisions. Notably, this question formed the nucleus of legal arguments made in opposition to the permitting of the controversial Keystone XL pipeline carrying heavy crude oil from Alberta’s oil sands into the United States. Opponents of the project sought a full assessment of development of higher-emitting oil sands projects in Canada as part of the NEPA review for the cross-border permit required from DOS to build the pipeline. DOS has permitted cross-border pipelines since long before the Keystone XL controversy emerged, and courts have upheld NEPA reviews for such pipelines that did not examine “upstream” effects, even of allegedly higher-emitting hydrocarbon sources. In *Sierra Club v. Clinton*,¹¹ a district court considered whether DOS was required to assess impacts associated with development of Canadian oil sands in its NEPA analysis accompanying a cross-border permit for the Alberta Clipper Pipeline.¹² *Sierra Club* filed suit alleging that DOS’s NEPA analysis was insufficient because it did not take into account the environmental impacts of the Canadian oil sands development.¹³ But, citing *Public Citizen*, the court found that DOS’s actions were not the legally relevant cause of the environmental effects at issue, explaining that because the pipeline was not the only cross-border pipeline that would transport Canadian oil sands, this particular permit could not be the proximate cause of additional oil sands development.¹⁴

In the context of “downstream” effects, courts have arrived at different answers regarding when effects like combustion must be considered, depending on the facts of individual projects. For example, in *Sierra Club v. FERC*, the D.C. Circuit required FERC to consider the greenhouse gas emissions generated by a natural gas power plant fed by the Sabal Trail natural gas pipeline as part of the pipeline’s EIS.¹⁵ Even though the facility was beyond the footprint of the project and outside of FERC’s jurisdiction, the court found the plant’s emissions to be reasonably foreseeable and reasonably related to the project because it was the primary outlet for the pipeline and the reason for its construction. But under different facts, the D.C. Circuit has declined to require these assessments. In *Sierra Club v. FERC*, a case challenging the permitting of the Corpus Christi LNG export facility, the court held that FERC’s “NEPA analysis did not have to address the indirect effects of the anticipated export of natural gas . . . because the Department of Energy, not the Commission, has sole authority to license the export of any natural gas.”¹⁶

While the scope of “indirect” effects assessments in NEPA reviews of oil and gas

permits is far from settled, as a general matter, reviewing courts have tended to tie any requirements to assess particular indirect effects to the individual facts of a project, rather than send agencies on endless efforts to uncover any potential effects. This case-by-case inquiry, however, has been less easily applied in the context of “cumulative effects.”

Cumulative Effects. Identifying the proper scope for assessment of “cumulative effects” has been a particularly difficult issue for CEQ and courts to address in recent years. As CEQ itself has pointed out, determining what a cumulative effect is has led to “confusion,” “been interpreted expansively[,]” and “result[ed] in excessive documentation about speculative effects[.]”¹⁷ Generally speaking, cumulative effects in the context of oil and gas projects could include the effects of historical oil and gas well construction in a particular area and, potentially, the incremental effects of new permitting decisions on global climate change.

As one federal court has recently suggested, cumulative effects in the context of Federal oil and gas leasing might be so broad as to require assessments of the effects of all individual leasing decisions whenever BLM seeks to hold a lease sale.¹⁸ In that court’s view, BLM must “quantify the emissions from each leasing decision—past, present, or reasonably foreseeable—and compare those emissions to regional and national emissions, setting forth with reasonable specificity the cumulative effect of the leasing decision at issue.”¹⁹ This would be a herculean task for BLM to undertake prior to holding any individual lease sale. While several other courts have addressed this question in the oil and gas context, the agencies at issue had made at least some attempt to consider emissions-related cumulative effects, and were not directed to do more.²⁰ But no Court of Appeals has affirmed the expansive “past, present, or reasonably foreseeable” cumulative effects requirement in the oil and gas context, while some have explicitly rejected it in the context of LNG export facilities.²¹ Even more than assessments of indirect effects, which can more easily be tied to specific factual considerations in the context of discrete projects, it is difficult to divine useful guideposts for what cumulative effects must be reviewed in the context of oil and gas projects—which is perhaps why CEQ no longer requires their consideration.

Attempts to require agencies to consider wider scopes of “indirect” and “cumulative” effects in the context of challenges to oil and gas infrastructure in recent years clearly reflect concerns over the effects of global climate change. Such concerns are rooted in active and worthy public policy conversations. However, as CEQ has said,

“NEPA is a procedural statute”²² that requires the identification and analysis of a proposed action’s impact to environmental resources.²³ It does not mandate that certain outcomes be achieved or prohibit any impacts to environmental resources.²⁴ As further evidenced by CEQ’s tumultuous history in issuing durable guidance regarding assessments of greenhouse gas emissions in NEPA reviews, the current statute may simply be ill-suited to meaningfully address such a titanic challenge.²⁵

Alternatives. Agency actions facilitating oil and gas project development are also frequently challenged on grounds that agencies did not consider a sufficient range of alternatives, including a “no action” alternative, or that the rejection of alternatives was not sufficiently justified. In *Citizens for a Healthy Community v. BLM*, a challenge to oil and gas well development on Federal lands in Colorado, the court found that BLM’s analysis of alternatives complied with NEPA where the agency considered alternatives proposed by plaintiffs regarding a phased development approach, and provided reasoned explanations for their rejection.²⁶ However, in *Wilderness Workshop v. BLM*, the same court found that BLM failed to adequately consider a “no action” alternative, even where BLM had considered scenarios in which development would have been minimal.²⁷

Mitigation. As the Supreme Court has noted, “one important ingredient of an EIS is the discussion of the steps that can be taken to mitigate adverse environment consequences.”²⁸ The Court went on to explain that “[t]here is a fundamental distinction, however, between a requirement that mitigation be discussed in sufficient detail to ensure that environmental consequences have been fairly evaluated, on the one hand, and a substantive requirement that a complete mitigation plan be actually formulated and adopted on the other.”²⁹ Citing *Methow Valley*, appellate courts have routinely confirmed that there is no substantive obligation to adopt mitigation measures identified in an EIS,³⁰ and this rule also applies in the oil and gas context.

In addition, extractive projects have also encountered mitigation measures imposed by agencies but over which the reviewing agency has no statutory authority or even particular expertise.³¹ In response, CEQ’s 2020 regulations impose new

requirements for agency mitigation to include an express statutory basis.³² Changes to the definition of “mitigation” make clear that mitigation must have an actual nexus to the proposed action and be limited to those actions that have an environmental effect while excluding those that do not.³³

§ 29:90 Legislative proposals

In part as a response to the challenges posed by NEPA review of oil and gas projects, several proposals to amend NEPA or create parallel procedures were considered in the 116th Congress. One proposal would have required agencies to more directly consider issues related to environmental justice, including how greenhouse gas emissions and global climate change uniquely affect disadvantaged communities, both under NEPA and under a new “Community Impact Report.”¹ Another would have streamlined and codified the “one federal decision” concept for projects requiring interlocking reviews by multiple agencies.² Amendments to NEPA are likely to be considered again in the 117th Congress.

B. RESOURCE CONSERVATION AND RECOVERY ACT—THE REGULATION OF WASTE GENERATED AT OIL AND GAS EXPLORATION AND PRODUCTION FACILITIES

§ 29:91 Introduction

This section discusses the application of the Resource Conservation and Recovery Act (RCRA)¹ to wastes generated at oil and gas production facilities. Contrary to popular belief, RCRA applies. There is no exemption under RCRA that excludes *all* waste generated at oil and gas production facilities. While wastes generated from the exploration, development, or production of crude oil or natural gas (referred to herein as E&P Waste) are excluded from the definition of “hazardous wastes” under RCRA, those wastes are “solid wastes” and remain subject to RCRA and state law regulating the management of solid waste. Wastes that are not considered E&P Waste are also solid waste and may be regulated as hazardous waste if they contain listed hazardous waste or exhibit a hazardous waste characteristic. Those wastes must be properly managed and disposed.

To assist oil and gas production facilities, this chapter summarizes: (1) the statutory and regulatory exemptions for E&P Waste; (2) what wastes generated at oil and gas production facilities the U.S. Environmental Protection Agency (EPA) considers to be subject to regulation as a hazardous waste; and (3) how various states regulate E&P Waste. Generally, most of the waste generated at oil and gas production facilities should be E&P Waste and exempt from regulation as a hazardous waste under RCRA and delegated state programs.

1174 (D. Colo. 2014) (U.S. Forest Service, part of the Department of Agriculture, could not rely on development of future coal mining mitigation technology to avoid disclosure of impacts in NEPA review).

§ 29:92 The Resource Conservation and Recovery Act

RCRA, originally passed in 1976, establishes a framework governing the generation, treatment, storage, and disposal of both hazardous and non-hazardous solid wastes under Subtitles C and D respectively.¹ RCRA charged EPA with developing and promulgating criteria used to identify and list hazardous wastes to be regulated under RCRA Subtitle C.² RCRA authorizes EPA to delegate the primary responsibility of implementing the RCRA hazardous waste program to individual states in lieu of EPA.³ Many states have also been authorized to implement additional parts of the RCRA program that EPA has since promulgated including corrective action, land disposal restrictions, and underground storage tanks. State RCRA programs must be at least as stringent as the federal requirements, but states can adopt more stringent requirements.

1. The Exploration and Production Waste Statutory Exemption

§ 29:93 History of the exemption

Following the passage of RCRA, EPA in 1978 published a proposed rule indicating categories of wastes the agency deemed “hazardous” and identifying the need for a separate regulatory scheme for (E&P Waste).¹ The proposed regulations recognized “some portion of certain very large volume exploration and production wastes will be hazardous”² under the statutory definition, which will subject the wastes to the authority of Subtitle C. Instead of subjecting large quantities of E&P Waste to Subtitle C, EPA instead suggested regulating the wastes as “special wastes” with less stringent requirements.³ The proposed regulations highlighted many implications of regulating E&P Waste under Subtitle C, including the cost to the energy industry, the precedential nature of granting special treatment to certain industries, the possible interference with other applicable federal laws, and a fear of delegating too much authority to EPA.⁴

In response to the proposed rulemaking, Congress introduced legislation to determine whether and how these wastes should be regulated. Because it appeared that Congress would act, EPA temporarily excluded these wastes from the final hazardous waste regulations, stating that “this exclusion will be revised, if necessary, to conform to the legislation which is ultimately enacted.”⁵

§ 29:94 The Bentsen Amendment

Through the Solid Waste Disposal Act Amendments of 1980, Senator Lloyd Bentsen of Texas sponsored an amendment exempting oil, gas, and geothermal E&P Wastes from EPA’s hazardous waste regulatory authority.¹ Colloquially referred to as “Bentsen wastes,” the amendment exempts “drilling fluids, produced waters, and

other wastes associated with the exploration, development, or production of crude oil or natural gas or geothermal energy” from regulation as hazardous wastes under Subtitle C of RCRA until EPA studied and, after public hearing and opportunity for comment, determined regulation is warranted.² The amendment placed an additional limit on EPA authority: any proposed hazardous waste regulations governing Bentsen wastes must be approved by both Houses of Congress prior to taking effect.³ It is important to note the Bentsen amendment only shields E&P Wastes from regulation as a hazardous waste under Subtitle C of RCRA. E&P Wastes are still considered solid wastes and remain subject to regulation under Subtitle D of RCRA and states are not restricted from imposing more stringent requirements on the management and disposal of E&P Waste.

The legislative history of the Bentsen amendment provides insight into which wastes do and do not fall within the scope of the amendment. While “drilling fluids” and “production wastes” are relatively straight forward terms, Congress included the term “other wastes associated” to cover “waste materials intrinsically derived from the primary field operations associated with exploration, development, or production of crude oil, natural gas, or geothermal energy.”⁴ This language differentiates “exploration, development, and production operations from transportation (from the point of custody transfer or of production separation and dehydration) and manufacturing operations.”⁵ In addition, Congress directed EPA to study the impact on the environment, human health, and the economy of regulating Bentsen wastes. RCRA tasks EPA to specifically consider:

- (A) the sources and volume of discarded material generated per year from such wastes;
- (B) present disposal practices;
- (C) potential danger to human health and the environment from the surface runoff or leachate;
- (D) documented cases which prove or have caused danger to human health and the environment from surface runoff or leachate;
- (E) alternatives to current disposal methods;
- (F) the cost of such alternatives; and
- (G) the impact of those alternatives on the exploration for, and development and production of, crude oil and natural gas or geothermal energy.⁶

In 1987, EPA submitted a report to Congress summarizing its studies in compliance with the Bentsen amendment. EPA concluded that regulation of Bentsen wastes under Subtitle C was not warranted. According to EPA, regulation under Subtitle C would be “logistically difficult to enforce and could pose a substantial financial burden on the oil and gas industry.”⁷ EPA also concluded that the potential hazards posed by E&P wastes are relatively low and best addressed through existing federal and statute regulations.⁸ The report included a list of wastes the agency considered exempt under the Bentsen amendment, as well as factors to help industry

members determine if a waste fits into the exemption.⁹ EPA published its findings in 1988, elaborating that Subtitle C regulations present an “unusually large number of highly detailed statutory requirements” that would be too costly and unnecessary for the safe management of E&P Waste.¹⁰ Since the initial determination, EPA has reviewed the need for E&P Waste regulation under Subtitle C and consistently found no such regulation is necessary.¹¹

2. Applying the Exploration and Production Waste Statutory Exemption

§ 29:95 The Bentsen Amendment—EPA Guidance on categorizing E&P waste

Any person who generates a solid waste must determine whether it is a hazardous waste and whether it falls within the E&P Waste statutory exemption. The procedure for making this determination is both important and complex.¹ The statutory exemption of E&P Waste does not specifically define “drilling water, production wastes, and other wastes associated with the exploration, development, or production of crude oil or natural gas or geothermal energy” covered by the exemption.² While EPA incorporates the statutory exemption into its regulations excluding certain types of solid waste as hazardous waste,³ EPA has never promulgated rules defining these terms.

EPA has issued a number of guidance documents categorizing E&P Waste as exempt and non-exempt with EPA paying particularly close attention to “primary field operations” as a means of differentiating exempt E&P Waste from waste generated during transport or from downstream manufacturing and processing activities. In the 1987 report to Congress, EPA indicated that “primary field operations” include “the primary, secondary, and tertiary production of oil or gas” and *not* wastes generated by transportation.⁴ Exempt E&P Wastes must also be “uniquely associated with exploration, development, and production” operations. EPA guidance defines this as waste “generated from a material or procedure that is necessary to locate and produce crude oil or natural gas. . . .[or] only occurs during the exploration and production of crude oil or natural gas.”⁵ This means that not all wastes produced during the exploration, development and production of crude oil or natural gas are automatically exempt from regulation as hazardous waste.⁶

For crude oil exploration, development and production operations, EPA guidance

⁹“Management of Wastes from the Exploration, Development, and Production of Crude Oil, Natural Gas and Geothermal Energy,” EPA/530-SW-88-003 (December 1987), at VIII-11, II-18, *hereinafter* (“Report to Congress”).

⁴Report to Congress at II-19.

⁵*Exemption of Oil and Gas Exploration and Production Wastes from Federal Hazardous Waste Regulations*, EPA530-K-01-004 (2002) at 22, *hereinafter* (“E&P Guidance”).

⁶For example, wastes such as solvents used to clean surface equipment or machinery is not exempt, because these same cleaning activities are not uniquely associated with the exploration and production of crude oil or natural gas. However, if the same cleaning solvent were used in a well, it would be exempt because the well is unique to production operations. *Exemption of Oil and Gas Exploration and Production Wastes from Federal Hazardous Waste Regulations*, EPA530-K-01-004 (2002) at

indicates “primary field operations” include “activities occurring at or near the wellhead, but prior to the transport of oil from an individual field facility or a centrally located facility to a carrier for transport to a refinery.”⁷ Specific examples of these activities include “crude oil processing, such as water separation, demulsifying, degassing, and storage tank batteries *associated with a specific well or wells*.”⁸ This exemption does not apply to wastes created by the transport of product from the exploration and production sites or downstream refining, but does cover wastes generated directly by exploration and production operations which are then moved off-site for further treatment or disposal. As EPA explained in its 1993 guidance, “wastes derived from the treatment of an exempt waste, including any recovery of product from an exempt waste, generally remain exempt from the requirements of RCRA Subtitle C.”⁹

For natural gas exploration, development and production operations, “primary field operations” include “those activities occurring at or near the wellhead or at the gas plant but prior to that point at which the gas is transferred from an individual field facility, a centrally located facility, or a gas plant to a carrier for transport to market.”¹⁰ Because natural gas typically requires processing to remove impurities before entering the sales line, EPA considers gas plants part of primary field operations regardless of their distance from the wellhead.¹¹

To assist industry members in interpreting these definitions, EPA has provided two “rule of thumb” questions to consider when categorizing E&P Wastes:

1. Has the waste come from down-hole, i.e., was it brought to the surface during crude oil or natural gas exploration, development and production operations?
2. Has the waste otherwise been generated by contact with the oil and gas production stream during the removal of produced water or other contaminants from the product?¹²

If the answer to *either* of these questions is yes, the waste is likely a Bentsen waste exempt from regulation under Subtitle C of RCRA.

§ 29:96 EPA List of Exempt and Non-Exempt E&P Waste

In addition to providing a framework for case-by-case waste determination, EPA has identified wastes the agency categorizes as exempt and non-exempt:¹

18, *hereinafter* (“E&P Guidance”).

⁷*Exemption of Oil and Gas Exploration and Production Wastes from Federal Hazardous Waste Regulations*, EPA530-K-01-004 (2002) at Report to Congress at II-18, *hereinafter* (“E&P Guidance”).

¹¹E&P Guidance at 7.

¹²E&P Guidance at 8.

[Section 29:96]

¹E&P Guidance at 10–11.

Exempt Wastes	Non-Exempt Wastes
<ul style="list-style-type: none"> • Produced water • Drilling fluids • Drill cuttings • Rigwash • Drilling fluids and cuttings from offshore operations disposed of onshore • Geothermal production fluids • Hydrogen sulfide abatement wastes from geothermal energy production • Well completion, treatment, and stimulation fluids • Basic sediment, water, and other tank bottoms from storage facilities that hold product and exempt waste • Accumulated materials such as hydrocarbons, solids, sands, and emulsion from production separators, fluid treating vessels, and production impoundments • Pit sludges and contaminated bottoms from storage or disposal of exempt wastes • Gas plant dehydration wastes, including glycol-based compounds, glycol filters, and filter media, backwash, and molecular sieves • Workover wastes • Cooling tower blowdown • Gas plant sweetening wastes for sulfur removal, including amines, amine filters, amine filter media, backwash, precipitated amine sludge, iron sponge, and hydrogen sulfide scrubber liquid and sludge • Spent filters, filter media, and backwash (assuming the filter itself is not hazardous and the residue in it is from an exempt waste stream) • Pipe scale, hydrocarbon solids, hydrates, and other deposits removed from piping and equipment prior to transportation • Produced sand • Packing fluids • Hydrocarbon-bearing soil • Pigging wastes from gathering lines • Wastes from subsurface gas storage and retrieval • Constituents removed from produced water before it is injected or otherwise disposed of • Liquid hydrocarbons removed from the production stream but not from oil refining • Gases from the production stream, such as hydrogen sulfide and carbon dioxide, and volatilized hydrocarbons • Materials ejected from a producing well during blowdown • Waste crude oil from primary field operations • Light organics volatilized from exempt wastes in reserve pits, impoundments, or production equipment 	<ul style="list-style-type: none"> • Unused fracturing fluids or acids • Gas plant cooling tower cleaning wastes • Painting wastes • Waste solvents • Oil and gas service company wastes such as empty drums, drum rinsate, sandblast media, painting wastes, spent solvents, spilled chemicals, and waste acids • Vacuum truck and drum rinsate from trucks and drums transporting or containing non-exempt waste • Refinery wastes • Liquid and solid wastes generated by crude oil and tank bottom reclaimers • Used equipment lubricating oils • Waste compressor oil, filters, and blowdown • Used hydraulic fluids • Waste in transportation pipeline related pits • Caustic or acid cleaners • Boiler cleaning wastes • Boiler refractory bricks • Boiler scrubber fluids, sludges, and ash • Incinerator ash • Laboratory wastes • Sanitary wastes • Pesticide wastes • Radioactive tracer wastes • Drums, insulation, and miscellaneous solids

Many of the waste determinations identified by EPA provide clarity to the limits of the E&P Waste exemption. For example, unused products, such as unused fracking fluids, waste solvents or used oil from equipment, are *not* exempt from regulation as a hazardous waste if disposed because they are not “uniquely associated” with the exploration and production operations.² Similarly, the exemption of pigging wastes stemming from *gathering* lines but not *transportation* lines emphasizes the difference between field and transportation activities. These slight distinctions highlight the importance EPA places on the waste being both associated with a primary field operation and uniquely associated with the exploration, development, or production of crude oil or natural gas. Before disposing of any waste generated at exploration and production sites, operators should carefully review EPA and state applicable guidance to ensure they are managing the waste appropriately. The failure to properly manage and dispose of the waste can lead to significant civil penalties and potentially criminal sanctions.

§ 29:97 E&P Waste Mixtures

In determining a waste’s status as exempt or non-exempt, EPA guidance also highlights the dangers of mixing exempt E&P Waste with other waste which may not fall into the exemption.¹ Recall, the Bentsen amendment only exempts E&P Wastes from regulation as hazardous wastes under RCRA Subtitle C; it does not ad-

²E&P Guidance at 19.

[Section 29:97]

¹E&P Guidance at 13–17.

dress mixtures of exempt and non-exempt waste. EPA, however, maintains authority to regulate mixtures of exempt and non-exempt wastes to ensure protection of human health and the environment. Three possible mixtures implicate the E&P Waste statutory exemption:

1. When an exempt E&P Waste is mixed with another exempt waste or a non-hazardous waste, the mixture remains exempt.
2. When an exempt E&P Waste is mixed with a non-exempt, characteristic hazardous waste, and the mixture does not exhibit any hazardous characteristic exhibited by the non-exempt waste, the mixture remains exempt.² However, if the mixture exhibits a hazardous characteristic exhibited by the non-exempt characteristic waste, the waste is considered a non-exempt characteristic hazardous waste and subject to RCRA Subtitle C.
3. When an exempt E&P Waste is mixed with a listed hazardous waste, the mixture is considered a listed hazardous waste and subject to RCRA Subtitle C.³

Operators of oil and gas production facilities and gas processing facilities need to be careful not to mix waste streams or could risk losing the Bentsen exemption all together. Even small amounts of listed hazardous wastes (spent solvents, lubricants or unused fracking fluids) is enough to lose the exemption. When bringing chemicals or other products to the site, a good rule of thumb is to separately manage those chemicals and products.

§ 29:98 Regulation of E&P Waste under RCRA

The Bentsen amendment, while excluding E&P Wastes from regulation as hazardous wastes under RCRA Subtitle C, did not extend the exemption to any other provisions of RCRA. Because the exemption only applies to RCRA Subtitle C, all E&P Waste which meet the definition of “solid wastes” remain subject to regulation under RCRA Subtitle D as well as other provisions under RCRA.¹ Subtitle D regulations typically impose less stringent requirements on waste management.²

RCRA defines “solid waste” as “any garbage, refuse, sludge from a waste treatment plant, water supply treatment plant, or air pollution control facility and other discarded material, including solid, liquid, semisolid, or contained gaseous material resulting from industrial, commercial, mining, and agricultural operations, and from community activities.”³ EPA interprets this definition as “any discarded material that is not excluded under § 261.4(a).”⁴ RCRA Subtitle D bans open dumping of solid wastes and sets minimum federal criteria for waste disposal methods.⁵ The D.C. Circuit in *American Iron and Steel Institute v. EPA* found that E&P Wastes are only exempt from regulation as “hazardous,” because exempting the wastes from *all* provisions of RCRA would “elevate Bevill-Bentsen wastes to a privileged position

²Note that EPA has taken the position that mixing non-hazardous or exempt waste with characteristic hazardous waste may be considered treatment for purposes of EPA’s hazardous waste regulations and could separately require a permit.

³E&P Guidance at 17.

[Section 29:98]

above all other nonhazardous solid wastes.”⁶

Improper management of E&P Waste can trigger additional RCRA provisions, including RCRA citizen suit provisions and corrective action in addition to claims arising under state law. RCRA § 7002 states that:⁷

Any person may commence a civil action on his own behalf:

against any person . . . who is alleged to be in violation of any permit, standard, regulation, condition, requirement, prohibition, or order which has become effective pursuant to this chapter; or

against any person . . . and including any past or present generator, past or present transporter, or past or present owner or operator of a treatment, storage, or disposal facility, who has contributed or who is contributing to the past or present handling, storage, treatment, transportation, or disposal of any **solid** or hazardous waste which may present an imminent and substantial endangerment to health or the environment.⁸

The citizen suit provisions are not limited to only the handling and management of hazardous wastes.⁹ Further, courts have liberally interpreted the terms “imminent and substantial endangerment to health or the environment.”¹⁰ Courts have the authority to grant injunctive relief and can award costs and fees.¹¹

In addition, RCRA § 3004(u) requires “corrective action for all releases of hazardous waste or constituents from any solid waste management unit at a facility seeking a permit.”¹² The D.C. Circuit held in *American Iron and Steel* that because this provision pertains to hazardous *constituents* as well as hazardous waste, the provision applies to constituents which migrated from E&P Waste.¹³

¹³*American Iron & Steel*, 886 F.2d at 395.

A major motivating factor in the Bentsen amendment exemption for E&P Waste was the state and federal regulations existing at the time Congress passed the amendment. Under RCRA, states may implement their own waste management programs so long as those programs are as stringent as the federal regulations.¹ States may adopt more stringent requirements if they desire. As part of the decision not to regulate E&P Waste under RCRA Subtitle C, EPA relied on the state regulatory programs which manage E&P Waste.

In 2019, EPA re-visited state regulation of E&P Wastes to ensure state regulations adequately address the technological developments in the field of hydraulic fracturing.² In its study, EPA reviewed regulations from 28 of the 34 states with reported production of oil and gas, as tracked by the Energy Information Administration.³ EPA found that the 11 highest oil and gas producing states account for 90% of the United States oil and gas production and,⁴ as such, have regulatory programs tailored specifically to E&P Waste. EPA found the remaining states generally have more general programs addressing E&P Waste under the framework of other solid wastes. As further discussed in the 2019 State Report, the majority of high production states regulate E&P Waste management and disposal through imposing: protection of groundwater, surface water, floodplains and endangered species; waste management location restrictions and requirements to protect these resources; storage tank requirements including construction, containment and monitoring; pit construction, operation, and closure requirements; spill notification requirements and corrective action requirements; restrictions or controls on venting or flaring natural gas; treating produced water prior placement in produced water pits; promoting proper reuse and recycling including beneficial re-use and land application; testing of wastes prior to disposal including testing for radionuclides and radioisotopes; and waste minimization and best practices.⁵

A comprehensive review of the state regulations for managing E&P Waste is beyond the scope of this Chapter. Oil and gas practitioners should carefully review their respective state laws regarding the management of E&P Waste. As noted above, non-exempt wastes are subject to RCRA Subtitle C and must be properly characterized, managed, and disposed.

§ 29:100 Applicability of additional federal statutes

RCRA is not the only statutory scheme which governs E&P Wastes, and E&P Waste is not exempt from regulation by alternative federal statutes simply because they are exempt from regulation as a hazardous waste. Owners and operators can be held liable under the Oil Pollution Act for releases of E&P Waste, including damages to natural resources.¹ E&P wastes may also be subject to the Clean Water Act's National Pollutant Discharge Elimination System permitting requirements as they pertain to the release of a pollutant from a point source into a water of the United

States;² and the Safe Drinking Water Act's underground injection control program.³

§ 29:101 Conclusion

EPA continues to exempt E&P Waste from regulation under RCRA Subtitle C. While EPA has released limited guidance on waste categorization, state regulations continue to form the basis of E&P Waste regulation.

C. CLEAN WATER ACT

Water is both an integral part of oil and gas operations and a produced waste. Produced water contains TDS, chloride, bromide, metals, and radioactive materials that may be harmful to human and environmental health.¹ The Clean Water Act (CWA) and its state proxy programs govern discharges of pollutants into the “waters of the United States,” including industrial wastewater, stormwater, and runoff from construction activities from oil and gas operations.²

§ 29:102 Section 402—NPDES Regulation (33 U.S.C. § 1342)

Of the regulated oil and gas wastes, *produced water* is the largest source by volume. Produced water is the fluid or brine “brought up by the hydrocarbon-bearing strata during the extraction of oil and gas and includes, where present, formation water, injection water, and any chemicals added downhole or during drilling, production or maintenance processes.”¹ The ratio and chemical makeup of produced water can vary drastically from formation to formation. Most of this water is regulated under the Safe Drinking Water Act because it is disposed of in underground injection wells used to recover more oil.² The portions of produced water disposed into surface waters or sent to treatment facilities are regulated under CWA § 402.³

§ 29:103 State programs

States may administer their own NPDES permit programs and submit them to the EPA for approval.¹ As of March 2021, 46 states and the Virgin Islands have been delegated the authority to administer at least a partial NPDES program. New

¹PRODUCED WATER REPORT, *supra* note 5, at 16. In Massachusetts, New Hampshire, New Mexico, Washington D.C., U.S. territories, and federal and tribal trust lands the EPA issues the NPDES permits. All other have states have state entities that have been delegated by the EPA to issue their

Mexico, Massachusetts, New Hampshire, and Washington, D.C. do not have an authorized state program. Oklahoma and Texas have partial programs, which do not include permitting for activities associated with the exploration, development, or production of oil, gas, or geothermal resources, including transportation of crude oil or natural gas by pipeline. The EPA is the permitting authority for these activities in Texas and Oklahoma.² No Tribe currently has TAS approval to operate the NPDES permit program.³

§ 29:104 NPDES Permits

NPDES permits can be issued individually to authorize and establish regulatory controls from a single facility, or they can be issued generally to permit discharges from multiple facilities with similar operations and/or pollutants.¹ General permits are written to cover one or more categories or subcategories of discharges, sludge use, disposal practices, or facilities described in the permit.² An individual permit may be required if the discharger is a significant pollutant contributor, a status which is determined by considering: (1) the location of the discharge with respect to waters of the United States; (2) the volume of the discharge; (3) the quantity and nature of the pollutants discharged; and (4) other relevant factors.³ NPDES regulation specifically directs the Regional Administrator to issue general permits to offshore oil and gas facilities, but this is not applicable to state programs.⁴ Further, where the offshore facility is in an area of biological concern, for which separate permit conditions are required, EPA may issue separate general permits, individual permits, or both to accommodate any additional required permit conditions.⁵ The Regional Administrator always has the ability to require an individual permit.⁶

A NPDES permit will specify both narrative and numerical limits on one or more regulated pollutants determined by technology- and water-quality-based standards.⁷ First, the permit writer must determine a pollutant's minimum discharge standard or effluent limitation guidelines (ELGs).⁸ This is done by identifying the best available technology that is economically achievable for that industry and setting regulatory requirements based on the performance of that technology.⁹ Different levels of control are established based on whether the pollutant is a priority pollutant,

conventional pollutant, or a nonconventional pollutant.¹⁰ Pollution guidelines come in several forms: (1) best practicable control technology (BPT); (2) best conventional pollutant control technology (BCT); (3) best available technology economically achievable (BAT); and (4) best available demonstrated control technology for new sources, or new source performance standards (NSPS).¹¹ Which guideline is applicable will depend on whether a discharge is existing or new and whether it is direct or indirect.¹² A direct discharge is just a point source that discharges pollutants directly to the waters of the United States; an indirect discharge is “a nondomestic discharg[e] that] introduc[es] ‘pollutants’ to a ‘publicly owned treatment works.’”¹³ Only direct discharges are governed by BPT, BAT, BCT, and NSPS standards. Indirect discharges are governed by pretreatment standards established under section 307 of the CWA.¹⁴ New sources face more immediate compliance deadlines than existing sources—if the EPA establishes new ELG standards, existing dischargers only need to comply with the standards current when their NPDES permits are issued, reissued or modified.¹⁵

The EPA publishes national ELGs for the oil and gas extraction industry in the Code of Federal Regulations at 40 C.F.R. Part 435.¹⁶ These regulations are subcategorized—onshore, offshore, agricultural and wildlife water, coastal, and stripper¹⁷—with varying guidelines assigned to each subpart. Each subcategory may have specific, additional requirements. For example, the specifications range from zero allowable discharge for onshore wells to no national ELG for stripper wells.¹⁸ The onshore subcategory contains pretreatment standards for new and existing wastewater sources from unconventional oil and gas extraction.¹⁹ The coastal subcategory contains pretreatment standards for sources that introduce pollutants into a POTW. These pretreatment standards allow no amount of discharge of produced water, workover and completion fluids, produced sand, or deck drainage.²⁰

ELGs serve as a baseline, but they do not always ensure that all designated ben-

¹²SUMMARY OF WASTEWATER MANAGEMENT PRACTICES, *supra* note 3, at 12.

¹³40 C.F.R. § 122.2 (2021).

¹⁴There are two pretreatment standards—pretreatment standards for new sources (PSNS) and pretreatment standards for existing sources (PSES). Both standards are national, uniform, technology-based standards that are designed to prevent the discharge of pollutants that pass through, interfere with, or are otherwise incompatible with the operation of POTWs. PSNS should be issued at the same time as NSPS. Under PSNS, new indirect dischargers are required to incorporate the best available demonstrated technologies within 90 days of commencing discharge. EPA, *Learn About Effluent Guidelines*, <https://www.epa.gov/eg/learn-about-effluent-guidelines> (last visited June 23, 2021).

¹⁵Memorandum from Linda Boornazian, EPA, New Source Dates for Direct and Indirect Dischargers at 2–3 (Sept. 28, 2006), *available at* https://www3.epa.gov/npdes/pubs/newsource_dates.pdf. A new source discharge is any building, structure, or installation from which there is or may be a discharge of pollutants, the construction of which commenced after promulgation of standards under § 306 of the CWA or after proposal of such standards. 40 C.F.R. § 122.22.

¹⁶Memorandum from Linda Boornazian, EPA, New Source Dates for Direct and Indirect Dischargers at 2–3 (Sept. 28, 2006), *available at* https://www3.epa.gov/npdes/pubs/newsource_dates.pdf; 40 C.F.R. § 435 (2021).

¹⁷A stripper well is “any oil or natural gas well whose maximum daily average oil production does not exceed 15 barrels of oil, or any natural gas well whose maximum daily average gas production does not exceed 90 thousand cubic feet of gas [] per day, during any 12-month consecutive time period.” NAT’L STRIPPER WELL ASSOC., *What is a Stripper Well?* Stripper Wells | National Stripper Well Association (nswa.us) (last visited June 21, 2021).

¹⁸40 C.F.R. § 435 (2021). However, produced waters may be discharged to surface waters west of the 98th meridian under Subpart E.

¹⁹40 C.F.R. § 435.33 (2021).

²⁰40 C.F.R. § 435.46 (2021).

eficial uses of the surface water will be protected. Thus, the permit writer may take a second step and consider more stringent water-quality-based effluent limits (WQBELs) when drafting NPDES permits. These limits may be numerical or narrative (“e.g., no toxic substances in toxic quantities”). To establish these limits, the permit writer must consider the “designated beneficial use of the water body; the amount of the pollutant in the effluent, toxicity, and assimilative capacity; and, where appropriate, dilution in the receiving water (including discharge conditions and water column properties).”²¹

§ 29:105 Off-Site Waste Treatment

Analogous treatment standards will apply if oil and gas wastewater is sent to a POTW or a centralized waste treatment facility (CWT). CWTs that accept produced water are also subject to ELGs.¹ Produced water is required to go through the CWT before it may be sent to a municipal wastewater treatment facility.² The waste treatment must meet one of three standards: pretreatment standards for existing sources (PSES), pretreatment standards for new sources (PSNS), or NSPS standards.³ These processing facilities are regulated as off-site facilities.⁴ Thus, these regulations will not apply unless the discharge facility is considered off-site. The EPA defines “site” as “the land or water area where any ‘facility or activity’ is physically located.”⁵ A “facility or activity” is defined as any NPDES “point source” or any facility or activity that is subject to regulation under the NPDES program.⁶ Despite these definitions, it is still somewhat unclear what processing facility would be treated as off-site. In a recent compliance guidance document, the EPA has defined “site” for the purpose of gas drilling activities as: “The land identified in the drilling permit; including the location of wells, access roads, lease areas, and any lands where the facility is conducting its exploratory, development or production activities, or adjacent lands used in connection with the facility or activity.”⁷ Using that definition, any land outside of those boundaries would be considered off-site and thus subject to the POTW and CWT regulations.

§ 29:106 Oil and gas stormwater discharge

Aside from wastewater discharge, industrial stormwater dischargers are typically required to apply for an individual permit or seek coverage under a general stormwater permit. Operators of oil and gas explorations, production, processing, treatment operation, or transmission facility are not required to submit an application for an individual permit so long as any stormwater runoff is not contaminated with “overburden, raw material, intermediate products, finished product, byproduct, or waste products located on the site of such operations.”¹ These limitations apply

even if the oil and gas activities are considered “construction activities.”² The exception, however, does not apply if the facility (a) “[h]as had a discharge of storm water resulting in the discharge of a reportable quantity for which notification is or was required pursuant to 40 C.F.R. 117.21”; (b) “[h]as had a discharge of storm water resulting in the discharge of a reportable quantity for which notification is or was required pursuant to 40 C.F.R. 110.6 at any time since November 16, 1987”; or (c) “[c]ontributes to a violation of a water quality standard.”³ But the third water-quality-standard exception does not apply to discharges of sediment from “construction activities associated with oil and gas exploration.”⁴ In other words, an individual permit is *not* required if the WQS violation arises from discharges of sediment caused by construction activities.

§ 29:107 Section 401—Water Quality Certificates (33 U.S.C. § 1341)

Under § 401 of the CWA, a federal agency may not issue any permit or license to conduct any activity that may result in any discharge into waters of the United States unless a § 401 water quality certification is issued by the state and/or authorized tribe where the discharge would originate, verifying compliance with water quality requirements.¹

States and tribes have used § 401 authority to deny federally permitted/licensed energy projects. For example, in 2017 the state of Washington denied a § 401 water quality certification for a joint aquatic resource permit application from Millennium Bulk Terminals to build a coal export terminal along the Columbia River. The state cited unavoidable harm to the Columbia River and surrounding environment and a failure to provide reasonable assurance that Millennium would, or even could, implement the identified mitigation steps necessary to protect clean water.² New York and New Jersey similarly denied a § 401 water quality certification for a FERC licenses needed to build a fracked natural gas transmission pipeline, citing potential harms to water quality, threatened marine life, and the need to transition away from fossil fuels and address climate change.³

It was in response to actions like those and at the behest of the Trump administra-

tion that the EPA revised its § 401 certification regulations to address scope and timing issues raised by commenters, the regulated community, and permitting agencies. The revised rule limits the scope of the § 401 certification to “assuring that a discharge from a Federally licensed or permitted activity will comply with water quality requirements.”⁴ Proponents of the new rule assert that the scope of authority afforded to states is consistent with CWA statutory language and is necessary to rein in states that are improperly using their § 401 certification authority to condition or deny a permit, which in turn results in the failure of entire projects. Recently, the American Petroleum Institute and the Natural Gas Association of America won a motion to intervene on behalf of the EPA in a suit brought by environmental advocacy organizations, states, tribes, and other environmental group to challenge the new rule.⁵ The intervening oil and gas parties argued that prior to the new rule, states had improperly used § 401 to delay approving oil and gas projects based on “non-water quality considerations, such as preferences regarding energy policy[.]”⁶ The case is ongoing in a California district court. The Biden administration has also targeted this rule for reevaluation and has announced its intent to revise the rule.⁷

§ 29:108 Section 403—Ocean Discharge Criteria (33 U.S.C. § 1343)

Under § 403, a project proponent can obtain an NPDES permit authorizing discharges to the ocean, rather than to jurisdictional waters of the United States, if the applicant can satisfy additional discharge criteria.¹

Section 403 NPDES permits affect offshore oil and gas exploration activities.² For example, in *Alaska Eskimo Whaling Commission v. United States Environmental Protection Agency*, the whaling community challenged a permit authorizing oil and gas exploration discharges in the Beaufort Sea.³ The permit authorized the discharge of 13 waste streams in accordance with specific “effluent limitations, monitoring requirements, and other conditions” set forth in the permit. The permit imposed a seasonal limitation on discharge of water-based drilling fluids and drill

cuttings to accommodate the fall bowhead whale hunting season, and it required the permittees to monitor to the “maximum extent possible” for deflection of marine mammals when discharging water-based drilling fluids, drilling cuttings, and non-contact cooling water.”⁴ There, the Ninth Circuit found the permit conditions and the EPA’s conclusions regarding degradation of the marine environment sufficiently supported by the record but the conclusion regarding non-contact cooling water was made in error. Thus, the court remanded for consideration of whether the non-contact cooling water will cause degradation of the marine environment and the effect or non-effect of this cooling water on the bowhead whale migration and subsistence whale hunting in the Beaufort Sea.⁵

§ 29:109 Section 404 Discharge of Dredge or Fill Material (33 U.S.C. § 1344)

Under 404, the Secretary of the Army Corps of Engineers (the Secretary) may, after notice and opportunity for public hearings, issue permits for the discharge of dredge or fill material into waters of the United States.¹ The Secretary may issue specific permits or general permits on a state, regional, or nationwide basis “for any category of activities involving discharges of dredged or fill material if the Secretary determines that the activities in such category are similar in nature, will cause only minimal adverse environmental effects when performed separately, and will have only minimal cumulative adverse effect on the environment.”² General permits may not be issued for a duration of more than five years, and the Secretary may revoke or modify any permit for an activity that results in an adverse impact on the environment.³

One such permit, Nationwide Permit 12 (NWP 12), authorizes discharge of dredged or fill material into jurisdictional waters as required for the construction, maintenance, repair and removal of utility lines and associated facilities.⁴ Oil and gas pipelines qualify as utility lines under NWP 12.⁵ The Secretary reissued the NWP-12 in 2017 after a public notice and comment period.⁶ When a project falls under a regional or nationwide permit, the evaluation guidelines are only applied once—when the general permits are issued.⁷ Reissuance of a nationwide permit also requires a national-scale cumulative impact assessment in accordance with the National Environmental Policy Act (NEPA) and evaluation under the Endangered Species Act (ESA).⁸

To be covered under the NWP 12, a potential project may not result in the loss of greater than one-half acre of jurisdictional waters for each single and complete

project.⁹ A “loss” under the NWP 12 is defined by a permanent adverse effect caused by filling, flooding, excavation, or drainage.¹⁰ Thus, the conversion of a wetland will not constitute a loss if the wetland continues to function as a wetland.¹¹ Further, if wetlands or waters are restored, there is similarly no loss—any loss or conversion must be permanent.¹² Under the NWP 12, a single and complete project is measured by separate and distant utility line crossings of a water body—“each crossing is considered a distinct ‘single and complete project.’”¹³ It is not appropriate to have a national threshold for determining “when water crossings are ‘separate and distant’” because of various factors, including “topography, geology, hydrology, soils, and the characteristics of wetlands, streams, and other aquatic sources.”¹⁴ The regulations allow the Secretary to establish local guidelines for identifying “separate and distant” water crossings, and District Engineers are also able to use their own discretion to identify whether a crossing is separate and distant or whether a project proponent needs an individual permit.¹⁵

On April 15, 2020, a Montana District Court vacated the NWP 12, finding the Secretary failed to consult with the U.S. Fish and Wildlife Service under the ESA.¹⁶ The court held that “substantial evidence exists that the [Secretary’s] reissuance of NWP 12 may affect listed species and a critical habitat.”¹⁷ The Montana District Court eventually narrowed its remedy so that it only vacated application of the NWP 12 for new pipeline projects. The court ordered the Secretary to withhold approval of “the discharge of dredged or fill material under NWP 12 for projects constructing new oil and gas pipelines.”¹⁸ The decision was appealed to the Ninth Circuit, and a petition for certiorari was filed with the U.S. Supreme Court. The Supreme Court granted a stay of the district court’s injunction for all except the part that applies to the Keystone XL pipeline, which was the subject of the original case.¹⁹ The grant of the stay relied on a brief from the Solicitor General that argued that a broad NWP 12 injunction was not necessary because the Secretary could always demand an individual permit from the pipeline developers.²⁰ Since the vacatur of the Montana injunction, the NWP 12 remains active,²¹ but project opponents will undoubtedly consider the Solicitor General’s argument and invoke the authority to challenge project approvals and demand individual permits in the

future.²²

In the waning days of the Trump administration, the Corps. issued a final rule on the Reissuance and Modification of Nationwide Permits.²³ The final rule reissued and modified 12 existing nationwide permits and issued four new nationwide permits. These NWP went into effect on March 15, 2021.²⁴ The Biden Administration released a memorandum to all agencies in late January suggesting that they postpone the effective date of final rules for at least 60 days. That did not happen, and the new NWP rules are now effective.²⁵ The final rule removes the 300 linear foot stream impact threshold for 10 of the nationwide permits while retaining the 1/2-acre limit on loss of jurisdictional waters to satisfy the “no more than minimal adverse effects” requirements for nationwide permits.²⁶ The final rule also divides the previous NWP 12 into three new permits: NWP 12 for oil and gas pipelines, a new NWP 57 for the construction of electric and telecommunication utility lines, and a new NWP 58 for the construction of water and sewer lines.²⁷ In February, environmental groups, like the Sierra Club and Center for Biological Diversity, issued 60-day notice of intent to sue the Corps over the final NWP rules.²⁸

§ 29:110 Oil Pollution Prevention (33 U.S.C.A. § 1321)

The CWA prohibits the discharge of oil or other hazardous substances into or upon the navigable waters of the United States.¹ In addition to regulating the discharge of oil or hazardous substances, the EPA has promulgated the Oil Pollution Prevention regulations under the CWA.² Originally published in 1973, the Oil Pollution Prevention regulations established requirements for prevention of, preparedness for, and response to, oil discharges at specific non-transportation related facilities.³ This included an oil spill prevention and education program for small vessels, which provided for the assessment, outreach, and training and voluntary compliance activities to prevent and improve the effective response to oil spills from vessels and facilities not required to prepare a vessel response plan under CWA, such as recreational vessels, commercial fishing vessels, marinas, and aquaculture facilities.⁴ The goals of these regulations were to prevent oil from reaching navigable waters, contain discharges of oil, and for facilities to implement and maintain Spill

Prevention, Control, and Countermeasure Plans.⁵

In 1990, the Oil Pollution Act (OPA) amended the CWA to require some oil storage facilities to prepare Facility Response Plans. These plans should detail a facility's response to a "worst-case discharge of oil."⁶ Under the OPA, any person who discharges oil will be strictly liable for all resulting removal and damage costs, unless specific statutory defenses apply.⁷ Facility Response Plans are required from the owners or operators of any non-transportation-related onshore facility that could "reasonably be expected to cause substantial harm to the environment by discharging oil into or on the navigable waters or adjoining shorelines[.]"⁸

The Regional Administrator will make the determination whether a facility is required to submit a response plan subject to the ensuing considerations.⁹ A facility must submit a response plan if it meets any of the following criteria: (1) the facility transfers oil over water to or from vessels and has a total oil storage capacity greater than or equal to 42,000 gallons; or (2) the facility's total oil storage capacity is greater than or equal to 1 million gallons, and one of the following is true: (A) the facility does not have secondary containment for each aboveground storage area sufficiently large to contain the capacity of the largest aboveground oil storage tank within each storage area plus sufficient freeboard to allow for precipitation; (B) the facility is located at a distance where discharge could cause injury to fish and wildlife in sensitive environments; (C) the facility is located at a distance where a discharge from the facility would shut down a public drinking water intake; or (D) the facility had had a reportable oil discharge in an amount greater than or equal to 10,000 gallons within the last five years.¹⁰ The Regional Administrator may consider: (1) frequency of past discharges; (2) proximity to navigable waters; (3) age of oil storage tanks; and (4) other facility-specific and region-specific information, including impacts on public health.¹¹ Any person may petition the Regional Administrator to determine whether a facility meets this criteria and should be required to submit a facility response plan.¹²

Facility Response Plans must be consistent with the National Oil and Hazardous Substance Pollution Contingency Plan and any applicable Area Contingency Plan and coordinated with the local emergency response plan.¹³ EPA provides a model format and requires all plans to include, at a minimum an emergency response action plan which must contain:

- (1) the identity and telephone number of a qualified individual having full authority, including contract authority, to implement removal actions;
- (2) a description of information to pass to response personnel in the event of a reportable discharge;
- (3) a description of the facility's response equipment and its location;
- (4) a description of response capabilities, include the duties of persons at the fa-

- cility during a response action and their response times and qualifications;
- (5) plans for evacuation;
- (6) a description of immediate measures to secure the source of the discharge, and to provide adequate containment and drainage of discharged oil; and
- (7) a diagram of the facility.¹⁴

The Facility Response Plan should also include (1) facility information, and (2) information about emergency response—both of which contain descriptions almost identical to the emergency response action plan requirements. Finally, the Facility Response Plan should contain:

- (1) a hazard evaluation that discuss the facility’s known or reasonably identifiable discharges;
- (2) response planning levels, including specific planning scenarios for a worst-case discharge, a discharge of 2,100 gallons or less, and a discharge greater than 2,100 gallons but less than 36,000 gallons (or 10% capacity of the largest tank at the facility);
- (3) discharge detection systems;
- (4) plan implementation;
- (5) methods for self-inspection, including drills, exercises, response training, and records of inspections;
- (6) safety diagrams;
- (7) security systems; and
- (8) a response plan cover sheet.¹⁵

If an owner or operator of a facility disagrees that it should be required to submit a Facility Response Plan, it may request reconsideration of the Regional Administrator’s decision.¹⁶ If reconsideration is denied, an appeal may be made to the EPA.¹⁷

§ 29:111 Enforcement and Penalties (33 U.S.C. § 1319)

The CWA authorizes enforcement through both government and citizen suits.¹ Oil is included in § 1321’s increased fines for the discharge of oil and other hazardous substances.² *Oil* is defined to include “any kind in any form, including, but not limited to, petroleum, fuel oil, sludge, oil refuse, and oil mixed with wastes other than dredged spoil[.]”³ *Discharge* includes “any spilling, leaking, pumping, pouring, emitting, emptying or dumping, but excludes discharges in compliance with a permit under § 1342[.]”⁴ For the purposes of this section, the president must determine “those quantities of oil and any hazardous substances the discharge of which may be harmful to the public health or welfare or the environment of the United States, including but not limited to fish, shellfish, wildlife, and public and private property, shorelines, and beaches.”⁵

Section 1321 also provides for the establishment of a National Contingency Plan

for an “efficient, coordinated, and effective action to minimize damage from oil and hazardous substance discharges, including containment, dispersal, and removal of oil and hazardous substances[.]”⁶ Under § 1321, the owner or operator of a onshore or offshore facility is liable for actual costs of removal and any other restoration costs incurred by the federal or state government in the restoration or replacement of natural resources damaged or destroyed as a result of a discharge of oil or hazardous substance.⁷ The president, or an authorized state representative, can act on behalf of the public as trustee of the natural resources to recover the costs of replacing or restoring those resources.⁸

Adjusted for inflation, Class 1 administrative penalties may not exceed \$19,505 per violation, except that the maximum amount of any Class 1 administrative civil penalties shall not exceed \$48,762.⁹ For Class 2 penalties, the maximum is \$19,505 per day for each day during which the violation continues, except that the maximum amount of any Class 2 civil penalty shall not exceed \$243,808.¹⁰ For civil penalty actions

[a]ny person who is the owner, operator, or person in charge of any vessel, onshore facility, or offshore facility from which oil or a hazardous substance is discharged in violation [the CWA], shall be subject to a civil penalty in an amount up to [\$48,762] per day of violation or an amount up to [\$1,951] per barrel of oil or unit of reportable quantity of hazardous substances discharged.¹¹

For violations where the person failed to properly carry out removal of the discharge or fails to comply with an order the penalty is \$48,762 per day or an amount up to 3 times the costs incurred by the Oil Spill Liability Trust Fund.¹² When a person fails or refuses to comply with any regulation promulgated pursuant to the National Response System, the maximum penalty is \$48,762 per day of the violation.¹³ And, for any violation that was the result of gross negligence or willful misconduct, the person shall be subject to a civil penalty not less than \$195,047 and not more than \$5,851 per barrel of oil or unit of reportable quantity of hazardous substance discharged.¹⁴

D. SAFE DRINKING WATER ACT

§ 29:112 Background Information

Before an oil and gas operator can drill a water disposal well, a steam injection well, or a carbon sequestration well, it must obtain a permit from the U.S. Environmental Protection Agency (EPA), or a state agency equivalent. The permit ensures that the applicant will meet the requirements set out in the federal Safe

Drinking Water Act (SDWA).¹ The SDWA was originally passed by the United States Congress in 1974 and was subsequently amended in 1986 and 1996. The SDWA is intended to protect the nation's drinking water and sources of drinking water, including rivers, lakes, reservoirs, springs, and certain groundwater supply wells. Under the SDWA, the EPA sets health-based standards for drinking water quality to protect against both naturally occurring and manmade contaminants, and monitors states, local authorities, and water suppliers who enforce those standards.²

§ 29:113 Enforcement Responsibility and Implementation

The SDWA is implemented and enforced by the EPA, but the EPA can delegate enforcement responsibility to the states when a state's program meets certain criteria.¹ This is called primary enforcement responsibility, or primacy. A state has primary enforcement responsibility for public water systems when the EPA determines that the state has: (1) adopted drinking water regulations that are no less stringent than the national primary drinking water regulations promulgated by the EPA; (2) adopted and is implementing adequate procedures for the enforcement of such state regulations;² (3) established and will maintain record keeping and reporting of its activities; (4) established adequate variance procedures as stringent as the federal procedures; (5) the authority to assess administrative penalties; (6) adopted and can implement an adequate plan for the provision of safe drinking water under emergency circumstances; and (7) adequate electronic records regulations.³

§ 29:114 Procedures/Process for State Delegation

A state may apply to the EPA for a determination that the state has primary enforcement responsibility for public water systems in the state pursuant to § 1413 of the SDWA.¹ The SDWA regulations specify that the application should be as concise as possible and include a side-by-side comparison of the federal requirements and the corresponding state authorities, including citations to specific statutes and administrative regulations or ordinances, and judicial decisions where appropriate, which demonstrate adequate authority to meet the requirements of § 142.10, described above.² State applications for primary enforcement responsibility must include, among other information, the text of the state's primary drinking water

regulations and a description of the state's enforcement procedures.³ The EPA must act on an application for primary enforcement responsibility within 90 days after receiving such application.⁴ Once a state's program has been approved, in order to retain primary enforcement responsibility, states must adopt all new and revised national primary drinking water regulations promulgated under the SDWA.⁵

§ 29:115 Underground Injection Control Program

Of particular interest to the oil and gas industry and its permitting needs for oil and gas operations is Part C of the SDWA. Part C is intended to ensure protection of underground sources of drinking water against contamination by underground injection (steam flooding, produced water re-injection, CO₂ injection, and the like in the context of oil and gas operations) and directs the establishment of statewide programs to control underground injections.¹ All state underground injection control (UIC) programs must prohibit “any underground injection in such State which is not authorized by a permit,” and require permit applicants to demonstrate that “the underground injection will not endanger drinking water sources.”² The EPA's regulations define an “underground source of drinking water” as an aquifer, or a portion thereof, which (1) supplies any public water system, or (2) contains a sufficient quantity of groundwater to supply a public water system, and currently supplies drinking water for human consumption, or contains fewer than 10,000 mg/l total dissolved solids; and is not an exempted aquifer.³ This means that oil and gas operators must obtain a UIC permit from either the EPA, or the state if primacy has been granted, before drilling disposal wells, enhanced recovery wells, or hydrocarbon storage wells.

A state's UIC program may be administered by the EPA, or the state may apply to the EPA for primary enforcement responsibility for the program by demonstrating that its UIC program meets the requirements set forth in the EPA's regulations.⁴ The EPA has approved UIC primacy programs for Class I, II, III, IV, and V wells in 33 states, for Class II wells in just eight states and two tribal reservations, and for all well classes in just two states.⁵

§ 29:116 UIC Well Classes

There are six different classes of injection wells.¹ Class I wells are industrial and municipal waste disposal wells and are used to inject hazardous and non-hazardous wastes into deep, confined rock formations. Class II wells are oil- and gas-related injection wells and are used only to inject fluids associated with oil and natural gas production. Class II fluids are primarily brines that are brought to the surface dur-

[Section 29:116]

¹40 C.F.R. § 144.6 (2021).

ing oil and gas production. Class III wells are injection wells for solution mining and are used to inject fluids to dissolve and extract minerals. Class IV wells are shallow hazardous and radioactive injection wells and are used to dispose of hazardous or radioactive wastes into or above a geologic formation that contains an underground source of drinking water.² Class V wells are for the injection of non-hazardous fluids underground, usually into or above underground sources of drinking water. Class VI wells are used for geologic sequestration of carbon dioxide.

§ 29:117 Focus on Class II Wells

As described above, Class II wells are used only to inject fluids associated with oil and gas production. There are three categories of Class II wells: (1) disposal wells; (2) enhanced recovery wells; and (3) hydrocarbon storage wells.¹

§ 29:118 UIC Permitting

Oil and gas operators cannot conduct any injection activity in a manner that allows for the movement of fluid containing any contaminant into underground sources of drinking water if the contaminant will violate a primary drinking water regulation or adversely affect people's health.¹ All underground injections must be authorized either by rule or by permit.² Permit applications for Class II wells must contain the information listed in 40 C.F.R. § 144.31(e), which includes information regarding the proposed injection activities, facility and operator information, a list of all permit approvals required for the project, and a topographic map.

§ 29:119 Aquifer Exemptions

Another important aspect of the SDWA as applied to oil and gas operations is the ability of the EPA to find an underground groundwater aquifer that is exempt from the SDWA's strictures. Aquifer exemptions allow certain underground sources of water to be used for oil or mineral extraction or disposal purposes in compliance with the EPA's UIC requirements.¹ UIC permit applicants can seek an aquifer exemption by submitting an application package to the primary agency. If a state has been granted primacy, the state reviews the applicant's submittal. If the information submitted supports a determination that the proposed aquifer exemption meets federal regulatory criteria contained in 40 C.F.R. § 146.4, the state proposes to exempt the aquifer, provides an opportunity for public participation and comment, and submits a request for approval of the exemption to the EPA.² No designation of an exempted aquifer is final until approved by the EPA Administrator as

²40 C.F.R. § 144.6 (2021); The EPA banned the use of Class IV injection wells in 1984, and these wells may only operate as part of an authorized groundwater cleanup action.

part of an approved UIC program.

As stated above, in order for the EPA to approve an aquifer exemption, it must follow the regulatory criteria laid out in 40 C.F.R. § 146.4. The EPA must find that the state, or the applicant if the state does not have primacy, has shown that the aquifer proposed for exemption does not currently serve as a source of drinking water.³ Next, the EPA must find that the aquifer cannot now, and will not in the future, serve as a source of drinking water, or that the total dissolved solids content of the groundwater is more than 3,000 and less than 10,000 mg/l and it is not reasonably expected to supply a public water system.⁴

E. COMPREHENSIVE ENVIRONMENTAL RESPONSE, COMPENSATION, AND LIABILITY ACT

§ 29:120 Overview

On December 11, 1980, Congress passed the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA).¹ It was prompted by environmental disasters such as the one that occurred at Love Canal and operates as a companion law to the Resource Conservation and Recovery Act (RCRA), although its purpose is different.² While RCRA provides cradle to grave regulation, CERCLA was designed to allow a federal response to releases, past releases, or threatened releases of hazardous substances that could endanger public health or the environment.³

CERCLA has two fundamental goals: the first is to clean up hazardous substances that are released into the environment, and the second is to hold responsible parties liable for the costs of these clean-ups.⁴ As a general matter, “[t]o state a prima facie case under CERCLA, 42 U.S.C. § 9607(a), a plaintiff must allege that:

- (1) The waste disposal site is a ‘facility’ within the meaning of 42 U.S.C. § 9601(9);
- (2) A ‘release’ or ‘threatened release’ of a ‘hazardous substance’ from the facility has occurred, *id.* § 9607(a)(4);
- (3) Such release or ‘threatened release’ will require the expenditure of response costs that are ‘consistent with the national contingency plan,’ *id.* §§ 9607(a)(4) and (a)(4)(B); and,
- (4) The defendant falls within one of four classes of persons subject to CERCLA’s liability provisions.”⁵

The following four categories of parties may be held liable under CERCLA (often

⁴40 C.F.R. § 146.4 (2021).

[Section 29:120]

¹42 U.S.C. §§ 9601 to 9675; See U.S. EPA, *Superfund: CERCLA Overview*, <https://www.epa.gov/superfund/superfund-cercla-overview> (last visited June 24, 2021). CERCLA was then amended by the Superfund Amendments and Reauthorization Act (SARA) on October 17, 1986. Pub. L. No. 99-499.

²See U.S. EPA, *What is Superfund?*, <https://www.epa.gov/superfund/what-superfund> (last visited June 24, 2021).

³See *What is Superfund?*, note 2. “Environment” is defined, in relevant part, as “any other surface water, ground water, drinking water supply, land surface or subsurface strata, or ambient air within the United States or under the jurisdiction of the United States.” 42 U.S.C. § 9601(8).

⁴See *Price Trucking Corp. v. Norampac Industries, Inc.*, 748 F.3d 75, 79, 78 Env’t. Rep. Cas. (BNA) 1133 (2d Cir. 2014) (“CERCLA’s primary purposes are axiomatic: (1) to encourage the timely cleanup of hazardous waste sites; and (2) to place the cost of that cleanup on those responsible for creating or maintaining the hazardous condition.”) (citation omitted).

⁵*Cose v. Getty Oil Co.*, 4 F.3d 700, 703–04, 37 Env’t. Rep. Cas. (BNA) 1153, 23 Env’tl. L. Rep. 21335, 129 O.G.R. 583 (9th Cir. 1993), as amended, (Oct. 1, 1993).

called Potentially Responsible Parties or PRPs):

- (1) Present owners and operators of facilities;
- (2) Those who, at the time of disposal of the hazardous substances, owned or operated facilities;⁶
- (3) Those who arranged for transport of hazardous substances for disposal or treatment;⁷ and
- (4) Certain transporters of hazardous substances.⁸

Unless a statutory defense or exclusion (including the petroleum exclusion) applies, covered parties are liable for “all costs of removal or remedial action incurred by the United States Government or a State . . . not inconsistent with the national contingency plan[.]” and “any other necessary costs of response incurred by any other person consistent with the national contingency plan[.]”⁹

§ 29:121 The Petroleum Exclusion

While CERCLA is discussed in detail elsewhere in this treatise, particular aspects are relevant to the oil and gas industry.

CERCLA provides that a “hazardous substance”¹ does not include:

- “petroleum, including crude oil or any fraction thereof which is not otherwise specifically listed or designated as a hazardous substance”;²
- “and the term does not include natural gas, natural gas liquids, liquefied nat-

⁶The Supreme Court held that, under CERCLA, “an operator must manage, direct, or conduct operations specifically related to pollution, that is, operations having to do with the leakage or disposal of hazardous waste, or decisions about compliance with environmental regulations.” *U.S. v. Bestfoods*, 524 U.S. 51, 66–67, 118 S. Ct. 1876, 141 L. Ed. 2d 43, 46 Env’t. Rep. Cas. (BNA) 1673, 28 Env’tl. L. Rep. 21225, 157 A.L.R. Fed. 735 (1998).

⁷An arranger is defined as “any person who by contract, agreement, or otherwise arranged for disposal or treatment . . . of hazardous substances owned or possessed by such person, by any other party or entity, at any facility . . . owned or operated by another party or entity and containing such hazardous substances[.]” 42 U.S.C. § 9607(a)(3).

⁸42 U.S.C. § 9607(a)(4).

⁹42 U.S.C. § 9607(a)(4)(A) to (B). CERCLA § 113, added in 1986 as part of SARA, contains a subsection entitled “Contribution.” This subsection states: “Any person may seek contribution from any other person who is liable or potentially liable under [§ 107(a)], during or following any civil action under [§§ 106 or 107(a)] In resolving contribution claims, the court may allocate response costs among liable parties using such equitable factors as the court determines are appropriate. Nothing in this subsection shall diminish the right of any person to bring an action for contribution in the absence of a civil action under [§§ 106 or 107].” 42 U.S.C. § 9613(f)(1). Under § 113, a party that “has resolved its liability to the United States or a State in an administrative or judicially approved settlement” is immune from contribution claims made by other Potentially Responsible Parties “regarding matters addressed in the settlement.” 42 U.S.C. § 9613(f)(2). *See* § 14:143 of this treatise.

[Section 29:121]

¹The term “hazardous substance” means:

(A) any substance designated pursuant to section 311(b)(2)(A) of the Federal Water Pollution Control Act . . . , (B) any element, compound, mixture, solution, or substance designated pursuant to section 9602 of this title, (C) any hazardous waste having the characteristics identified under or listed pursuant to section 3001 of the Solid Waste Disposal Act . . . (but not including any waste the regulation of which under the Solid Waste Disposal Act . . . has been suspended by Act of Congress), (D) any toxic pollutant listed under section 307(a) of the Federal Water Pollution Control Act . . . , (E) any hazardous air pollutant listed under section 112 of the Clean Air Act . . . , and (F) any imminently hazardous chemical substance or mixture with respect to which the Administrator has taken action pursuant to section 7 of the Toxic Substances Control Act The term does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically listed or designated as a hazardous substance under subparagraphs (A) through (F) of this paragraph, and the term does not include natural gas, natural gas liquids, liquefied natural gas, or synthetic gas usable for fuel (or mixtures of natural gas and such synthetic gas).

42 U.S.C. § 9601(14).

²42 U.S.C. § 9601(14).

ural gas, or synthetic gas usable for fuel (or mixtures of natural gas and such synthetic gas).³

This is known as the “petroleum exclusion.” Courts have found that “the primary purpose of the exclusion for petroleum, which is defined principally in terms of crude oil and crude oil fractions, was to exclude from CERCLA’s coverage ‘spills or other releases strictly of oil,’ S. Rep. No. 96-848, 96th Cong., 2d Sess. 29 to 30 (1980), not releases of hazardous substances mixed with oil.”⁴

Courts have noted that “CERCLA has acquired a well-deserved notoriety for vaguely-drafted provisions and an indefinite, if not contradictory, legislative history.”⁵ While the exact intent behind the exclusion is unclear from an examination of the hastily-drafted statute and its history, one potential basis for the exclusion is the fact that petroleum is covered by other statutes. These include the Oil Pollution Act of 1990 (P.L. 101-380), passed after the Exxon Valdez oil spill and decades of debate over a comprehensive law governing oil spills.

In analyzing the limits of the exclusion, the EPA took the position in a 1987 memo that when petroleum is mixed with hazardous substance(s) before it is released into the environment, the entire mixture should be considered hazardous under CERCLA.⁶ This allows the EPA to respond to releases of hazardous substances that occur together with petroleum releases.

The outlines of this exclusion have been litigated in a number of cases.⁷ However, the practical effect of the exclusion has been to exclude CERCLA itself as a favorable statute for petroleum cleanups in many cases.

§ 29:122 The petroleum exclusion: Excluded as a “Hazardous Substance”

One of the early cases analyzing the petroleum exclusion, *Wilshire Westwood Associates*, held that “the application of the standards governing statutory construction to the words of the petroleum exclusion requires us to exclude gasoline, even leaded gasoline, from the term ‘hazardous substance’ for purposes of CERCLA.”¹ The effect of this is to apply the petroleum exclusion to unrefined and refined gasoline, despite the fact that “certain of its indigenous components and certain addi-

³42 U.S.C. § 9601(14); “Mineral spirits that are distilled from petroleum are considered petroleum for the purpose of CERCLA Section 101(14) and, therefore, are excluded from the definition of hazardous substance.” U.S. EPA, *Mineral Spirits Excluded From the CERCLA?*, <https://www.epa.gov/epcra/mineral-spirits-excluded-cercla> (last visited June 24, 2021).

⁵*U.S. v. Mottolo*, 605 F. Supp. 898, 902, 22 Env’t. Rep. Cas. (BNA) 1529, 15 Env’t. L. Rep. 20444 (D.N.H. 1985).

⁶See U.S. EPA, Office of General Counsel, *Scope of the CERCLA Petroleum Exclusion Under Sections 101(14) and 104(a)(2)* (July 31, 1987), <https://www.epa.gov/sites/production/files/2013-09/documents/petro-exclu-mem.pdf>; see also *Franklin County Convention Facilities Authority v. American Premier Underwriters, Inc.*, 240 F.3d 534, 541, 51 Env’t. Rep. Cas. (BNA) 2125, 31 Env’t. L. Rep. 20470, 2001 FED App. 0041P (6th Cir. 2001) (“[P]etroleum products mixed with hazardous substances [that are] not constituent elements of petroleum are hazardous substances.”).

⁷Disputes over the categorization of the chemicals may preclude summary judgment. See *U.S. v. Poly-Carb, Inc.*, 951 F. Supp. 1518, 1528, 44 Env’t. Rep. Cas. (BNA) 1306, 27 Env’t. L. Rep. 20902 (D. Nev. 1996) (“[I]f we cannot say what was in those tanks, we likewise cannot say whether it was ‘spent,’ a ‘by-product,’ a ‘feedstock,’ or ‘being reclaimed.’ Summary judgment is not appropriate.”).

[Section 29:122]

¹*Wilshire Westwood Associates v. Atlantic Richfield Corp.*, 881 F.2d 801, 804, 30 Env’t. Rep. Cas. (BNA) 1065, 19 Env’t. L. Rep. 21313 (9th Cir. 1989); see *Kuneman v. Redwood Oil Co.*, 32 Fed. Appx. 962, 963 (9th Cir. 2002) (“petroleum exclusion applies to refined and unrefined gasoline”).

tives during the refining process have themselves been designated as hazardous substances within the meaning of CERCLA.”²

The *Wilshire Westwood* principle that indigenous compounds which are, by themselves, hazardous substances, but when combined with petroleum in the refining process trigger the petroleum exclusion, has been applied under numerous circumstances.³ As one court succinctly put it, “whether the petroleum exclusion applies depends both on *what* is spilled and on *how* it is spilled,” noting that lead in spilled gasoline would be excluded under CERCLA, while lead in the form of abandoned lead acid batteries would not.⁴

Similarly, a plume of a hazardous substance, such as benzene, that effectively separates from and migrates away from an oil spill will likely still be subject to the exclusion.⁵ A self-evident extension of the principle is that the addition to petroleum of substances or compounds that are *not* themselves deemed “hazardous,” such as spacer fluid and drilling mud, will not vitiate application of the exclusion.⁶

Under a liberal application of the exclusion, the mere presence of particular hazardous substances, such as benzene, ethylbenzene, toluene, xylene, and lead, can lead a court to the “inescapable conclusion” that those hazardous substances were derived from petroleum products onsite, resulting in dismissal of a CERCLA lawsuit.⁷ Moreover, even if concentrations of hazardous substances are above those normally found in unused petroleum, a court may still apply the petroleum exclusion if the evidence indicates that those higher concentrations are due to natural volatilization and biodegradation of petroleum over time.⁸

Some courts have also held that “used petroleum products are covered by the petroleum exclusion,” as long as “CERCLA-listed hazardous substances have not been added to the petroleum product during its use, nor have the concentrations of CERCLA-listed hazardous substances in the petroleum product been increased by its use.”⁹ At least one court has ruled that even an allegedly intentional “spill” of a refined petroleum product was exempt from CERCLA’s purview.¹⁰ The EPA’s “rules and regulations also provide that the petroleum exclusion applies to crude oil, petroleum feedstocks, and refined petroleum products.”¹¹

¹⁰*Foster*, 922 F. Supp. at 652 (finding no CERCLA liability where a defendant “sprayed” kerosene onto the facility).

¹¹*In re Oil Spill by the Oil Rig Deepwater Horizon in the Gulf of Mexico, on April 20, 2010*, 81 Env’t. Rep. Cas. (BNA) 1867, 2015 WL 5363039, at *5 (E.D. La. 2015).

Many courts, and the EPA itself,¹ have concluded that, while “Congress intended to exclude oil spills from the coverage of CERCLA,” it “did not intend to exclude waste oils . . . which are by no means strictly ‘crude oil or any fraction thereof.’”² Courts have regularly applied the distinction between excluded crude oil or refined petroleum and non-excluded used or waste oils, and have held that used motor oil, emulsions containing used oil, and used oil sludge are all subject to CERCLA.³

Additional caselaw further refined this basic principle: for example, in *Cose v. Getty Oil*, the Ninth Circuit held that “crude oil tank bottoms are not ‘petroleum, including crude oil or a fraction thereof’ under CERCLA and therefore do not fall within CERCLA’s petroleum exclusion in the first instance.”⁴ Crucial to the court’s holding was the fact that “crude oil tank bottoms are never ‘subjected to various refining processes’ . . . [or] used ‘for producing useful products,’” and therefore are not “petroleum” under the Ninth Circuit’s definition announced in *Wilshire Westwood*.⁵

As an elaboration of *Wilshire Westwood* and its progeny, when hazardous substances are added to waste oil, resulting in larger amounts of hazardous components than would occur in crude or refined petroleum products, the exemption does not apply.⁶ Even a *de minimis* amount of additional hazardous substances can lead to CERCLA liability,⁷ and the fact that the addition was unintentional does not save the defendant from liability.⁸ Likewise, hazardous substances that have “comingled with the petroleum products in the soil and [are] floating on the groundwater” have also been held to render the CERCLA petroleum exclusion inapplicable.⁹

The EPA has distinguished between “oil that naturally contains low levels of haz-

ardous substances and oil to which hazardous substances have been added through use.”¹⁰ While the EPA has “extended the petroleum exclusion to the former category of oily substances, it has specifically declined to extend such protection to the latter category.”¹¹ Some courts have held that this interpretation of the petroleum exclusion comports with the relevant legislative history, which indicates that the “exclusion was intended for oil spills, not for releases of oil which has become infused with hazardous substances through use.”¹²

§ 29:124 Reportable Quantity reporting

Despite the petroleum exclusion, some oils are regulated under CERCLA because they are specifically listed. For example, “40 CFR 302.4, Table 302.4 specifically lists a number of waste oils (e.g., F010, and K048 through K052)” and their Reportable Quantities (“RQs”).¹ If those chemicals are released in quantities equal to or greater than their RQs, the release is required to be reported.²

CERCLA requires the reporting of releases of a hazardous substance into the environment in an amount that exceeds a reportable quantity within a 24-hour period.³ Section 101(22) defines “release” as any “spilling, leaking, pumping, pouring, emitting, emptying, discharging, injecting, escaping, leaching, dumping, or disposing into the environment (including the abandonment or discarding of barrels, containers, and other closed receptacles containing any hazardous substance or pollutant or contaminant).” Further, the term “hazardous substance” is defined in § 101(14) by reference to the Clean Water Act, the Clean Air Act, the Resource Conservation and Recovery Act, and the Toxic Substances Control Act.

RQs can initially be provisionally set by Congress.⁴ After further evaluation and notice and comment, the EPA can then further adjust them in order to protect public health and the environment from the hazard.⁵ The EPA employs a two-step process: the first step evaluates the “intrinsic physical, chemical, and toxicological properties of each substance” and the second step evaluates the substance’s “susceptibility to certain degradative processes.”⁶

CERCLA provides exemptions from the notification requirement in limited circumstances. Section 103(f) exempts reporting for “any release of a hazardous substance . . . which is a continuous release, stable in quantity and rate and is . . . a release of which notification has been given [pursuant to reporting requirements]

for a period sufficient to establish the continuity, quantity, and regularity of such release.”⁷ This provision addresses releases from sources that are “routine, anticipated, and intermittent and incidental to normal operations or treatment processes.”⁸

§ 29:125 Federally permitted releases

Although CERCLA requires that any release of a hazardous substance in excess of the reportable quantity of the substance be reported; there is an exception when the release is a federally permitted release, defined by reference to various environmental statutes.¹ For that category of releases, 42 U.S.C. § 9607(j) states that “[r]ecovery by any person (including the United States . . .) for response costs or damages resulting from a federally permitted release shall be pursuant to existing law in lieu of this section.”

Typically, the emissions in question are required to comply with the relevant permits in order to be exempt from the reporting requirements.² However, in the recent *Clean Air Council* case, which involved the releases of hydrogen sulfide, benzene, and other hazardous components, the court was asked to determine whether “emissions from a facility that holds Clean Air Act [CAA] permits are exempt from CERCLA’s reporting requirements, regardless of whether the emissions comply with those permits.”³ There, the court concluded that “the phrase ‘subject to,’ as used in § 9601(10) of CERCLA, is unambiguous and does not require that the air emissions comply with a Clean Air Act permit in order to be exempt.”⁴ In the court’s opinion, the phrase “[s]ubject to” means only that the “responsible facility must abide by the requirements of that permit,” in addition to the requirements of the CAA and the reporting requirements of that law, “rather than the reporting requirements of CERCLA.”⁵ This court’s interpretation was unusually broad, and the case has been appealed as of the date of this publication.

⁷Such continued releases are governed by 40 C.F.R. § 302.8 (2021).

⁸40 C.F.R. § 302.8(b) (2021). According to the EPA’s CERCLA and EPCRA Continuous Release Reporting guidance, located at <https://www.epa.gov/epcra/cercla-and-epcra-continuous-release-reporting>, releases that may qualify as continuous releases include those that:

- “Are normal plant operation or treatment processes;
- Are stable in quantity and rate; and either
- Occur without interruption of abatement, or
- Are routine, anticipated and intermittent.”

[Section 29:125]

¹“Congress defined the term ‘federally permitted release’ in relation to other environmental protection laws: the Clean Water Act (which includes the Federal Water Pollution Control Act); the Solid Waste Disposal Act; the Marine Protection, Research, and Sanctuaries Act of 1972; the Safe Drinking Water Act; the Clean Air Act; the Atomic Energy Act of 1954; and state laws related to crude oil and natural gas. 42 U.S.C. § 9601(10).” *Clean Air Council v. § 29:126 CERCLA Defenses

Significantly, CERCLA provides for the imposition of strict and retroactive liability, which can also be joint.¹ This was done because CERCLA's focus is on the cleanup of sites contaminated with hazardous waste. Defenses under CERCLA are limited to the following:

- (1) Acts of God;²
- (2) Acts of war;
- (3) “[A]n act or omission of a third party other than an employee or agent of the defendant, . . . if the defendant establishes by a preponderance of the evidence that (a) he exercised due care with respect to the hazardous substance concerned, . . . and (b) he took precautions against foreseeable acts or omissions of any such third party and the consequences that could foreseeably result from such acts or omissions”;³ or
- (4) Any combination of (1), (2), or (3).⁴

These defenses are generally unsuccessful. In the oil and gas context, for example, courts have denied the “act of war” defense to oil companies who released hazardous substances during wartime while acting at the Government’s direction.⁵

The petroleum exclusion has been characterized by courts as a “statutory exception” and not, technically speaking, an affirmative defense. This is true because the exclusion makes petroleum-related contamination “nonactionable for policy reasons even though such contamination might otherwise be actionable under CERCLA’s general definition of ‘hazardous material.’”⁶

In January of 2002, Congress enacted the Small Business Liability Relief and Brownfields Revitalization Act,⁷ which amended CERCLA to provide liability limitations for the following:

[Section 29:126]

¹42 U.S.C. § 9601(32) (“The terms ‘liable’ or ‘liability’ under this subchapter shall be construed to be the standard of liability which obtains under section 311 of the Federal Water Pollution Control Act”); *U.S. v. Alcan Aluminum Corp.*, 964 F.2d 252, 259, 35 Env’t. Rep. Cas. (BNA) 1073, 22 Env’tl. L. Rep. 21124 (3d Cir. 1992).

²CERCLA defines an “act of God” as “an unanticipated grave natural disaster or other natural phenomenon of an exceptional, inevitable, and irresistible character, the effects of which could not have been prevented or avoided by the exercise of due care or foresight.” 42 U.S.C. § 9601(1). Courts have construed the “act of God” defense narrowly. *See U.S. v. M/V Santa Clara I*, 887 F. Supp. 825, 843, 41 Env’t. Rep. Cas. (BNA) 1101, 1996 A.M.C. 910, 26 Env’tl. L. Rep. 20264 (D.S.C. 1995) (“Even a poorly forecasted storm has been held under the Clean Water Act not to constitute an act of God because it was predicted and was avoidable.”); *U.S. v. Stringfellow*, 661 F. Supp. 1053, 1061, 17 Env’tl. L. Rep. 21134 (C.D. Cal. 1987) (“[T]he Court finds that the rains were not the kind of ‘exceptional’ natural phenomena to which the narrow act of God defense . . . applies. The rains were foreseeable . . . and any harm caused by the rain could have been prevented through design of proper drainage channels.”).

³42 U.S.C. § 9607(b)(3).

⁴42 U.S.C. § 9607(b)(4).

⁵*See U.S. v. Shell Oil Co.*, 294 F.3d 1045, 1061–62, 55 Env’t. Rep. Cas. (BNA) 1052, 32 Env’tl. L. Rep. 20783 (9th Cir. 2002).

⁶*Nixon-Egli Equipment Co. v. John A. Alexander Co.*, 949 F. Supp. 1435, 1443, 27 Env’tl. L. Rep. 20584 (C.D. Cal. 1996); *see further Morgan v. Exxon Corp.*, 869 So. 2d 446, 452, 159 O.G.R. 829 (Ala. 2003) (“we disagree with those cases that have required the defendant to prove the applicability of the petroleum exclusion”).

⁷Small Business Liability Relief and Brownfields Revitalization Act, Pub. L. No. 107-118, 115 Stat. 2356 (2002).

- (1) Bona fide prospective purchasers (BFPPs);⁸
- (2) Contiguous property owners (CPOs);⁹ or
- (3) Innocent landowners (ILOs).¹⁰

While an extensive discussion of these protections is beyond the scope of this chapter, parties who seek these protections are required to perform “all appropriate inquiries” into property before acquisition; and, for BFPPs and CPOs, must demonstrate no “affiliation” with a liable party.¹¹

There are also several common continuing obligations, as detailed by the EPA in a recent guidance memo entitled *Enforcement Discretion Guidance Regarding Statutory Criteria for Those Who May Qualify as CERCLA Bona Fide Prospective Purchasers, Contiguous Property Owners, or Innocent Landowners*:¹²

- “Demonstrating that no disposal of hazardous substances occurred at the facility after acquisition by the landowner (for BFPPs and ILOs);”
- “Complying with land use restrictions and not impeding the effectiveness or integrity of institutional controls”;
- “Taking ‘reasonable steps’ with respect to hazardous substance releases affecting a landowner’s property”;
- “Providing cooperation, assistance, and access to persons authorized to conduct response actions or natural resource restoration”;
- “Complying with information requests and administrative subpoenas (for BFPPs and CPOs);” and
- “Providing legally required notices (for BFPPs and CPOs).”¹³

One example of the attempted use of the innocent landowner defense in the context of petroleum contamination occurred in *Washington v. Time Oil Co.*¹⁴ There, the court held that the innocent landowner defense was not available where (1) contaminants found on the property “were found in amounts in excess of the amounts that would have occurred in petroleum during the oil refining process” and (2) other “substances found on the property would not have occurred due to the refining process.”¹⁵ Because of this, the petroleum exclusion could not effectively shield the defendant from liability.¹⁶

§ 29:127 Penalties for CERCLA violations

A liable party under CERCLA is responsible for all costs of response (cleanup and

⁸The BFPP, found in CERCLA § 107(r), protects a party from liability if the party acquires property after January 11, 2002 and meets the criteria in CERCLA §§ 101(40) and 107(r).

⁹CERCLA § 107(q).

¹³Memorandum from Susan Parker Bodine, EPA Assistant Administrator for Enforcement & Compliance, to Regional Counsels, Superfund National Program Managers (July 29, 2019) at 2, <https://www.epa.gov/sites/production/files/2019-08/documents/common-elements-guide-mem-2019.pdf>.

¹⁴State of Wash. v. Time Oil Co., 687 F. Supp. 529, 531, 27 Env’t. Rep. Cas. (BNA) 2076, 18 Env’tl. L. Rep. 21376 (W.D. Wash. 1988).

¹⁵State of Wash. v. Time Oil Co., 687 F. Supp. 529, 531, 532, 27 Env’t. Rep. Cas. (BNA) 2076, 18 Env’tl. L. Rep. 21376 (W.D. Wash. 1988).

¹⁶State of Wash. v. Time Oil Co., 687 F. Supp. 529, 531, 27 Env’t. Rep. Cas. (BNA) 2076, 18 Env’tl. L. Rep. 21376 (W.D. Wash. 1988).

investigation) incurred by the United States, a State, or a Tribe “not inconsistent with the National Contingency Plan” (the CERCLA cleanup blueprint) or “necessary” costs of response incurred by any other person, to the extent affirmatively consistent with the NCP.¹ Additionally, defendants are responsible for natural resource damages (e.g., to wildlife, habitat, waters, etc.).²

CERCLA provides for a range of penalties for violations, which the EPA may adjust to account for inflation.³ If a liable party “fails without sufficient cause to properly provide removal or remedial action upon order of the President pursuant to section 9604 or 9606 of this title,” that party may be also held to be liable “for punitive damages in an amount at least equal to, and not more than three times, the amount of any costs incurred by the Fund as a result of such failure to take proper action.”⁴

In addition to significant fines, criminal penalties of three years imprisonment (up to five years for second or subsequent convictions), are possible for notification failures.⁵ Any person in charge of a facility or vessel who fails to immediately notify the appropriate agency of the U.S. Government as soon as that person became aware of the release into the environment of a hazardous substance in an amount equal to or greater than a reportable quantity without a federal permit may be subject to such penalties.⁶

§ 29:128 Conclusion

Given the potentially broad reach of CERCLA liability, which has been described as “a black hole that indiscriminately devours all who come near it,”⁷ parties in the oil and gas industries should be aware of the limits of the petroleum exclusion and reporting requirements applicable to specific situations.

F. CLEAN AIR ACT

§ 29:129 Generally

The federal Clean Air Act (CAA) imposes permitting (both preconstruction and operating) obligations and technical standard on oil and gas operations. States are often the primary regulator under the CAA, based on delegated authority from the U.S. Environmental Protection Agency (EPA). While states are only required to meet federal minimum standards, they have significant discretion in how they implement their programs and what limits they set. This can lead to dramatic differences in permitting and operational requirements applicable to the same oil and gas operations in different states. Permitting requirements also vary based on the emissions associated with a source. Typically, oil and gas operations are considered

“minor sources,” which qualifies them for more streamlined permits. The CAA also imposes requirements related to the accidental release of certain substances, but oil and gas operations are generally exempt from these requirements.

§ 29:130 Cooperative federalism under the Clean Air Act

The CAA is administered by the EPA, in coordination with state, local, and tribal governments. At the federal level, the EPA promulgates National Ambient Air Quality Standards (NAAQS) for pollutants considered harmful to public health and the environment. Specifically, the NAAQS establish standards for six criteria pollutants (carbon monoxide, lead, nitrogen oxide, ozone, particulate matter, and sulfur dioxide) that must be met in all states.

Although EPA establishes federal standards, much of the implementation is left to the states. In fact, the CAA statute establishes that “air pollution prevention . . . is the primary responsibility of States and local governments.”¹ Accordingly, states have the ability to determine how to achieve those standards and meet the associated requirements within their own borders. As the U.S. Supreme Court noted shortly after the implementation of the CAA, provided that a state’s choice of emission limitations is compliant with the NAAQS, “the State is at liberty to adopt whatever mix of emission limitations it deems best suited to its particular situation.”²

States regulate air pollution within their borders by promulgating and enforcing State Implementation Plans or “SIPs.” A SIP is the overall body of regulations that governs air emissions in the state. In some cases, a tribal government will also implement its own body of regulations, referred to as a Tribal Implementation Plan or “TIP.” EPA has responsibility for reviewing and approving SIPs and TIPs that meet the NAAQS. If a state fails to submit a SIP or the SIP does not fully comply with the NAAQS, EPA will issue a federal implementation plan or “FIP” to ensure that the state complies with the relevant NAAQS. EPA may also develop FIPs for tribal lands if the tribe does not adopt its own implementation plan. Currently, EPA oversees a handful of FIPs spread across several states and tribal governments. For example, EPA administers a FIP for the Fort Berthold Indian Reservation that focuses on emissions from upstream oil and gas operations. This FIP establishes requirements to reduce emissions of volatile organic compounds (VOCs) from well completions, recompletions, and production and storage operations.³

§ 29:131 Preconstruction Permitting

The CAA requires operators to obtain a preconstruction permit before commencing construction or operation of a source as part of New Source Review (NSR) permitting. NSR permitting falls into one of three categories: (1) prevention of significant deterioration (PSD) permitting for construction of a “major source” or “major modification” within an area that meets all NAAQS; (2) nonattainment NSR permitting for construction of “major sources” or “major modifications” in areas that do not meet all NAAQS; and (3) minor NSR permitting for those sources that do not trigger PSD or nonattainment NSR permitting (*i.e.*, for sources or modifications that do not meet the “major” thresholds). In the oil and gas segment, operators are required to permit emissions from air emitting equipment associated with their activities, including but not limited to storage tanks, engines, flares and other

³*See* 40 C.F.R. § 49.4161 (2021).

combustion devices, compressors, and heater treaters.

EPA's regulations establish the federal NSR permitting requirements and set the minimum requirements for state permitting programs to receive approval under the state SIP. States or tribes may assume delegation of NSR permitting pursuant to their SIP or TIP. Once a state or tribe receives delegation, it takes responsibility for issuing preconstruction permits. At that point, the state or tribe may implement its own unique (and sometimes more stringent) permitting requirements, provided they meet EPA's basic requirements. If the state or tribe fails to develop a SIP or TIP that establishes delegation of NSR permitting, EPA retains responsibility for permitting. EPA currently has authority to issue nonattainment, PSD, and minor NSR permits on tribal lands.¹

For PSD permitting, a "major source" generally refers to new facilities that have the potential to emit 250 tons per year (tpy) or more of a pollutant. EPA regulations establish a major source threshold of 100 tpy for 28 named sources, with 250 tpy the relevant threshold for unnamed sources.² Although the 28 named sources include petroleum refineries and certain petroleum storage and transfer units, they do not cover typical upstream oil and gas operations. Accordingly, the 250 tpy threshold is relevant for oil and gas operations.

A "major modification" is a physical change or change in the method of operation at a major stationary source that results in a net significant increase in criteria emissions above defined modification thresholds.³ The thresholds for a major modification vary from 0.6 tpy to 100 tpy based on the pollutant.⁴

New major sources and major modifications in nonattainment areas (those that do not meet all NAAQS) are subject to a similar permitting program. However, the thresholds for what constitutes a major source and major modifications are lower than the thresholds applicable to PSD permitting.⁵

Both PSD and nonattainment NSR permitting processes require a Best Available Control Technology (BACT) evaluation.⁶ For PSD permitting, this requires a case-by-case analysis of the available control technologies for the pollutant and the source. These control technologies are ranked by effectiveness, but technologies that are technically infeasible or economically unreasonable may be excluded.⁷ In contrast, the BACT review for nonattainment NSR permitting is subject to a heightened standard that does not consider costs.⁸

Finally, minor NSR permitting applies when a source does not meet the major source or major modification thresholds of PSD and nonattainment NSR permitting. States take a variety of approaches to minor NSR permitting. However, in some cases, states have established a one-size approach for these minor sources, rather than requiring an individual case-by-case permit. For example, Texas allows operators to claim a permit by rule (PBR) for certain facilities that have emissions below

⁸U.S. EPA, *New Source Review Workshop Manual*, <https://www.epa.gov/sites/production/files/2015-07/documents/1990wman.pdf> (last visited June 25, 2021).

25 tpy of VOCs and can satisfy a suite of other requirements.⁹ Operators can claim PBRs for oil and gas production facilities, temporary oil and gas facilities, flares, and other upstream oil and gas operations or equipment. Similarly, operators may permit oil and gas minor sources in New Mexico using a general construction permit for oil and gas facilities, which is available for sources with VOC emissions below 95 tpy.¹⁰

Preconstruction permits must generally be obtained prior to construction and startup of oil and gas facilities. However, oil and gas exploration and production activities can present unique issues related to estimating emissions for permit applications. In contrast to those sources with generally consistent emissions as part of normal operations, production rates and the resulting emissions from wells often dramatically decline following startup. As a result, operators may not be able to precisely estimate annual emissions until after the startup of an oil or gas well. To address this relative uncertainty, states have established permitting programs that allow operators to secure preconstruction authorization based on initial estimates that they can then refine based on actual production data. For example, minor source wells in North Dakota's Bakken Pool may submit a well registration rather than a preconstruction permit.¹¹ The well registration is not required to be submitted until 90 days following the first date of production, which gives the operator time to develop more accurate emissions estimates based on the first month of production activity. At the same time, the registration requires the operator to establish enforceable emissions limitations and commit to certain emission control requirements.

§ 29:132 Title V Permitting

Title V of the CAA establishes the requirement for operating permits. These operating permits (referred to as Title V Permits) are designed to consolidate all applicable air quality requirements—both emissions limits and monitoring methods for demonstrating compliance with those limits—into one permit. All sources with the potential to emit 100 tpy or more of a regulated pollutant or combination of pollutants are required to obtain a Title V permit.¹ Title V permits are generally issued by delegated state authorities. However, as with other permits and air quality regulations, EPA implements a federal program if the state fails to do so. All operators with Title V permits must submit a deviation report identifying noncompliance with the many terms of the permit every six months and submit an annual certification of their compliance with the conditions of the permit.²

§ 29:133 Technology-Based Standards

The CAA also requires that EPA develop technology-based standards for specific categories of stationary sources. These New Source Performance Standards (NSPS) apply to new, modified, and reconstructed facilities. One example within upstream

¹42 U.S.C. § 7661(2).

²See Tex. Comm'n on Env't Quality, *Title V Deviation Reporting and Compliance Certification*, at 2 (Nov. 2012).

operations is NSPS OOOOa. The NSPS OOOOa standard applies EPA’s “best system of emissions reduction” for reducing emissions of greenhouse gases and VOCs across a number of emissions sources in the oil and natural gas source category, including wells, compressors, pneumatic controllers, storage vessels, and collections of fugitive components.¹ This includes the use of reduced emission completions and completion combustion devices for well completion operations and semiannual monitoring and repairs for fugitive emissions from well sites and compressor stations.²

States may also impose technology-based standards for new sources through the BACT analysis discussed above. In addition, the CAA requires that SIPs for nonattainment areas include reasonably available control technology (RACT) requirements for existing sources.³ RACT is the “lowest emissions limitation that a particular source is capable of meeting by the application of control technology that is reasonably available, considering technological and economic feasibility.”⁴ States and tribal authorities make their own determination as to what constitutes RACT for a specific source category. As is often the case with state implementation, states will sometimes impose more stringent requirements than the federal equivalent. For example, Colorado’s Regulation 7 imposes control requirements for VOC emissions that are more stringent than those found in NSPS OOOOa.⁵

§ 29:134 Greenhouse Gas Regulation

In addition to technology-based standards, EPA requires annual greenhouse gas emission reporting under NSPS Subpart W. Pursuant to NSPS Subpart W, owners and operators of onshore and offshore oil and gas operations must report data concerning their greenhouse gas emissions for production, processing, transmission, and distribution facilities.¹ The emissions estimates must include emissions from equipment leaks identified during leak inspections that track those required under NSPS OOOOa.²

President Biden’s stated commitment to addressing climate change and the country’s reentry into the Paris Agreement (an international agreement focused on reducing climate change), will likely spur new regulatory initiatives by the EPA. In addition, individual states have recently taken steps to advance greenhouse gas regulation from oil and gas activities. For example, in January 2019, the governor of New Mexico signed an executive order that includes a goal of reducing statewide greenhouse emissions by at least 45% by 2030 and directed the state environmental and oil and gas regulatory agencies to jointly develop a statewide, enforceable regulatory framework to secure reductions in oil and gas sector methane emissions.

§ 29:135 Risk management plan

Section 112(r) of the CAA requires that EPA establish regulations to prevent the accidental release and minimize the consequence of the release of certain listed sub-

[Section 29:133]

¹See 40 C.F.R. § 98.231 (2021).

²40 C.F.R. § 98.234 (2021).

stances and other extremely hazardous substances.¹ To effectuate this mandate, EPA's risk management plan (RMP) regulations at 40 C.F.R. Part 68 establish requirements for operators to develop and implement a risk management program if they have any processes at their facilities that meet or exceed certain threshold quantities of flammable or toxic chemicals. Facilities must submit a facility-specific RMP and revise the RMP every five years.² This submittal includes assessments of offsite consequences, potential worst-case releases, accident history, release prevention, and emergency planning.³ Facilities are also subject to additional requirements depending on their program level, which is assessed based on the level of risk associated with their processes.⁴ However, as discussed in more detail in Section 29:172 below, upstream oil and gas operations are generally excluded from RMP regulation under an exemption for naturally occurring hydrocarbons.

In addition to EPA's RMP regulations, § 112(r) of the CAA establishes a general duty, often referred to as the "general duty clause." The provision states that "owners and operators of stationary sources producing, processing, handling or storing such substances have a general duty in the same manner and to the same extent as section 654 of title 29 to identify hazards which may result from such releases using appropriate hazard assessment techniques, to design and maintain a safe facility taking such steps as are necessary to prevent releases, and to minimize the consequences of accidental releases which do occur."⁵ EPA has taken the position that the general duty clause applies to any facility that uses a regulated substance or other extremely hazardous substance in "any amount."⁶ In other words, even a facility with less than a threshold quantity of a flammable substance or toxic chemical that is otherwise excluded from the RMP regulations can be cited for a violation of the general duty clause. EPA often uses this general duty clause as the basis for enforcement actions following industrial incidents.

§ 29:136 Enforcement

The CAA also provides robust authority for EPA to take enforcement action against any person who violates CAA requirements. EPA may seek administrative, civil, or criminal penalties, the cost of which can be substantial. Although the CAA sets statutory maximum civil and administrative penalties of up to \$25,000 per violation per day, this amount has been increased over the years to adjust for inflation.¹ Currently, EPA can seek up to \$48,762 per day in administrative penalties and up to \$102,638 per day in civil penalties.²

In some cases, the injunctive relief associated with a CAA enforcement action can be more costly than the penalties themselves. In recent years, EPA has imposed broad injunctive obligations for upstream and midstream oil and gas operations. For example, in 2015 and the years following, EPA entered several consent decrees with exploration and production companies addressing alleged violations associated with

emissions from storage tanks and vapor control systems. In addition to imposing millions of dollars in civil penalties and mitigation projects, these consent decrees also required operators to complete extensive engineering evaluations, third-party audits, inspections, and modifications to vapor control systems across thousands of tank batteries. EPA has also targeted midstream operations, with a focus on pigging operations in recent years. In 2018, EPA entered a consent decree with one operator that imposed over \$600,000 in civil penalties and required injunctive relief (valued at approximately \$2.6 million according to EPA's estimates) aimed at reducing emissions associated with pigging operations for compressor stations and stand-alone facilities in a natural gas gathering system.

§ 29:137 Carbon sequestration

In the wake of the Paris Agreement and continued focus on the impact of greenhouse gases from industry, including oil and gas operations, both public and private interests are looking more closely at carbon sequestration technologies. Carbon sequestration involves capturing carbon dioxide from emitting activities (power plants and other large industrial sources) and permanently storing it, typically via injection into deep subsurface formations. These subsurface formations can include depleted oil and gas reservoirs. For example, Texas statutes establish jurisdiction for the Railroad Commission of Texas—the state's primary oil and gas regulator—over wells used for the injection of carbon dioxide into a reservoir that is initially or may be productive of oil and gas.¹

Utilization of carbon sequestration in the U.S. is still in the early stages, but there have been recent initiatives to deploy carbon sequestration at scale. In 2010, EPA issued a rule establishing minimum requirements for all aspects of the injection process for carbon sequestration as part of the Safe Drinking Water Act's Underground Injection Control (UIC) program.² These requirements covered permitting, geologic site characterization, well construction, operation, mechanical integrity testing, plugging, and site closure.³ Although the rule was primarily designed to protect drinking water resources, EPA's statements at the time it published the rules identified the potential benefits of carbon sequestration. Specifically, EPA noted that although carbon sequestration "is occurring now on a relatively small scale, it could play a larger role in mitigating greenhouse gas (GHG) emissions from a wide variety of stationary sources" and "even if only a fraction of [the US] geologic capacity is used, [carbon sequestration] would play a sizeable role in mitigating US GHG emissions."⁴ To date, there have been only six carbon sequestration well permits issued and only two wells exist. But tax credit incentives, government-funded research, an increase in corporate commitments to carbon neutrality, and anticipated market opportunities have converged to create a recent surge in interest in carbon sequestration projects.

In 2017, Secretary of Energy Rick Perry requested that the National Petroleum Council (NPC) provide advice concerning carbon capture, use, and storage (CCUS).⁵ In response, the NPC released a report in late 2019 that determined the US is "uniquely positioned" and has "substantial capability" to drive widespread deploy-

ment of CCUS technology.⁶ The NPC determined that the expansion potential for CCUS depends in part on improving financial incentives and further developing the regulatory framework.⁷

G. OIL POLLUTION ACT

§ 29:138 Introduction

The Oil Pollution Act (OPA)¹ was enacted in 1990 in response to the *Exxon Valdez* oil spill in Prince William Sound, Alaska.² OPA imposes strict and limited liability on the owners and operators of vessels, oil producing and handling facilities, and pipelines for discharges or substantial threats of discharges of oil into navigable waters, adjoining shorelines, and the exclusive economic zone.³ “Oil” is defined as “oil of any kind or in any form, including petroleum [and] fuel oil,” but exclusive of listed or designated hazardous substances under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA).⁴ Prior to the enactment of OPA, federal liability for marine oil spills was governed by the Clean Water Act (CWA).

§ 29:139 *Exxon Valdez*

On March 24, 1989, the crude oil tank vessel *Exxon Valdez* ran aground on the Bligh Reef in Prince William Sound, Alaska. The *Exxon Valdez* carried over one million barrels of crude oil, supplied from the Trans-Alaska Pipeline connected to producing fields in Alaska’s North Slope, and bound for refineries on the West Coast.¹ The single-hulled vessel was breached, causing a release of over 260,000 barrels of crude which, at the time, was the largest oil spill in U.S. history. After extensive cleanup efforts in the unique ecosystem of the Sound, images of which remain indelible to practitioners and the public alike over 30 years later, Exxon was eventually liable for \$2.1 billion in restitution and other fines. This included \$125 million in fines under the CWA and hundreds of million more under a consent decree with the United States and the State of Alaska.²

Just a few months later, the Senate Environment and Public Works Committee approved the bill that would become OPA,³ finding that the *Exxon Valdez* spill, as well as three other significant spills across the lower-48 in the same year, “have demonstrated that oil pollution from accidental tanker spills is a real and continuing threat to the public health and welfare and the environment. The disaster

caused by the nation's largest oil spill in Prince William Sound was exacerbated greatly by an unreasonably slow, confused and inadequate response by industry and government that failed miserably in containing the spill and preventing damage.”⁴

§ 29:140 Liability

OPA imposes strict liability on a “responsible party” for removal costs and damages resulting from a release or threatened release. A “responsible party” is generally the owner or operator of a vessel, facility, or pipeline. Multiple responsible parties (e.g., the owner and charterer of a vessel) may be jointly and severally liable.¹ Responsible parties are liable for removal costs, including costs incurred by federal, state, and tribal governments.² Responsible parties are also liable for natural resource damages, damages to property, and loss of profits and earning capacity, among other costs.³

In circumstances not involving gross negligence, willful misconduct, violation of federal regulation, or failure to report or assist with a spill,⁴ OPA liability is limited based on the type of facility from which the discharge occurs. Statutory liability for discharges from tank vessels is limited to the greater of \$1,900 per gross ton, or \$4 million for vessels 3,000 gross tons or smaller or \$16 million for larger vessels.⁵ For discharges from offshore facilities (such as offshore oil wells), excluding deepwater ports, the limit is \$75 million plus removal costs.⁶ For discharges from onshore facilities (such as refineries and pipelines) and deepwater ports, liability is limited to \$350 million.⁷ For discharges from mobile offshore drilling units (MODUs), the limits for vessels apply, unless removal costs and damages exceed the applicable vessel liability limits, in which case the offshore facility limits apply.⁸

OPA gives the president the ability to adjust liability limits for every type of facility discharge except discharges from vessels,⁹ but he or she shall adjust limits for all facility spills to reflect increases in the Consumer Price Index.¹⁰ And unlike the pre-OPA CWA framework applicable to oil spills, “any person,” not just the federal government, can recover costs and damages from responsible parties.¹¹

Responsible parties can assert certain defenses to liability. OPA provides three complete statutory defenses that a responsible party may assert: an act of God, act of war, and act or omission of a third party other than the responsible party's em-

⁹33 U.S.C. § 2704(d).

¹⁰33 U.S.C. § 2704(d)(4). These limits have been adjusted several times. See, e.g., Consumer Price Index Adjustments of Oil Pollution Act of 1990 Limits of Liability—Vessels, Deepwater Ports and Onshore Facilities, 84 Fed. Reg. 39970 (Aug. 13, 2019).

¹¹33 U.S.C. § 2702(b)(1)(B). Under the CWA, only the Federal government could recover removal costs. CONG. RESEARCH SERV., OIL POLLUTION ACT OF 1990 (OPA): LIABILITY OF RESPONSIBLE PARTIES 1 (June 2, 2010).

ployee or agent.¹² A fourth defense is also available with respect to particular claimants who can be shown to have caused a discharge through their own gross negligence or willful misconduct.¹³ While facts will vary from incident to incident, as a general matter, these defenses can be fairly limited. For example, as a statutory threshold to asserting any of the complete defenses, a responsible party must have complied with other obligations under OPA, including release reporting requirements, compliance with removal orders, and compliance and assistance with cleanup efforts.¹⁴ In addition, third party liability cannot be asserted as a defense if the third party's act or omission occurred in connection with a contractual relationship with a responsible party,¹⁵ or if the responsible party failed to exercise due care or failed to take precautions as to foreseeable actions by the third party.¹⁶

Importantly, OPA's liability limits do not preempt state laws regarding oil spill liability or financial responsibility.¹⁷ Responsible parties can therefore be liable under both OPA and state law equivalents for the same discharge.

§ 29:141 Oil Spill Response

OPA amended existing provisions in the CWA regarding the National Contingency Plan (NCP) and individual facility oil spill response plans.¹ The NCP, overseen and implemented by the U.S. Environmental Protection Agency and the U.S. Coast Guard, is a comprehensive plan for oil spill response and removal that divides response efforts into nationwide regional teams and coordinates efforts among 16 federal agencies. Individual response efforts are led by a single designated Federal On-Scene Coordinator.²

Vessels and onshore and offshore oil facilities are also required to prepare and maintain individual facility oil spill response plans that are consistent with the NCP.³ For example, tank vessel spill response plans must include a list of contacts, shore-based response activities, training and exercise procedures, and plan review and update procedures.⁴ Responsible parties may not assert acts in accordance with individual spill response plans as a defense to OPA liability.⁵

OPA also firmly established the Oil Spill Liability Trust Fund (OSLTF) by fully funding and authorizing expenditures from a fund established by Congress (but never used) in 1986.⁶ The OSLTF is available to pay removal costs incurred by governments and uncompensated damages claims,⁷ up to a limit of \$1 billion per incident.⁸ The primary source of funding for the OSLTF is a per-barrel tax imposed

on crude oil imported into, exported from, or consumed in the United States.⁹ The OSLTF can also recover removal costs from responsible parties.¹⁰ Between FY2007 and FY2018, appropriations from the OSLTF totaled \$3.37 billion. In addition to excise tax receipts, the OSLTF collected \$2.13 billion from OPA fines and penalties and \$1.28 billion in other cost recovery.¹¹ This includes \$2.1 billion collected following the *Deepwater Horizon* incident, which is expected to generate an additional \$76 million in receipts through 2031.¹²

§ 29:142 *Deepwater Horizon*

On April 20, 2010, the MODU *Deepwater Horizon*, owned by Transocean Ltd., experienced a loss of well control while operating above BP's Macondo offshore oil well in the U.S. Gulf of Mexico, resulting in an explosion and fire aboard the dynamically-positioned drilling vessel. The vessel eventually sank, laden with nearly 700,000 gallons of diesel fuel, and causing a subsea release of more than 4 million barrels of crude oil from the Macondo well¹ that was not brought under control for 87 days after the subsea blowout preventer failed to stop the flow of oil from the well.² It was the largest oil spill by volume in U.S. history.

In ensuing Multi-District Litigation, involving hundreds of claimants and consolidated in the Eastern District of Louisiana, the Court found that both BP and Transocean were responsible parties under OPA. With respect to the subsurface discharge of oil from the Macondo well, BP was the responsible party because the Court found that the MODU was operating as an "offshore facility" at the time of the discharge, in which case OPA defines the offshore lessee as the responsible party.³ Transocean was also found to be a responsible party for removal costs as an "operator" of an offshore facility.⁴ The Court apportioned OPA's joint and several liability in the amounts of 67% to BP and 30% to Transocean.⁵ In addition, the Court found that OPA's liability limits did not apply on grounds that failures in well construction violated applicable federal regulations.⁶

While the previous largest U.S. oil spill, *Exxon Valdez*, spurred the enactment of

The remaining 3% was assigned to Halliburton, a contractor providing cementing services at the Macondo well, under general maritime law. In re Oil Spill by Oil Rig Deepwater Horizon in Gulf of Mexico, on April 20, 2010, 21 F. Supp. 3d 657, 757, 2014 A.M.C. 2113 (E.D. La. 2014).

⁶In re Oil Spill by Oil Rig Deepwater Horizon in Gulf of Mexico, on April 20, 2010, 21 F. Supp. 3d

OPA, the *Deepwater Horizon* incident did not result in major changes to federal statutes. But it did precipitate major changes in other areas, including the reorganization of Department of the Interior (DOI) agencies responsible for offshore oil and gas operations,⁷ as well as the creation of industry-led safety initiatives such as the Helix Well Containment Group and the Center for Offshore Safety. These changes were intended to separate revenue collection and industry regulation functions in federal oversight, and to augment industry's ability to prevent and respond to major offshore spill incidents.

§ 29:143 Other Major U.S. Oil Spill Incidents

- ***Santa Barbara Oil Spill.*** Prior to the *Deepwater Horizon* incident, the largest offshore oil spill incident in the U.S. occurred offshore California in 1969. A Union Oil platform in the Santa Barbara channel experienced a blowout that released at least 80,000 barrels of crude. While the blowout preventer functioned as intended, unlike during the *Deepwater Horizon* incident, crude continued to flow through fissures in the seabed as a result of the well being permitted at a shallower than typical depth.¹ Like *Deepwater Horizon*, no major statutory changes specific to oil spills were enacted in the immediate wake of the incident, but the spill and resulting images of slicks along beaches catalyzed significant changes in offshore oil regulation, including a temporary offshore drilling moratorium and enactment of new offshore regulations.² The incident may also have contributed to Congressional action in the form of the National Environmental Policy Act, enacted in 1970.³
- ***Athos I.*** In 2004, the tank vessel *Athos I* was laden with heavy Venezuelan crude oil when it struck an abandoned and uncharted anchor in the Delaware River en route to a refinery in Paulsboro, New Jersey.⁴ The anchor punctured the single-hulled vessel, resulting in a discharge of over 6,000 barrels of crude into the river. While the owner of the *Athos I* was found to be the responsible party and subject to OPA's liability limits, the U.S. Supreme Court was asked to resolve a related contract dispute regarding the scope of a "safe berth" provision in the vessel's charter agreement and whether the presence of the anchor in the river affected its application. The Court found that the safe berth provision imposed a warranty of safety, which shifted contractual liability to the

657, 754-55, 2014 A.M.C. 2113 (E.D. La. 2014); 33 U.S.C. § 2704(c)(1)(B); 30 C.F.R. § 250.420(a)(2) (2021) (Department of the Interior regulation regarding cementing and casing of offshore wells).

⁷Pre-Macondo, the Minerals Management Service ("MMS") was responsible for offshore permitting, safety, and collection of royalty revenue. Following the incident, MMS was reorganized as the Bureau of Ocean Energy Management, Regulation, and Enforcement; and, later, as the Bureau of Ocean Energy Management (responsible for permitting), the Bureau of Safety and Environmental Enforcement (responsible for operations), and the Office of Natural Resources Revenue (responsible for royalty collection).

refinery for failure to scan for and warn the *Athos I* about the presence of the anchor.⁵ The dispute revealed another seam in OPA's ostensibly clear liability scheme.

- **Cosco Busan.** In late 2007, the cargo vessel *Cosco Busan* allided with the Bay Bridge, causing a discharge of over 1,000 barrels of bunker fuel into the San Francisco Bay. The owner of the *Cosco Busan* was the responsible party under OPA, but argued that it was not liable for cleanup and removal costs because the government had failed to comply with all of OPA's claim presentment requirements.⁶ The Court concluded this argument was foreclosed by OPA's plain language, which provides that claims for removal "may be commenced . . . at any time."⁷ This reading was found to further OPA's major purpose of allowing the government to "recover removal and cleanup costs [with] greater flexibility . . . than individuals seeking damages."⁸ Because OPA is primarily concerned with expedient and economically efficient environmental remediation, mere technical deficiencies in claims presentment will not foreclose cost recovery.

§ 29:144 State law

Because OPA does not preempt state laws on oil spill liability, standards for liability and the types of parties that can be held liable vary widely from state to state. Some states impose strict liability on even "passive" parties to a discharge incident, such as holders of title to oil cargoes transported by vessel.¹ Any party with even limited interests in physical oil or means of transportation of oil should therefore carefully vet any applicable state laws to understand potential liability in the event of a release.

H. TOXIC SUBSTANCES CONTROL ACT—APPLICATION TO OIL AND GAS OPERATIONS

§ 29:145 Introduction

This section discusses the application of the Toxic Substances Control Act (TSCA)¹ to oil and gas operations. Specifically, this chapter will briefly discuss the three TSCA Sections that are most applicable to the oil and gas industry: chemical data reporting under Section 8, pre-manufacturer notices and significant new use rules under Section 5, and testing requirements under Section 4. For each of these Sections, this part of the chapter analyzes the potential impacts on upstream oil and gas exploration and production, downstream processing and refining, and drilling and service providers.

Generally, upstream oil and gas production facilities will have few obligations under TSCA unless they are importing chemicals for use in fracking or enhanced oil recovery operations. Downstream processors and refineries are not exempt; they will have limited reporting obligations under Section 8 and are subject to Section 5

and Section 4 of TSCA. Well drilling and service providers may also be subject to TSCA if they manufacture or import chemicals. With the recent change in the presidential administration as of publication, there also exists the possibility that the use of fracking chemicals may come under greater scrutiny. This could lead to additional reporting or testing obligations and potential restrictions on the use of such chemicals.

§ 29:146 The Toxic Substances Control Act

Following World War II, commercial production of industrial chemicals remained largely unregulated despite having become pervasive in agriculture, manufacturing, mining, construction, and consumer products.¹ The first major piece of legislation regulating industrial chemicals was enacted by Congress in 1976 under the Toxic Substances Control Act.² The purpose of TSCA was to empower the Environmental Protection Agency (EPA) to evaluate the potential risks of new and existing chemicals and to find ways to prevent or reduce pollution caused by these chemicals before they can enter the environment.

Despite its substantial policy goals, the original TSCA was, for the most part, a chemical recording and notification act. Following its enactment, the EPA compiled an inventory of 62,000 industrial chemicals then in use. These chemicals, including many naturally occurring and petroleum stream chemicals discussed below, were grandfathered into commercial use and assumed to be safe.³ However, the EPA's ability to assess the risks of these existing chemicals was limited. For example, in the first 15 years of its enactment, the agency was only able to review about 2% of the existing chemicals listed, despite the fact that the agency estimated that about 26% were potentially of concern based on their production volume and chemical properties.⁴

Due to these and other drawbacks, Congress enacted its first major revision to TSCA on June 22, 2016, under the Frank R. Lautenberg Chemical Safety for the 21st Century Act (the "Lautenberg Act.")⁵ The Lautenberg Act adopted several significant changes, including new obligations and deadlines imposed on the EPA, enhancements to the EPA's authority to regulate, and a clearer explanation of the process for the review and determination of risks.⁶ One of the most substantial new obligations is a mandate to review the safety of existing chemicals.⁷ Under the Lautenberg Act, chemicals are evaluated against a new risk-based safety standard to determine whether a chemical use poses an "unreasonable risk."⁸ Given that there are over 83,000 chemicals currently listed in the TSCA inventory, this is a

considerable undertaking.⁹

§ 29:147 Chemical Data Reporting

Under Section 8, manufacturers and importers are required to provide the EPA with information on chemicals, currently listed on the TSCA inventory, that they manufacture domestically or import into the United States.¹ EPA has promulgated regulations to implement the reporting requirements.² This is commonly called the Chemical Data Reporting rule (CDR rule). Examples of required information includes: chemical or mixture identity, categories of use, quantity manufactured or processed, by-product description, health and environmental effects information, number of individuals exposed, and method(s) of disposal.³ The EPA uses this data to help assess the potential human health and environmental impacts of these chemicals and makes the non-confidential business information it receives available to the public.⁴ Generally, the EPA collects this information every four years from those manufacturers and importers who produce or import 25,000 lbs. or more of a chemical substance at a single site for a specific reporting year.⁵ However, a lower threshold may apply for chemical substances that are the subject of certain TSCA actions, such as those mandated by TSCA sections 4, 5, or 6.⁶

§ 29:148 Application of CDR to Oil and Gas Exploration and Production Facilities

Under the CDR rule, certain categories of chemical substances—including polymers, microorganisms, naturally occurring chemical substances, and certain forms of natural gas and water—are fully exempt from the reporting requirements.¹ Therefore, oil and gas exploration and production companies generally do not have any obligations to report under the CDR rule unless they are importing chemical substances that are not fully exempt under 40 C.F.R. § 711.6.

Although oil and gas exploration and production facilities may not be subject to the regular reporting requirements under Section 8(a), these companies may still be subject to Section 8(e). Section 8(e) states that any person who “manufactures,

⁴See U.S. EPA, *TSCA Chemical Data Reporting Fact Sheet: Chemical Substances which are the Subject of Certain TSCA Actions* available at https://www.epa.gov/sites/default/files/2015-03/documents/chemical_substances_which_are_the_subject_of_certain_tsc_a_actions.pdf.

⁵40 C.F.R. § 711.15 (2021). Any person who must report under this part, as described in § 711.8, must submit the information described in this section for each chemical substance described in § 711.5 that the person manufactured (including imported) for commercial purposes in an amount of 25,000 lb. (11,340 kg) or more (or in an amount of 2,500 lb. (1,134 kg) or more for chemical substances subject to the rules, orders, or actions described in § 711.8(b)) at any one site during any calendar year since the last principal reporting year (e.g., for the 2020 submission period, consider calendar years 2016, 2017, 2018, and 2019, because 2015 was the last principal reporting year).

⁶40 C.F.R. § 711.8(b) (2021).

processes,² or distributes in commerce a chemical substance or mixture and who obtains information which reasonably supports the conclusion that such substance or mixture presents a substantial risk of injury to health or the environment shall immediately inform the Administrator of such information unless such person has actual knowledge that the Administrator has been adequately informed of such information.”³ This is unlikely to apply to naturally occurring substances produced from the well, but could apply to fracking chemicals or chemicals used in enhanced recovery operations. Further, this Section does *not* provide exemptions for small businesses, small production or importation volumes, or commercial activities such as manufacture for export only or research and development.⁴

§ 29:149 Application of CDR to Downstream Processors and Refiners

Under the CDR Rule, petroleum process streams are only partially exempt from reporting.¹ Therefore, downstream petroleum manufacturers and refiners are required to provide some information to the EPA under the CDR rule, such as a certification statement signed and dated by an authorized official of the submitter company, company and site information, and some chemical-specific information, if they manufacture or import such materials above the requisite thresholds.² Downstream processors and refiners are exempt from the requirement to provide chemical-specific information related to processing and use, including consumer and commercial use information and production volumes.³ After considering the totality of information available regarding petroleum streams, including the chemical substance’s chemical and physical properties or potential for persistence, bioaccumulation, health effects, environmental effects, and several other risk factors,⁴ the EPA concluded that this chemical-specific information related to processing and use of petroleum is of “low current interest” and therefore, not necessary to report at this time.⁵

In light of the events at the time of TSCA’s enactment, such as the 1973 oil crisis and ensuing enactment of Energy Policy and Conservation Act of 1975, the EPA’s choice not to impose potentially burdensome reporting requirements on petroleum manufacturers that could have slowed petroleum production is understandable. However, with the adoption of the Lautenberg Act in 2016 and based on recent information regarding the link between petroleum use and climate change, some TSCA critics argue that these chemicals may pose a substantial risk of injury to health or the environment pursuant to Section 8(e). They maintain that the EPA should therefore reassess the petroleum stream exemption to reflect government policies on the reduction of greenhouse gas emissions.⁶

§ 29:150 Application of CDR to Well Drilling and Service Providers

²A “processor” is someone who prepares a substance or mixture, after its manufacture, for distribution in commerce either (a) in the same form or physical state or in a different form or physical state, or (b) as part of an article containing the chemical substance or mixture. *See* 15 U.S.C. § 2602(13).

⁶*Supra* note 7, at 232.

Well drilling and service providers that are not manufacturing or importing chemical substances will not have any reporting obligations under the CDR rule. However, if a well drilling company or service provider imports non-exempt chemical substances, such as hydraulic fracturing (a.k.a., “fracking”) fluids, at or above the reporting threshold, they would have an obligation to report under the CDR rule.

§ 29:151 Pre-Manufacture Notices and Significant New Use Rules

For purposes of regulation under TSCA, if a chemical is listed on the TSCA inventory as described above, the substance is considered an “existing” chemical substance in commerce. Any chemical that is not on the inventory is considered a new chemical substance.¹ The purpose of Section 5 of TSCA is to help manage the potential risk to human health and the environment from these new chemicals. Section 5 functions as a gatekeeper that can identify potential conditions or restrictions, up to a complete ban on production, that should be placed on the use of a new chemical before it enters commerce.² Any person who intends to manufacture or import a new chemical substance for a non-exempt commercial purpose is required to submit a pre-manufacture notice (PMN) at least 90 days prior to the manufacture or import of the chemical.³ PMN submissions must include all available data, pursuant to 40 CFR §§ 720.45 and 720.50, for consideration by EPA risk assessors, on the following: chemical identity; structure and formula process; diagram and description; production volume; byproducts and impurities; intended use; environmental release; disposal practices; human exposure; and existing available test data on the effect on human health or the environment.⁴

Additionally, Section 5 can regulate “new significant uses” of existing chemicals substances or mixtures. Significant New Use Rules (SNURs) can be used to require notice to EPA before chemical substances and mixtures are used in new ways that might create concerns.⁵ Once the EPA determines that a use of a chemical substance is a significant new use, TSCA section 5(a)(1)(B) requires persons to submit a significant new use notice (SNUN) to the EPA at least 90 days before they manufacture or process the chemical substance for that use.⁶ In determining whether to issue SNURs for particular chemicals, the EPA will consider all relevant factors, including those listed in TSCA section 5(a)(2): [p]rojected volume of manufacturing and processing of a chemical substance; [e]xtent to which a use changes the type or form of exposure of humans or the environment to a chemical substance; [e]xtent to which a use increases the magnitude and duration of exposure of humans or the environment to a chemical substance; [and] [r]easonably anticipated manner and methods of manufacturing, processing, distribution in commerce, and disposal of a

⁶15 U.S.C. § 2604(a)(1)(B)(i).

chemical substance.”⁷

If the EPA determines that a new chemical or significant new use presents unreasonable risk of injury to health or the environment, the “EPA may: (1) limit the amount manufactured/processed/distributed in commerce or impose other restrictions on the substance via an immediately effective proposed rule under section 6 of TSCA; or (2) issue an order to prohibit or limit the manufacture, processing or distribution in commerce to take effect on the expiration of the applicable review period.”

§ 29:152 Application of PMN and SNURs to Oil and Gas Exploration and Production Facilities

Oil and gas exploration and production facilities would typically not be subject to any PMN regulations. Naturally occurring chemical substances are automatically included in the TSCA chemical inventory.¹ Specifically included on the list are any chemical substances which are naturally occurring and: (1) which are (i) unprocessed or (ii) processed only by manual, mechanical, or gravitational means; by dissolution in water; by flotation; or by heating solely to remove water; or (2) which are extracted from air by any means, will automatically be included in the inventory under the category “Naturally Occurring Chemical Substances.”² Examples of such substances include: raw agricultural commodities; water, air, natural gas, and crude oil; and rocks, ores, and minerals.³ Similarly, it would be unlikely that the EPA would, considering the criteria listed above, issue a SNUR for any of these naturally occurring substances.

§ 29:153 Application of PMN and SNURs to Downstream Processors and Refiners

Downstream processors and refiners are subject to both PMNs and SNURs. In December of 2020, the EPA posted a Compliance Advisory entitled “*Applicability of the Toxic Substances Control Act to Chemicals made from Petroleum and Renewable Sources Used as Fuels and Fuel Additives and Distillates*.”¹ The Compliance Advisory reaffirmed that chemical substances used as fuels, fuel additives, and distillates made from either petroleum or renewable sources are subject to the TSCA and anyone who plans to manufacture or import a chemical made from petroleum or renewable sources must comply with the statutory and regulatory new chemical requirements under TSCA Section 5.² Currently, there are about 142 “naphthas” and 178 “distillates” on the TSCA Inventory, and they are considered Unknown, Variable composition, Complex, or Biological (UVCB) substances.³ The EPA clearly states that anyone who desires to manufacture or import a chemical that is not on the TSCA Inventory must submit a PMN. If a manufacturer is unsure whether

²*Id.*

³*Id.*

their chemical is listed, they are encouraged to submit a Bona Fide Intent to Manufacture or Import Notice under 40 C.F.R. § 720.25. The EPA will consider the information submitted in a bona fide notice and will provide a determination on the TSCA Inventory status for the chemical substance.

A SNUN will be required at least 90 days before any person may manufacture or process a chemical substance subject to a SNUR. There are several existing and proposed SNURS that may apply to petroleum manufactures, such as those with NAICS codes 325 and 324110 (e.g., chemical manufacturing and petroleum refineries).⁴ Manufacturers are encouraged to search their chemicals on the EPA's Substance Registry Services site to determine if any manufactured or imported chemical is subject to a SNUR, or any other TSCA actions.⁵

§ 29:154 Application of PMN and SNURs to Well Drilling and Service Providers

As discussed above, well drilling and service providers that do not manufacture or import chemicals will not be subject to TSCA. However, a well drilling or service provider who *is* manufacturing or importing chemicals would be subject to the same Section 5 requirements as other manufacturers or importers. As noted above, importers need to submit a PMN to the EPA if they intend to import an unlisted chemical, and they will need to submit a SNUN in the event they import a chemical subject to a SNUR.

Companies that manufacture or import hydraulic fracking fluids are also subject to the TSCA Section 5 requirements. The fracking fluid used to recover gas and oil from shale rock usually contains mostly water in addition to some chemical additives and proppants.¹ Different chemicals are added depending on the rock type and other specifics of the extraction site.² The EPA identified 1,084 chemicals that were reported to have been used in fracking fluids between 2005 and 2013. The EPA's analysis of FracFocus 1.0 data indicates that between 4 and 28 chemicals were used per well between January 2011 and February 2013 and that no single chemical was used in all wells.³ As fracking companies continue to alter and refine the composition of their fracking fluids, the new chemicals added to these fluids are subject to TSCA Section 5. Additionally, many of the chemicals already used in this process have not been fully evaluated or tested, making it possible that the EPA could issue a SNUR if it determines that any new or increased use of these existing chemicals could pose a potential risk under the criteria listed above.⁴

§ 29:155 Chemical testing

Under Section 4 of TSCA, the EPA has authority to require chemical manufacturers, importers, or processors to test chemical substances and mixtures and report

⁴See, for example, 85 Fed. Reg. 26419 (May 4, 2020); 84 Fed. Reg. 43266 (Aug. 20, 2019); 85 Fed. Reg. 45109 (July 27, 2020); 80 Fed. Reg. 2885 (Jan. 21, 2015); 84 Fed. Reg. 66591 (Dec. 5, 2019).

the results to the EPA.¹ The EPA can require testing on the health and environmental effects of a chemical if there is insufficient information and if the testing is relevant to make a determination of whether the substance would cause an “unreasonable risk of injury to health and the environment.”² The EPA can also order testing to review notices, perform a risk evaluation, or to prioritize a chemical substance.³

Prior to the 2016 Lautenberg Act, the EPA’s testing authority was limited and, absent an Enforceable Consent Agreement (as discussed below), could only be exercised through the passing of a formal rule with public notice and comment. The EPA had to show a more than theoretical probability of a hazard or significant exposure risk that poses an “unreasonable risk of injury.”⁴ This created a “catch-22” where the EPA had to prove the existence of a risk that it needed testing to assess the presence of.⁵ Because of this high standard, very few chemicals were actually tested, creating a gap in knowledge about certain chemical risks.⁶

The amended rule gave the EPA broader authority to order the testing of substances without issuance of a formal rule. In order to compel testing, the EPA need only to: (1) identify the need for the information to be gleaned from testing; (2) describe how readily available information was used to inform the decision to require new information; and (3) where applicable, explain why the use of an order is warranted rather than a rule or consent agreement.⁷ Testing must be conducted in a tiered fashion where the results of screening tests inform future tests.⁸ Additionally, under Section 21, any person can petition to the EPA to initiate a proceeding for the issuance, amendment, or repeal a Section 4 rule.⁹

The EPA also has the option to enter into Enforceable Consent Agreements (ECAs).¹⁰ With an ECA, the EPA works with members of the U.S. chemical industry who have volunteered to perform testing on certain chemicals.¹¹ ECAs are designed to provide the EPA with data identified as necessary to evaluate a particular chemical substance without the need for the EPA to first make the risk or exposure based findings for a TSCA Section 4 test rule, and without introducing delays inherent in the rulemaking process.¹² As of 2018, there were 52 substances being evaluated

under ECAs.¹³

§ 29:156 Applicability of Testing Requirements to Oil and Gas Exploration and Production Facilities

Oil and gas exploration and production companies are technically subject to Section 4 of TSCA.¹ Unlike Section 8, there are no express exemptions under Section 4 for naturally occurring chemical substances, such as crude oil and natural gas.² Despite this, these naturally occurring chemical substances are extremely common in commerce and have generally be considered low-risk. It is unlikely that the EPA would determine the existence of a need to compel testing for crude oil and natural gas.

However, while traditional crude oil and gas production are unlikely to be subject to testing at this time, oil and gas producers that develop their own fracking fluids have been under particular scrutiny in recent years. For example, in August 2011, the environmental group Earthjustice petitioned EPA requesting that the EPA pursue regulation of chemicals used in hydraulic fracturing, including drilling muds and fracturing fluids, under both Section 4 and Section 8.³ Specific to Section 4, the group asked the EPA to pursue a requirement for manufacturers and processors of fracturing fluids to identify all chemicals used and to conduct toxicity testing on those chemicals.⁴ Earthjustice argued that the chemicals used in fracking may present an unreasonable risk of injury to health and the environment for several reasons.⁵ The group also argued that the large volume of chemicals used in hydraulic fracturing of wells in the United States could result in substantial human exposure to the chemicals, as well as a substantial release of the chemicals into the environment.⁶ In the group's view, testing was required to obtain sufficient data on the chemicals' effects because existing federal and state disclosure requirements were inadequate.⁷

In November 2011, the EPA denied the petitioners' request for adoption of a rule under Section 4, stating that the petition did not set forth facts sufficient to support the required findings under TSCA Section 4(a)(1)(A) or 4(a)(1)(B) for issuance of a test rule. The EPA concluded that Earthjustice did not demonstrate that the

⁷Earthjustice and 114 other organizations. Letter from Deborah Goldberg, Earthjustice to Wendy Cleland-Hamnett, Director, Office of Pollution Prevention and Toxics. Re: Citizen Petition Under Toxic Substances Control Act Regarding the Chemical Substances and Mixtures Used in Oil and Gas Exploration or Production, (Aug. 4, 2011), 78 Fed. Reg. 41768, 41771 (Jul. 11, 2013), http://www.epa.gov/opp/t/chemtest/pubs/Section_21_Petition_on_Oil_Gas_Drilling_and_Fracking_Chemicals8.4.2011.pdf.

chemicals presented an “unreasonable risk of injury to human health or the environment.”⁸ Additionally, the group failed to identify an “exposure trigger” demonstrating that the chemical will be produced or released into the environment in substantial quantities.⁹ The authors of *Disclosure of Hydraulic Fracturing Fluid Chemical Additives: Analysis of Regulations* pointed to the inherent tension that existed in the regulations before the adoption of the Lautenberg Act. While EPA was able to require testing if it found that insufficient data existed, often the agency still had to prove an “unreasonable risk” for the risk trigger and “substantial quantities” for the exposure trigger.¹⁰ In short, without the necessary data, the agency could not properly assess a chemical’s risks, and without an identifiable risk, the agency could not collect a chemical’s data.

While Earthjustice’s petition for Section 4 testing was not successful, the EPA’s testing authority has been considerably expanded since 2011 under the Lautenberg Act. While hydraulic fracking fluids are not currently being considered for further testing, this expanded authority leaves open the possibility that similar substances may be tested in the future.

§ 29:157 Applicability of Testing Requirements to Downstream Processors and Refiners

Downstream processors and refiners are subject to the EPA’s testing authority under Section 4. Again, there are no exemptions or partial exemptions under this rule for petroleum stream chemicals. Petroleum manufactures have previously been subject to both ECAs and, more recently, test orders.

For example, in January 2021, EPA ordered the testing of several chemicals involved in petrochemical manufacturing (1,2,2-Trichloroethane, 1,2-Dichloroethane) and petroleum products (p-Dichlorobenzene, o-Dichlorobenzene).¹ The evaluation process for these chemicals began in December 2019 as part of the second batch of chemicals ordered to undergo testing after the passage of the Lautenberg Act.² Prior to the issuance of the test orders for these chemicals, the EPA designated 20 high priority substances for risk evaluation based on factors such as hazard potential, persistence and bioaccumulation, and potential uses of the chemical.³ The EPA then released draft scope of risk evaluations for 13 of the 20 high priority substances prior to initiating testing.⁴ All steps in the testing order process provided the opportunity for public input through notice and comment procedures. Although the testing of these chemicals was ordered after prioritization and risk evaluation, the information provided by Section 4 may also be used as the basis for prioritization findings as well.⁵

Prior to these test orders, the EPA negotiated ECAs with gasoline manufactures

and processors for the development and submission of test data for methyl tertiary-butyl ether (MTBE), tertiary-amyl methyl ether (TAME) and the nine-carbon aromatic hydrocarbon fraction (C9 fraction) used in gasoline blending.⁶ The EPA's choice to use ECAs for these petroleum additives instead of a formal test rule was controversial. In his article, *MTBE: A Precautionary Tale*, Tom McGarity describes the several "critical points" at which EPA or Congress could have avoided the regulatory pitfalls that lead to groundwater contamination from MTBE.⁷ One of these critical points was EPA's decision to allow for industrial users of MTBE, rather than the manufacturers of the chemical, to conduct their own chemical testing. After more than a year of additional negotiations, the EPA published notice of a Consent Order to which the EPA and five major oil companies had agreed on.⁸ The companies agreed to conduct several different types of tests to identify potential risk factors for human exposure.⁹ However, despite the EPA's concerns regarding groundwater contamination, the companies were able to avoid any environmental testing, and conducted little testing regarding risks posed by ingestion, one of the most common ways humans would be exposed to MTBE in drinking water.¹⁰ Ultimately, after conducting this limited testing on MTBE, and similar testing on TAME, and C-9 fraction, the EPA closed each project and determined to take no further action.¹¹

§ 29:158 Applicability of Testing Requirements to Well Drillers and Service Providers

Finally, as with the Sections discussed above, Section 4 would not have any major implications for well drillers or service providers that do not manufacture or import chemicals in their operations. The Section 4 testing requirements apply only to parties that currently or intend to produce, process, import, or manufacture chemicals.¹ However, as noted above, service companies that import chemicals into the customs territory of the U.S. are subject to the same testing requirements as manufacturers, and these imported chemicals may be subject to testing.² Additionally, fracking companies that manufacture or import chemicals may be subject to testing requirements.

§ 29:159 Conclusion

In total, oil and gas exploration and production operations have not typically been a high priority under TSCA. Most traditional oil and gas exploration and production operations are exempt from reporting under Section 8, and unlikely to be heavily

²See 15 U.S.C. §§ 2602 to 2603; <https://www.federalregister.gov/documents/2021/01/11/2020-28585/fees-for-the-administration-of-the-toxic-substances-control-act-tsca>.

impacted by PMN rules and SNURs under Section 5, and testing rules under Section 4. This is because naturally-occurring chemical substances are excluded from the reporting requirements and are generally well-known and extremely common in commerce. Downstream processors and refiners, on the other hand, have obligations under Section 8 and have historically been minimally impacted by PMN rules, SNURs, or testing requirements.

However, innovation in refinement processes may bring about the introduction of new chemicals that could be identified as higher risk and in need of further evaluation. Additionally, the EPA has more recently signaled through its December 2020 Compliance Advisory and January 2021 test orders that petroleum manufacturers may be under greater scrutiny in the future.

Finally, while many well drilling and field service providers are not regulated under TSCA because they do not manufacture or import any chemicals, those companies that import chemicals and companies that manufacture chemicals used for fracking are regulated and are subject to the reporting requirements under TSCA Section 8, the PMN requirements under TSCA Section 5 and possibly the testing requirements under TSCA Section 4. The manufacturing of fracking chemicals is likely one area that will be subject to much higher scrutiny under TSCA, especially under Sections 5 and 4.

I. EMERGENCY PLANNING AND COMMUNITY RIGHT-TO-KNOW ACT

§ 29:160 Introduction

The Emergency Planning and Community Right-to-Know Act (EPCRA), passed by Congress on October 17, 1986, enables nimble community emergency response to chemical releases and promotes public disclosure of possible chemical hazards.¹ EPCRA ensures that communities and state governments work together to protect public health through a series of measures including: the preparation of chemical emergency response plans, required emergency notifications subsequent to release, the submission of Safety Data Sheets (SDSs) to state, local, and tribal officials, and annual reporting of toxic chemical release inventory forms—each of which are applicable in some fashion to oil and gas operations.²

EPCRA utilizes tiers of commissions and levels of reporting to ensure compliance and prompt response.³ The pertinent parties are:

- State Emergency Response Commissions (SERCs)
- Local Emergency Planning Committees (LEPCs)
- Tribal Emergency Response Commissions (TERCs)
- Tribal Emergency Planning Committees (TEPCs)

The Governor and Chief Executive Officer of the tribe establish SERCs and TERCs respectively. The SERCs and TERCs in turn oversee LEPCs and TEPCs. LEPCs and TEPCs then develop emergency response plans, review them annually, and inform the public about chemicals in the community. As a practical matter, the

[Section 29:160]

¹42 U.S.C. §§ 11001 to 11005, 11021 to 11023, 11041 to 11050.

²The major EPCRA provisions include emergency planning (§§ 301–303), emergency release notification (§ 304), hazardous chemical storage reporting requirements (§§ 311–312), and toxic chemical release inventory (§ 313). The regulations implementing these provisions are codified in 40 C.F.R. §§ 350 to 372 (2021).

³See U.S. EPA, *Guide to the Emergency Planning and Community Right-to-Know Act*, available at https://www.epa.gov/sites/production/files/2020-10/documents/guide_to_epcra.pdf. (Last visited on June 29, 2021).

Environmental Protection Agency (EPA) is responsible for EPCRA regulation and oversight.

§ 29:161 Emergency Planning Notification (Section 302)

Section 302 requires facilities containing any Extremely Hazardous Substance (EHS) to develop an Emergency Response Plan, to be provided to the appropriate SERC and LEPC (or TERC and TEPC). Broadly, these plans contain information that help community officials react swiftly in the event of an accident.¹ The EPA maintains a list of EHSs and respective Threshold Planning Quantities (TPQs), based on acute toxicity in the event of an accidental release, above which facilities must provide these planning reports.² There are currently around 355 EHSs listed by the EPA.³

§ 29:162 Hazardous Substance Release Notification (Section 304)

Section 304 requires facilities to immediately report releases of EHSs or hazardous substances (HSs) listed under CERCLA regulations, that are equal to or in excess of the minimum Reportable Quantities (RQs) allowed, where such releases could result in exposure to people outside the boundary of the facility.¹ In addition to the 355 EHSs listed under EPCRA, there are over 800 HSs listed under CERCLA—a release of any one of these substances would trigger the need for an emergency release notification.

In 1990, the EPA revised the definition of “facility” to include “manmade structures as well as natural structures in which chemicals are purposefully placed or removed through human means such that it functions as a containment structure for human use.”² This change expanded the confines of facilities to cover subsurface areas where there are subterranean operations. This is particularly applicable to upstream oil and gas operations engaged in exploration and production. By virtue of drilling, these operations extend their “facility,” and the related release notification obligations, underground.

As an example, hydrogen sulfide can frequently be found in the ground where drilling for oil and gas. Because drilling operations risk releasing this gas, the subsurface area where drilling occurs falls within the definition of “facility.”

[Section 29:161]

¹40 C.F.R. § 355.20 (2021).

²40 C.F.R. § 355, App. A (alphabetical order) and B (CAS number order). “TPQs are based on acute mammalian toxicity and potential for airborne dispersion and represent those quantities of substances that can cause significant harm should an accidental release occur.”; U.S. EPA, *What is the relationship between reportable quantities (RQs) and threshold planning quantities (TPQs)?*, <https://www.epa.gov/epcra/what-relationship-between-reportable-quantities-rqs-and-threshold-planning-quantities-tpqs> (last visited June 29, 2021).

³40 C.F.R. § 355, App. A.

[Section 29:162]

¹40 C.F.R. § 355 (2021) App. A (alphabetical order) and B (CAS number order). “The reportable quantity (RQ) that triggers emergency release notification (Section 304) was developed as a quantity that when released, poses potential threat to human health and the environment.” U.S. EPA, *Emergency Planning and Community Right-to-Know Act Frequent Questions*, <https://www.epa.gov/epcra/what-relationship-between-reportable-quantities-rqs-and-threshold-planning-quantities-tpqs> (last visited June 29, 2021) (explaining the relationship between RQs and TPQs); As a practical matter the release notification requirement is in addition to and independent of the release notification requirements of Section 103 of CERCLA—releases at a facility that are not reportable under EPCRA Section 304 may still be reportable under CERCLA Section 103.

²55 Fed. Reg. 30632, 30644 (July 26, 1990).

Hydrogen sulfide is an EHS,³ meaning the quantity the facility generates must be included in TPQ determinations for Section 302 notifications. Further, as a result of drilling, any release of this hydrogen sulfide that affects persons off-site would also be subject to Section 304 reporting.

Oil and gas operations should be aware of one release notification distinction between EPCRA and CERCLA. Whereas petroleum, including crude oil or any fraction thereof, is excluded from the list of HSs under CERCLA,⁴ no such “petroleum exclusion” exists under EPCRA.⁵ Under CERCLA, petroleum contamination, and petroleum’s constituent substances such as benzene, toluene, and xylene, do not need to be reported as long as the constituent substances do not exceed levels normally found in refined petroleum.⁶ Under EPCRA however, if there is a petroleum release, and the constituent substances of that petroleum are EHSs or HSs that exceed the RQs, then that release would need to be reported.

The Fifth Circuit, in *Center for Biological Diversity, Inc. v. BP America Production Co.*, affirmed this distinction between CERCLA and EPCRA reporting for petroleum.⁷ In response to the Deepwater Horizon oil spill, the Center for Biological Diversity brought suit against BP alleging, *inter alia*, current/continuing violations of CERCLA and EPCRA. The trial court dismissed the claims for lack of standing, mootness, and a failure to state a claim.⁸ However, on appeal, the Fifth Circuit remanded the EPCRA claim for further proceedings to determine whether BP’s EPCRA notifications were sufficient. In remanding, the court implicitly acknowledged the possibility that the petroleum exclusion does not extend to EPCRA, rather than affirming on the basis of failure to state a claim.

The petroleum exclusion under EPCRA was later formally acknowledged in comments to a proposed final rule regarding the exclusion of air emissions from animal waste at farms.⁹ In this final rule, the EPA buttressed the rationale for excluding air emissions from animal waste by comparing to the petroleum exclusion. Although acknowledging that petroleum (including crude oil or any fraction thereof) is “expressly excluded from the definition of ‘hazardous substance’ in CERCLA,” the EPA affirmatively stated that a release of petroleum containing an EHS is still subject to Section 304 reporting under EPCRA.¹⁰

§ 29:163 Hazardous Chemical Inventory Reporting

Under Section 311 and 312 of EPCRA, facilities that have SDSs for chemicals held above certain threshold quantities must submit copies of the SDSs to the SERC (or TERC), LEPC (or TEPC), and local fire department. The minimum thresh-

¹⁰Amendment to Emergency Release Notification Regulations on Reporting Exemption for Air Emissions From Animal Waste at Farms, Emergency Planning and Community Right-to-Know Act, 84 Fed. Reg. 27533, 27536 (June 13, 2019) (codified at 40 C.F.R. § 355 (2021)).

old for Section 311 and 312 reporting is the TPQ or 500 pounds, whichever is less, for EHSs. For all other hazardous substances, the reporting threshold level is 10,000 pounds.

Each facility must submit an individual report unless the facilities are adjacent and contiguous or are otherwise similar.¹ To be considered similar, facilities must have the “same EHSs and HSs on-site at any one time in similar amounts.”² If similar, facilities can submit a single generic report applicable to all facilities as long as they meet statutory information requirements.³ This is particularly applicable for oil drilling operations. While a single company might operate multiple wells across an oil field that accesses a single subsurface oil deposit, they are still considered separate facilities under EPCRA.⁴ But because the oil wells in a single oil field are likely similar, generic reporting is a beneficial alternative for drilling operations hoping to avoid multiple filings.

As part of Section 311–312 reporting, the EPA made clear that facilities must aggregate EHSs for TPQ exceedance evaluation.⁵ In response to a 1989 notice of proposed rulemaking, specific questions arose regarding the treatment of hazardous components in crude oil. The EPA responded that “[a]ny EHS component of crude oil must be aggregated unless the crude oil is reported as a mixture.”⁶ Where crude oil is reported as a mixture, instead of the aggregate of its component parts, all EHSs must still be evaluated across the facility to determine, whether in the aggregate, they exceed the TPQ. For example, if a facility has two vessels on site that each hold 10,000 pounds of crude oil containing three percent by weight hydrogen sulfide, that facility can choose to report that hydrogen sulfide, an EHS, in either of two ways. First, they can aggregate the amount across the two tanks and report only 600 pounds of hydrogen sulfide (10,000 lbs * 2 tanks * 3% H₂S concentration). Or second, they can report 20,000 lbs of a mixture containing 3% H₂S. And because this applies to all EHSs, oil and drilling facilities must be cognizant of all potential sources of EHSs; these include both produced sources, such as crude oil, as well as stored sources, such as the hydrofluoric acid commonly found in drilling fluid.

§ 29:164 Toxic Chemical Release Inventory

The Toxic Release Inventory (TRI), established under Section 313, is a database available to the public that details information about certain toxic chemicals released annually to air, water and land, or managed as waste by facilities throughout the United States.¹ Facilities are required to submit annual reports, by July 1 each year, that list toxic chemicals or chemical categories manufactured, processed, or used in the previous calendar year that exceed the reporting threshold as defined by EPA. The goal of TRI is to empower citizens, through information, to hold companies and local governments accountable for how toxic chemicals are

managed. While natural gas processing facilities are subject to Section 313, other oil and gas extraction operations—for example, other operations classified under SIC code 13—are exempt.²

§ 29:165 Transportation Exemptions

Both transportation of chemicals and storage of chemicals incident to transportation, including natural gas, such as that at warehouses and transfer facilities, are largely exempt from EPCRA's reporting requirements.¹ This extends to oil and gas transportation in pipelines.² There are two exceptions to this rule: (1) transporters are still required to follow the emergency notification of release provisions under Section 304;³ and (2) hazardous chemicals must have active shipping papers and stored chemicals must still be “moving under active shipping papers and which have not reached the ultimate consignee.”⁴

J. IMPACTS TO WILDLIFE

§ 29:166 Generally

The law of oil and gas is closely intertwined with federal wildlife law. The oil and gas industry and the nation's wildlife both depend upon natural resource lands and, as a result, oil and gas developers and legal practitioners routinely interact with federal statutes designed to protect wildlife. The law in this area continues to evolve as policymakers, industry, conservation interests, and courts seek to balance the need for energy development with conservation values. Those themes are reflected throughout recent federal wildlife policies, including the greater sage-grouse conservation effort and the polar bear listing decision, both discussed further below.

This section summarizes three key federal wildlife statutes that oil and gas practitioners are likely to encounter: the Endangered Species Act, the Migratory Bird Treaty Act, and the Marine Mammal Protection Act. These statutes present potentially significant regulatory implications for individual oil and gas project proponents and the industry as a whole.

§ 29:167 Endangered Species Act

The cornerstone federal environmental law protecting wildlife and habitat is the Endangered Species Act of 1973 (ESA).¹ The oil and gas industry routinely encounters the ESA through two main entrance points. First, the expansive “take” prohibition in Section 9 of the ESA poses liability risk for many activities commonly associated with oil and gas exploration and development. Second, all federal agencies are obligated, under Section 7 of the ESA, to avoid actions that are likely to jeopardize the continued existence of any species protected under the ESA or adversely affect species' critical habitat. As a result, project proponents seeking federal approvals or permits or entering into federal contracts or leases may trigger

²Addition of Natural Gas Processing Facilities to the Toxics Release Inventory, 82 Fed. Reg. 1651, 1653 (Jan. 6, 2017) (codified at 40 C.F.R. § 372 (2021)).

[Section 29:167]

¹16 U.S.C. §§ 1531 to 1543.

additional regulatory requirements under Section 7.

The ESA's provisions apply to species that are "listed" through a federal rulemaking process as "endangered" or "threatened" pursuant to Section 4(a).² In conjunction with the listing process, the ESA also requires the federal government to designate "critical habitat" for each listed species "to the maximum extent prudent and determinable."³

Two federal agencies have primary responsibility to implement the ESA's provisions. The National Marine Fisheries Service (NMFS) has authority (delegated by the Secretary of Commerce) extending to most marine species and to anadromous species, such as salmon. The U.S. Fish and Wildlife Service (USFWS) has authority (delegated by the Secretary of the Interior) extending to all species not overseen by NMFS. The ESA refers to each Secretary as the "Secretary," and the two implementing agencies are colloquially referred to as the "Services."

As noted, two key provisions of the ESA most commonly affect individual oil and gas project proponents. First, the ESA's "take" prohibition in Section 9 prohibits any person—including any business entity—from "taking" an endangered species of fish or wildlife on public or private lands.⁴ The "take" prohibition is expansive and imposes strict liability for both direct and indirect acts that injure or kill wildlife,⁵ as well as acts that are "incidental to"—i.e., not the purpose of—other lawful actions. The Services have authority to enforce the take prohibition through administrative

²16 U.S.C. § 1533(a). An "endangered" species is one that "is in danger of extinction throughout all or a significant portion of its range." 16 U.S.C. § 1532(6). A "threatened" species is one that "is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range." 16 U.S.C. § 1532(20).

³16 U.S.C. § 1533(a)(3)(A). The term "critical habitat" refers to (1) specific areas within the geographical area occupied by the species at the time of listing, which contain physical or biological features essential to the conservation of the species and that may require special management considerations or protection, and (2) specific areas outside the species' geographical area at the time of listing that the Secretary determines to be "essential" for the species' conservation. 16 U.S.C. § 1532(5)(A). For further discussion of the ESA's listing and critical habitat designation processes, see Environmental Law Institute, *Law of Environmental Protection*, Spring 2021, Environmental Law Institute, §§ 21.9–21.22).

⁴16 U.S.C. § 1538(a)(1)(B). Historically, the USFWS had presumptively extended the take prohibition to all threatened species as well, unless the Service had promulgated a "4(d) rule" specifying special management requirements for a particular threatened species. In 2019, the USFWS promulgated a new regulation reversing that presumption and providing that threatened species are *not* subject to the ESA's take prohibition unless either Service has promulgated a species-specific rule extending the take prohibition to that species. See U.S. Department of the Interior, *Endangered and Threatened Wildlife and Plants; Regulations for Prohibitions to Threatened Wildlife and Plants*, 84 Fed. Reg. 44753 (Aug. 27, 2019); 50 C.F.R. § 17.31 (2021). That approach was consistent with the approach that NMFS has historically taken to extend the take prohibition to threatened species on a species-specific basis. See generally 50 C.F.R. pt. 223, Subpart B ("Restrictions Applicable to Threatened Marine and Anadromous Species"). As of June 2021, the Biden Administration's USFWS had announced that it intended to reverse the Trump Administration's approach and reinstate the "blanket 4(d)" rule presumptively extending the take prohibition to all threatened species. See U.S. Fish and Wildlife Service, *Endangered Species: ESA Implementation—Regulation Revisions*, https://www.fws.gov/endangered/improving_ESA/regulation-revisions.html. For further discussion of this issue, refer to *Law of Environmental Protection*, Spring 2021, Environmental Law Institute, § 21.33.

⁵The ESA broadly defines "take" as "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct." 16 U.S.C. § 1532(19). The ESA's implementing regulations, in turn, define "harass" as any "intentional or negligent act or omission which creates the likelihood of injury to wildlife by annoying it to such an extent as to significantly disrupt normal behavioral patterns which include, but are not limited to, breeding, feeding, or sheltering." 50 C.F.R. §§ 17.3, 222.102 (2021). "Harm" is defined as "an act which actually kills or injures wildlife"; the term may include significant habitat modification or degradation that significantly impairs essential behavioral patterns, such as breeding, feeding, or sheltering. 50 C.F.R. §§ 17.3, 222.102 (2021); see also *Law of Environmental Protection*, Spring 2021, Environmental Law Institute, § 21.34.

and, in some cases, civil and criminal actions.⁶ And, as further discussed below, the Services may also authorize “incidental,” unintentional take under certain circumstances. In addition, the ESA’s citizen suit provision enables private citizens to enforce the take prohibition in federal court.⁷

Second, Section 7 of the ESA requires that each federal agency “consult” with the relevant Service to ensure that any action authorized, funded, or carried out by the agency is not likely to jeopardize the continued existence of any endangered species or threatened species or result in the destruction or adverse modification of any critical habitat of such species.⁸ Oil and gas projects routinely trigger the consultation requirement through requests for federal agency permits or other authorizations, including but not limited to Federal Energy Regulatory Commission (FERC) approvals, oil and gas leases and rights-of-way on federal lands and the Outer Continental Shelf, and permits needed under the Clean Water Act, Clean Air Act, and other environmental statutes for oil and gas development and/or operations. Through the Section 7 consultation process, the Services may impose conditions on project operations to minimize impacts to ESA-listed species.⁹ For that reason, the Services can play a key role in conditioning and minimizing the impacts of oil and gas projects or operations, even though the Services do not authorize the actual projects or operations. Further, federal agency actions triggering Section 7 are subject to judicial review in federal court under the Administrative Procedure Act (APA), as are the Services’ consultation documents issued through the Section 7 process.¹⁰ Therefore, the Section 7 process provides another litigation avenue for project opponents.

The ESA does provide a number of mechanisms for project proponents and operators to proactively limit their liability under the statute. Project proponents may enter into a variety of voluntary conservation agreements with the federal government. As one example, project proponents can prepare a “habitat conservation plan” and apply to the relevant Service for an “incidental take permit” under Section 10.¹¹ A “biological opinion” issued through the Section 7 process may also include an “incidental take statement” authorizing the activities that are the subject of the consultation, subject to terms and conditions imposed by the consulting Service.¹²

Because of the regulatory reach of both Section 9 and Section 7, a decision to list

a particular species as endangered or threatened may have significant implications for oil and gas interests. For example, the USFWS's final decision to list the polar bear as a threatened species in 2008 has resulted in extensive litigation in addition to material practical implications for oil and gas activities impacting polar bears. In 2005, motivated in large part by its opposition to oil and gas exploration and development in and offshore of Alaska, the Center for Biological Diversity (CBD) petitioned the Service to list the polar bear under the ESA, citing the projected loss of the bears' sea ice habitat resulting from the effects of global climate change.¹³ The Service failed to act within certain statutory deadlines triggered by the petition, resulting in litigation filed by CBD and, ultimately, a court order directing the Service to issue a final listing decision by May 15, 2008.¹⁴ The Service's final decision listing the polar bear as a threatened species,¹⁵ as well as its accompanying 4(d) rule,¹⁶ and subsequent critical habitat designation,¹⁷ resulted in multiple litigation challenges, including opposition by the oil and gas industry.¹⁸ Ultimately, the courts upheld the Service's listing decision, final 4(d) rule, and critical habitat designation, meaning that oil and gas activities with the potential to cause take of polar bears are subject to direct regulation under the ESA. The USFWS has since issued multiple biological opinions for oil and gas activities impacting polar bears, pursuant to Section 7 of the ESA, and those biological opinions have themselves resulted in additional litigation.¹⁹

In another significant example, the USFWS determined in 2010 that the greater sage-grouse warranted protection as a threatened species under the ESA but that higher-priority actions precluded listing at that time.²⁰ Because of the ESA's Section 7 consultation requirement, the decision to list sage-grouse would have had sweeping consequences for activities requiring federal leases or permits, including oil and gas exploration activities on millions of acres of public lands managed by the Bureau of Land Management (BLM) throughout the western United States. The Service's

¹³See Center for Biological Diversity, Before the Secretary of the Interior: Petition to List the Polar Bear (*Ursus maritimus*) as a Threatened Species Under the Endangered Species Act (Feb. 16, 2005) 87–105, available at https://www.biologicaldiversity.org/species/mammals/polar_bear/pdfs/15976_7338.pdf.

¹⁴Center for Biological Diversity v. Kempthorne, 2008 WL 1902703 (N.D. Cal. 2008).

¹⁶As noted, a 4(d) rule is a special rule pertaining to a species listed as threatened under the ESA. Through a 4(d) rule, the relevant Service can customize prohibitions and regulate activities to provide for the conservation of the threatened species. After several years of litigation over the initial polar bear 4(d) rule, the USFWS issued the final polar bear 4(d) rule in 2013. See U.S. Department of the Interior, Endangered and Threatened Wildlife and Plants; Special Rule for the Polar Bear Under Section 4(d) of the Endangered Species Act, 78 Fed. Reg. 11766 (Feb. 20, 2013). The final 4(d) rule is intended to align management of the polar bear under the ESA with management provisions under the Marine Mammal Protection Act, discussed below. 78 Fed. Reg. 11768; see also Center for Biological Diversity v. Salazar, 695 F.3d 893, 910–11, 75 Env't. Rep. Cas. (BNA) 1919, 183 O.G.R. 92 (9th Cir. 2012) (discussing intersection between the ESA's and MMPA's management provisions for polar bears).

¹⁷See United States Department of the Interior, Endangered and Threatened Wildlife and Plants; Designation of Critical Habitat for the Polar Bear (*Ursus maritimus*) in the United States, 75 Fed. Reg. 76086 (Dec. 7, 2010); Alaska Oil and Gas Ass'n v. Jewell, 815 F.3d 544, 550, 82 Env't. Rep. Cas. (BNA) 1128 (9th Cir. 2016) (upholding critical habitat designation rule challenged by oil and gas trade associations, among other plaintiffs, as unjustifiably large).

¹⁹See, e.g., Center for Biological Diversity v. Salazar, 695 F.3d 893, 75 Env't. Rep. Cas. (BNA) 1919, 183 O.G.R. 92 (9th Cir. 2012).

²⁰U.S. Department of the Interior, Endangered and Threatened Wildlife and Plants; Determination for the Gunnison Sage-Grouse as a Threatened or Endangered Species, 75 Fed. Reg. 59804 (Sept. 28, 2010).

2010 decision led to litigation that ultimately resulted in the largest landscape-scale conservation planning effort in U.S. history between federal agencies, states, and private stakeholders to address threats to sage-grouse habitat without listing the species under the ESA.²¹ The resulting conservation approach relies heavily on land management plans adopted by the BLM in coordination with state and local decision-makers, which prioritize public lands based on their relative value as sage-grouse habitat and limit development activities in priority sage-grouse habitat areas.²² BLM's decisions to issue oil and gas leases on public lands pursuant to those management plans have been the subject of ongoing litigation,²³ and the sage-grouse's ultimate listing fate under the ESA remains to be seen.

§ 29:168 Migratory Bird Treaty Act

The Migratory Bird Treaty Act of 1918 (MBTA) is one of the oldest federal wildlife conservation statutes.¹ The MBTA's protections extend to nearly every bird species found in North America,² and, as a result, the statute has potentially far-reaching implications for oil and gas development projects across the country.³ Like the ESA, the MBTA prohibits “take” of species protected by the Act. However, unlike the ESA, the MBTA does not include an express pathway to authorize incidental, unintentional take. For many oil and gas developers, that risk of liability under the MBTA may materially impact how a project is designed and implemented.

The MBTA's key section provides:

Unless and except as permitted by regulations made [by the Secretary of the Interior], it shall be unlawful at any time, by any means or in any manner, to pursue, hunt, take, capture, kill, attempt to take, capture, or kill, possess, offer for sale, sell, offer to barter, barter, offer to purchase, purchase, deliver for shipment, ship, export, import, cause to be shipped, exported, or imported, deliver for transportation, transport or cause to be transported, carry or cause to be carried, or receive for shipment, transportation, carriage, or export, any migratory bird, any part, nest, or egg of any such bird, or any product, whether or not manufactured, which consists, or is composed in whole or part, of any such bird or any part, nest, or egg thereof, included in the terms of [various international conventions].⁴

The USFWS's definition of take under the MBTA does not include activities that “harm” or “harass” wildlife and is, therefore, narrower than under the ESA.⁵ The MBTA also departs from the ESA in that it does not contain a citizen suit provision.

¹16 U.S.C. §§ 703 to 712.

²See 50 C.F.R. § 10.13 (2021) (“List of Migratory Birds”).

³In addition, the Bald and Golden Eagle Protection Act (BGEPA) prohibits the “take” of eagles and their parts, nests, or eggs, unless authorized by a permit issued by the USFWS. 16 U.S.C. § 668. Practitioners should be aware of the possible applicability of the BGEPA for oil and gas activities with the potential to impact eagles.

⁴16 U.S.C. § 703(a).

⁵See 50 C.F.R. § 21.3 (2021).

As a result, the USFWS is the sole entity responsible for enforcing the Act.⁶

Under the MBTA, knowingly taking a protected bird with intent to sell, barter, or offer for sale or barter is a felony.⁷ More importantly for oil and gas activities, the MBTA provides that “any person, association, partnership, or corporation” that violates the MBTA is guilty of a misdemeanor punishable by a fine of not more than \$15,000, six months’ imprisonment, or both.⁸ Courts have split regarding whether the misdemeanor provision imposes strict liability on any activities that cause “take” of migratory birds or is limited to intentional or direct acts.⁹

The scope of the MBTA’s take prohibition has specific relevance to the oil and gas industry. The penalty for violating the MBTA is criminal liability, and recent high-profile examples indicate that MBTA penalties can be a significant source of exposure for the industry. Criminal penalties under the MBTA were a major component of the settlement for the Deepwater Horizon oil spill of 2010, totaling \$100 million.¹⁰ However, more routine oil and gas exploration and development activities also have the potential to incidentally kill or harm birds, including via well drilling and pipeline construction in nesting areas. Unlike the ESA, the MBTA includes no express authority to permit incidental take of protected birds.¹¹ As of this writing, Incidental take permits are currently unavailable under the MBTA. Therefore, the only risk management option historically available to project proponents has been to design operations to minimize the risk of unpermitted incidental take to birds—for example, by scheduling pipeline construction to occur outside of the nesting season or by covering oil waste pits.

During the Obama Administration, the USFWS considered establishing an incidental take permitting program under the MBTA.¹² The agency ultimately abandoned that effort and, in the final days of the Obama Administration in January 2017, the Department of the Interior issued a Solicitor’s Opinion affirming its strict liability interpretation of the MBTA. The Solicitor’s Opinion concluded that “the MBTA’s prohibitions on taking and killing migratory birds apply broadly to any activity, subject to the limits of proximate causation,” including “direct incidental take.”¹³ Later that year, the Trump Administration issued a new Solicitor’s Opinion (the “Trump M-Opinion”) withdrawing and replacing the Obama Administration’s previous opinion.¹⁴ Contrary to the prior opinion, the Trump M-Opinion concluded that the MBTA does *not* prohibit the incidental take of MBTA-protected birds and instead “is a law limited . . . to affirmative and purposeful actions, such as hunting and poaching, that reduce migratory birds and their nests and eggs, by killing or

capturing, to human control.”¹⁵ The USFWS subsequently issued further guidance interpreting the Trump M-Opinion “to mean that the MBTA’s prohibitions on take apply when the *purpose* of an action is to take migratory birds, their eggs, or their nests.”¹⁶ The scope of the MBTA’s liability provisions and the availability of incidental take permits under the MBTA remain key issues for oil and gas practitioners and project proponents going forward. On January 7, 2021, the USFWS published a Final Rule clarifying that “[i]njury to or mortality of migratory birds that results from, but is not the purpose of, an action (*i.e.*, incidental taking or killing) is not prohibited by the Migratory Bird Treaty Act.”¹⁷ However, on March 8, 2021, the Biden Administration issued Memorandum M-37065 permanently revoking and withdrawing the Trump M-Opinion,¹⁸ and on May 7, 2021, the Service published a notice proposing to revoke the Final Rule, previewing its legal interpretation that the MBTA prohibits incidental take.¹⁹

§ 29:169 Marine Mammal Protection Act

Offshore oil and gas developers will almost certainly encounter the Marine Mammal Protection Act of 1972 (MMPA).¹ The MMPA imposes a “moratorium on the taking and importation of marine mammals and marine mammal products.”² The term “marine mammal” encompasses all marine mammals, including sea otters, manatees, walrus, dugongs, seals, whales, dolphins, and porpoises, and “any mammal” that “primarily inhabits the marine environment (such as the polar bear).”³ The term “take” means “to harass, hunt, capture, collect, or kill . . . any marine mammal,” or to attempt to engage in such conduct.⁴ The term “harassment” means “any act of pursuit, torment, or annoyance” that (i) “has the potential to injure a marine mammal or marine mammal stock in the wild” (known as “Level A harassment”) or (ii) “has the potential to disturb a marine mammal or marine mammal stock in the wild by causing disruption of behavioral patterns, including, but not limited to, migration, breathing, nursing, breeding, feeding, or sheltering” (known as “Level B harassment”).⁵ Thus, the definition of “take” under the MMPA is similar—but not identical to—the scope of “take” under the ESA.

The USFWS and NMFS are tasked with implementing the MMPA, with a jurisdictional division of species that mirrors that of the ESA.⁶ Additionally, the Marine Mammal Commission, a three-member independent federal agency, provides

⁵16 U.S.C. § 1362(18)(A); 50 C.F.R. § 216.3 (2021).

⁶16 U.S.C. § 1362(12)(A). NMFS is responsible for implementing the MMPA’s provisions with respect to whales, dolphins, porpoises, and seals and sea lions. The USFWS has responsibility for all other marine mammals, including walrus, manatees, sea otters, and polar bears. 16 U.S.C. § 1362(12)(A).

policy and scientific oversight for activities under the MMPA.⁷ Unlike the ESA, the MMPA does not contain a citizen suit enforcement provision. Therefore, the USFWS and NMFS are the entities that enforce the MMPA.⁸

The MMPA includes exceptions to the take prohibition. Key among them, Section 101(a)(5) of the act authorizes the Services to “issue permits which authorize the taking or importation of any marine mammal.”⁹ The Services issue two forms of incidental authorization.

First, the Services may issue an incidental take regulation (ITR) through formal rulemaking.¹⁰ An ITR prescribes requirements to authorize the “incidental, but not intentional, taking . . . of small number of marine mammals” as the result of a “specified activity . . . within a specified geographical region,” and is effective for up to five years.¹¹ Once an ITR has been established, an individual project proponent may apply for a Letter of Authorization (LOA) authorizing incidental take within the scope of the specific regulations. Second, the Services may issue an incidental harassment authorization (IHA), without undertaking a formal rulemaking process.¹² IHAs are project-specific authorizations that function like other types of incidental take authorizations. IHAs may authorize only take by harassment and are limited to a period of one year.¹³ The key requirements for both ITRs and IHAs are that the permitted activity be a “specified activity” that occurs in a “specified geographic region,” involve the taking of “small numbers” of a marine mammal species or population stock, have a “negligible impact” on such species or stock, and “not have an unmitigable adverse impact on the availability of such species or stock for taking for subsistence.”¹⁴

Pursuant to Section 101(a)(5) of the MMPA, the Services have issued many incidental take authorizations for oil and gas activities.¹⁵ For example, since the early 1990s, the oil and gas industry has routinely requested, and the USFWS has issued, ITRs applicable to oil and gas exploration, development, and production activities in the Beaufort and Chukchi Seas off the coast of Alaska.¹⁶ Individual operators seek and are granted LOAs pursuant to those regulations identifying, among other things, monitoring and mitigation plans for impacts to polar bears and walrus.¹⁷ Environmental advocacy groups have filed unsuccessful challenges to many of those regulations.¹⁸ As another example, in 2021, NMFS issued the first-ever ITR addressing oil and gas exploratory activities in the Gulf of Mexico. The ITR, which became effective April 19, 2021, is the result of more than a decade of effort by the industry and is the most extensive ITR ever issued.¹⁹ NMFS has also recently issued IHAs for oil and gas seismic survey activities in the Atlantic Ocean,

which were challenged by environmental plaintiffs in federal court.²⁰ As these examples reflect, MMPA incidental take authorizations can be a significant source of litigation. Developing an early strategy to engage with the relevant Service and build a strong administrative record is essential.

VIII. HEALTH AND SAFETY IN THE OILFIELD

§ 29:170 Generally

The federal agencies with primary oversight for health and safety issues related to industrial operations include the EPA, the Occupational Safety and Health Administration (OSHA), and the Pipeline and Hazardous Material Safety Administration (PHMSA). However, two of the most well-known industrial safety programs—EPA’s Risk Management Plan (RMP) regime and OSHA’s Process Safety Management of Highly Hazardous Chemicals (PSM) standard—generally do not apply to upstream oil and gas operations. In addition to these federal agencies, operations can also be regulated under state counterparts that have received delegation of workplace safety programs from OSHA and regulation of intrastate pipelines from PHMSA.

§ 29:171 U.S. Environmental Protection Agency

EPA’s RMP regulations are focused on reducing and responding to offsite health and safety impacts from releases. Facility-specific RMPs evaluate worst-case scenarios and outline release prevention and emergency planning considerations. RMPs for regulated facilities are also publicly available and facilities are required to hold a public meeting after any RMP reportable accident with a known offsite impact. EPA’s RMP regulations require coordination with local emergency planning organizations—including scheduled emergency response exercises—to ensure an effective response in the event of a release.¹

As discussed in Section 29:135, EPA’s RMP regulations require facilities with more than a threshold quantity of a regulated substance to develop an RMP. These regulated substances are divided between two categories—regulated toxic substances and regulated flammable substances. Threshold quantities for regulated toxic substances varies depending on the substance, but all flammable substances are subject to a 10,000 pound threshold.² If a facility has a covered process that involves 10,000 pounds or more of a listed flammable substance, it must comply with RMP requirements. However, EPA’s regulations provide several exemptions to the calculation of the 10,000 threshold, including an exemption for “naturally occurring hydrocarbon mixtures.”³ This includes “any combination of the following: condensate, crude oil, field gas, and produced water.”⁴

Based on the exclusion for naturally occurring hydrocarbon mixes, most upstream oil and gas operations are exempt from compliance with EPA’s RMP regulations.

Importing Marine Mammals; Taking Marine Mammals Incidental to Geophysical Surveys Related to Oil and Gas Activities in the Gulf of Mexico, 86 Fed. Reg. 5322 (Jan. 19, 2021).

²⁰*See, e.g.,* S.C. Coastal Conservation League v. Ross, Case No. 18-cv-03326 (D.S.C.). This litigation has since been dismissed without prejudice, in light of the expiration of the challenged IHAs in 2020. *See* S.C. Coastal Conservation League v. Ross, Case No. 18-cv-03326 (D.S.C.), Order, Dkt. 463 (Oct. 6, 2020).

[Section 29:171]

¹*See* 40 C.F.R. §§ 68.93 to 68.96 (2021).

²*See* 40 C.F.R. § 68.130 (2021).

³40 C.F.R. § 68.115(b)(2)(iii) (2021).

⁴40 C.F.R. § 68.115(b)(2)(iii) (2021).

Typically, EPA's RMP regulations are a larger concern for downstream operations (e.g., refineries), where threshold levels of flammable substances are more likely to be met. However, even if a facility is not subject to the RMP regulations based on operation of a process meeting or exceeding threshold quantities, EPA may seek to enforce for noncompliance with the general duty clause.⁵

§ 29:172 U.S. Occupational Safety and Health Administration

In contrast to EPA's RMP regulations, which focus on offsite impacts, the U.S. Occupational Safety and Health Administration's (OSHA's) regulations focus on worker health and safety within the fence line. One of OSHA's flagship regulations is the PSM standard, which applies to processes involving a chemical at or above a listed threshold quantity, or flammable substances with a threshold of 10,000 pounds.¹ The PSM standard includes 14 elements, covering among other things: employee involvement, process safety information, process hazard analyses, operating procedures, training mechanical integrity, management of change, and emergency preparedness.²

Like EPA's RMP program, OSHA's PSM standard excludes certain oil and gas activities. In contrast to EPA's exclusion based on determination of threshold quantities, OSHA's regulations explicitly exclude "oil or gas well drilling or servicing operations" from applicability of the PSM standard.³ OSHA has evaluated this exemption and the potential extension of PSM applicability to oil and gas production facilities several times over the years. In 2000, OSHA issued a stay on enforcement of the PSM standard at oil and gas production facilities.⁴ However, OSHA continues to enforce the PSM standard for natural gas processing.⁵

Even when the PSM standard does not apply, operators are required to comply with standards for general industry (e.g., requirements for personal protective equipment, environmental controls, and materials handling). In addition, the Occupational Safety and Health Act of 1970 establishes a general duty for each employer to "furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees."⁶ OSHA uses this general duty clause when it identifies a hazard that is not otherwise addressed by a specific OSHA standard. As with the EPA RMP general duty clause, OSHA commonly ap-

⁵EPA's guidance on implementing the general duty clause states that "EPA has jurisdiction to implement and enforce the general duty clause through Sections 113 and 114 of the Clean Air Act at any facility where extremely hazardous substances are present." See EPA, *Guidance for Implementation of the General Duty Clause Clean Air Act Section 112(r)(1)*, at 10 (May 2000), <https://www.epa.gov/sites/production/files/documents/gendutyclause-rpt.pdf>. In addition, EPA issued recent guidance to "[r]emind upstream (exploration and production) oil and gas facility owners and operators of public safety hazards associated with their facilities, and their obligations under the Clean Air Act general duty clause." See EPA, *Safety Alert Public Safety at Oil and Gas Upstream Facilities*, at 1 (March 2021), https://www.epa.gov/sites/production/files/2021-03/documents/safety_alert_for_oil_and_gas_storage_3-18-21.pdf.

⁵OSHA, *Standard Interpretation: Production facilities that recover natural gas liquids may have enforceable PSM-covered processes*, December 19, 2018, <https://www.osha.gov/laws-regs/standardinterpretations/2018-12-19> (last visited June 29, 2021).

⁶29 U.S.C. § 654(a)(1).

plies the general duty clause in enforcement actions following an incident.

§ 29:173 Pipeline and Hazardous Materials Safety Administration

PHMSA, within the U.S. Department of Transportation, develops and enforces regulations applicable to interstate pipelines, covering gathering, transmission, and distribution systems. PHMSA's regulations for oil and gas pipelines set minimum safety requirements, including requirements concerning design, construction, testing, and operation standards.

A key aspect of PHMSA's regulation of oil and gas pipelines is the requirement for operators to establish and implement integrity management programs. These integrity management programs apply to those pipelines where a leak of failure could impact a high consequence area (certain areas with high populations or potential impacts on waterways or drinking water or ecological resources).¹ Integrity management programs must meet a suite of requirements associated with periodic testing/integrity assessments (e.g., in-line inspection tools, pressure tests, or similar approaches) and the repair of any identified integrity concerns.²

§ 29:174 EPA

In keeping with the cooperative federalism framework of the CAA, while EPA is the primary regulatory authority for accidental releases pursuant to its RMP program, states may also receive delegated authority to implement and enforce a state program comparable to EPA's RMP program.¹ As with other CAA delegation standards, the state must establish standards at least as stringent as the federal requirements, though states may also set different or more stringent requirements or procedures.² Currently, nine states have received delegation from EPA to implement and enforce the RMP program.³ The EPA remains the primary regulator in those states that have not received delegation.

§ 29:175 OSHA

Although OSHA establishes federal minimum standards, the Occupational Safety and Health Act allows states to assume responsibility for development and enforcement of occupational safety and health standards. States may receive delegation from OSHA if they establish a plan that imposes standards that are "at least as effective in providing safe and healthful employment" as OSHA's standards.¹ OSHA must review and approve the plan before the state can take delegation.² Currently, 22 states have received OSHA approval for their state plans covering private sector

²29 U.S.C. § 667(c).

workers.³ Delegated states may impose their own additional requirements, procedures, and penalty calculations. States also have the flexibility to impose stricter requirements than the federal minimum. OSHA continues to enforce federal requirements in states without an approved state plan.

§ 29:176 PHMSA

While PHMSA regulates *inter* state pipelines, states may take responsibility for promulgating and enforcing standards applicable to *intrastate* pipelines. Every state—except Hawaii and Alaska—has entered a form of certification or agreement with PHMSA to take authority for at least certain aspects of the pipeline safety program.¹ As with the other programs that involve cooperative federalism, states may adopt more stringent regulations for pipeline safety, provided they continue to meet federal minimum standards. For example, a 2013 study by the National Association of Pipeline Safety Representatives noted that as of the date of the report “[t]here are at least 1,361 state regulatory administrative rules, legislative provisions and state agency orders that address pipeline safety requirements exceeding the federal pipeline safety code. This demonstrates that the majority of state pipeline safety programs are actively and constantly pursuing pipeline safety at a level responsive to local conditions.”²

Those states that do not establish their own programs are subject to PHMSA’s federal standards and PHMSA enforcement actions. In addition, although the majority of states have primary jurisdiction over intrastate pipelines through these agreements with PHMSA, interstate pipelines remain subject to PHMSA’s jurisdiction. States may inspect pipelines on PHMSA’s behalf, but PHMSA remains responsible for ensuring compliance and commencing enforcement actions.³

IX. REGULATION OF REFINING AND MARKETING (THE “DOWNSTREAM” SECTOR)

§ 29:177 History and Overview of Petroleum Refining

On the receiving end of the transportation (midstream) sector of the oil and gas industry lies the downstream sector, consisting of the functions of petroleum refining and marketing. Petroleum refineries perform a simple function in society—they convert crude oil and liquids into a myriad of petroleum-based fuels and other products that people use every day. How refineries *perform* this function is, in contrast, technically and legally complex. This section and those that follow provide a brief background into the history, technical operation, and federal environmental regulation of petroleum refining and marketing in the United States.

Petroleum refining techniques were practiced as far back as the early first century in China, but the advent of modern commercial refining happened in late nineteenth century, following the discovery of oil in Titusville, Pennsylvania in 1859. The development of modern refining was driven by technological changes, both on the supply side by improved refining techniques and on the demand side by innovations requiring new fuels and refined products.

Initially, crude oil was refined to produce kerosene—a relatively heavy fraction of oil—to compete with whale oil as an illumination product. Generally considered a waste byproduct, gasoline—a lighter fraction of oil—was allowed to evaporate or was dumped into pits or nearby streams for disposal.¹ Early refining techniques for separating heavy from light fractions to render these products were highly inefficient. The method of separation used today, fractional distillation, did not come into widespread use in the United States until the 1920s, when alcohol distillers looking for work in the wake of Prohibition brought the technology to their new jobs

[Section 29:177]

¹WILLIAM L. LEFFLER, PETROLEUM REFINING IN Nontechnical Language 1 (4th ed. 2008).

in the refining industry.²

Meanwhile, the invention of the internal combustion engine and the widespread adoption of automobiles amplified demand for gasoline. Fractional distillation alone could not produce enough gasoline to satisfy demand, necessitating the advent in the early 1900s of cracking technology to cook heavier fractions until they “crack” into lighter ones like gasoline. Over the ensuing decades, increasing demand for ever-lighter and more-efficient fuels led to the emergence of the techniques of catalysis and catalytic cracking in the 1930s and 1940s, and hydrocracking and reforming processes in the 1950s, which define modern refining.³

On the strength of demand for refined products, oil refineries proliferated through the first half of the twentieth century. By the 1970s, however, concerns over air emissions from the burning of refined fuels and their additives—in particular, lead—ushered in federal environmental regulation of the refining industry.⁴ As regulation increased, the number of operating refineries decreased. From 1982 to 1994, the number of U.S. refineries fell by around 71%.⁵ Small independent refineries constituted the bulk of the closures. In large part, the attrition owes to the difficulty in constructing new ones; the newest refinery with significant downstream capacity came online in 1977.⁶ Environmental permitting and compliance costs contribute substantially to the already enormous capital investment and working capital requirements for constructing and operating a refinery, creating a barrier to entry that did not exist before the 1970s.⁷ Additionally, some environmental regulations, such as federal and state fuel standards, have a direct impact on the value of refined products,⁸ and therefore on refineries’ profit margins. While difficult to predict, current efforts to increase regulation of greenhouse gas emissions from both the upstream industry and downstream sources of power generation, as well as fluctuating demand for refined products in the United States and abroad, may accelerate the trend of refinery closures in the coming decade. Notwithstanding the challenges, however, refineries may remain profitable enterprises, so long as there remains a margin between the cost of crude oil inputs and the composite value of the refined products.⁹

While the number of operable petroleum refineries has fallen, overall capacity has been creeping up, indicating the increase in efficiency achieved in recent decades. As of January 1, 2020, there were only 135 operable petroleum refineries in the United States, but refining capacity (referred to as “distillation capacity”) reached an all-time high of 19 million barrels per day.¹⁰ As depicted in the below map, these refineries are concentrated on the Texas and Louisiana shores of the Gulf of Mexico and other coastal locales where there is ready access to shipping lanes for refined products.

Under the Defense Production Act of 1950, the nation's refineries are aggregated into five geographical districts, called Petroleum Administration for Defense Districts (PADDs), for purpose of federal regulation.¹¹ The federal government uses PADDs to collect, organize, and report data on petroleum refining through the Energy Information Administration (EIA) and to organize regulatory standards under various environmental statutes and regulations. PADDs are depicted in the following map:

¹¹50 U.S.C. §§ 4501 to 68.

§ 29:178 Overview of the Marketing Sector

Together with the refining sector, petroleum marketing makes up the “downstream” side of the oil and gas industry. Marketing refers to the wholesale and retail distribution of refined products to end users in industry, business, and government sectors, as well as to individual consumers.¹ A significant portion of the marketing sector involves retail sale of fuels to consumers through gasoline stations. In addition to gasoline stations, refined products are marketed directly to factories, power plants, and transportation-related industries.² The significant diversity of marketing operations is revealed by the number of individual North American Industry Classification categories that fall within the downstream industry—nine in total, excluding petroleum refining.³ These categories include fuel dealers; bulk stations and terminals; manufacturers of petroleum products, asphalt products, lubricating oil and grease; and wholesalers of manufactured products.

Though not nearly as heavily regulated as the petroleum refining sector, petroleum marketing operations are subject to significant environmental regulation. This regulation focuses primarily on (1) the operation, monitoring, and remediation of leaking underground storage tanks used at gasoline stations,⁴ and (2) the types of fuels that may be sold in any particular region of the country, under the Clean Air Act’s (CAA’s) fuel standards programs and related state boutique fuel requirements.⁵ These fuel standards influence both the refining and marketing sectors by limiting the regions where certain fuels may be marketed.⁶

⁶Pierce Jr., *Environmental Regulation, Energy, and Market Entry*, 15 DUKE ENVTL. L. & POL’Y F.

To comprehend the environmental regulation of refineries, it is helpful to understand some basic aspects of refinery operations. Modern petroleum refineries are massive and complex. Refineries operate around the clock, typically 24 hours per day and 365 days per year. They employ large numbers of employees and occupy massive tracts of land.¹ The details of a refinery's operations are determined by the kind and quality of crude oil and other liquids available as inputs,² as well as the prevailing market demand for particular refined products.³ Because the refining process generally decreases the density of crude oil, a standard 42-gallon (U.S.) barrel of crude oil yields about 45 gallons of refined petroleum products.⁴ These refined products include, in various proportions, gasoline, distillate (diesel and heating oil), kerosene, jet fuel, and many other residual products and products used in petrochemical manufacturing.

167, 170 (2005).

gallons

Note: A 42-gallon (U.S.) barrel of crude oil yields about 45 gallons of petroleum products because of refinery processing gain. The sum of the product amounts in the image may not equal 45 because of independent rounding.

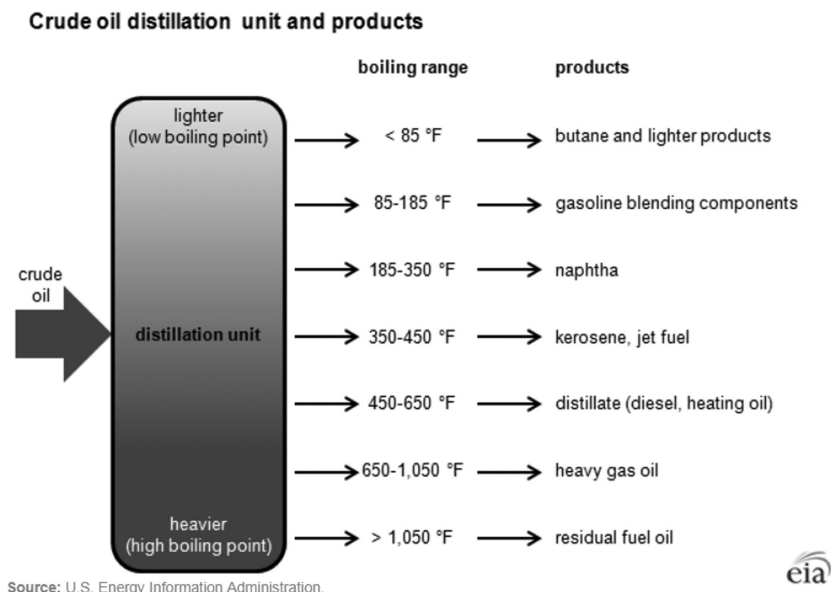

Source: U.S. Energy Information Administration, *Petroleum Supply Monthly*, April 2020, preliminary data

A bit of background into the chemistry of petroleum refining is also helpful. Crude oil refining proceeds in three basic sequential steps: (1) separation; (2) conversion; and (3) treatment.

Step 1: Separation. The first step is intended to break the crude oil into its component fractions to derive valuable products from each fraction. In the physical separation process, crude oil is first “desalted” by running it through hot furnaces to remove certain solids. The resulting fluids are discharged into atmospheric distillation units where they are introduced to super-heated steam.⁵ Inside the distillation units, the liquids and vapors separate according to their various boiling points into petroleum components called “fractions.” Light fractions rise to the top of the distillation tower and heavier fractions remain on the bottom.⁶ As the following graphic illustrates, light fractions include gasoline, medium fractions include kerosene and jet fuel, and heavy fractions include residual fuel oils and heavy gas oils.

⁵FAHIM ET AL., *supra* note 7, at 1–3.

⁶U.S. EIA, *supra* note 6.

At most modern refineries, the heaviest fractions (bottoms) are then introduced to a vacuum distillation tower where additional products are obtained.⁷ Unlike *atmospheric* distillation, *vacuum* distillation towers operate below atmospheric pressure.⁸ This is necessary because, at atmospheric pressure, heavy fractions cannot be heated to the needed temperatures without thermally cracking and degrading the oil. At the lower pressures present in vacuum distillation units, the boiling point of bottoms is low enough that lighter products can be obtained without cracking.

Step 2: Conversion. In this step, heavy fractions are processed into lighter products of higher economic value, like high-octane gasoline, jet fuel, and diesel fuel. Unlike in the separation stage, conversion typically employs chemical processes, often using catalysts, to break down the molecular structure of heavy fractions to create new petroleum products. The processes of “cracking,” “coking,” and “visbreaking” break large petroleum molecules into smaller ones. Cracking is the most commonly employed. It uses heat, pressure, and sometimes catalyst (cat-cracking) or hydrogen (hydrocracking) to break apart (crack) large petroleum molecules into smaller ones. Hydrocracking is an important source of diesel and jet fuels.⁹ The primary source of gasoline is fluid catalytic cracking (FCC), which employs a fluid catalyst and heat in the cracking process.¹⁰ Coking is a mode of thermal cracking in which residue from vacuum distillation is heated in a furnace and flashed into large drums where coke is then deposited on the walls. Coking produces gases, gasoline, and gas oils.¹¹ Visbreaking is another thermal cracking process used to break the high viscosity of heavy fractions.¹²

Other conversion processes create useful products by rearranging, rather than breaking down, the molecular structures of fractions. “Polymerization” and “alkyla-

¹²FAHIM ET AL., *supra* note 7, at 4.

tion” processes are like cracking in reverse; they combine small petroleum molecules into larger ones. Similarly, “isomerization” and “reforming” processes rearrange petroleum molecules to produce high-value products.¹³

Step 3: Treatment. The final step in the process is treatment. Here, technicians combine a variety of streams from the conversion process to blend fuels with varying octane levels, vapor pressure ratings, and other special considerations dictated by market demand and federal and state regulation.¹⁴ The finished products are typically stored in large above-ground tanks in a tank farm on or near the premises of the refinery until they are transported to market by pipeline, rail, marine vessel, or truck.

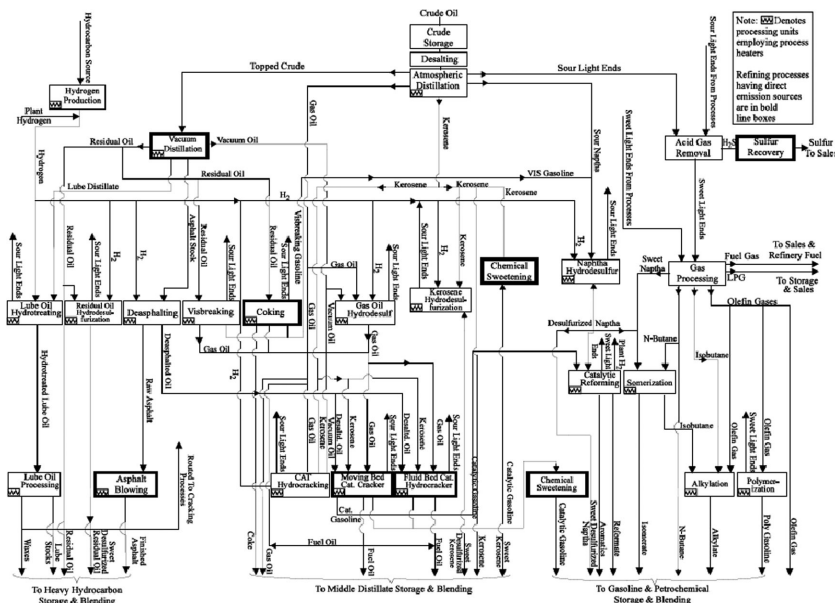

Figure 5.1-1. Schematic of integrated petroleum refinery.

I EPA, COMPILATION OF AIR POLLUTANT EMISSIONS FACTORS-42, Figure 5.1-1 (5th ed. 1995).

§ 29:180 Types and Sources of Pollution from Refineries

As described above, the refining process involves a complicated, technical, and multi-layered manufacturing procedure to develop many of the products we continue to rely on nationwide, from gasoline to diesel to petrochemical feedstocks. The process can also produce multiple kinds of waste and pollution. Broadly, refining processes generate three categories of waste: air emissions, solid waste and sludge, and polluted wastewater. Air emissions may be further subdivided into point source emissions, which are emitted from stacks, vents, and flares and are relatively easy to monitor and control, and non-point (or fugitive) emissions, which leak from valves, flanges, pumps, tanks, and the like and are more difficult to monitor and control.¹ Air emissions include greenhouse gasses (GHGs), volatile organic compounds (VOCs), all the criteria pollutants defined under the CAA—carbon monoxide, ground-level ozone, lead, nitrogen oxides, particulate matter, and sulfur

dioxide—and numerous air toxins such as the so-called BTEX compounds of benzene, toluene, ethylbenzene and xylene.² During the separation process, the desalter emits hydrogen sulfide to the atmosphere and produces large volumes of “wash water” that contain chlorides, sulfides, ammonia, hydrocarbons, and suspended solids.³ Distillation produces emissions of hydrocarbons (which contain VOCs) and hydrogen sulfide, as well as wastewater containing hydrocarbons and a number of chemicals, such as antifoam and corrosion additives.⁴ The conversion process may be the greatest source of pollution. Catalytic cracking can cause air emissions of carbon monoxide, sulfur dioxide, nitrogen oxides, hydrogen sulfide, particulates, hydrocarbons, benzene, ammonia, and aldehydes.⁵ The primary point sources for air emissions from the coking process are furnace stacks and flares, where off gas is rejected from the coking unit and combusted. Coking emissions can include hydrogen sulfide, carbon monoxide, in addition to hydrocarbons and VOCs.⁶ Coking also uses large volumes of water as a coolant and to clean coking drums. While much of this water is recycled through the system, resulting wastewater may contain pollutants such as oil, sulfides, ammonia, and phenol.⁷ Steam boilers, process furnaces, process heaters, and engines to run compressors, which are used throughout the refining process, may emit carbon monoxide, sulfur oxides, nitrogen oxides, and hydrocarbons.⁸ In transportation and marketing operations downstream of the refining process, air emissions result from evaporation of vapors from refined products. Evaporative losses occur from large storage tanks; during loading into rail cars, tank trucks, and marine vessels; while products are stored in underground storage tanks at fuel stations (breathing losses); and during fueling of vehicles.⁹

§ 29:181 Regulation of Air Emissions: Greenhouse Gas Emissions Reporting Program

The following sections survey the major federal environmental laws that pertain to each of the above-described categories of waste generated by the refining process: air emissions, water discharges, and solid and hazardous wastes. This survey begins with regulation of air emissions under the federal Clean Air Act (CAA), and, specifically, with a relatively recent program for the regulation of GHG emissions.

In 2008, Congress appropriated money for the U.S. Environmental Protection Agency (EPA) to use its authority under the CAA to “require mandatory reporting of greenhouse gas emissions above appropriate thresholds in all sectors of the economy of the United States,” including the downstream sector of the oil and gas industry.¹ The resulting regulations impose extensive monitoring, reporting, and record-keeping requirements on petroleum refineries,² as well as suppliers of petroleum products (defined as refineries and importers and exporters of petroleum products

and natural gas liquids)³ that emit certain GHGs above applicable annual thresholds.⁴ Annual GHG reports must be submitted to EPA no later than March 31 of each calendar year for GHG emissions produced in the previous calendar year.⁵

§ 29:182 Regulation of Air Emissions: New Source Review

One of the most significant sources of pollution regulation of petroleum refineries is the CAA's new source review (NSR) program, which requires facility operators to obtain a preconstruction permit before constructing a new source or a major modification of an existing source.¹ The key question for owners and operators of refineries under this program is whether a proposed modification to the refinery will constitute a "major modification." NSR was enacted in 1977, after all the significant United States refineries had already been constructed. This means that, to trigger the stringent requirements of the program, a refinery must undertake a "major modification."² Refineries are highly motivated to characterize any modifications as not major, as non-major modifications trigger only the laxer requirements of Minor NSR. A modification is "major" if it would cause a net increase in the source's actual emissions or its potential to emit (PTE) in excess of thresholds set for various pollutants by regulation,³ or if the modification occurs within 10 kilometers of a designated Class I area (a wilderness area, for example) and the increased emissions would increase the 24-hour average concentration of any regulated pollutant in the ambient air by at least one microgram per cubic meter.⁴ For a new petroleum refinery to qualify as a "major stationary source" and trigger major NSR, it must emit 100 tons per year (tpy) or more of any criteria pollutant (including fugitive emissions). As a practical matter, virtually any significant new refinery would exceed this threshold.⁵ Alternatively, if a new refinery were to voluntarily accept federally enforceable limits on its emissions to keep the emissions below the major source threshold, it may avoid major NSR requirements as a "synthetic minor source."⁶

§ 29:183 Regulation of Air Emissions: New Source Performance Standards

In addition to the preconstruction permitting programs under NSR, the CAA imposes emissions standards for criteria pollutants on designated industrial or source categories of new sources under the new source performance standards (NSPS) program.¹ Sources subject to NSPS requirements must install best demonstrated technology (BDT), which refers to the best system of emission reductions that EPA determines has been adequately demonstrated, considering the costs of achieving such emission reductions, any non-air quality health and environmental

impact, and energy requirements.²

Petroleum refineries are subject to a number of NSPS, each promulgated at 40 C.F.R. Part 60. Subpart J imposes NSPS for fluid catalytic cracking units, fluid coking units, delayed coking units, fuel gas combustion devices, and sulfur recovery plants that were constructed as part of a petroleum refinery between 1970 and 2007.³ Subpart J sets emissions control standards for particulate matter, carbon monoxide, and sulfur oxides,⁴ and imposes monitoring, testing, and reporting and recordkeeping requirements.⁵ Subpart Ja imposes NSPS for the same category of refinery components (i.e. parts within refineries) that are constructed, reconstructed, or modified after May 14, 2007.⁶ The emissions limitations of Subpart Ja cover the same criteria pollutants as Subpart J plus sulfur dioxides.⁷ Subpart Ja also requires operators of flares to develop and implement a written flare management plan,⁸ and imposes operational requirements for certain flares, combustion devices, and sulfur recovery plants.⁹ It further permits owners and operators to apply to EPA for permission to employ alternative means of emission limitation.¹⁰ Like Subpart J, Ja requires performance testing, leak monitoring, reporting, and recordkeeping.¹¹

Subparts GGG and GGGa establish standards of performance for equipment leaks of VOCs at petroleum refineries constructed, reconstructed, or modified between January 1983 and November 2006 and after November 2006, respectively.¹² Similarly, Subpart QQQ sets standards of performance for VOCs emissions from petroleum refinery wastewater systems,¹³ including drain systems, oil-water separators, and aggregate facilities.¹⁴ In addition to the performance standards, the regulations require leak repairs, monitoring, reporting, recordkeeping,¹⁵ and permit alternative standards of emission limitation.¹⁶

The petroleum marketing sector is also subject to NSPS. Subpart XX establishes VOCs emissions from new and modified bulk gasoline terminals. A bulk gasoline terminal transfers and stores gasoline and other refined petroleum products as they are distributed from refineries to service stations, bulk plants, etc.¹⁷ These regulations set emission standards for loading racks and on the loading of liquid product, vapor tightness standards for tank trucks, and pressure standards for pressure-vacuum vents on a vapor collection system.¹⁸ Subpart XX also requires the use of vapor collection equipment and requires monthly inspections for equipment leaks.¹⁹

¹⁹40 C.F.R. §§ 60.502(a), 60.505 (2021).

§ 29:184 Regulation of Air Emissions: National Emissions Standards for Hazardous Air Pollutants

The national emissions standards for hazardous air pollutants (NESHAPs) program of the CAA is another significant source of pollution regulation of petroleum refineries.¹ NESHAPs sets emissions standards for hazardous air pollutants (HAPs) applicable to new, modified, and existing major sources within defined source categories. Subject facilities must install the maximum achievable control technology (MACT) to control emissions of HAPs.

HAPs are air toxics. In addition to those specifically listed by statute,² HAPs may include “substances which are known to be, or may reasonably be anticipated to be, carcinogenic, mutagenic, teratogenic, neurotoxic, which cause reproductive disruption, or which are acutely or chronically toxic[]”³ The list of HAPs emitted by petroleum refineries is published at 40 CFR Part 63, Appendix to Subpart CC, Table 1. Notably, these HAPs include the BTEX compounds (benzene, toluene, ethylbenzene, and xylene).

MACT refers to

the maximum degree of reduction in emissions . . . that . . . , taking into consideration the cost of achieving such emission reduction, and any non-air quality health and environmental impacts and energy requirements, determines is achievable . . . through application of measures, processes, methods, systems or techniques⁴

MACT may include measures that:

- 1) Reduce or eliminate emissions of HAPs through process changes, substitutions of materials, or other modifications;
- 2) Enclose systems of processes to eliminate emissions;
- 3) Collect, capture or treat such pollutants when released from a point source;
- 4) Are design, equipment, work practice, or operational standards (including requirements for operator training or certification); or
- 5) Are a combination of these.⁵

A stationary source is a “major source” subject to NESHAPs if it falls within an EPA-designated source category and emits at least 10 tpy of any single HAP or 25 tpy of any combination of HAPs.⁶ On October 1, 2020, EPA finalized a new rule that allows sources once categorized as “major” to reclassify as a non-major “area source” after reducing emissions below the major threshold.⁷

EPA has designated multiple source categories subject to NESHAPs that affect petroleum refining and marketing operations. Two of these, commonly referred to as “MACT 1” and “MACT 2,” pertain directly to refineries. MACT 1, promulgated at 40 C.F.R. Part 63 Subpart CC, regulates HAPs emissions from miscellaneous process vents, storage vessels, wastewater, equipment leaks, gasoline loading racks, marine tank vessel loading, and heat exchange systems at petroleum refineries.⁸ MACT 2, promulgated at Subpart UUU, regulates HAPs emissions from process vents on

catalytic cracking units (CCUs, including fluid catalytic cracking units (FCCUs)), catalytic reforming units, and sulfur recovery units (SRUs).⁹ The regulations include operational standards for decoking of delayed coking units¹⁰ and “fenceline monitoring” requirements for monitoring for regulated HAPs in the proximity of refineries.¹¹

EPA has also promulgated NESHAPs for industrial process cooling towers, which are common components of petroleum refineries. Subpart Q sets standards for emissions of chromium compounds, which are released from towers during the cooling process.¹² NESHAPs also exist for certain site-remediation technologies and practices, which are often used at petroleum refineries to clean up contaminated soil and water. These regulations, at Subpart GGGGG, aim to control emissions of organic HAPs by imposing MACT requirements and work practices designed to limit emissions.¹³

The distribution and marketing segment of the downstream industry is also subject to NESHAPs. Subparts R,BBBBBB, and CCCCCC impose limitations on the emission of air toxics from, respectively, area source categories such as bulk gasoline terminals and pipeline breakout stations;¹⁴ gasoline distribution bulk terminals, bulk plants, and pipeline facilities;¹⁵ and gasoline dispensing facilities.¹⁶ The general aim of these NESHAPs is to control releases of HAPs during the loading, unloading, and transportation of refined products like gasoline, and limit vapor leaks from pumps, valves, and similar equipment. Subpart Y requires large marine loading terminals for refined products to reduce emissions of VOCs using Reasonably Available Control Technology (RACT) and to limit emissions of HAPs using MACT.¹⁷ Special NESHAPs also apply, under Subpart BB, to facilities which transfer benzene (a refined product), such as where it is loaded into trucks, railcars, or marine vessels.¹⁸

§ 29:185 Regulation of Air Emissions: Refined Fuel Products

One of the distinctive features of environmental regulation of petroleum refineries is that, in addition to their operation, the products that refineries manufacture are themselves subject to significant regulation. Described as the most burdensome and costly regulation of the industry,¹ the CAA Amendments of 1990 established national gasoline standards and empowered states to adopt their own unique fuel programs to meet local air quality needs.² To implement one of these so-called “boutique” fuel program, states must receive approval from EPA in their SIPs. Approval is conditioned on a demonstration that the state fuel program is strictly necessary to achieve the NAAQs that the SIP implements.³ A list of approved state fuel programs

is maintained in the Federal Register and EPA's website.⁴

The purpose of the gasoline standards programs is to reduce ground-level ozone (smog) and toxic emissions from fuel burned in motor vehicles.⁵ The programs cover standards for sulfur content,⁶ the content of toxic chemicals like benzene,⁷ Reid vapor pressure (RVP),⁸ winter oxygenates,⁹ and reformulated gasoline (RFG).¹⁰ RVP standards require use of specially formulated gasoline that evaporates at a higher temperature than normal gasoline, which reduces emissions of VOCs and hydrocarbons that contribute to smog. The winter oxygenates program mandates addition of oxygenates to gasoline during winter months to increase combustion efficiency and reduce carbon monoxide emissions. The RFG program prohibits the sale of non-reformulated gasoline, or "conventional" gasoline, in certain areas of the country in nonattainment for ozone. The program aims to improve air quality in certain areas of the county through the use of gasoline that is specifically formulated to reduce motor vehicle emissions of ozone-forming compounds.¹¹

The gasoline standards programs had a profound effect on the refining industry. Before the 1990 Amendments, there were three types of gasoline sold in the United States: regular, midgrade, and premium. By 2002, under federal and state fuel programs, that number had increased to 21 types of gasoline.¹² The proliferation of gasoline types disrupted the operation of refineries as well as the gasoline distribution system. Individual gasoline types must be fed through product pipelines in batches and cannot be comingled. To produce a new type of gasoline, refineries often must incur large capital investments. These investments are difficult to recoup when the gasoline may be marketed in a limited number of states and localities.¹³ Owing to these dislocations, by 2005 the gasoline production and distribution system had become vulnerable to supplies problems and disruption.¹⁴

In response to these and related issues in the gasoline market, the Energy Policy Act of 2005 amended the CAA to restrict EPA's authority to approve state boutique fuel programs.¹⁵ Under the 2005 Act, EPA cannot approve a state fuel if it would cause the total number such fuels to increase above the number that had been approved as of September 1, 2004. Further, before approving a new fuel, EPA must consult with the Department of Energy to ensure the new fuel will not cause a supply or distribution interruption or have a significant adverse impact on fuel producibility in the affected or continuous areas.¹⁶ With certain exceptions, EPA also has the discretion to deny approval of a state fuel unless the fuel is already in an existing SIP within the same PADD.¹⁷

§ 29:186 Regulation of Water Discharges: Effluent Limitations for Petroleum Refining Point Sources

Refineries use thousands of gallons of water per day for production and cooling processes, and much of this becomes wastewater. Sources of wastewater include, without limitation, the desalting process, tank bottoms, cooling towers, and condensate blowdown.¹ Most of the wastewater that is not reused is generally treated on site and discharged into surface waters or publicly owned treatment works (POTWs).² Since 1974, these discharges have been subject to EPA's petroleum refining effluent guidelines and standards, promulgated under the national pollutant discharge elimination system (NPDES) of the Clean Water Act (CWA).³ In general, the NPDES program prohibits discharges of pollutants through a point source into the waters of the United States without a NPDES permit.⁴

For direct discharges into surface water, effluent guidelines and standards are incorporated into a required NPDES permit. The standards require that existing point sources in the following source subcategories achieve certain effluent limitations for various pollutants: topping, cracking, petrochemical, lube manufacturing, and integrated operations.⁵ The applicable effluent limitations depend on the type of pollutant and are based variously on the best available technology economically achievable (BAT), best practicable control technology currently available (BPT), and best conventional pollutant control technology (BCT).⁶ The regulations additionally impose new source performance standards (NSPS) for new point sources in each category, which function similarly to NSPS under the CAA.⁷

Discharges into POTW are subject to the national pretreatment program component of the NPDES program. Under this program, the effluent guidelines and standards require separate pretreatment standards for existing and new sources in each of the covered source subcategories.⁸

§ 29:187 Regulation of Water Discharges: Stormwater Discharges

The NPDES program requires industrial facilities to obtain a permit for wastewater discharges from the facility.¹ Petroleum refineries are subject to this additional requirement of NPDES despite a broad exemption from the program for upstream oil and gas facilities. Section 402(l)(2) of the CWA prohibits EPA and states from requiring a NPDES permit for uncontaminated stormwater runoff

discharges from oil and gas exploration, production, processing, treatment operations, and transmission facilities.² EPA has interpreted this exemption not to apply to conventional petroleum and petrochemical refineries, oil shale refineries, cracking plants, or refined products pipelines that connect refineries with local and distant product storage facilities.³

§ 29:188 Regulation of Water Discharges: Spill Prevention, Control and Countermeasures Plans and Facility Response Plans

Petroleum refineries are subject to the spill prevention, control and countermeasures (SPCC) requirements of the CWA and its oil pollution prevention regulations.¹ Covered facilities are those non-transportation-related facilities that store greater than 1,320 gallons of “oil” in aggregate above-ground storage or that have 42,000 gallons of completely buried “oil” storage capacity, and that has a “reasonable expectation of an oil discharge to navigable waters of the United States and adjoining shorelines.”² “Oil” is defined to include petroleum and nonpetroleum-based oils, crude oil, and—importantly for this sector of the industry—refined products.³ Oil storage that is permanently closed is exempt from the SPCC requirements.⁴ Additionally, because refinery tank farms can contain large volumes of “oil,” refineries may also have to prepare facility response plans (FRPs) under the 1990 Oil Pollution Act amendments to the CWA.⁵ A facility is subject to the FRP requirement if it could reasonably be expected to cause “substantial harm” to the environment by discharging oil into or on waters of the United States.⁶ Refining and downstream facilities that could pose a “significant and substantial harm” must have their FRPs approved by the appropriate EPA regional administrator.⁷ EPA considers the following factors in determining whether a facility poses a “significant and substantial harm”: age of tanks, type of transfer operations, oil storage capacity, lack of secondary containment, proximity to wildlife and sensitive environments or drinking-water intakes, spill history and frequency of past discharges, or other information, including local impacts on public health.⁸

§ 29:189 Regulation of Water Discharges: Discharge Reporting

The CWA requires any person in charge of a petroleum refinery to report to the federal government any discharge of “harmful quantities” of oil or hazardous

substance from the facility “as soon as he has knowledge of” the discharge.¹ EPA has defined “harmful quantities” by the “sheen rule,” which requires reporting of discharges that “[c]ause a film or sheen upon or discoloration of the surface of the water”²

§ 29:190 Regulation of Hazardous Substances: Resource Conservation and Recovery Act

The petroleum refining process can also generate large amounts of hazardous and non-hazardous solid wastes regulated under the Resource Conservation and Recovery Act (RCRA).¹ The 1984 Hazardous Solid Waste Amendments (HSWA) to RCRA prohibit the land disposal of untreated hazardous wastes and require EPA to set maximum concentration levels or prescribe treatment standards for hazardous waste before land disposal is permissible.² EPA maintains four separate lists of hazardous wastes that are subject to land disposal restrictions. Of primary importance to the refining industry are the K list³ and F list.⁴

The K list identifies source-specific wastes. EPA initially listed several petroleum refinery wastes in 1980.⁵ In 1998, as a result of a consent decree resolving a lawsuit filed by the Environmental Defense Fund, EPA listed several additional refinery wastes on schedule K.⁶ This was accomplished pursuant to section 3001(e)(2) of RCRA, which required EPA to determine whether to list as hazardous a number of waste residuals—including several generated by petroleum refining.⁷

F listings target more general types of waste than K listings. These listings were intended to complement the more specific listings for K-listed wastes, K051 and K048, by covering all types of petroleum refinery wastewater treatment sludges and floats, rather than only the specific ones listed in K.⁸

Petroleum Refining “K” Wastes

K048	Dissolved air flotation (DAF) float from the petroleum refining industry	(T)
K049	Slop oil emulsion solids from the petroleum refining Industry	(T)
K050	Heat exchanger bundle cleaning sludge from the petroleum refining industry	(T)
K051	API separator sludge from the petroleum refining Industry	(T)
K052	Tank bottoms (leaded) from the petroleum refining Industry	(T)
K169	Crude oil storage tank sediment from petroleum refining operations	(T)
K170	Clarified slurry oil tank sediment and/or in-line filter/separation solids from petroleum refining operations	(T)
K171	Spent Hydrotreating catalyst from petroleum refining operations, including guard beds used to desulfurize feeds to other catalytic reactors (this listing does not include inert support media)	(I, T)

K172	Spent Hydrotreating catalyst from petroleum refining operations, including guard beds used to desulfurize feeds to other catalytic reactors (this listing does not include inert support media).	(I, T)
K176	Baghouse filters from the production of antimony oxide, including filters from the production of intermediates (e.g., antimony, metal or crude antimony oxide).	(E)
K177	Slag from the production of antimony oxide that is speculatively accumulated or disposed, including slag from the production of intermediates (e.g., antimony metal or crude antimony oxide).	(T)
K178	Residues from manufacturing and manufacturing-site storage of ferric chloride from acids formed during the production of titanium dioxide using the chloride-ilmenite process.	(T)

Petroleum Refining “F” Wastes

F037	Petroleum refinery primary oil/water/solids separation sludge—Any sludge generated from the gravitational separation of oil/water/solids during the storage or treatment of process wastewaters and oily cooling wastewaters from petroleum refineries. Such sludges include, but are not limited to, those generated in oil/water/solids separators; tanks and impoundments; ditches and other conveyances; sumps; and stormwater units receiving dry weather flow. Sludge generated in stormwater units that do not receive dry weather flow, sludges generated from non-contact once-through cooling waters segregated for treatment from other process or oily cooling waters, sludges generated in aggressive biological treatment units as defined in § 261.31(b)(2) (including sludges generated in one or more additional units after wastewaters have been treated in aggressive biological treatment units) and K051 wastes are not included in this listing. This listing does include residuals generated from processing or recycling oil-bearing hazardous secondary materials excluded under § 261.4(a)(12)(i), if those residuals are to be disposed of	(T)
F038	Petroleum refinery secondary (emulsified) oil/water/solids separation sludge—Any sludge and/or float generated from the physical and/or chemical separation of oil/water/solids in process wastewaters and oily cooling wastewaters from petroleum refineries. Such wastes include, but are not limited to, all sludges and floats generated in: induced air flotation (IAF) units, tanks and impoundments, and all sludges generated in DAF units. Sludges generated in stormwater units that do not receive dry weather flow, sludges generated from non-contact once-through cooling waters segregated for treatment from other process or oily cooling waters, sludges and floats generated in aggressive biological treatment units as defined in § 261.31(b)(2) (including sludges and floats generated in one or more additional units after wastewaters have been treated in aggressive biological treatment units) and F037, K048, and K051 wastes are not included in this listing	(T)

§ 29:191 Regulation of hazardous substances: underground injection wells

Petroleum refineries are among the most significant users of Class I underground injection wells for hazardous and non-hazardous fluid wastes. Class I wells, authorized by the underground injection control (UIC) program of the federal Safe Drinking Water Act (SDWA),¹ are used to inject hazardous and non-hazardous wastes (as defined by RCRA)² into deep, confined rock formations thousands of feet below underground sources of drinking water. Most Class I wells are found in the Gulf Coast and Great Lakes areas, where much of the country’s refining capacity is located and where the geology is well suited to this type of well. Class I wells are subject to extensive requirements relating to siting, construction, operation, monitoring, testing, recordkeeping, reporting, and closure.³

§ 29:192 Regulation of Hazardous Substances: Comprehensive Environmental Response, Compensation, and Liability Act

Refinery facilities that fall short of complying with RCRA could also run afoul of the Comprehensive Environmental Response, Compensation, and Liability Act’s (CERCLA’s) regime of strict liability for the cleanup of sites where there has been a

[Section 29:191]

¹42 U.S.C. § 300f.

²RCRA § 3004(f), 42 U.S.C. § 6924(f).

³40 C.F.R. §§ 146.1 to 146.10 (2021) (general UIC requirements), 146.11 to 146.16 (standards applicable to Class I wells). For discussion of Class I permitting requirements, see § 14:68 of this treatise.

release or threatened release of hazardous substances.¹ Critically, to define “hazardous substances,” CERCLA incorporates anything classified as a hazardous or toxic waste, chemical, substance, emission, or effluent under RCRA, as well as the CAA, CWA, and the Toxic Substances Control Act²—all of which apply to petroleum refining operations. The wide scope of liability, broad definition of hazardous substances, and the potentially incredible costs of cleanup, combine to make CERCLA one of the most financially consequential environmental regulations of the downstream oil and gas industry. There are a number of exclusions from CERCLA’s definition of hazardous wastes relevant to the petroleum refining sector. Oil-bearing hazardous secondary materials, such as sludges, byproducts, or spent materials, that are generated at a petroleum refinery are excluded if they are reused in the petroleum refining process, such as in distillation, catalytic cracking, fractionation, or thermal cracking (coking) processes. This exclusion is lost, however, if the material is placed on the land or “speculatively accumulated before being so recycled.” The exclusion does not cover materials inserted into certain thermal cracking units.³ Oil that is reclaimed from secondary materials (including wastewater) generated from normal refining, bulk storage, and transportation practices and recycled in the same manner is also excluded.⁴ Petrochemical recovered from oil from an associated organic chemical manufacturing facility is also excluded if reused in the petroleum refining process.⁵ Groundwater that is hazardous only because it exhibits the toxicity characteristic of 40 C.F.R. § 261.24 and that is reinjected through an underground injection well pursuant to free phase hydrocarbon recovery operations at petroleum refineries, petroleum marketing terminals, petroleum bulk plants, petroleum pipelines, and petroleum transportation spill sites is excluded if conducted before January 25, 1993, or subsequently under certain conditions.⁶

Additionally, CERCLA excludes from the definition of “hazardous substances” “petroleum, including crude oil or any fraction thereof” and “natural gas, natural gas liquids, liquefied natural gas, or synthetic gas usable for fuel”⁷ Courts have interpreted this “petroleum exclusion” to encompass gasoline leaking from underground storage tanks, even where certain additives in the gasoline themselves had been designated as hazardous substances.⁸ EPA, however, interprets the exclusion narrowly, such that it encompasses only crude oil and fractions of crude oil, including the hazardous substances, such as benzene, that are indigenous in those petroleum substances. Further, EPA’s interpretation encompasses within the exclusion hazardous substances that are normally mixed with or added to crude oil or crude oil fractions during the refining process, including hazardous substances the levels of which are increased during refining. The exclusion does not cover, under EPA’s interpretation, hazardous substances that are added to petroleum or that

increase in concentration as a result of contamination of the petroleum during use.⁹

§ 29:193 Regulation of Hazardous Substances: The Toxic Substances Control Act

As manufacturers and users of chemical substances, petroleum refineries are subject to the provisions of Subtitle I of the Toxic Substances Control Act (TSCA). The law regulates the manufacture, sale, and use in commerce of all existing and newly manufactured or imported chemicals in the United States that pose “an unreasonable risk to health or to the environment.” TSCA applies to any person, including refineries, that manufactures, processes, distributes in commerce, uses, or disposes of a regulated chemical substance.¹ “Chemical substance” is defined broadly to include “any organic or inorganic substance of a particular molecular identity,” but excludes substances controlled under other federal statutes, such as pesticides, tobacco products, nuclear materials, and food, cosmetics, and drugs.²

EPA must maintain the TSCA Chemical Substance Inventory, which includes more than 86,000 chemical substances manufactured and used in the United States.³ Under the chemical data reporting (CDR) rule (formerly the inventory update rule (IUR)), every four years, manufacturers that meet or exceed production volume thresholds (generally 25,000 pounds or more of a chemical substance) must report information to EPA about their production and use of chemicals in commerce.⁴ The manufacture of new chemical substances, or the new use of existing substances, is prohibited unless the manufacturer gives EPA at least 90 days’ notice (premanufacture notice) and the EPA Administrator, after a review, determines it does not present an unreasonable risk of injury to health or the environment.⁵ New chemical substances are subsequently added to the inventory.

Under Section 6(a), EPA may promulgate rules restricting or prohibiting the manufacturing, processing, or distribution commerce of certain chemical substances.⁶ Section 21 permits parties to petition EPA to undertake 6(a) rulemakings. On November 4, 2019, EPA denied such a petition from the Public Employees for Environmental Responsibility to promulgate a Section 6(a) rule prohibiting petroleum refineries from using hydrofluoric acid in manufacturing processes and require a phase-out within two years.⁷

§ 29:194 Regulation of Hazardous Substances: Emergency Planning and Community Right-to-Know Act

By virtue of the presence of a number of hazardous substances in significant quantities at petroleum refining facilities, refineries are subject to the Emergency

Planning and Community Right-to-Know Act (EPCRA).¹ EPCRA creates a framework to require facilities, including petroleum refineries, where extremely hazardous substances (EHSs) are present to disclose these substances to local and state authorities to report their accidental release. EHS are listed in Appendix A to 40 C.F.R. Part 355. Refineries are covered facilities if they employ 10 or more full-time-equivalent employees (as they invariably do) and manufacture or process the listed chemicals in excess of applicable thresholds.² Covered facilities must annually submit a material safety data sheet (MSDS), as well as an emergency and hazardous chemical inventory form, to the local and state planning authorities and local fire departments for each hazardous chemical (as defined under the Occupational Safety and Health Act).³ Additionally, refineries are subject to EPA's Toxics Release Inventory (TRI) program, which requires reporting of the quantities of listed toxic chemicals that the refinery uses, manufactures, or processes above applicable thresholds during the previous year.⁴ Refineries must also submit either a Tier I or Tier II hazardous chemical inventory form, which identifies the amount, location, and potential hazards of each EHS on site at any point during the year.⁵

§ 29:195 Regulation of Underground Storage Tanks

The marketing sector of the downstream industry makes great use of underground storage tanks (USTs) to store refined products; in particular, for gasoline at filling stations. Leaking USTs can contaminate underground sources of drinking water. These issues led EPA to promulgate regulations addressing USTs under the authority of amendments to Subtitle I of the Solid Waste Disposal Act of 1984 (amending RCRA),¹ which in turn was amended by the Energy Policy Act of 2005.² EPA revised its UST regulations in July 2015 to increase requirements on operation and maintenance and leak prevention and detection.³ Generally, the UST regulations impose performance standards for new USTs, upgrading standards for existing systems,⁴ and general operating requirements for all USTs. These operating requirements cover spill and overfill controls, operation and corrosion protection, reporting and recordkeeping, periodic testing of spill prevention and containment mechanisms, and periodic inspections.⁵ Additionally, the regulations mandate release detection, reporting and investigation, and response and corrective action procedures.⁶ The regulations also address closure procedures and recordkeeping and financial responsibility requirements.⁷

The statutes permit states to develop their own UST programs with the approval

[Section 29:194]

of EPA to operate in lieu of federal standards.⁸ State-imposed standards may be more stringent than federal requirements.⁹ EPA maintains a list of approved state programs at 40 C.F.R. Part 282 Subpart B.

In 1986, Congress created the Leaking Underground Storage Tank (LUST) Trust Fund to address petroleum releases from federally regulated USTs.¹⁰ The Energy Policy Act of 2005 expanded the permissible uses of funds from the Trust Fund, such that they may be used to oversee cleanups of petroleum releases, enforce cleanups, pay for cleanups at sites where the owner or operator is unknown, unwilling, or unable to respond or which require emergency action, and conduct inspections and other release prevention activities.¹¹ States and tribes may use Trust Fund money to support these purposes if they enter an assistance agreement with the federal government.

§ 29:196 Federal Statutes Implicated by Permits Issued under the CAA, CWA, and RCRA

Certain federal environmental statutes that do not directly regulate petroleum refining and marketing are implicated nonetheless when a federal agency issues a permit under the CAA, CWA, or RCRA. These include, notably, the National Environmental Policy Act (NEPA), National Historic Preservation Act (NHPA), Endangered Species Act (ESA), and Coastal Zone Management Act (CZMA). NEPA is triggered by any “major federal action,” which is defined to include “approval of specific projects . . . by permit or other regulatory decision under the CAA, CWA, and RCRA.”¹ Similarly, NHPA requires any federal agency with the authority to license a project to account for the effects of the project on historic properties.² Section 7 of ESA requires federal agencies to consult with the U.S. Fish and Wildlife Service or National Marine Fisheries Services to ensure that “any action authorized . . . by such agency . . . is not likely to jeopardize the continued existence of any endangered species or threatened species or result in destruction or adverse modification of habitat for such purposes.”³ CZMA mandates that private activities requiring a federal permit affecting a coastal use or resource be “fully consistent” with enforceable of the relevant state coastal zone management plan.⁴

Consequently, any time a petroleum refinery or other downstream operation requires a permit from a federal agency, such as a Section 404 dredge and fill permit under the Clean Water Act or a New Source Review permit under the Clean Air Act, the permittee must demonstrate compliance not only with the requirements of the statute under which it seeks a permit, but also the requirements of NEPA, NHPA, ESA, and CZMA. For example, if an existing refinery were to undertake a major modification to increase capacity, it would need to consider whether the modification triggers any Clean Air Act permitting programs, such as NSR, NSPS, and NESHAPS. If so, EPA would be obligated to conduct analyses under NEPA, NHPA, the ESA, and the CZMA before issuing the requested permit. These ad-

ditional requirements can substantially increase the time and expense of obtaining a permit.

X. REGULATION OF TRANSPORTATION

§ 29:197 Overview and Background

Almost all natural gas and most liquid petroleum transported in the United States moves by pipeline. This section therefore focuses on environmental regulation of pipeline transportation. The section also briefly describes the regulation of rail transportation of oil, an alternative mode of shipment that increased sharply during the domestic energy revolution because of constraints in pipeline capacity.¹

Several different legal frameworks regulate the environmental, health, and safety risks of the pipeline networks carrying oil and gas. Federal and state public utility laws, state energy facility siting laws, and federal executive orders govern whether and where pipeline facilities should be built. The cooperative federalist framework of the Pipeline Safety Act governs leaks or spills of products from pipeline facilities.² Finally, certain pipeline activities are regulated under media-specific environmental laws such as the Clean Water Act and Clean Air Act.³

Environmental regulation of pipeline facilities depends on the type of system, the substance transported, and whether the facilities are part of a system that crosses state or national borders. There are three types of pipeline systems: (1) gathering pipeline systems, which collect raw natural gas or crude oil extracted from production wells and transport it to processing facilities or to transmission networks; (2) transmission pipeline systems, which transport gas, oil, or other petroleum products over long distances; and (3) gas distribution pipeline systems, which deliver gas to local customers. Of these systems, the risks of transmission pipeline systems are subject to the most oversight. The federal government directly considers the environmental effects of interstate gas transmission pipeline projects and pipeline projects involving cross-border facilities in determining whether to approve the projects. In contrast, the effects of other types of systems are primarily regulated through safety standards that are designed to prevent accidents. Unlike the disparate legal frameworks governing pipelines, the risks of rail transportation of oil are governed by one framework comprised of two related laws: federal hazardous materials safety regulations promulgated in 2015 and a federal statute enacted six months later.

§ 29:198 Approval and siting of interstate natural gas transmission pipelines

Under Section 7 of the Natural Gas Act, a natural gas company that intends to construct or extend facilities used for transportation of natural gas in interstate commerce is required to obtain a certificate of public convenience and necessity from

[Section 29:197]

¹Oil is also transported by barge, vessel, and tanker truck. Environmental regulation of oil-carrying vessels is governed by the Oil Pollution Act, a statute covered in other sections. The U.S. Department of Transportation (DOT) regulates the shipment of oil on roadways under the Hazardous Materials Transportation Act. The DOT's regulations focus on containment of hazardous materials and hazard communication.

²49 U.S.C. §§ 60101 to 60143.

³For example, as explained in another section of this chapter, construction of a pipeline that results in a discharge of dredged or fill material must obtain a permit from the U.S. Army Corps of Engineers under Section 404 of the Clean Water Act.

the Federal Energy Regulatory Commission (FERC).¹ These facilities include transmission pipelines and the equipment needed to operate a pipeline system, such as compressor stations.

To issue a certificate, FERC must find “that the applicant is able and willing properly to do the acts and to perform the service proposed” and the project “is or will be required by the present or future public convenience and necessity.”² When considering an application, FERC follows the decision-making procedure in its Certificate Policy Statement.³ An applicant who proposes to expand an existing pipeline system must first establish that the project is not dependent on subsidies from existing customers.⁴ If this threshold test is met or the pipeline is new, FERC considers whether the applicant has addressed adverse effects of the project on other pipelines and their existing customers, on owners of land where the facilities will be sited, and on communities affected by the facilities. FERC then weighs the residual adverse effects against the public benefits of the project, namely, the need for the project. This balancing test is primarily focused on economic effects but includes some environmental issues, such as land disturbance.

FERC’s decision to certificate is considered a “major federal action” under the National Environmental Policy Act (NEPA), which means FERC must prepare an Environmental Impact Statement (EIS) for a project if there are significant environmental effects.⁵ FERC normally prepares an EIS when there is a major construction project involving a new right-of-way.⁶ When the project meets the initial balancing test, FERC proceeds to evaluate the environmental impacts and alternatives. The scope of the environmental analysis has been controversial, particularly the extent to which FERC is required to assess the indirect impacts of the project on climate change.⁷ FERC generally defers to the U.S. Department of Transportation’s pipeline safety requirements in evaluating the potential for natural gas releases.

If FERC finds that the environmental impacts of the project are acceptable given the public benefits, it issues a certificate and approves the pipeline route and location of other facilities. FERC may impose environmental conditions on the certificate to mitigate adverse impacts.⁸ The certificate provides a natural gas company with the authority to use eminent domain to obtain easements for the pipeline project.⁹ The certificate is generally the final siting approval, as the Natural Gas Act

[Section 29:198]

¹15 U.S.C. §§ 717(b), 717f(c). Such interstate facilities include pipelines that extend across state borders and pipelines within a state that are part of a system that transports gas among states.

²15 U.S.C. § 717f(e).

³Certification of New Interstate Natural Gas Pipeline Facilities, 88 FERC ¶ 61227 (1999), *clarified*, 90 FERC ¶ 61128, *further clarified*, 92 FERC ¶ 61094 (2000) (Certificate Policy Statement). FERC also issues blanket certificates for routine activities that do not require case-specific review. 18 C.F.R. §§ 157.201 to 157.218 (2021).

⁴FERC uses this criterion as a threshold test because it ensures that there is a market need for the pipeline and protects existing customers as well as landowners from the adverse effects of an unnecessary pipeline. 88 FERC ¶ 61227 at 21-22.

⁵See 42 U.S.C. § 4332(2)(C).

⁶18 C.F.R. § 380.6(a)(3) (2021).

⁷In 2017, the D.C. Circuit Court of Appeals held that FERC must quantify the effects of a pipeline project on climate change in an EIS or explain why the agency is unable to do so. *Sierra Club v. Federal Energy Regulatory Commission*, 867 F.3d 1357, 1375, 85 Env’t. Rep. Cas. (BNA) 1035 (D.C. Cir. 2017).

⁸15 U.S.C. § 717f(e).

⁹15 U.S.C. § 717f(h).

preempts state and local zoning law.¹⁰

§ 29:199 Approval and Siting of Other Transmission Pipelines

Interstate natural gas transmission pipeline projects are the only pipeline projects that must be approved by FERC. While FERC regulates the rates and service of interstate oil transmission pipelines under the Interstate Commerce Act,¹ it does not have authority to approve oil pipeline projects or to consider the environmental impacts of these projects.

Thus, state law governs the siting of interstate and intrastate oil transmission pipeline projects and gas transmission pipeline projects. Half of the states require review and approval of at least some types of transmission pipeline projects.² In the remaining states, public utility commissions may generally oversee transmission pipeline projects by companies that deliver gas to customers, but there is no specific review of impacts mandated by law.

Some states that require review of transmission pipeline projects employ a process similar to the one used by FERC: a company must seek a certificate of public convenience and necessity or other approval from the state public utility commission. For example, a company that intends to construct a pipeline that will operate as a common carrier in Illinois is required to obtain a certificate in good standing from the state Commerce Commission.³ In determining whether the public convenience and necessity require issuance of a certificate for an oil pipeline, the commission must consider environmental impacts and impacts to natural resources.⁴ Other states review transmission pipeline projects as part of a centralized process for siting energy facilities. These states generally require the decision-maker to determine the acceptability of impacts to the environment. For example, in Connecticut, a company that intends to construct an energy facility—which includes an intrastate gas transmission pipeline—and utilize eminent domain authority must apply to a siting council for a certificate of environmental compatibility and public need.⁵ To issue the certificate, the council must conclude that the significant adverse environmental effects of the project “are not sufficient reason to deny the application.”⁶

§ 29:200 Trans-Border Oil and Gas Pipeline Projects

Oil and gas transmission pipeline projects that cross the U.S.-Canada or U.S.-Mexico border must obtain a Presidential Permit for the facilities at the border. Courts have upheld this permit requirement as an exercise of the president’s constitutional power over foreign affairs. In practice, this means that there is federal review of the environmental impacts of transborder pipeline projects that would not otherwise be subject to federal approval and NEPA, such as intrastate gas transmission pipelines and interstate and intrastate oil transmission pipelines.

By executive order, FERC is vested with the authority to issue a Presidential

⁴220 Ill. Comp. Stat. 5/15-401(b)(1), (3).

⁵Conn. Gen. Stat. § 16-50k.

⁶Conn. Gen. Stat. § 16-50p(3)(B), (C).

Permit for construction of natural gas facilities at the border if it is “consistent with the public interest.”¹ FERC has not defined this term by rule or in a policy statement. Before FERC may grant the permit, the Secretaries of State and Defense must also recommend approval. If the agencies do not agree, the application is submitted to the president for a final decision.

In addition to a permit, the facilities are required to obtain a separate approval from FERC under Section 3 of the Natural Gas Act.² Pursuant to this section, FERC must approve the construction and siting of facilities for import or export of natural gas unless it is not consistent with the public interest. The statute provides that importing gas from or exporting gas to a nation with which the United States has a free trade agreement that grants national treatment to trade in natural gas is “deemed to be consistent with the public interest.”³ FERC is required to grant such Section 3 applications “without modification or delay.”⁴ Since the U.S.-Mexico-Canada Agreement grants national treatment to natural gas, gas transmission pipelines that cross the borders of Canada and Mexico must be approved under the statute. No similar expedited approval is mandated for the Presidential Permit, however. FERC’s practice is to consider applications for a Presidential Permit and Section 3 approval in one proceeding and to balance environmental impacts with the importance of free trade and economic effects. An Environmental Assessment is normally prepared under NEPA to determine if there are significant environmental impacts.⁵ To comply with NEPA, FERC’s environmental review encompasses indirect environmental impacts caused by the whole pipeline even if it only transports gas within a state and is therefore not otherwise subject to FERC jurisdiction. If the pipeline transports gas in interstate commerce and requires approval under Section 7, FERC generally incorporates all of the authorizations into one proceeding and prepares an EIS. FERC may—and usually does—impose environmental conditions on its approvals.⁶

By separate executive order, the U.S. State Department is authorized to issue a Presidential Permit for construction of oil and petroleum product facilities at the border if it “would serve the national interest.”⁷ A detailed administrative procedure governs the process for making the decision. The State Department must request the views of certain heads of other departments and agencies, including the Administrator of the Environmental Protection Agency and the Secretaries of Interior and Energy. For applications involving the border with Mexico, the U.S. Commissioner of the International Boundary and Water Commission must also be consulted. An official who disagrees with the State Department’s proposed determi-

[Section 29:200]

¹Exec. Order No. 10485, 18 Fed. Reg. 5397 (Sept. 3, 1953). The executive order gave the permitting authority to the Federal Power Commission, the predecessor to FERC, but it is now vested in FERC.

²15 U.S.C. § 717b(a). The authority to approve imports or exports of natural gas under the Natural Gas Act is divided between FERC and the Department of Energy. FERC has the responsibility to “[a]pprove or disapprove the construction and operation of particular facilities, the site at which such facilities shall be located, and with respect to natural gas that involves the construction of new domestic facilities, the place of entry for imports or exit for exports.” DOE Delegation Order No. 00-004.00A (effective May 16, 2006). The Department of Energy’s Office of Fossil Energy authorizes the import or export of the natural gas.

³15 U.S.C. § 717b(b), (c).

⁷Exec. Order No. 11423, 33 Fed. Reg. 11741 (Aug. 16, 1968), *as amended by* Exec. Order No. 13337, 69 Fed. Reg. 25299 (Apr. 30, 2004).

nation must object within 15 days of being notified. The application is referred to the president for a final decision when the officials cannot agree.

The State Department has not defined the standard for a permit in its regulations; however, in making individual national interest determinations, the department has considered environmental impacts together with other factors such as energy security, economic impacts, and foreign policy objectives. The department's NEPA regulations do not specify how a Presidential Permit for a cross-border facility should be treated under NEPA.⁸ In the past, the department has prepared an EA for smaller, intrastate pipeline projects and an EIS for larger, interstate pipeline projects. As with cross-border natural gas facilities, environmental review of the project includes indirect environmental impacts caused by the entire pipeline. In its most recent determinations, the department has also considered other indirect environmental impacts, such as the effects on climate change of the method of production of the oil transported through the pipeline and of the ultimate use of the oil. In issuing permits, the department has relied on the authority to set terms and conditions granted by executive order to impose environmental requirements on the project.

§ 29:201 Oil and Gas Pipeline Safety

The federal Pipeline Safety Act grants the Pipeline and Hazardous Materials Safety Administration (PHMSA) in the U.S. Department of Transportation the authority to establish minimum safety standards for pipeline facilities that are “practicable” and “designed to meet the need for . . . pipeline safety . . . and protecting the environment.”¹ PHMSA's broad regulatory authority over pipeline systems does not, however, extend to siting; the statute prohibits the agency from specifying the location or route of a pipeline.²

If certified by PHMSA, a state may create its own program to regulate intrastate pipelines and may adopt more stringent standards if they are compatible with the federal minimum standards.³ PHMSA has exclusive jurisdiction over interstate pipelines.

There are separate safety standards for pipelines that transport natural gas and pipelines that transport hazardous liquids such as oil and petroleum products.⁴ While the details of the two programs differ, the general approach to regulation is the same. The safety standards regulate the life cycle of a pipeline system once it has been sited: from the design, installation, and construction; to day-to-day operation; to maintenance and repair of the system; to planning for an emergency; and, finally, to abandonment of the pipeline when it is no longer needed.

When a transmission pipeline system or a gas distribution pipeline system is being newly constructed or part of the system is being replaced, prescriptive requirements and performance standards regulate the design specifications, installation and construction methods, and initial inspections and tests. After the infrastructure is in place, PHMSA cannot require a company to comply with updates to these

⁸Prior to 2020, the State Department identified issuance of a Presidential Permit as an action that would normally require an EA. 22 C.F.R. § 161.7(c)(1) (2021).

safety standards.⁵ The risks associated with an existing pipeline system are managed through operation, maintenance, and emergency procedures. Each pipeline company must create a written plan for inspection and maintenance of its system to ensure that it is safely operated and does not exceed the maximum allowable operating pressure.⁶

Transmission pipeline companies must develop special integrity management programs to prevent accidents in protected areas, known as “high-consequence areas.”⁷ For gas transmission pipelines, a “high-consequence area” is a densely populated area. For hazardous liquid pipelines such as oil and petroleum product pipelines, the term is defined more broadly to include populated areas, commercially navigable waterways, and “unusually sensitive areas.”⁸ As part of the management program, a company must inspect its pipelines regularly, assess the risks of the system, and remediate conditions that reduce a pipeline’s integrity within a set schedule.⁹

To prepare for an accident and mitigate its impacts, each pipeline company must develop “an emergency response plan describing the operator’s procedures for responding to and containing releases.”¹⁰ These include procedures for establishing liaisons and communicating with state and local officials. Under the Oil Pollution Act, companies that own oil pipelines must also create a facility response plan containing procedures and a list of resources to respond to a worst-case discharge of oil into navigable waters or adjoining shorelines.¹¹ These plans must be kept on file by PHMSA and redacted versions provided to the public on request.¹²

Only some gathering pipeline systems are subject to safety regulation.¹³ Safety standards apply to crude oil gathering pipeline systems in urban areas and certain systems in rural areas that are located in or within one-quarter mile of an unusually sensitive area. Most safety standards also apply to natural gas gathering pipeline systems in more densely populated areas.

§ 29:202 Rail Transportation of Crude Oil

The safety of rail transportation is generally governed by two statutes: the Hazardous Materials Transportation Act (HTMA)¹ and the Federal Railroad Safety Act (FRSA).² Under the HTMA, PHMSA is authorized to “prescribe regulations for the safe transportation, including security, of hazardous material in intrastate, inter-

⁵49 U.S.C. § 60104(b).

⁶49 U.S.C. § 60108(a).

⁷49 U.S.C. § 60109. A gas distribution pipeline company must also create an integrity management plan for its entire system that analyzes the risks to its system and effectively manages leaks. 49 U.S.C. § 60109.

⁸PHMSA has defined an “unusually sensitive area” in its regulations to include sources of drinking water and certain habitats of imperiled, threatened, or endangered species. 49 C.F.R. § 195.6 (2021).

⁹Companies that own gas transmission pipelines in less densely settled areas, known as “moderate-consequence areas,” must conduct inspections of these pipelines at least once every 10 years. 49 C.F.R. § 192.710 (2021).

state, and foreign commerce”;³ under the FRSA, the Federal Railroad Administration is authorized to “prescribe, as necessary, appropriate rules, regulations, orders, and standards for all areas of railroad safety.”⁴

In 2015, PHMSA and the Federal Railroad Administration promulgated hazardous materials regulations for trains carrying flammable liquids, such as crude oil.⁵ Pursuant to these regulations, “high-hazard flammable trains” must meet operational requirements such as routing limitations and speed restrictions. A “high-hazard flammable train” is defined as “a single train transporting 20 or more loaded tank cars of a Class 3 flammable liquid in a continuous block or a single train carrying 35 or more loaded tank cars of a Class 3 flammable liquid throughout the train consist.”⁶ Six months later, Congress supplemented these standards by requiring all tank cars carrying Class 3 flammable liquids to use safer tank car designs, with a timeline for phasing out trains with an older design.⁷ Railroads must also provide “real-time” information on trains carrying hazardous materials to first responders and emergency response officials.⁸

XI. ENERGY POLICY

A. ENERGY POLICY ACT OF 2005

§ 29:203 Background and Purpose

The Energy Policy Act of 2005 (EPAcT 2005)¹ was an omnibus law that impacted many forms of energy production, technologies, and incentives in the United States, including: (1) energy efficiency; (2) renewable energy; (3) oil and gas; (4) coal; (5) Tribal energy; (6) nuclear energy and related security; (7) vehicles and motor fuels, including ethanol; (8) hydrogen; (9) electricity; (10) energy tax provisions and incentives; (11) hydropower and geothermal energy; and (12) technology to address climate change. The purpose of the EPAcT 2005 was to “promote[] dependable, affordable, and environmentally sound production and distribution of energy for America’s future.”² The scope of the EPAcT 2005 was broad but this section will focus on the oil and gas provisions found in Title III.³

The oil and gas provisions of the EPAcT 2005, as stated in the Congressional Testimony, served to “encourage[] more domestic production of oil with incentives such as a streamlined permit process, promote a greater refining capacity to bring more oil to market, and increase the gasoline supply by stopping the proliferation of expensive regional boutique fuels.”⁴ Congress focused on domestic oil and gas production because gas prices were on the rise—partly as a result of “a worldwide

explosion in demand”⁵—and the U.S. Department of Energy (DOE) predicted that U.S. oil and natural gas demand would increase 46% by 2025.⁶

One of the overarching goals of the EPAct 2005 was to make the Strategic Petroleum Reserve (SPR) and the Northeast Home Heating Oil Reserve (NEHHOR) permanent. The Energy Policy and Conservation Act of 1975 (EPCA) was passed in response to the 1973–74 Arab oil embargo and established the SPR, an emergency supply of crude oil, to prevent another such situation from disrupting energy supply and markets in the United States.⁷ The SPR, currently the world’s largest emergency supply of crude oil, is held in four major storage facilities within underground salt caverns in the Gulf Coast region of the United States (Louisiana and Texas) that have a combined authorized storage capacity of 714 million barrels.⁸ In 2000, President Clinton issued a directive that required the Energy Secretary to create a two million barrel home heating oil component of the SPR in the Northeast; as a result, the NEHHOR was created.⁹ The NEHHOR was intended to provide “a buffer large enough to allow commercial companies to compensate for interruptions in supply during severe winter weather,”¹⁰ but not so large that companies are disincentivized to keep sufficient heating oil stock to respond to routine weather events or recognize that a price increase is an indicator of a rise in demand.¹¹

There was a period of several months in 2000 when the authority for the SPR had expired, motivating Congress to make the SPR permanent and establish the NEHHOR by statute. The EPAct 2005 also expanded the SPR authorized volume to one billion barrels and permitted that volume to increase when the oil supply is tight and/or prices are elevated. Additionally, the EPAct 2005 established provisions to acquire oil for the SPR in a way that would minimize impacts to oil prices and markets.¹²

§ 29:204 Natural Gas Act Revisions

Title III Subtitle B of the EPAct 2005 amended the Natural Gas Act of 1938 (NGA)¹ in part to address the introduction and rapid expansion of hydraulic fracturing (fracking), the process wherein high-pressure fluids are injected into coal beds to enhance recovery of oil and natural gas from underground formations. With the rapid expansion of fracking came an increase in the country’s proven natural gas reserves and the potential to export gas to other countries in significant volumes, mainly as liquified natural gas (LNG). For the first time, the U.S. had the opportunity to become a net LNG exporter whereas, in years prior, the U.S. faced rising costs of natural gas imports. However, LNG production faced disparate local and state regulation as well as a lack of necessary infrastructure. The EPAct 2005

¹Natural Gas Act, 15 U.S.C. §§ 717 to 717w (2000).

aimed to remedy these weaknesses in domestic natural gas production, transportation, and exportation through a centralized and streamlined process to approve natural gas projects. A more detailed discussion of the EAct 2005's specific fracking provisions is set forth below in Section § 29:210.

§ 29:205 FERC's Role

Through the streamlined process, FERC was given broad regulatory tasks and responsibilities, including “exclusive authority” “to approve or deny an application for the siting, construction, expansion, or operation of an LNG terminal”¹ for the export and import of natural gas, to coordinate with the Secretary of Defense in authorizing an LNG facility that will impact a military installation,² and to serve as the lead agency in the federal authorization process for interstate natural gas facilities, including LNG terminals.³ This “lead agency” responsibility entails FERC working with other state and federal agencies to expeditiously complete proceedings and schedules in the natural gas permitting process. Section 313 of the EAct 2005 defines a “federal authorization” as “any authorization required under Federal law with respect to an application for authorization. . . or a certificate of public convenience and necessity,” including “any permits, special use authorizations, certifications, opinions, or other approvals as may be required under Federal law. . . .”⁴ FERC's expanded authority over LNG facilities was a result of industry concerns that the existing process was taking too long, too chaotic, and too uncertain in a market where demand was ever increasing. While FERC's authority was expanded to push other federal agencies to stick to a FERC-set schedule in issuing permits for new interstate gas pipeline and LNG terminal development, the EAct 2005 also included limitations on FERC's authority; these limitations were intended to streamline and minimize rate regulation over LNG terminal services. FERC was not permitted to deny approval of a natural gas project before January 1, 2015, solely because the applicant would use the gas, either in whole or in part, themselves.⁵ Further, FERC could not condition approval on: (i) a requirement to offer service to others; (ii) a directive to file rates or tariffs with FERC; or (iii) any other regulation of rates and service.⁶ These changes to the NGA codified FERC's policies announced in *Hackberry LNG Terminal LLC*.⁷ These rate-related provisions will cease to have effect on January 1, 2030.⁸

§ 29:206 Penalties and Market Manipulation

The EAct 2005 significantly increased penalties for violations of the NGA, the National Gas Policy Act of 1978 (NGPA),¹ and FERC regulations and orders thereunder. With respect to criminal penalties, the maximum prison term increased from two to five years, and the maximum fine increased from \$500 per violation to \$50,000 for each day the violation took place. Additionally, violations of emergency

[Section 29:206]

¹15 U.S.C. § 3414(c).

orders are subject to fines of up to \$1 million per day.²

The EAct 2005 also increased civil penalties under the NGA, the NGPA,³ and the Federal Power Act⁴ to a maximum of \$1 million per day (inflation adjusted).⁵ This was in response to increased concerns about energy market manipulation after the fallout from the Enron Corporation accounting scandal. Some examples of behavior that have been subject to civil penalties under these statutes include pipeline tariff violations and violations of FERC's capacity release program rules.

Section 315 of the EAct 2005, which amends the NGA to prohibit market manipulation, is largely patterned off of section 10(b) of the Securities Exchange Act of 1934.⁶ This section made it unlawful to use or employ, in connection with the purchase or sale of natural gas or transportation services subject to the jurisdiction of FERC, "any manipulative or deceptive device or contrivance" in contravention of FERC's prescribed rules and regulations.⁷ Some examples of behavior that violates this provision of EAct 2005 are creating artificial conditions that would cause energy market prices to be raised to premiums, uneconomic trading in physical gas markets to benefit related financial positions, and "gaming" energy systems to capture revenues without providing any corresponding benefit to the market.⁸

§ 29:207 Other Natural Gas Provisions

In addition to expanding FERC's responsibilities and role in developing natural gas projects, the EAct 2005 implemented natural gas market transparency rules,¹ reporting requirements,² and the process and jurisdiction of judicial review, designated as the U.S. Court of Appeals for the circuit in which the project would be constructed.³

§ 29:208 Gasoline Content Changes and Renewable Fuels

The EAct 2005 took the first steps towards formulating law that requires renewable fuels to be part of the everyday domestic energy supply. The Clean Air Act (CAA)¹ previously had required that reformulated gasoline contain at least 2% oxygen, which effectively forced refiners and importers to use methyl tertiary butyl ether (MTBE), ethanol, or other oxygenates in their reformulated gasoline to meet this requirement. The goal of the 2% oxygen requirement was to combat poor air quality and reduce emissions of ozone and carbon monoxide. However, MTBE became controversial when it was shown to lead to contamination of water across the country, with petroleum released from leaking underground storage tanks being the leading cause of MTBE contamination of drinking and groundwater.

²EAct 2005 § 316.

³EAct 2005 § 313.

[Section 29:208]

¹42 U.S.C. § 7545.

The EPO 2005 amended § 211(k) of the CAA to eliminate the 2% oxygen requirement and require that each refinery or importer of gasoline maintain the average annual reductions in emissions of toxic air pollutants that were achieved in their production or distribution from calendar years 2001 and 2002.² Refiners and importers, therefore, had to determine how to keep their toxic air emissions low. The purpose of this provision was to prevent backsliding in reductions of emissions of toxic air pollutants and alleviate some of the initial burden on gasoline refiners and importers by establishing a credit trading program for such emissions.

Additionally, in lieu of the 2% oxygen requirement, the EPO 2005 established the initial renewable fuels standard program, known as the “RFS1” program, under § 211 of the CAA. As discussed further below in Section X, the program required that gasoline produced or imported to the United States contain a certain of volume of renewable fuel—a category that includes not only conventional ethanol, but also natural gas (methane) from landfills and sewage treatment plants, as well as biodiesel.³ The EPO 2005 also incentivized the use and development of cellulosic ethanol to “accelerate deployment and commercialization of biofuels” by establishing a formulation that 1 gallon of cellulosic ethanol counts as 2.5 gallons of renewable fuel.⁴

§ 29:209 Hydraulic Fracturing

The EPO 2005, in seeking to address the rapid expansion of fracking discussed above in Section § 29:205, removed oil and gas fracking from EPA’s jurisdiction. Prior to 1997, EPA had not regulated fracking for oil and gas development, because it was not considered an activity subject to regulation under the Safe Drinking Water Act’s (SDWA)¹ underground injection control (UIC) program.² However, in *Legal Environmental Assistance Foundation, Inc. v. United States Environmental Protection Agency*,³ the Eleventh Circuit Court of Appeals determined that (i) the injection of fluids for the purpose of fracking constituted underground injection, (ii) all underground injection must be regulated, and, therefore, (iii) it was EPA’s responsibility to regulate under the SDWA’s UIC program. The EPO 2005 clarified the SDWA to specify that the definition of “underground injection” *excludes* the injection of fluids or propping agents (other than diesel fuel) that are used in hydraulic fracturing related to oil, gas, or geothermal production activities.⁴ The effect of this was to remove EPA’s prior authority to regulate the underground injection of fluids, other than diesel fuel, used in hydraulic fracturing in order to protect ground and drinking water.

§ 29:210 Other Provisions

The EPO 2005 is an expansive omnibus piece of legislation that addressed many other areas of energy utilization and growth outside the scope of this chapter,

including the following: nuclear energy development and security,¹ including amendments to the Price-Anderson Act;² electricity;³ energy policy tax incentives;⁴ and climate change matters focusing on technology development and deployment.⁵

B. ENERGY INDEPENDENCE AND SECURITY ACT OF 2007

§ 29:211 Background and Purpose

The Energy Independence and Security Act (EISA) of 2007¹ came quickly on the heels of passage of the EPAct 2005. EISA is another omnibus energy policy law promulgated to increase energy efficiency and the availability of renewable energy.² Where the EPAct 2005 was sweeping legislation that included a heavy focus on the oil and gas industry, EISA took a forward-looking approach to address renewable fuels and innovations.

The key provisions of the EISA achieve the following: (i) changes to the Corporate Average Fuel Economy (CAFE) Standards;³ discussed in Section § 29:213 below; (ii) creation of appliance and lighting efficiency standards,⁴ discussed in Section § 29:214; and (iii) expansion of the Renewable Fuel Standard program that was created under the EPAct 2005,⁵ discussed in Section § 29:216 below.

Two proposed provisions were never enacted into law due to their controversy in the legislature.⁶ First was the Renewable Energy Portfolio Standard (RPS), which would have required electric utilities selling electricity in retail markets to provide a minimum amount of their electricity from renewable fuel sources or meet that requirement by purchasing an equal amount of tradeable credits. The minimum requirement was set to be a percentage share of the electric supplier's total retail electricity sales.

The second provision that was never enacted focused on energy tax subsidies. As proposed, the tax provisions were set to repeal about \$22 billion of federal oil and gas subsidies in order to offset the cost of renewable energy and energy efficiency tax incentives included in the EISA. The final version of the EISA that was passed included tax revenue offsets large enough to cover the estimated cost of the CAFE standards, discussed in Section § 29:213 below, but the proposed repeal of the \$22 billion in federal oil and gas subsidies was not in the final legislation.

§ 29:212 Improved Vehicle Fuel Economy; Title I

The EISA fundamentally restructured the country's automotive fuel economy program and made significant changes to the CAFE Standards. The CAFE Standards set fuel economy averages that must be met for each model year of a vehicle. The purpose of the CAFE Standards, as set up by Congress at the time of enactment in 1975, was to reduce energy consumption by increasing the fuel economy of both cars and light trucks. In order to do this, Congress created a program to establish industry wide averages that each manufacturer must meet for each vehicle in its fleet, beginning in 1978. The CAFE standards were originally crafted under the EPCA,¹ with the National Highway Traffic and Safety Administration (NHTSA) setting and enforcing the standards and EPA calculating the average fuel economy levels.

The EISA changes to the CAFE Standards included a few parts. First, the EISA set a single CAFE standard of 35 miles per gallon by 2020, with interim standards beginning in 2011.² Additionally, manufacturers were required to be within 92% of the standard for each given model year.³ However, the EISA established a credit system to allow manufacturers to purchase credits in order to reach compliance. These credits did not have a set expiration date, but the use of credits for compliance was required to be phased out by model year 2020 automobiles.⁴ Manufacturers can buy and sell these credits amongst themselves, or alternatively, an individual manufacturer can exceed the CAFE Standard for one vehicle class and apply the exceedance (with limitations) to another of that manufacturer's vehicle class that may be short of compliance.⁵

§ 29:213 Other Energy Efficiency Measures; Titles III and IV

The EISA set new standards to reduce energy use and increase energy efficiency for a variety of appliances and lighting, including dishwashers, refrigerators, freezers, residential boilers, heating and air conditioning, incandescent lamps, and lamp fixtures.¹ The EISA also provides for energy savings in industry buildings.²

§ 29:214 Carbon Capture & Sequestration; Title VII

The EISA amended the EPCA 2005 to expand research and development into carbon capture and sequestration (CCS).¹ The section dedicated to CCS increased DOE's funding for research and development. DOE was also required to coordinate with the National Academy of Sciences to jointly update and review DOE's research and development programs around CCS.² There were also various provisions directing the Department of the Interior to focus their research into the ability to sequester carbon geologically and ways to utilize ecosystems to reduce emissions of

various pollutants, including carbon dioxide, methane and nitrous oxides.³ Thus far, CCS has not been adopted widely due to comparatively high costs (making generation from facilities using CCS uneconomic) and a lack of federal and state government incentives comparable to renewable resources like wind and solar.

C. RENEWABLE FUEL STANDARD, TITLE II, SUBTITLE A

§ 29:215 Historical Setting

In 2005, Congress established the Renewable Fuel Program under § 1501 of the EPCA 2005 to increase the use of renewable fuels in gasoline consumed in the United States. Congress charged EPA with implementing and enforcing the program.¹ Accordingly, EPA promulgated regulations implementing the first rendition of the Renewable Fuel Standard (commonly referred to as the “RFS1”) in April 2007 to ensure that the pool of gasoline sold in the contiguous 48 states contained specific volumes of renewable fuel for each calendar year. This started with 4 billion gallons of renewable fuel in 2006, ramping up to 7.5 billion gallons by 2012.²

The RFS1 established compliance standards for refiners and importers of gasoline, a credit system based on renewable identification numbers (RINs) that could be verified and traded for compliance, an exemption from the RFS for small refineries, and general waiver provisions. EPA anticipated the RFS1 would reduce dependence on foreign sources of oil, increase domestic energy security, and reduce carbon dioxide emissions that contribute to climate change and air toxics emissions such as benzene.³

On December 19, 2007, two years after Congress enacted the EPCA 2005 and less than one year after EPA promulgated the RFS1 regulations, the EISA superseded the RFS1 and greatly expanded the RFS program.⁴ EPA issued its final rule to implement and administer the expanded program (referred to as the “RFS2”) on February 3, 2010. The RFS2 sets a target of 9 billion gallons of biofuels blended into transportation fuel in 2008, increasing to 36 billion gallons in 2022. After 2022, EPA must conduct annual rulemakings to determine the volumes of biofuels to be used in transportation fuel.

In addition to the expanded volumes and extended date, the RFS2 modifies the RFS1 in other significant ways. Unlike the RFS1, which limited renewable fuel blending requirements to gasoline, the RFS2 expands the scope of the program to apply to additional types of transportation fuel, most notably diesel.⁵ The RFS2 also redefines renewable fuel to include subcategories, assigns a separate volume requirement to each category of fuel, and requires that renewable fuels qualifying under each category must achieve certain minimum thresholds of lifecycle greenhouse gas (GHG) emission reductions.⁶ Further, the RFS2 provides EPA with an expanded

⁵42 U.S.C. § 7545(o)(1)(L).

⁶42 U.S.C. § 7545(o)(2)(B).

waiver authority to lower RFS volumes.⁷

D. THE CURRENT FRAMEWORK OF THE RENEWABLE FUEL STANDARD

§ 29:216 Renewable Fuel Categories and RINs

The RFS2 is the current regulatory framework under which obligated parties must comply.¹ The EISA provides a schedule of increasing volume mandates for four fuel categories—total renewable fuel, advanced biofuel, cellulosic biofuel, and biomass-based diesel (BBD)—through 2022.² The four fuels categories are nested; total renewable fuel encompasses advanced biofuel (volume mandate specified in the statute) and conventional biofuel (no volume mandate specified in the statute); in turn, advanced biofuel encompasses cellulosic biofuel and BBD (both of which are specified in the statute), as well as “other advanced biofuels” (not specified in the statute). The volume of conventional biofuel is measured by taking the difference between the total renewable fuel volume and the advanced biofuel volume. The “other advanced biofuel” category is similarly measured by subtracting the cellulosic biofuel and BBD volumes from the total advanced biofuel volume.

To regulate compliance with the RFS, EPA uses a tradable credit system in which each gallon of renewable fuel produced for RFS compliance generates a certain number of credits, or RINs.³ Each year, obligated parties—generally, refiners and importers of transportation fuel—incur a renewable volume obligation (RVO) for each fuel category, which is the obligated party’s total gasoline and diesel sales multiplied by the annual renewable fuel percentage standard announced by EPA for that fuel category.⁴ An obligated party’s RVOs indicate the number of RINs the party must submit, or retire, in order to be in compliance with the RFS for a certain year.

Because the fuel categories are nested, cellulosic biofuel and BBD, or their RIN-equivalents, can be used to satisfy the advanced biofuel volume mandate and all three subcategories of fuels and RINs can be used to satisfy the total renewable fuel mandate. However, some biofuels generate more RINs per volume than others because of the difference in the fuel’s energy content. For example, 1,000 physical gallons of ethanol (which qualifies as conventional biofuel) would equal 1,000 RIN gallons of biofuel, whereas 1,000 physical gallons of biodiesel would equal 1,500 RIN gallons of advanced biofuels.⁵

§ 29:217 Compliance with the RFS

EPA has identified refiners and importers of transportation fuels as the obligated parties under the RFS.¹ Thus refiners and importers must comply with the annual percentage standards adopted under the RFS. As discussed briefly in Section 29:216 above, obligated parties must retire RINs to EPA to meet their compliance

⁷42 U.S.C. § 7545(o)(7).

[Section 29:216]

¹The RFS2 is located at 40 C.F.R. pt. 80 Subpart M.

²See 42 U.S.C. § 7545(o)(1) for the statutory definitions of the fuel categories. Each fuel category must achieve certain GHG reductions relative to gasoline and diesel fuel.

³See 40 C.F.R. § 80.1426 (2021) for detail on how RINs are generated and assigned to batches of renewable fuel; see 40 C.F.R. § 80.1426 (2021) for detail on how RINs are used for compliance.

⁴EPA issues the percentage standards in its annual renewable volume rulemakings.

⁵See 40 C.F.R. § 80.1415 (2021) for more on equivalence values (EVs).

[Section 29:217]

¹40 C.F.R. § 80.1406 (2021).

obligation.² RINs have a two-year lifespan, meaning that they are only valid for use to demonstrate compliance in the year they are generated and the following year.³

If an obligated party cannot retire sufficient RINs to meet its RVOs for a given compliance year, the party can carry a deficit into the next year.⁴ In the year following the deficit, the obligated party must meet compliance for that year's renewable fuel volume requirement and purchase or generate enough credits to satisfy the deficit from the previous year.⁵ When an obligated party fails to either meet its RIN retirement obligations or carry a deficit, the party is in violation of the Clean Air Act and EPA has authority to bring an enforcement action.

§ 29:218 EPA's authority to waive or reset volume obligations

Although the EPCA 2005 and EISA set out mandatory minimum renewable volumes, Congress provided EPA with statutory authority to lower the annual volumes under certain circumstances. First, EPA has a general waiver authority, under which it can waive the scheduled total renewable fuel volume if implementation of the volume requirement would severely harm the economy or the environment or there is an inadequate domestic supply.¹ Second, EPA can waive the cellulosic biofuel mandate if the projected cellulosic biofuel production in a given year is less than the statutory volume.² Finally, EPA can waive the BBD mandate if a significant renewable feedstock disruption or other market circumstance would significantly increase the price of BBD.³

Under its cellulosic biofuel and BBD waiver authorities, EPA can reduce the total renewable fuel and advanced biofuel requirements by the same amount as it reduced either the cellulosic biofuel volume or BBD volume due to the way those fuel categories are nested. For example, in its final renewable volume rule for 2020, EPA announced that it was using its cellulosic biofuel waiver authority to reduce not only the cellulosic biofuel, but also the advanced biofuel and total renewable fuel volume requirements.⁴ EPA must announce each year's renewable fuel volumes by November 30 of the previous year, with the exception of the BBD volume, which EPA must announce at least 14 months before the year in which it will apply.⁵

After 2015, if EPA waives the statutory volumes for any of the four fuel categories (total renewable, advanced biofuel, cellulosic biofuel, or BBD) by at least 20% for two consecutive years or by at least 50% for a single year, then EPA must modify, or reset, the statutory volumes for all subsequent years for that fuel type.⁶ The reset provision has been triggered by EPA's use of its cellulosic waiver authority every year from 2016 to 2020. However, EPA has yet to reset statutory volumes for any

²See 40 C.F.R. § 80.1427 (2021).

³40 C.F.R. § 80.1427(a)(6)(i) (2021). The EPA Moderated Transaction System (EMTS) is used to register RIN transactions.

⁴40 C.F.R. § 80.1427(b) (2021).

⁵40 C.F.R. § 80.1427(b) (2021).

[Section 29:218]

¹42 U.S.C. § 7545(o)(7)(A).

²42 U.S.C. § 7545(o)(7)(D).

³42 U.S.C. § 7545(o)(7)(E). Note that the RFS program only provides statutory BBD volumes up to 2012, not 2022. This means that EPA no longer needs to use its BBD waiver authority, because there are no more statutory volumes to waive. Thus, EPA determines BBD volumes each year independent of its various waiver authorities.

fuel type.⁷

§ 29:219 Small refinery relief from the RFS

The EPCRA 2005 exempted small refineries from compliance with the RFS from 2007 through 2010.¹ EPA extended the initial blanket exemption for certain small refineries for an additional two years, through 2012, based on a study commissioned by Congress and conducted by the Department of Energy (DOE).² In its study, DOE determined that certain small refineries would suffer a “disproportionate economic hardship” if required to participate in the program. Small refineries can also petition EPA “at any time” for an exemption from the RFS mandate due to disproportionate economic hardship.³ When deciding whether to grant an exemption, EPA must consult with the Secretary of Energy, which takes the form of a recommendation from DOE to EPA.⁴ By statute, the EPA Administrator has 90 days to act on a petition.⁵

§ 29:220 Current Trends

In recent years, a variety of factors contributed to changes in the landscape of oil and gas in the United States. For LNG export terminals, growth has slowed due to changes in economics and a downward trend in global demand. This trend continued through 2020 and the beginning of 2021, particularly due to low global gas prices, stiff competition from Australia for Asia-based LNG markets, and the COVID-19 pandemic.¹ Many of the recent planned and FERC-approved LNG terminals in the past few years are expansions of existing terminals, rather than new terminals.²

With respect to the more traditional oil and gas companies, there has been a push to diversify to establish a more sustainable footprint, even among oil majors. A fac-

⁷EPA submitted a draft proposal to reset the statutory volumes for the 2020–2022 compliance years to the Office of Management and Budget in May 2019. In December of the same year, EPA withdrew its draft proposal. OFF. OF INFO. & REGUL. AFFS., *OIRA Conclusion of EO 12866 Regulatory Review*, <https://www.reginfo.gov/public/do/eoDetails?rriid=129140> (last visited June 30, 2021). EPA has not indicated how it will address the reset requirement moving forward.

[Section 29:219]

¹42 U.S.C. § 7545(o)(9)(A)(i). A small refinery is defined as “a refinery for which the average aggregate daily crude oil throughput for a calendar year (as determined by dividing the aggregate throughput for the calendar year by the number of days in the calendar year) does not exceed 75,000 barrels.” 42 U.S.C. § 7545(o)(1)(K).

ADMIN., (June 23, 2020), <https://www.eia.gov/todayinenergy/detail.php?id=44196> (last visited June 30, 2021).

²FED. ENERGY REGUL. COMM’N, LNG MAPS EXPORTS (Nov. 2, 2020), <https://www.ferc.gov/media/lng-maps-exports>; see also *U.S. LNG exports will return to pre-Covid levels by November 2020 as series of monthly increases begins*, LNG JOURNAL, (Sept. 10, 2020) available at <https://lngjournal.com/index.php/latest-news-mainmenu-47/item/101055-us-lng-exports-will-return-to-pre-covid-levels-by-november-2020-as-series-of-monthly-increases-begins>.

tor of this drive has been pressure from abroad—namely, among European-based oil and gas companies that are working to incorporate more green energies into their business model.³ Another factor is the emphasis on clean energy and renewables as a driving point of the Biden administration.⁴ The Biden administration has emphasized addressing methane and other chemical leaks from abandoned oil and gas wells, working with American growers instead of just oil lobbyists, and moving towards a carbon-pollution free power sector by 2035.⁵

The RFS, which in recent years has been the subject of intense political debate and scrutiny, stands to undergo significant change, affecting obligated parties (e.g., refineries and fuel importers) and others (e.g., renewable fuel producers and downstream blenders) alike. Stakeholders and politicians have placed a spotlight on small refinery exemptions and, in January 2020, a decision from the United States Court of Appeals for the Tenth Circuit further escalated the debate when the court ordered EPA to revoke extensions of the small refinery exemption it granted to three small refineries for the 2016 and 2017 compliance years because the small refineries had not received extensions every year since the beginning of the program.⁶ On June 25, 2021, the United States Supreme Court reversed the lower court's decision, holding that the Clean Air Act does not require a refinery to receive an exemption for all prior years to remain eligible for future exemptions.⁷

Another hot button issue under the RFS is EPA's promulgation of annual renewable fuel volume targets. Stakeholders have challenged EPA's annual rulemakings as setting the renewable volumes both too high and too low. Currently, the 2020 renewable volumes rule is under judicial review in the United States Court of Appeals for the District of Columbia Circuit.⁸ EPA has not yet issued the 2021 and 2022 renewable fuel volumes rules, which EPA was required by statute to promulgate by November 30, 2020 and November 30, 2021, respectively. It is anticipated that EPA will promulgate the 2021 and 2022 renewable fuel volumes rules and adjust the 2020 rule in a single rulemaking that has yet to be released. However, how the Biden administration will approach these annual rulemakings is unknown as of the time of publication.

Growth in the hydrogen sector may be poised to take off in the coming years. The EPCA 2005 included language directing the Secretary of Energy to coordinate research and development into hydrogen energy with the goal of further hydrogen production and hydrogen pipelines.⁹ This has not yet taken off, but research into hydrogen fuel has been ongoing and will likely grow given the various pressures on companies, discussed above, to invest in more clean energy. With a potential growth in hydrogen fuel production, it is likely that issues will arise concerning the scope of FERC's regulatory authority. The extent of FERC's regulatory authority, if any, over pure-hydrogen interstate pipelines and gas quality standards in already FERC-regulated pipelines where producers may try blending hydrogen into the natural gas stream for transport remains to be seen.

I. INTRODUCTION TO NUCLEAR ENERGY AND THE ENVIRONMENT

§ 30:1 In general

Nuclear energy is once again at the forefront of the energy debate. Renewed interest in nuclear energy is driven by many factors, including disruptions in energy supplies due to geopolitical tensions, concerns with the reliability of the electric grid, and the desire to reduce greenhouse gas emissions. Many countries around the globe, including the United States, have prioritized a transition to clean energy and are looking to nuclear as part of the answer.

The relationship between nuclear energy and the environment is complex. Although nuclear energy offers many climate benefits, there is also negative public perception about the risk of exposure to radioactivity and the long-term disposal of radioactive wastes. Yet no other baseload source has the potential to contribute as much to meeting U.S. energy demand without a rise in carbon dioxide emissions. In the United States, nuclear energy accounts for over 60 percent of the emissions-free energy.¹ Every year nuclear-generated electricity saves our atmosphere from more than 470 million metric tons of carbon dioxide emissions—equal to the emissions of 100 million passenger vehicles.² Nuclear is also the most reliable source of power, with the nation's reactors consistently operating at full capacity more than 90 percent of the time and in many adverse weather conditions.

To understand nuclear energy's key role in decarbonization and how the U.S. regulates nuclear activity, this chapter describes the basics of nuclear energy, the governing laws and regulations for the licensing of nuclear reactors and environmental protection, and other environmental considerations essential to understanding the benefits nuclear energy can bring to the clean energy transition.

§ 30:2 Nuclear energy today

Nuclear power is simply an advanced way of heating water to produce steam that then spins a turbine to generate electricity. Nuclear energy can be produced in two ways: (1) fission—when the nuclei of the atom split into several parts; or (2) fusion—when nuclei fuse together. The nuclear energy harnessed around the world today to produce electricity is produced through nuclear fission, while technology to generate electricity from fusion remains in the research and development phase.

Figure 30-2 Nuclear Reaction¹

Today, 93 nuclear reactors in 28 U.S. states generate nearly 20 percent of the nation's electricity.² Nuclear plants are nearly always on, even during extreme weather events, supporting the grid for 24 hours, 7 days a week, except for occasional outages for refueling and maintenance.³ This reliability is because nuclear has the highest capacity factor of any energy sources, which means that nuclear power plants are producing maximum power more than 92% of the time during the year. That capacity factor is nearly twice that of coal (49.3%) or natural gas (54.4%) and almost three times more than wind (34.6%) and solar (24.6%).⁴ Nuclear power plants are designed to operate for long stretches before refueling (typically every 1.5 or 2 years). Renewable plants are considered intermittent or variable sources and are mostly limited by a lack of “fuel” (i.e. wind, sun, or water), which results in the

need for a backup power source such as large-scale storage (not currently available at grid-scale)—or being paired with a reliable baseload power like gas or nuclear energy.⁵

Over the last few years, nuclear energy has garnered renewed attention. Climate change concerns and the global need to keep the lights on have sparked interest in supporting the existing fleet of nuclear power plants, as well as promoting new reactors, including small modular and advanced reactor designs.

In the United States, the federal government—with strong bipartisan support—has enacted significant legislation aimed at reducing greenhouse gas emissions (GHG), including in the Infrastructure Investment and Jobs Act (IIJA), passed in November 2021, and the Inflation Reduction Act (IRA), passed in August 2022. Under the IIJA, Congress invested more than \$8 billion in supporting existing nuclear plants and bankrolling advanced nuclear demonstration projects. The IRA provides financial incentives and tax credits for clean energy produced by nuclear and funding for new fuel types needed for advanced reactors. The CHIPS and Science Act, also passed in August 2022, takes the incentives for advanced nuclear in the IRA a step further by promoting university nuclear science and engineering programs, creating diverse streams of funding for advanced nuclear activities. Many states have also been hard at work reducing their GHG emissions through passing bills that enable electric vehicle charging infrastructure and providing sites for advanced nuclear demonstration projects (discussed later in this Chapter).⁶

While these initiatives are critical, the complex and interdependent changes required to meet net-zero requires coordinated transition plans. All sources of power have environmental impacts. Nuclear power comes with its own set of potential concerns, particularly how to handle and dispose of radioactive waste that can remain dangerous for thousands of years. Yet radioactive waste and spent nuclear fuel have been safely managed and stored for decades now, and these risks are reduced with new technologies, including advanced reactor designs being developed today.

◆ **NUCLEAR AS A RESPONSE TO THE CLIMATE CRISIS?** The primary driver for nuclear’s rebounding support, according to proponents, is simple: It is not possible for the world to meet its emissions-reduction targets without a substantial global expansion of nuclear energy.

The U.N. Intergovernmental Panel on Climate Change (IPCC) has identified four model pathways for avoiding more than 1.5-degree warming. Three of those pathways involve increasing nuclear’s share of primary energy by between 150 and 500 percent; none allow for nuclear’s share to decline. Supporting the IPCC Report, the International Energy Agency (IEA) mapped out a path to net-zero global emissions by 2050, and found that hitting that target would likely require doubling worldwide nuclear-power production.

Nuclear’s potential for playing a key role in the clean and secure energy transition was also examined in an official June 2022 report by the IEA titled “Nuclear Power and Secure Energy Transitions: From Today’s Challenges to Tomorrow’s Clean Energy Systems.” The IEA report examined how nuclear can address two major crises the world is facing today—energy and climate—explaining that “[a]mid today’s global energy security crisis, reducing reliance on imported fossil fuels has become the top energy security priority. No less important is the climate crisis: reaching net zero emissions of greenhouse gases by mid-century requires a rapid

⁵See DOE Office of Energy Efficiency and Renewable Energy, *Changing the Game by Linking Nuclear and Renewable Energy Systems* (Dec. 8, 2022), available at <https://www.energy.gov/eere/articles/changing-game-linking-nuclear-and-renewable-energy-systems>.

⁶National Conference of State Legislators, *Greenhouse Gas Emissions Reduction Targets and Market-based Policies* (2021).

and complete decarbonization of electricity generation and heat production. Nuclear energy . . . contributes to both goals.”

§ 30:3 Overview of nuclear energy in the United States

Following President Eisenhower’s “Atoms for Peace” speech to the United Nations in 1953, the U.S. Congress enacted the Atomic Energy Act the next year. The Atomic Energy Act of 1954 established the Atomic Energy Commission (AEC) and provided for private sector involvement in the nuclear power industry under a comprehensive licensing and regulatory scheme.¹ As the U.S. Supreme Court noted in its 1983 *Pacific Gas and Electric Co. v. State Energy Resources Conservation & Development Comm’n* decision,² Congress determined that the “national interest would be best served if the Government encouraged the private sector to become involved in the development of atomic energy.”

◆ **Atomic Energy Act** Key Atomic Energy Act provisions to note include sections 189 “Hearing and judicial review” and 274 “Cooperation with states.”

Under sec. 189, the Nuclear Regulatory Commission is obligated to afford the public an opportunity to challenge proposed licensing actions, and to conduct a public hearing regarding the construction of certain types of facilities, even if there is not a challenge by any affected party. These hearings are conducted in accordance with the Administrative Procedure Act and the NRC regulations set forth at 10 C.F.R. Part 2.

Under sec. 274, the NRC may enter into an agreement with a State for discontinuance of the NRC’s regulatory authority over some materials licenses within that State. The State must first show that its regulatory program is compatible with the NRC’s and adequate to protect public health and safety. The NRC retains authority over, among other things, nuclear power plants within the State and certain exports.

Electricity generation from commercial nuclear power plants in the U.S. began in 1958. At that time, the AEC developed a licensing process for the construction and operation of power reactors based on the statutory standards and provisions of Sections 185 and 189 of the Atomic Energy Act.³ The Act imposes the basic safety standard that the licensing of a power reactor must provide “adequate protection of the public health and safety” and be consistent with the “common defense and security.” In a 1961 decision, *Power Reactor Development Co. v. Electricians*,⁴ the Supreme Court affirmed the principle that the Act does not mandate absolute safety or zero risk, but rather “reasonable assurance” of adequate protection of the public health and safety. This remains the standard today for granting a license to construct and operate a nuclear power plant.

Eventually some 130 nuclear power reactors were constructed in the U.S. during the first four decades of the industry. All were licensed by the AEC or its successor the NRC. A number of the plants have been retired and either decommissioned or are shutdown awaiting decommissioning.⁵ As of the end of 2021, the United States had 93 operating commercial nuclear reactors at 55 nuclear power plants in 28

[Section 30:3]

²*Pacific Gas and Elec. Co. v. State Energy Resources Conservation & Development Com’n*, 461 U.S. 190, 207, 103 S. Ct. 1713, 75 L. Ed. 2d 752 (1983).

³42 U.S.C.A. §§ 2235, 2239.

⁴*Power Reactor Development Co. v. International Union of Elec., Radio and Mach. Workers*, AFL-CIO, 367 U.S. 396, 81 S. Ct. 1529, 6 L. Ed. 2d 924 (1961).

⁵This is when the facility is placed in a safe, stable condition and maintained in that state, and the facility is decontaminated and dismantled at the end of the storage period to levels that permit license termination (often referred to as “SAFSTOR”). Therefore, the SAFSTOR determination includes

states. The average age of these nuclear reactors is about 40 years—with the oldest operating reactor, Nine Mile Point Unit 1 in New York, beginning commercial operation in December 1969. The newest reactor to enter service, Watts Bar Unit 2, came online in 2016—the first new reactor since 1996 when the Watts Bar Unit 1 came online.

Nuclear electricity generation capacity in the U.S. peaked in 2012 at about 102,000 MW, when there were 104 operating nuclear reactors. At the end of 2021, the 93 operating reactors had a combined generating capacity of about 95,492 MW. In 2013 through 2019, annual nuclear generation capacity and electricity generation increased each year (except in 2017) even as the number of operating reactors declined, either through increases in capacity factor or power uprates (increases in the licensed capacity of the reactor). Today, nuclear energy provides about one-fifth of U.S. electricity.⁶

§ 30:4 Overview of nuclear energy in the United States—Status of currently operating plants

While new nuclear construction has changed course, in 2016 the Tennessee Valley Authority's Watts Bar Unit 2 in Tennessee became the first new U.S. reactor to come online since 1996. In February 2012, the Nuclear Regulatory Commission (NRC) voted to approve Southern Company's application to build and operate two new reactors, Units 3 and 4, at its Vogtle plant in Georgia, each with a planned capacity of about 1,100 MW. The new Vogtle reactors are the first new reactors to receive construction approval in more than 30 years and are expected to come online by 2023. Notably, Unit 3 loaded fuel in October 2022. Despite this new construction and the renewed interest in keeping operating reactors online, as of November 2021, there were 23 shut down commercial nuclear power reactors at 19 sites in various stages of decommissioning.¹

Nuclear development in the U.S. suffered a major setback after the 1979 Three Mile Island Unit 2 accident. While official reports concluded that no person was injured or exposed to harmful radiation, many orders and projects were cancelled or suspended at that time (mostly for economic reasons, such as the effects of recession and inflation with high interest rates in the late 1970s and early 1980s), and the nuclear construction industry contracted over the next two decades.

§ 30:5 Overview of nuclear energy in the United States—U.S. Nuclear Regulatory Commission

Nuclear reactors are licensed and regulated, with strict safety, technical, and environmental oversight, by the Power Reactor Development Co. v. International Union of Elec., Radio and Mach. Workers, AFL-CIO, 367 U.S. 396, 81 S. Ct. 1529, 6 L. Ed. 2d 924 (1961). The Energy Reorganization Act of 1974 created the NRC, an independent federal regulatory agency that began operations on January 19, 1975. The NRC was a successor to the licensing and regulatory functions of the Atomic Energy Commission (AEC); other promotional functions of the AEC were transferred to the Department of Energy.

consideration of those activities necessary for final decontamination and dismantlement of the facility. Regulatory Guide 1.202, *Standard Format and Content of Decommissioning Cost Estimates for Nuclear Power Reactors*, available at <https://www.nrc.gov/docs/ML0502/ML050230008.pdf>.

⁶Energy Information Agency (EIA), *Electricity in the U.S. for 2021*, available at <https://www.eia.gov/energyexplained/electricity/electricity-in-the-us.php>.

[Section 30:4]

¹NRC, *Location of Power Reactor Sites Undergoing Decommissioning*, available at <https://www.nrc.gov/info-finder/decommissioning/power-reactor>.

At that time, the NRC focused its attention on the licensing process for the many power reactors that were in the application stage, along with several broad issues essential to protecting public health and safety, such as radiation protection, reactor safety, and the regulation of nuclear materials. The courts have repeatedly held that the NRC, in making its safety judgments, is the expert administrative agency for matters of nuclear safety and thus its decisions are entitled to great deference. As the Supreme Court noted, in its 1983 *Baltimore Gas & Electric Co. v. NRDC* decision:¹

[A] reviewing court must remember that the Commission is making predictions, within its area of special expertise, at the frontiers of science. When examining this kind of scientific determination, as opposed to simple findings of facts, a reviewing court must generally be at its most deferential.

Despite attempts by certain courts to impose special procedures on the NRC in view of the importance of its safety mission, the Supreme Court has also made clear that the Administrative Procedure Act, 5 U.S.C.A. §§ 551 *et seq.*, establishes the “maximum procedural requirements” that Congress was willing to impose on the agency.² This important principle shows that the regulation of nuclear energy matters is essentially the same as that for other regulated industries.

Today, the NRC’s regulatory activities are focused on reactor safety oversight and license renewal for existing plants, as well as waste management of both high-level and low-level radioactive waste. The NRC coordinates its regulatory efforts with other federal agencies, and continually updates its approaches based on technical innovation, such as improvements in probabilistic risk assessment that can support risk-informed, performance-based regulation—where the focus is on technical matters having the most significance from a safety perspective. This practice must strike a delicate balance between accommodating new technologies and protecting the health and safety of the public, which is the NRC’s primary responsibility. The NRC does this by regulating the entire lifecycle of a nuclear power plant from the design phase through construction, operation, and decommissioning (commonly referred to as “cradle to grave” regulation).

Part II of this Chapter walks through the various NRC regulatory frameworks for nuclear licensing and the stringent environmental considerations associated with nuclear licensing.

II. NUCLEAR LAW AND REGULATIONS

§ 30:6 NRC licensing and regulation of commercial nuclear facilities

The Nuclear Regulatory Commission (NRC) is responsible for licensing new nuclear power plants, as well as test and research reactors, and maintains a stringent process for the planning, siting, construction, and operation of all commercial nuclear reactors. Through the licensing process, the NRC generally licenses an applicant for any or all of the following activities: (1) constructing, operating, and decommissioning commercial reactors and fuel cycle facilities; (2) possessing, using, processing, exporting, and importing nuclear materials and waste; and (3) handling

[Section 30:5]

¹*Baltimore Gas and Elec. Co. v. Natural Resources Defense Council, Inc.*, 462 U.S. 87, 103, 103 S. Ct. 2246, 76 L. Ed. 2d 437 (1983).

²*Vermont Yankee Nuclear Power Corp. v. Natural Resources Defense Council, Inc.*, 435 U.S. 519, 98 S. Ct. 1197, 55 L. Ed. 2d 460 (1978).

certain aspects of their transportation.¹ The requirements contained in the regulatory frameworks for these activities are robust and require potential applicants to make significant investments in environmental and safety reviews, and ensure that they are financially and technically qualified to see a nuclear license through from inception to decommissioning.

NRC regulations provide a combination of regulatory requirements for environmental and public safety oversight, including inspections, performance evaluations, enforcement, and operating experience evaluations. The NRC issues licenses for nuclear power plants under 10 C.F.R. Part 50, “Domestic Licensing of Production and Utilization Facilities,” and this framework includes measures to protect the public, occupational workers, and the environment. Under the reforms of 10 C.F.R. Part 52, “Licenses, Certifications, and Approvals for Nuclear Power Plants,” the NRC licenses new reactors through a “combined license” approach, authorizing both construction and operation. Part 52 also involves the issuance of early site permits, standard design certifications, standard design approvals, and manufacturing licenses for nuclear power facilities. These processes are intended to bring about standardization of designs and early resolution of siting and design issues to help streamline the licensing process for new reactors. The NRC also licenses fuel cycle facilities in accordance with 10 C.F.R. Part 70, “Domestic Licensing of Special Nuclear Material,” which establishes requirements, procedures, and criteria for the issuance of licenses to possess special nuclear material (enriched uranium), spent fuel, radioactive waste, and other radioactive materials.

To supplement the requirements in these regulations, the NRC publishes and endorses official guidance. These guidance documents describe methods for implementing the NRC’s regulations, techniques for evaluating specific problems or postulated accidents, and the type of data that the NRC needs in reviewing applications for permits and licenses. Guidance is not a substitute for regulations and compliance is not mandated, but it establishes acceptable practices to meet the NRC’s licensing standards and other regulatory requirements.

§ 30:7 NRC environmental review for reactor licensing

The Nuclear Regulatory Commission’s (NRC) licensing process for reactors includes a comprehensive review of environmental impacts. The NRC’s review is designed to comply with the National Environmental Policy Act (NEPA) and other environmental laws. In particular, the NRC has followed the 1971 decision of the D.C. Circuit in *Calvert Cliffs’ Coordinating Committee, Inc. v. Atomic Energy Commission*,¹ holding that NEPA requires full consideration of environmental impacts through preparation of an Environmental Impact Statement for the licensing of a new nuclear power plant. This decision led the NRC to revise its regulations on environmental reviews for new plants.

§ 30:8 NRC environmental review for reactor licensing—Compliance with NEPA, environmental assessments and impact statements

The National Environmental Policy Act (NEPA) is a central pillar of environmental law and requires federal agencies to evaluate the impacts of proposed major federal

[Section 30:6]

¹The regulations on the different licensing processes are contained in 10 C.F.R. Parts 50, 52, 30, 70, 71, and 72.

[Section 30:7]

¹*Calvert Cliffs’ Coordinating Committee, Inc. v. U. S. Atomic Energy Commission*, 449 F.2d 1109, 17 A.L.R. Fed. 1 (D.C. Cir. 1971).

actions on the human environment.¹ The Nuclear Regulatory Commission (NRC) implements NEPA and other environmental laws through its regulations in 10 C.F.R. Part 51, which contain criteria for conducting environmental reviews. When an applicant seeks a nuclear reactor license, NEPA regulations, as enforced by the NRC, serve as safeguards for the interests of affected communities and the environment.

In compliance with NEPA, the NRC is obligated to assess the environmental effects of proposed actions prior to making licensing decisions and to conduct an evaluation that balances the environmental costs and benefits of the proposed action. Where environmental effects are remote and speculative, the NRC can approve plant construction and operation even though uncertainties exist. The environmental review of a proposed action is subject to a “rule of reason” and as a result is limited to the review of environmental effects which are reasonably foreseeable and not theoretical or speculative. The NRC’s environmental review can involve three different levels of analysis—spanning from a categorical exclusion based on generic analysis to conducting a full Environmental Impact Statement (EIS)—depending on the potential effects of a proposed action on the environment. The levels of analysis correspond with the following:

1. Highest level. The NRC determines whether a proposed project requires the preparation of an EIS for “major federal actions significantly affecting the quality of the human environment” or for proposed actions that the NRC determines should be covered by an EIS.² An EIS is required for licensing the construction and operation of a nuclear power facility, and the licensing of a uranium enrichment facility. Typical environmental impact areas that are reviewed in an EIS include, but are not limited to, water resources, air quality, land use, waste management, public and occupational health, geology and soil, historical and cultural sources, and environmental justice.
2. Most common. The NRC determines whether an action has a significant impact on the environment based on an Environmental Assessment (EA). An EA is a concise document that provides sufficient evidence and analysis for determining whether to prepare an EIS or make a finding of no significant impact (FONSI). The NRC typically makes a FONSI in the context of proposed license amendments for licensed facilities. If an EA supports a FONSI, the environmental review process is complete. If the EA reveals that the proposed action may have a significant effect on the human environment, the NRC may then prepare an EIS.
3. Lowest level. The NRC has determined that certain licensing, regulatory, and administrative actions may be “categorically excluded” from a detailed environmental review if the action does not “individually or cumulatively have a significant effect on the human environment.”³ Once it has established a categorical exclusion, the agency is not required to prepare an EA or EIS for

[Section 30:8]

¹See Chapter 10 of this treatise for a discussion of NEPA.

²While the NRC is responsible for complying with NEPA, the process of creating an EIS begins with the license renewal applicant. Under 10 C.F.R. §§ 51.45(a) and 51.53(c)(1), license renewal applicants must submit an environmental report to the NRC “to aid the Commission in complying with section 102(2) of NEPA.” See 10 C.F.R. § 51.14(a) (definition of “environmental report”). The NRC staff reviews the environmental report submitted by the applicant and uses it to draft the plant-specific SEIS. Under 10 C.F.R. § 51.53(c)(3), “[f]or those applicants seeking an initial renewed license . . . the environmental report . . . for the operating license renewal stage is not required to contain analyses of the environmental impacts of the license renewal issues identified as Category 1 issues.”

³10 C.F.R. § 51.22 “Criterion For Categorical Exclusion; Identification Of Licensing And Regulatory Actions Eligible For Categorical Exclusion Or Otherwise Not Requiring Environmental Review.”

any action that falls within the scope of the categorical exclusion, unless the agency finds, for any particular action, that there are special (e.g., unique, unusual, or controversial) circumstances that would preclude use of the categorical exclusion. The NRC has identified categorical exclusions in 10 C.F.R. 51.22(c), which include, but are not limited to, the procurement of general equipment and supplies, license amendments that involve no significant hazards considerations, license amendments that change surety bonds, insurance, recordkeeping, reporting, or other administrative requirements, and license amendments without significant construction impacts.

§ 30:9 NRC environmental review for reactor licensing—Public involvement in licensing actions through the hearing process

The Nuclear Regulatory Commission (NRC) considers the licensing of a new reactor to be a major federal action requiring preparation of an Environmental Impact Statement (EIS) in accordance with National Environmental Policy Act (NEPA). During the licensing and environmental review processes for new reactors, the NRC will conduct public scoping meetings to receive comments on the scope of its planned environmental review and EIS. Individuals or entities affected by NRC licensing actions may also participate by requesting a hearing and submitting a petition to intervene, requesting an opportunity to present oral testimony, or submitting a written statement.¹ Hearings are mandatory for certain actions such as issuance of a construction permit for a power reactor or a commercial uranium enrichment facility. The NRC's environmental review process for a new facility, from its internal analysis and consideration of public comments and potential hearings, takes approximately 24 to 36 months.

§ 30:10 NRC environmental review for reactor licensing—License amendments and extensions

At initial licensing, the Nuclear Regulatory Commission (NRC) typically issues a license for commercial reactors to operate for up to 40 years. NRC regulations permit these licenses to be renewed beyond the initial 40-year term for an additional period of time, limited to 20-year increments per renewal. There are no specific limitations in the Atomic Energy Act or the NRC's regulations restricting the number of times a license may be renewed. Initial license renewals generally extend a plant's license from 40 to 60 years, while a so-called "subsequent license renewal"—or SLR—extends a plant license from 60 to 80 years. The first SLR application, for Turkey Point Units 3 and 4, was submitted to the NRC in January 2018, and the NRC issued the Turkey Point SLRs in December 2019.¹ As of January 2022, the NRC had issued SLRs for six reactors, and SLR applications are currently under review for an additional nine reactors.²

In deciding to grant a renewed license, the NRC evaluates whether the nuclear

[Section 30:9]

¹10 C.F.R. § 2.309 "Hearing requests, petitions to intervene, requirements for standing, and contentions."

[Section 30:10]

¹Two years after the NRC granted the renewed license, the NRC staff determined that it needed to "examine the environmental issues that the Commission determined were not properly evaluated for the subsequent license renewal term, as well as any new information for Turkey Point." The NRC issued revised views on SLR reviews in a February 24, 2022, order. The order (CLI-22-02) reversed a 2020 ruling (CLI-20-03) that backed the NRC staff's reliance on the GEIS for evaluating the Turkey Point SLR application.

²For information on the NRC issued SLRs and pending applications, see U.S. NRC, Nuclear

facility can continue to operate safely during the period of extended operation. The review is conducted in accordance with both safety (10 C.F.R. Part 54) and environmental (10 C.F.R. Part 51) requirements.

1. Environmental Reviews During License Renewal. In addition to a safety review, the renewal of a nuclear power plant operating license requires the preparation of an EIS to comply with National Environmental Policy Act (NEPA). The Environmental Impact Statement (EIS) includes the NRC staff's analysis that considers and weighs the environmental effects of the proposed renewal. To support the preparation of an EIS for license renewals, the NRC published the Generic Environmental Impact Statement for License Renewal of Nuclear Plants (GEIS) in 1996, and updated the GEIS in 2013.³ The intent of the GEIS was to improve the efficiency of license renewals by determining which environmental impacts would result in essentially the same impact at all nuclear power plants (i.e., generic or "Category 1" issues) and which ones could result in different levels of impacts at different plants and would require a plant-specific analysis to determine the impacts ("Category 2" issues). The NRC also promulgated a rule that codified the findings of the GEIS into its regulations in 10 C.F.R. Part 51, Subpart A, Appendix B, Table B-1.⁴ For issues not generically addressed—the Category 2 issues—the NRC staff prepares plant-specific supplements to the GEIS, i.e., a plant-specific supplemental EIS (SEIS).
2. Updated GEIS for SLRs. In February 2022, the NRC issued a major decision on its SLR process. The decision ordered that reviews of SLR applications must rely on a new, more extensive environmental analysis rather than the license renewal GEIS that applicants previously relied on to streamline the renewal process. Specifically, the Commission stated that the initial license renewal GEIS did not explicitly cover a subsequent licensing period and can apply only to *initial* license renewal applications—not SLRs. The Commission ordered the NRC staff to hit the "reset" button on its NEPA analyses in several SLR proceedings to account for this change in policy. The NRC staff submitted a proposed rule to the Commission at the end of 2022, which included a mixture of small, organizational changes and larger, substantive changes, including the addition of GHG and climate change impacts as factors to be considered when the NRC is reviewing license renewal applications. Following Commission approval, the final rule would be published to incorporate the updated GEIS and SLR applicants could, once again, rely on the GEIS. Notably, SLR applicants are not *required* to wait for the Commission's approval of the new GEIS; applicants can elect to proceed with their applications by performing their own site-specific analyses of the Category 1 issues analyzed in the original GEIS.

§ 30:11 How the NRC will approach environmental reviews for licensing advanced reactors

New reactor technologies have emerged over the past two decades, such as small modular reactors (SMR) (usually reactors less than 300 MWs) and advanced reactors (reactors of different sizes that use coolants such as liquid metal or sodium

Reactors, available at <https://www.nrc.gov/reactors/operating/licensing/renewal/subsequent-license-renewal.html>.

³NRC NUREG-1437, Rev. 1 "Generic Environmental Impact Statement for License Renewal of Nuclear Plants," all documents, available at <https://www.nrc.gov/reading-rm/doc-collections/nuregs/staff/sr1437/r1/index.html#abstract>.

⁴See NRC NUREG-1437, Rev. 1 "Generic Environmental Impact Statement for License Renewal of Nuclear Plants" (last updated 2021), available at <https://www.nrc.gov/reading-rm/doc-collections/cfr/part051/part051-appb.html>.

rather than water). These technologies hold the promise of enhanced safety through use of passive safety systems that reduce accident risks. As discussed later in this chapter, they are also being developed to work in tandem with renewable energy sources (e.g., through onsite energy storage systems) and to provide process heat to support hydrogen production or other industrial uses.

The environmental review process for licensing these new advanced and small modular reactors is anticipated to be substantially similar to the environmental review process for traditional light-water reactors (LWR) as described above. A key difference, however, is that the NRC will consider the advanced safety features and performance unique to the design of advanced reactor. For example, similar to the way the NRC streamlined the environmental review process through the GEIS, the NRC is developing a GEIS for advanced nuclear reactors (AR GEIS). In developing the AR GEIS, the NRC is using a technology-neutral, performance-based approach, which includes general analyses evaluating the potential environmental impacts of a reactor taking into account the limits of the specific reactor design features, and the site-specific conditions of the affected environment.

A future license application referencing the AR GEIS must demonstrate that the project is limited to the analysis in the AR GEIS and that there is no significant new information that affects the evaluation. The NRC will incorporate the AR GEIS by reference, and no further analysis would be required. If appropriate, site-specific information and analysis could be provided in an SEIS. This will spare license applications for new reactor types from additional review and accelerate the licensing process.

§ 30:12 NRC regulation of uranium recovery activities

As part of its responsibility to protect public health and safety and the environment, the Nuclear Regulatory Commission (NRC) also regulates certain uranium recovery activities. The production of fuel for nuclear power plants starts with taking uranium ore from the ground and then purifying and processing it through a series of steps. This process, known as “uranium recovery,” focuses on extracting natural uranium ore from the earth and concentrating (or *milling*) that ore. These operations produce a uranium concentrate product, which is then transported to a succession of fuel cycle facilities where it is converted into fuel for nuclear power reactors. In addition to this uranium concentrate, the uranium recovery operations also generate waste products, called “byproduct materials,” that contain low levels of radioactivity. Although mining operations are primarily regulated by the Bureau of Land Management, the U.S. Department of the Interior, and the individual States where the mines are located, the NRC regulates conventional milling operations under 10 C.F.R. Part 40, “Domestic Licensing of Source Material.” As defined in that regulation, uranium milling is any activity that produces byproduct material within the meaning of Section 11e(2) of the Atomic Energy Act—i.e., “. . . the tailings or wastes produced by the extraction or concentration of uranium or thorium from any ore processed primarily for its source material content.” However, 10 C.F.R. Part 40 expands upon this definition by adding, “. . . including discrete surface wastes resulting from uranium solution extraction processes.” In situ recovery facilities perform uranium milling under this expanded definition. Therefore, the NRC has authority over milling of mined materials and in situ processes used to recover uranium. The NRC regulates these facilities in close coordination with other Federal agencies and State and Tribal governments and provides technical support and guidance to those *Agreement States* that have authority pursuant to Atomic Energy Act § 274 over uranium recovery activities.

- ◆ An **Agreement State** is a State that has signed an agreement with the NRC authorizing the State to regulate certain uses of radioactive materials within the

State. Pursuant to AEA § 274, the NRC delegates to the States portions of its regulatory authority to license and regulate byproduct materials (including radioisotopes); source materials (uranium and thorium); and certain quantities of special nuclear material. The NRC closely coordinates with the Agreement States on training, technical licensing and inspection issues, rulemaking, and other regulatory efforts. There are currently 39 NRC Agreement States.

§ 30:13 NRC and DOE coordination on managing nuclear waste

The Nuclear Regulatory Commission (NRC) and U.S. Department of Energy (DOE) share responsibilities for the management of nuclear waste, including low-level radioactive waste and spent nuclear fuel and high-level waste. High-level radioactive wastes are the highly radioactive materials produced as a byproduct of the reactions that occur inside nuclear reactors and includes spent (*used*) reactor fuel. Low-level waste includes items that have become contaminated with radioactive material or have become radioactive through exposure to neutron radiation, which typically consists of contaminated protective shoe covers and clothing, wiping rags, mops, reactor water treatment residues, equipment and tools, luminous dials, medical tubes injection needles, syringes, and laboratory animal carcasses and tissues. In carrying out these responsibilities, the NRC coordinates with the DOE and other agencies.

◆ The **Nuclear Waste Policy Act of 1982 (NWPA)** establishes a national program for the safe, permanent disposal of spent nuclear fuel from reactor operations and other highly radioactive wastes.

The **Low-Level Radioactive Waste Policy Act (as amended in 1985)** provides that states are responsible for providing disposal capacity for commercial low-level waste generated within their borders and encourages regional compacts to develop new disposal facilities.

Following are key examples of federal laws designed to ensure safe storage and disposal of nuclear waste.

§ 30:14 NRC and DOE coordination on managing nuclear waste—Low-Level Radioactive Waste Policy Act

The Low-Level Radioactive Waste Policy Act, as amended in 1985, provides that each state, including the District of Columbia and the Commonwealth of Puerto Rico, is responsible for providing disposal capacity for commercial low-level waste generated within its borders and encourages regional compacts to develop new disposal facilities. This Act is based on the following principles: (1) state responsibility for providing low-level waste (LLW) disposal capacity; (2) encouragement of inter-state compacts for the exercise of this responsibility; and (3) the right of regional compacts to prohibit disposal, at the parties' regional facilities, of LLW generated in non-compact states. Congress' goal was to ensure the safe and efficient management of LLW on a regional basis. The U.S. Supreme Court restricted the reach of the Low-Level Radioactive Waste Policy Act in its 1992 *New York v. United States* decision,¹ holding that Congress could not require states to "take title" to, or maintain ownership responsibilities for, low-level waste under the Act, as such a mandate exceeded the power of Congress under the Commerce Clause. This decision slowed some state-level action to meet the responsibilities and goals established by the Act.

In the U.S. today there are only four disposal sites, in Utah, South Carolina, Washington State, and Texas. States without sites for disposal facilities may enter

[Section 30:14]

¹New York v. U.S., 505 U.S. 144, 112 S. Ct. 2408, 120 L. Ed. 2d 120 (1992).

into compacts with other states under Congressional authorization to maintain access to disposal facilities. It is DOE's responsibility to keep track of these arrangements and to provide technical assistance and information to the States and regional compacts on alternative low-level radioactive waste disposal technology designs, volume reduction options, transportation practices for shipment, and health and safety considerations for LLW management.²

The Act confers authority on DOE to assign additional emergency disposal capacity to reactors while the NRC can authorize emergency access to existing sites. The Act sets forth conditions under which the NRC may grant emergency disposal facility access to a non-complying state if an imminent threat exists to the public safety or common defense.

§ 30:15 NRC and DOE coordination on managing nuclear waste—Nuclear Waste Policy Act

The Nuclear Waste Policy Act of 1982 (NWPA) establishes a national program for the safe, permanent disposal of spent nuclear fuel from reactor operations and other highly radioactive wastes. It also provided a timetable of key milestones the federal agencies must meet in carrying out the program. The NWPA establishes procedures to select deep geologic repositories for the safe storage and/or disposal of spent nuclear fuel and high-level radioactive waste and directs the U.S. Environmental Protection Agency (EPA) to develop environmental standards for protection of the general environment from offsite releases of radioactive material in repositories. Additionally, the NWPA provides for temporary federal storage of waste and authorized the Department of Energy (DOE) to provide up to 1,900 metric tons of temporary storage capacity for spent fuel from civilian nuclear reactors.

Congress assigned responsibility to the DOE to site, construct, operate, and close a repository for the disposal of spent nuclear fuel and high-level radioactive waste. The Act directs the Nuclear Regulatory Commission (NRC) to license DOE to operate a repository only if it meets EPA's environmental standards and other relevant requirements. Later amendments explicitly named Yucca Mountain, in Nevada, as the only site that DOE could use for a permanent repository for the nation's high-level radioactive waste and spent nuclear fuel.

At this time, DOE has canceled the Yucca Mountain repository program in the face of opposition from the State of Nevada, in order to focus on potential solutions to achieve a broader consensus. DOE is focusing on the potential development of consolidated interim storage facilities for safe storage of spent fuel until a permanent disposal solution can be developed. Most nuclear power plants in the United States store spent fuel onsite in independent spent fuel storage installations (ISFSI) pursuant to licenses granted by the NRC. The spent fuel and high-level waste will be stored onsite at the ISFSI until DOE is ready to take delivery of the spent fuel for storage or disposal. If the spent fuel is stored onsite in casks certified by the NRC under 10 C.F.R. Part 72, the licensee may use an ISFSI in accordance with a Part 72 general license; otherwise, the licensee must obtain a site-specific Part 72 license from the NRC.

III. LEGAL DEVELOPMENTS AND NEW FRAMEWORKS

§ 30:16 Recent U.S. legislation demonstrating support for nuclear as a clean energy solution

²The federal government's responsibilities for disposal are contained in the Low-Level Radioactive Waste Policy Amendments Act of 1985 (1985 Act), Pub. L. 99-240 § 102, 99 Stat. 1842, 1844 (1986) (codified at 42 U.S.C.A. § 2021c(b)(1)(D)). DOE's Office of Environmental Management carries out its responsibility.

Recent support for nuclear energy in the U.S. is driven by the difficulty in meeting clean energy goals coupled with surging electricity demand. There is strong bipartisan backing for increased nuclear energy in the U.S., which is expressed in recent legislation.

The Inflation Reduction Act of 2022 (IRA) provides \$369 billion for climate and energy projects generally, including: specific financial incentives and tax credits for clean energy produced by the existing nuclear fleet, clean electricity produced by advanced nuclear reactors (including small modular reactors (SMRs)), and fuel needed to operate advanced reactors. The CHIPS and Science Act of 2022, as mentioned earlier, promotes university nuclear science and engineering programs. The Infrastructure Investment and Jobs Act of 2021 (IIJA) contains a number of provisions that support the existing nuclear fleet, including a \$6 billion Civil Nuclear Credit program through DOE to help operators at financially troubled nuclear plants keep reactors running. A qualifying nuclear facility must demonstrate that: (1) it is at risk of ceasing operations due to economic factors; and (2) closure will lead to increases in carbon and air pollutant emissions.

State-level examples recognizing this demand for nuclear include actions taken by California to keep the Diablo Canyon Nuclear Power Plant operating, and by the Governor of Virginia to establish Virginia as a nuclear hub and a place to develop SMRs.¹ In addition, some industrial users are starting to expand portfolios for nuclear to support decarbonization agendas, such as X-energy's collaboration with Dow Chemical, which is intended to serve as a blueprint for decarbonizing the chemical manufacturing industry.²

§ 30:17 Changes in the NRC's environmental justice policy

In 2021, the Nuclear Regulatory Commission (NRC) initiated an update of its environmental justice policy. This is a move that may have significant implications for environmental reviews of new nuclear projects.

In 1994, President Clinton issued Executive Order 12898, "Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations," which directed federal agencies to identify and address the "disproportionately high and adverse human health or environmental" impact on minority and low-income communities of government "programs, policies, and activities."¹ Independent regulatory agencies were only encouraged and not bound to comply with E.O. 12898, but the NRC agreed to implement the measures and released its first environmental justice (EJ) Strategy document in 1995 and reactor and materials-specific guidance documents in 1997.² The Biden administration more recently took a whole-of-government approach to EJ. While this strategy seeks to use EJ and climate change considerations to drive decision-making across all U.S. agencies and sectors,³ it does not drastically impact the NRC's consideration of EJ in its already-established environmental review.

[Section 30:17]

¹59 Fed. Reg. 7629 (Feb. 16, 1994).

²NEI's Comments Regarding the NRC's Systematic Assessment of Its Environmental Justice Programs, Policies, and Activities (Docket ID NRC-2021-0137), p. 1.

³White House Fact Sheet: A Year Advancing Environmental Justice (Jan. 26, 2022).

For the nuclear energy industry, EJ considerations may be relevant to every stage of the fuel cycle, from uranium mining to spent fuel storage. For instance, in a 2020 case involving a proposed consolidated interim storage facility for spent fuel, the NRC held that it was permissible for the Atomic Safety and Licensing Board Panel, the licensing adjudicatory body inside the NRC, to mandate that environmental reports required under NEPA contain EJ information related to the transportation of waste.⁴ The applicants in that case considered the EJ impacts only of the location of the proposed spent fuel storage facility and not those associated with the transportation routes.

§ 30:18 Changes in the NRC’s environmental justice policy—Impacts faced by low-income and otherwise marginalized communities

According to the Nuclear Regulatory Commission (NRC) environmental justice considerations are potentially relevant to nearly every stage of the life cycle of nuclear energy. Potential environmental justice issues can arise for uranium mining, the siting and permitting of new nuclear reactors and other nuclear fuel cycle facilities, and the management of nuclear waste. Due to its nature as a low-carbon energy source with the need for stringent safety requirements, nuclear energy projects are likely to receive more scrutiny than many renewable energy technologies.

§ 30:19 Changes in the NRC’s environmental justice policy—A fresh look at environmental justice

The U.S. Environmental Protection Agency (EPA) defines “environmental justice” (or “EJ”) as: “the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation and enforcement of environmental laws, regulations and policies.”¹

In April 2021, the Nuclear Regulatory Commission (NRC) directed the staff to “systematically review how the agency’s programs, policies, and activities address environmental justice,” and include an opportunity for public comment.² As part of the review, the Commission directed the NRC staff to evaluate relevant Executive Orders and assess whether EJ is appropriately addressed in the agency’s programs, policies, and activities, given the agency’s mission. The NRC staff performed a comprehensive self-assessment that included benchmarking EJ activities of other federal and state agencies. Central to its review, the staff assessed the adequacy of the NRC’s existing 2004 Policy Statement on the Treatment of Environmental Justice Matters in NRC Regulatory and Licensing Actions (“2004 Policy Statement”), and considered whether establishing formal methods to gather stakeholder input would benefit future EJ efforts.³

The NRC staff conducted extensive outreach to a diverse groups and interested persons, including EJ communities and sovereign Tribal nations, other federal agencies, industry groups, nuclear safety organizations, and the public at large. Over the course of the assessment, the NRC held a series of public meetings and

⁴Interim Storage Partners LLC (Wcs Consol. Interim Storage Facility), 92 N.R.C. 463, 482 (Dec. 17, 2020).

[Section 30:19]

¹U.S. EPA, Learn About Environmental Justice, <https://www.epa.gov/environmentaljustice/learn-about-environmental-justice>.

²NRC Commission Environmental Justice Directive, available at <https://www.nrc.gov/docs/ML2111/ML21113A070.pdf>.

³NRC, “Policy Statement on the Treatment of Environmental Justice Matters in NRC Regulatory and Licensing Actions” (August 24, 2004), available at <https://www.govinfo.gov/content/pkg/FR-2004-08-24/pdf/04-19305.pdf>.

received approximately 2,500 written comments. The general takeaway was that the NRC's approach to EJ in its programs, policies and activities has mostly served the agency well, yet there are opportunities for programmatic and policy enhancements moving forward. On April 12, 2022, the NRC staff completed its systematic assessment of how the NRC approaches environmental justice and made a variety of revised EJ policy recommendations to the Commission.⁴

The NRC staff put forth six high-level recommendations to the Commission, six commitments that the staff will undertake, and 13 enclosures explaining the review findings in detail. The NRC staff's plans to update the agency's consideration of EJ include the following, some of which do not require Commission approval:

1. **Enhance communication.** The NRC staff will boost engagement with EJ communities and Tribal nations on issues associated with dose and radiation protection and related interagency research. The NRC staff will increase communication related to emergency preparedness, response and recovery activities, and use existing outreach and media processes to enhance communication and information related to impacts on EJ communities stemming from shutting down nuclear facilities. The NRC staff will also improve communications with EJ communities and Tribal nations about the NRC's hearing process.
2. **Implement lessons learned.** The NRC staff continues to assess the most comprehensive enhancement to the consideration of environmental justice in regulatory cost-benefit analysis guidance and consider best practices and knowledge gained through this review in future updates to environmental review guidance.

If the NRC ultimately adopts a more proactive approach to addressing EJ issues, nuclear developers can expect to see direct changes to the licensing process and other NRC activities, such as having to communicate more proactively with the surrounding site community, coordinate with a federal or state-level EJ advisory board, and demonstrate an integration of EJ considerations into a licensee's business and operational practices.

IV. NUCLEAR ENERGY AS CLEAN ENERGY AND LOOKING AHEAD

§ 30:20 Overview on advanced nuclear and small modular reactors

Today's nuclear industry is being reinvigorated by dozens of new entrants with new reactor designs with potential to make nuclear power safer, cheaper, and cleaner. Prominent examples include **advanced nuclear reactors** and **small modular reactors** ("SMRs").

An "advanced nuclear reactor" is defined in legislation enacted in 2018 as either "a nuclear fission reactor with significant improvements over the most recent generation of nuclear fission reactors" or a reactor using nuclear fusion.¹ Such reactors include light-water reactor designs that are much smaller than existing reactors, as well as concepts that would use different moderators, coolants, and types of fuel. Many of these advanced designs are considered to be SMRs, which DOE defines as reactors with electric generating capacity of 300 megawatts and below, in contrast to an average of about 1,000 megawatts for existing commercial reactors. Major categories of advanced reactors include advanced water-cooled reactors, which would

⁴SECY-22-0025 (March 2022), providing the NRC staff's findings and recommendations to the Commission.

[Section 30:20]

¹Nuclear Energy Innovation Capabilities Act of 2017, Pub. L. 115-248, Sept. 28, 2018, 132 Stat. 3154.

have safety, efficiency, and other improvements over existing commercial reactors;² gas-cooled reactors, which could use graphite as a neutron moderator or have no moderator;³ liquid-metal-cooled reactors, which would be cooled by liquid sodium or other metals and have no moderator; molten salt reactors, which would use liquid fuel; and fusion reactors, which would release energy through the combination of light atomic nuclei (such as a mixture of hydrogen atoms) rather than the splitting (fission) of heavy nuclei such as uranium.

The Nuclear Energy Innovation and Modernization Act (“NEIMA,” P.L. 115-439), enacted in January 2019, tasked the NRC to develop a regulatory framework suitable for advanced nuclear technologies by the end of 2027.

Some advantages of these advanced reactors include:

- **Safety Benefits.** Advanced reactors can operate with enhanced safety compared with traditional light-water nuclear reactors. Advanced reactors often run at lower pressures because of the special coolants they use. In many cases, they can also take advantage of passive safety measures, such as pressure relief valves, rather than relying on active safety features that require a backup power supply or human intervention. These passive safety measures allow reactors to withstand a broader set of accident conditions without resulting damage.
- **Versatility and Flexibility.** Reactors will come in a wide range of sizes, from a few megawatts to more than 1,000 (like traditional reactors), which means advanced reactors can be more flexible and versatile than traditional large-scale reactors. They can be installed at sites where traditional reactors cannot, such as underground where radiation and security risks are better mitigated. This also allows owners to tailor their electricity generation to the demand, which is important for smaller companies, such as rural electric cooperatives or municipal agencies, and for isolated sites. Some advanced nuclear reactors can vary the amount of power they produce more easily than traditional reactors, enabling them to play a greater role in balancing electricity loads. Many advanced reactors can also go much longer without refueling, requiring less infrastructure, and having the ability to remain online for long periods of time with no interruption in their power output.
- **Industrial Decarbonization.** Advanced reactors operate at high temperatures that can be used for industrial processes. Many industrial processes currently rely on fossil fuels to produce necessary heat levels; advanced reactors could substitute for fossil fuels in processes that would be difficult to electrify. In this way, advanced reactors have the potential to help decarbonize industries and power hybrid energy systems that not only produce electricity for the grid, but can also produce clean drinking water, and hydrogen or heat to decarbonize industrial and transportation activities.
- **Increased Efficiency.** Some advanced reactors use fuel more efficiently than traditional reactors, converting up to 95 percent of the energy in the fuel to usable electricity (traditional reactors convert much less, in some cases below 10 percent).⁴
- **Less Risk from Waste.** The increased energy efficiency of many advanced

²World Nuclear Association, “Advanced Nuclear Power Reactors” (updated Apr. 2021), available at <https://world-nuclear.org/information-library/nuclear-fuel-cycle/nuclear-power-reactors/advanced-nuclear-power-reactors.aspx>; International Atomic Energy Agency, “Passive Safety Systems in Advanced Water Cooled Reactors—Case Studies” (2013).

³A “moderator” is a material used on a nuclear reactor **to slow down the neutrons produced from fission**. By slowing down neutrons, the probability of a neutron interacting with Uranium-235 nuclei is greatly increased, thereby maintaining the chain reaction.

⁴Resources for the Future, “Advanced Nuclear Reactors 101” (Mar. 26, 2021), available at <https://>

reactors also results in a smaller amount of nuclear waste. The waste that is created can be less toxic and may remain toxic for a shorter period.

◆ **Fusion energy**, the process that powers the sun and stars, has long been viewed as the **“holy grail” of energy production**, with the promise to produce immense amounts of clean energy, but has long proved elusive for researchers and developers, especially getting at least as much, if not more, energy out of the reaction than went into making it—what is known as “breakeven” fusion.

Today’s fusion industry is being reinvigorated with business entrants and start-ups quickly moving from the drawing board to the field. Fusion companies are looking to develop more advanced testing and demonstration facilities, laying the groundwork for **eventual commercial deployment**.

In December 2022, DOE achieved a **major scientific breakthrough** in fusion when the National Ignition Facility at the Lawrence Livermore National Laboratory successfully produced a nuclear fusion reaction resulting in a net energy gain.

§ 30:21 Coal-to-nuclear transition

Another innovative approach to decarbonization is advanced nuclear’s role in the coal-to-nuclear transition (C2N). A 2022 Department of Energy (DOE) report titled “Investigating Benefits and Challenges of Converting Retiring Coal Plants into Nuclear Plants” demonstrated that hundreds of coal plant sites could host new nuclear reactors because the infrastructure can be repurposed and personnel retrained.¹ Sitting new nuclear at retiring coal sites can offer positive economic and environmental impacts. Many of these coal plants are already retired or slated for retirement, and a new nuclear plant on these sites would maintain the availability of well-paying jobs, and generate continued economic activity in the local communities.² The use of existing sites, infrastructure, and personnel can help lower the economic costs of building new reactors, which has been a major challenge for the nuclear power industry. The C2N transition is already underway. For example, nuclear innovation startup TerraPower and Berkshire Hathaway Energy subsidiary PacifiCorp entered into a partnership to advance the Natrium nuclear demonstration project at the site of a coal plant scheduled for retirement in Wyoming.³

Considerable overlap exists between job functions at a coal power plant and a nuclear power plant, offering an opportunity to redirect skilled workers from the coal power industry to new nuclear plants. This could result in local economic benefits as nuclear plants historically offer the highest median wage across the entire energy sector.⁴ Retaining these jobs could support local communities that may otherwise be hurt by the shutdown of coal power stations.

§ 30:22 Pairing nuclear with renewables and hydrogen

Many advanced reactor developers are designing their technologies to pair with

renewables. A recent report from the North American Electric Reliability Corporation (NERC), the entity responsible for overseeing America's bulk power system, underscores the benefits that can be achieved through an advanced nuclear-renewable energy partnership to compensate for the intermittent nature of solar and wind power.¹ For power grids relying on renewable energy, supply and demand hang in a balance based on the time of day and weather forecast. To maintain equilibrium in grid systems powered by renewable energy, flexible backup sources must remain online at all times. This provides an opportunity for advanced reactors to support renewables. Advanced nuclear power technologies are intended to operate flexibly, either at full capacity or load following (producing added power when needed to meet demand), promoting reliability of the grid at any time of day.

Hydrogen production is another promising tool of advanced nuclear reactors. Nuclear power plants can supply the required heat and electricity to produce hydrogen without generating carbon emissions.² Using nuclear in place of current energy alternatives in process heat applications can also result in price stability and increased energy security because nuclear power has the highest capacity factors to remain consistent and reliable, which reduces ramp-up or ramp-down costs. Nuclear-produced hydrogen can either be used as fuel for generators based on combustion or sold for industrial purposes. As markets incorporate renewable sources of energy and the demand continues to vary—falling during the day and peaking in the early evening as people return home from work—it is becoming more difficult to sustain the supply-demand balance. The operational flexibility and reliability of advanced reactors can help respond to demand shifts, hourly market pricing changes, and make a nuclear hydrogen combination appealing.

Hydrogen has taken center stage in the discussion of decarbonization of the energy, transportation, and industrial sectors—which combined account for nearly 77 percent of all greenhouse gas emissions in the U.S.³ The Infrastructure Investment and Jobs Act of 2021 set a large amount of money aside for the development of hydrogen-based power systems, allocating \$8 billion for a regional hydrogen hub that will produce, transport, and store lower-carbon forms of hydrogen over a five-year period.⁴

§ 30:23 Conclusion

Nuclear energy will play a key role in the global efforts to address climate change concerns, reduce carbon dioxide emissions, and stabilize energy security. Like any energy source, nuclear energy has its strengths and challenges. With many decades of experience, the NRC and other federal agencies maintain stringent regulatory controls to ensure that nuclear energy will provide adequate protection of the public health and safety and the environment.

²To produce hydrogen, it must be separated from the other elements in the molecules where it occurs. There are many different sources of hydrogen and ways for producing it for use as a fuel. The two most common methods for producing hydrogen are steam-methane reforming and electrolysis (splitting water with electricity). Researchers are exploring other hydrogen production methods.

- § 31:47 Generally

I. INTRODUCTION

§ 31:1 In General

Ocean and coastal governance is a substantial topic for an environmental treatise. This chapter is designed to introduce readers to the seascape of U.S. ocean law, beginning with a discussion of the United States' effort to bring a "whole of government" approach to decisionmaking impacting ocean and coastal users and resources. The chapter proceeds in Part II to describe the extent of federal and state jurisdiction in the context of the ocean jurisdictional zones defined in the United Nations Convention on the Law of the Sea (e.g., territorial sea, exclusive economic zone, high seas) that the United States has considered to reflect contemporary customary law. Part III describes the federal Coastal Zone Management Act, as implemented by state coastal management programs, as the primary mechanism for federal and state cooperation on sustainable coastal management. Part IV and Part VII focus on biodiversity protection, with an overview, respectively, of the Marine Mammal Protection Act and the Magnuson-Stevens Fishery Conservation and Management Act. Part V, Part VIII, and Part IX describe the federal responses to preventing

ocean pollution caused by intentional dumping activities, shipping operations, and oil spills. Part VI focuses on designation and implementation of federally managed marine sanctuaries. Finally, Part X offers some brief reflections on topics of significant importance for long-term ocean health, including ocean acidification where there has been limited policymaking in part because the challenges involve regulating many actors who have not been the subject of ocean policymaking (e.g., plastic production industry) and actions that may take place far from coasts and ocean jurisdictional spaces (e.g., electricity production and transport). The intent of this chapter is to offer readers a glimpse into the complex, interacting legal challenges of designing ocean and coastal governance strategies across numerous agencies, legitimate ocean-based priorities (e.g., biodiversity conservation, energy production, and fisheries), and changing conditions (e.g., larger coastal populations and warming trends across global oceans).

§ 31:2 Ocean Policy

The United States does not have a single comprehensive ocean law statute. It does have an Ocean Policy Committee to coordinate federal actions related to the ocean. The purpose of this committee is to coordinate “management, science, and technology matters” related to the waters and seabeds of the ocean, coasts, and Great Lakes waters of the United States and its territories.¹ To achieve interagency coordination, the committee is co-chaired by the Chairperson of the Council on Environmental Quality and the Director of the White House Office of Science and Technology Policy, with additional representation from multiple agencies and the assistants to the president for National Security Affairs, Homeland Security and Counterterrorism, Domestic Policy, and Economic Policy.² Reports from the committee are expected to be delivered to appropriate congressional committees.³

Previously in 2010, the United States created a National Ocean Council under the now revoked Executive Order No. 13547, *Stewardship of the Ocean, Our Coasts, and the Great Lakes*. The council had the same participation except for a Director of Energy and Climate Change.⁴

The Ocean Policy Committee is responsible for oversight over numerous subcom-

[Section 31:2]

¹10 U.S.C. § 8932. The committee as it existed at the time of the Thornberry National Defense Authorization Act for Fiscal Year 2021 is described in Executive Order No. 13840, *Ocean Policy to Advance the Economy, Security, and Environmental Interests of the United States*, 83 Fed. Reg. 29431 (June 19, 2018).

²10 U.S.C. § 8932; Exec. Order No. 13840, *Ocean Policy to Advance the Economy, Security, and Environmental Interests of the United States*, 83 Fed. Reg. 29431 (June 19, 2018). Additional agency representation includes participation from the Secretary of State, Secretary of Defense, Attorney General, Secretary of the Interior, Secretary of Agriculture, Secretary of Commerce, Secretary of Transportation, Secretary of Energy, Secretary of Homeland Security, Administrator of the Environmental Protection Agency, Director of the Office of Management and Budget, Administrator of the National Aeronautics and Space Administration, Director of the National Science Foundation, Director of National Intelligence, Chairman of the Joint Chiefs of Staff, Under Secretary of Commerce for Oceans and Atmosphere, Assistant Secretary of the Army (Civil Works), and Commandant of the Coast Guard.

³10 U.S.C. § 8932(i). Congressional committees include the Committee on Commerce, Science, and Transportation of the Senate; the Committee on Armed Services of the Senate; the Committee on Appropriations of the Senate; the Committee on Natural Resources of the House of Representatives; the Committee on Science, Space, and Technology of the House of Representatives; the Committee on Armed Services of the House of Representatives; and the Committee on Appropriations of the House of Representatives.

⁴Exec. Order No. 13547, *Stewardship of the Ocean, Our Coasts, and the Great Lakes*, 75 Fed. Reg. 43021 (July 19, 2010) (revoking Executive Order No. 13366, *Committee on Ocean Policy*, 69 Fed. Reg. 76589 (Dec. 17, 2004)).

mittees, programs, councils, interagency working groups, and teams. From an environmental protection perspective, two notable interagency groups include the U.S. Ocean Action Climate Plan Interagency Team and the National Strategy for a Sustainable Ocean Economy Interagency Team.

In 2023, the Ocean Policy Committee released the first U.S. Ocean Climate Action Plan.⁵ This plan has three major goals: (1) to achieve a carbon-neutral future through mitigation and carbon sequestration; (2) to accelerate nature-based solutions to reduce greenhouse gas emissions and store carbon; and (3) to enhance community resilience to ocean change with investments in coastal adaptation.⁶ The eight priority actions for the plan include:⁷

- *Expanding offshore wind and marine energy while monitoring for potential environmental and social impacts to inform design and deployment
- *Advancing “green” maritime shipping and ports to achieve the U.S. commitment of a goal of zero emissions from international shipping by 2050
- *Sequestering carbon in sub-seabed geological formations along the U.S. outer continental shelf (OCS)
- *Creating policy and standards for marine carbon dioxide removal, including evaluating environmental and social impacts of these technologies
- *Retaining coastal blue carbon and carbon sequestration as part of the effort to conserve at least 30% of U.S. lands and waters by 2030
- *Creating, connecting, strengthening, and expanding marine protected areas (MPAs) and their networks through engagement with the public, especially Indigenous communities, to advance climate-resilient MPAs
- *Planning for climate-ready fisheries, aquaculture, and fishing communities, including protecting and restoring ocean and coastal habitats and using offshore infrastructure for artificial reefs
- *Preparing coastal communities for the impacts of climate change through coastal resilience projects

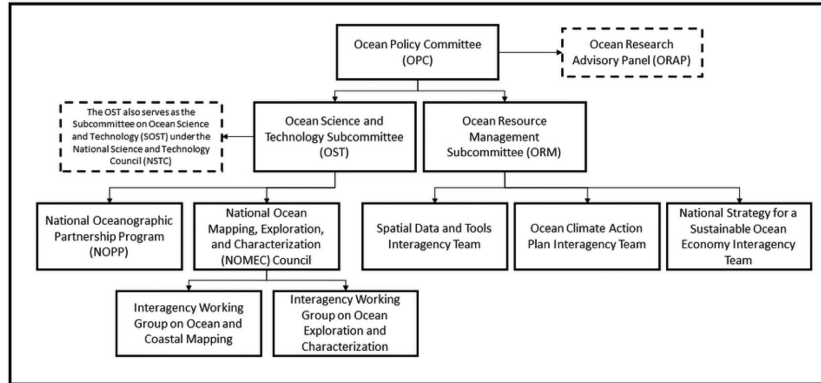

In pursuing these priority areas, several cross-cutting principles and actions will apply, including developing an Ocean Justice Strategy to identify barriers to and opportunity for integrating environmental justice into ocean protection efforts; engaging tribal nations and Indigenous persons through both formal and informal consultations; strengthening outreach and engagement with a broad range of stakeholders (private sector, academia, nongovernmental organizations (NGOs)); and prioritizing federal ocean research to support the priority area from the Ocean Climate Plan.⁸

In addition to the Ocean Policy Committee, there is an Ocean Research Advisory Panel reauthorized under the most recent version of the National Oceanographic Partnership Program.⁹ The panel includes between 10 and 18 members, including three individuals from the National Academies of Sciences, Engineering, and Medicine; individuals from ocean industries, state governments, tribal governments, territorial governments, and local governments; and individuals “eminent in the fields of marine science, marine technology, and marine policy.”¹⁰

II. OCEAN JURISDICTION—FEDERAL AND STATE

§ 31:3 General

Before 1945, all coastal countries asserted jurisdictional claims over ocean the realm. Because these claims varied from country to country, leading to the potential for conflicts between States claiming territorial interests and other States claiming high seas rights, the International Law Commission took steps in 1958 to codify a shared law of the sea. The first law of the sea conference efforts resulted in four Geneva Conventions: the Convention on the Territorial Sea and Contiguous Zone, the Convention on the Continental Shelf, the Convention on the High Seas, and the Convention on Fishing and Conservation of the Living Resources of the High Seas.¹ Issues over jurisdiction were not resolved by these conventions, and two subsequent conferences were held to create a more comprehensive treaty. At the third conference, the United Nations Convention on the Law of the Sea (UNCLOS) was negotiated for nearly a decade (1973-1982) and resulted in the current practices associated with ocean jurisdiction.² The United States is not a party to UNCLOS, but has accepted the jurisdictional limits established by this international treaty with the exception of the Area (the “Area” refers to the seabed floor and subsoil beyond limits of national jurisdiction).³ Figure 1 illustrates the UNCLOS jurisdictional zones.

§ 31:4 Internal waters

Internal waters are the waters on the landward side of the baseline from which the breadth of the territorial sea is measured. The waters are entirely under the sovereign control of a nation. States can exercise jurisdiction over foreign flagged merchant vessels within its internal waters and ports on the basis of a principle of territoriality.¹ Internal waters encompass rivers, bays, ports, and tidal waters above mean low water. Foreign vessels cannot exercise innocent passage in internal waters and must have U.S. permission to operate. Examples of inland waters include:

- A) Bays—The Chesapeake Bay and San Francisco Bay are examples of inland waters. They qualify as bays under the 1982 UNCLOS.² Generally, a bay is formed by curvature of the mainland, though sizable islands can be used to

⁹10 U.S.C. § 8931.

[Section 31:4]

¹RESTATEMENT (THIRD) OF FOREIGN RELATIONS § 512 cmt. h (Am. L. Inst. 1977).

²UNCLOS Article 10(2) defines a “bay” as “a well-marked indentation whose penetration is in such proportion to the width of its mouth as to contain landlocked waters and constitute more than a mere curvature of the coast.”

form a bay for purposes of determining internal waters.³ If a bay's mouth is 24 nautical miles or less, the mouth of the bay is the limit of the inland waters. However, if a bay's mouth is more than 24 miles in length, as is the case for Cook Inlet, Alaska, the United States is expected to construct a 24-mile line and enclose the maximum possible water area for its inland waters.

- B) Rivers—There is no limit on the width of a river. For purposes of measuring inland waters, jetties extending from natural riverbanks may be used for measuring the mouth of the river.⁴
- C) Ports—Ports are inland waters with the “outermost permanent harbour works which form an integral part of the harbour system” being regarded as “part of the coast.”⁵

§ 31:5 Baseline

The baseline for purposes of measuring other jurisdictional zones starts at zero miles, and is the boundary between the outer edge of internal waters and the territorial sea. It is not always straightforward how to draw baselines. “Naturally formed” features can be used for measuring baselines.¹ In the United States, a baseline is measured from the mean lower low water line along a coast as shown by an official U.S. nautical chart. The U.S. Supreme Court generally defers to the National Oceanic and Atmospheric Administration (NOAA) on defining baselines.²

Baselines can be ambulatory. Accretion and erosion can cause a change to a coastline. While a court may start with a nautical chart, evidence can be introduced to indicate that a baseline may have moved.³

Ed. 2d 619 (1981), supplemented, 574 U.S. 105, 135 S. Ct. 563, 190 L. Ed. 2d 514 (2014).

³U.S. v. Alaska, 521 U.S. 1, 22-32, 117 S. Ct. 1888, 138 L. Ed. 2d 231 (1997).

§ 31:6 Territorial Sea

The territorial sea is the ocean waters immediately adjacent to the coast of a nation measured out to 12 nautical miles.¹ Within this range,² the United States exercises its sovereign rights over air space, water columns, and seabed subject to certain rights associated with freedom of navigation, including innocent passage of vessels.³ The right of innocent passage is even extended to warships as long as they do not interfere with the peace and security of the coastal state.⁴ In the United States, the right of innocent passage is extended to submarines as long as they navigate on the surface showing a flag.⁵ Civil and criminal jurisdiction is limited over a vessel exercising “innocent passage” unless the activities impact the United States.

§ 31:7 State Interests

Lands under tidewaters have historically been under the control of coastal states. In the 1930s, the Supreme Court diverged from this perspective, holding that the United States had a superior interest to coastal states to ownership of the seabed in a region from mean low water line to three miles seaward.¹ Congress passed the Submerged Lands Act in 1953 to recognize that states have authority over “state waters,” extending three nautical miles from baselines, to use and manage resources in the water column, on the seabed, and under the seabed floor.² For historical reasons, Florida and Texas have been recognized as having authority over nine nautical miles (three marine leagues).³ Based on a historic statute, Puerto Rico also

[Section 31:6]

¹A nautical mile is approximately 1.1508 land-measured miles. A nautical mile equals one minute of latitude along the earth’s longitude and latitude grid. Because the curvature of the earth matters for marine navigation, and mariners already have to rely on longitude and latitude to locate themselves, a nautical mile is conveniently used for purposes of measuring ocean jurisdiction zones.

²President Ronald Reagan declared a 12-nautical-mile territorial sea for the United States in 1988. Proclamation No. 5928, Territorial Sea of the United States of America, 54 Fed. Reg. 777 (Jan. 9, 1988).

³All of the maritime zones described in this chapter also apply to the Commonwealth of Puerto Rico, Guam, American Samoa, the U.S. Virgin Islands, and other territories and possession over which the United States exercises sovereignty.

⁴Activities under Article 19(2) of UNCLOS that are considered to be prejudicial include “(a) any threat or use of force against the sovereignty, territorial integrity or political independence of the coastal State, or in any manner in violation of the principles of international law embodied in the Charter of the United Nations; (b) any exercise or practice with weapons of any kind; (c) any act aimed at collecting information to the prejudice of the defence or security of the coastal State; (d) any act of propaganda aimed at affecting the defence or security of the coastal State; (e) the launching, landing or taking on board of any aircraft; (f) the launching, landing or taking on board of any military device; (g) the loading or unloading of any commodity, currency or person contrary to the customs, fiscal, immigration or sanitary [health] laws and regulations of the coastal State; (h) any act of wilful and serious pollution contrary to [UNCLOS]; (i) any fishing activities; (j) the carrying out of research or survey activities; (k) any act aimed at interfering with any systems of communication or any other facilities or installations of the coastal State; [or] (l) any other activity not having a direct bearing on passage.”

⁵Convention on the Territorial Sea and the Contiguous Zone art. 14(6), Apr. 29, 1958, 516 U.N.T.S. 205.

[Section 31:7]

has a recognized nine-mile boundary.⁴

The Coastal Zone Management Act (CZMA), discussed below, provides for the development of a state coastal program appropriate for the given state that conforms with federal standards.

§ 31:8 Contiguous Zone

The contiguous zone is the zone adjacent to the territorial sea where a nation can assert some authority by implementing its customs, fiscal, immigration, and sanitary laws. The United States declared a 24-nautical-mile contiguous zone in 1999,¹ which provides the U.S. Coast Guard with authority to enforce U.S. coastal laws, including pollution laws against foreign flagged vessels operating in this area. Since 1999, the United States has interpreted the right to enforce U.S. domestic environmental and historic preservation (marine archaeology protection) laws within the contiguous zone in part on the basis of the protective principle of international law.² A foreign vessel does not need to assert a right of innocent passage during transit of the contiguous zone.

§ 31:9 Exclusive Economic Zone

The United States, after the conclusion of UNCLOS, declared that “the sovereign rights and jurisdiction of the United States” would be extended to reach 200 nautical miles from the coastal baseline.¹ The presidential power allowing for this proclamation is the constitutional authority for the president to represent U.S. interests in international affairs. Within this region, which is typically measured from 12 nautical miles to 200 nautical miles, the United States has sovereign rights to explore, exploit, conserve, and manage natural resources, including fish, wind, minerals, and oil. It can assert its natural resource protection laws within this zone in order to protect and preserve the marine environment.² Beyond the 24-nautical-mile contiguous zone, the United States does not assert control over vessel traffic, aircraft overflight, or the laying of cables and pipelines within this region.

Marine research in the exclusive economic zone (EEZ) requires advance consent and must be in conformity with existing U.S. law, including the Marine Mammal Protection Act (MMPA).³ Jurisdictional rights can reach temporarily beyond the

[Section 31:9]

¹Proclamation No. 5030, The Exclusive Economic Zone of the United States of America, 48 Fed. Reg. 10605 (Mar. 14, 1983).

²Under the Magnuson-Stevens Fishery Conservation and Management Act, the exclusive economic zone is measured from the outer seaward boundary of each of the coastal states to the 200-nautical-mile mark.

³Proclamation No. 5928, Territorial Sea of the United States of America, 54 Fed. Reg. 777 (Jan. 9, 1988) (“[n]othing in this Proclamation: (a) extends or otherwise alters existing Federal or State law or any jurisdiction rights, legal interests, or obligations derived therefrom.”).

EEZ if the United States is in “hot pursuit” of a vessel into the high seas or the EEZ of a neighboring State that has violated U.S. law within a zone under the U.S. immediate jurisdiction.⁴

In the U.S. EEZ, the Coast Guard is the lead agency for at-sea enforcement activities within the EEZ.

§ 31:10 High Seas

The high seas refer to all waters beyond the EEZ and not under the jurisdiction of another State.¹ Countries are expected to exercise governmental jurisdiction over their nationals (including both citizens and legal residents) and any vessels that have been authorized to fly their flag (“flagged vessels”) operating on the high seas.² Most of the world’s oceans are high seas. There are a number of freedoms associated with the high seas, including freedom of surface/submerged navigation, freedom of flight, freedom to fish, freedom to conduct scientific research, freedom to lay cable and pipe, and freedom to construct installations. Some of these freedoms have been restricted over time in light of the need for better management of the commons and to give “due regard” to the interests of other nations.³ For example, today regional fisheries management organizations assert conservation measures over stocks that transit the high seas, including highly migratory species such as tuna.⁴

In 2023, after negotiations that started almost 20 years previously, States adopted the United Nations (U.N.) High Seas Treaty to protect and sustainably use marine biodiversity in areas beyond national jurisdiction.⁵ The treaty is divided into several subparts and draws upon several general principles, including the precautionary principle/approach and the promotion of ecosystem resilience to maintain and restore ecosystem integrity.⁶ Part II of the treaty provides for equitable access and benefit sharing associated with genetic data of marine resources. States are prohibited from claiming sovereign rights over marine genetic resources beyond national jurisdiction.⁷ All States, regardless of their geographical location, have the right to undertake activities related to marine genetic resources in compliance with

⁴“Hot pursuit” is not permitted with the consent of a State into the territorial sea of another State. RESTATEMENT (THIRD) OF FOREIGN RELATIONS LAW § 513 cmt. g.

[Section 31:10]

¹About 61% of the ocean is not under national jurisdiction.

²*U.S. v. Arra*, 630 F.2d 836, 1982 A.M.C. 1216 (1st Cir. 1980) (vessels have nationality of country where they are registered and whose flag they have a right to fly); *U.S. v. Keller*, 451 F. Supp. 631 (D.P.R. 1978) (the United States will assert federal maritime jurisdiction over a vessel even if a vessel is only partially owned by a U.S. citizen). *See also* *U.S. v. Holmes*, 18 U.S. 412, 5 L. Ed. 122, 1820 WL 2141 (1820) (As a general rule, the United States will not assert federal criminal jurisdiction over offenses committed by foreigners or against foreigners on a foreign vessel.).

³UNCLOS art. 87(2).

⁴The United States is a Party to many regional fisheries management organization agreements, including the International Commission for the Conservation of Atlantic Tuna, the North Atlantic Salmon Conservation Organization, the Northwest Atlantic Fisheries Organization, the Western Central Atlantic Fisheries Commission, the Inter-American Tropical Tuna Commission, the North Pacific Anadromous Fish Commission, the Convention on the Conservation and Management of Pollock Resources in the Central Bering Sea, the Pacific Salmon Commission, the Western and Central Pacific Fisheries Commission, the International Pacific Halibut Commission, the South Pacific Regional Fisheries Management Organization, the North Pacific Fisheries Commission, and the Commission for the Conservation of Antarctic Marine Living Resources.

⁵Agreement Under the United Nations Convention on the Law of the Sea on the Conservation and Sustainable Use of Marine Biological Diversity of Areas Beyond National Jurisdiction, UN Doc. A/CONF.232/2023/4 (June 19, 2023) [hereinafter High Seas Treaty].

⁶High Seas Treaty art. 7.

⁷Under the High Seas Treaty, “marine genetic resources” refer to “any material of marine plant,

the treaty. States involved in collecting marine genetic material from the high seas are expected to notify a “clearing-house mechanism” before collection efforts and to, no later than one year from the collection, provide a report with any findings from the collection efforts. Parties are expected to provide additional information about utilization. Benefits from the genetic material are expected to be shared and can include both non-monetary and monetary benefits.⁸

The U.N. High Seas Treaty also creates, in Part III, a process for designating MPAs and other area-based management tools for globally protecting biodiverse regions. Under the treaty, decisions should be taken by consensus, but may be taken by a three-fourths majority if at least two-thirds of the Parties present and voting decide that “all efforts to reach consensus have been exhausted.”⁹ Parties may also take emergency measures to protect marine biological diversity from “serious or irreversible harm” due to “a natural phenomenon or a human-caused disaster.”¹⁰ Part IV of the treaty establishes processes for conducting environmental impact assessments for areas beyond national jurisdiction. These reports are expected to be available through the clearing-house mechanism.¹¹ These assessments should use best available science and scientific information to evaluate environmental impacts and associated economic, social, cultural, and human health impacts, not just for areas beyond national jurisdiction, but also for areas within national jurisdiction that may be impacted by high seas activities.¹² Parties are expected to prevent, mitigate, and manage potential adverse effects of a project.¹³ Under Part V of the treaty, nations with capacity will share knowledge and technologies with other nations. Finally, the treaty creates a new international authority for the high seas, a scientific and technical body, a Conference of Parties, and a clearing-house mechanism.¹⁴ Dispute settlement and enforcement mechanisms rely on both existing UNCLOS dispute mechanisms and a newly formed Implementation and Compliance Committee.¹⁵ It may be some time before the 2023 treaty goes into force.¹⁶

§ 31:11 Continental Shelf

In addition to the zones described above, the United States also asserts control over its continental shelf as an extension of its territorial jurisdiction. In 1945, President Harry S. Truman opined that the “Government of the United States regards the natural resources of the subsoil and seabed of the continental shelf. . . subject to its jurisdiction and control.”¹ Today, the United States asserts a continental shelf interest out to 200 nautical miles or the outer edge of the continental margin where

animal, microbial, or other origin containing functional units of heredity of actual or potential value.”

⁸High Seas Treaty arts. 14 and 51.

⁹High Seas Treaty art. 23.

¹⁰High Seas Treaty art. 24.

¹¹High Seas Treaty arts. 29 and 51.

¹²High Seas Treaty art. 31(b).

¹³High Seas Treaty art. 31(d).

¹⁴High Seas Treaty arts. 47, 49, 50, and 51.

¹⁵Under Part VIII, the treaty creates an Implementation and Compliance Committee, but the success of this committee depends on good faith reporting. Under Part IX of the treaty, Parties are advised to settle their disputes peacefully with reference back to the mechanisms provided in UNCLOS.

¹⁶High Seas Treaty art. 68. Sixty states must submit ratification, approval, acceptance, or accession instruments. As of 2024, 87 countries have signed the treaty, but only two countries—Chile and Palau—are Parties to the treaty.

[Section 31:11]

¹Proclamation No. 2667, Policy of the United States With Respect to the Natural Resources of the

there is a geological extension of the continental shelf beyond 200 nautical miles (e.g., extended continental shelf).² There is overlap between the U.S. EEZ interests and its continental shelf, as under both regimes the United States asserts interests over 200 nautical miles of seafloor and subsoil. In contrast to the EEZ, where UNCLOS encourages a coastal State to allow foreign vessels to catch excess fish that are not being caught by the coastal State,³ the continental shelf does not require the State asserting rights to allow for exploration or exploitation. Other States may navigate water above a continental shelf and lay submarine pipelines and cables on another State's continental shelf.⁴ As illustrated in Figure 2, the United States also asserts interests over extended continental shelves along portions of the Atlantic Coast, Gulf of Mexico, Bering Sea, the Arctic Ocean, the Northern Mariana Islands, and the Pacific Ocean. In December 2023, it announced geographic coordinates defining its asserted extended continental shelf covering 288,000 square nautical miles.⁵

FIGURE 2:

Map of the U.S. Claim for an Extended Continental Shelf

Subsoil and Sea Bed of the Continental Shelf, 10 Fed. Reg. 12303 (Oct. 2, 1945).

²See Part VI of UNCLOS. The continental shelf is usually measured out to 200 nautical miles unless there is an extended prolongation of the land mass. No extended continental shelf shall exceed 350 nautical miles from baselines or “100 nautical miles from the 2,500 metre isobath, which is a line connecting the depth of 2,500 metres.” UNCLOS art. 76(5).

³UNCLOS art. 62(2).

⁴UNCLOS arts. 78-79. For laying of pipelines, the continental shelf State can put measures on to avoid pollution and can choose the route of the pipeline.

⁵See U.S. Department of State, *The U.S. ECS*, <https://www.state.gov/the-us-ecs/> (last visited Apr. 29, 2024).

§ 31:12 Federal Environmental Law Referencing Different Jurisdictional Limits Than Those Adopted by Presidential Proclamations

Laws that were adopted before the presidential proclamations went into effect are not necessarily consistent with these jurisdictional zones. Some ocean-related statutes have been updated.¹ Others have not. Both the Clean Water Act (CWA) and the Oil Pollution Act (OPA) define the seaward limit of the “territorial seas” at three miles.² The Ocean Dumping Act also does not have a clear extension.³ There has been no effort to update these laws. Other laws use the term “territorial sea,” but rather than relying on U.S. presidential proclamations, they seem to be relying on the 1958 Convention on Territorial Sea, which was understood to have a contiguous zone of 12 miles from the baseline but only a three-mile territorial sea.⁴ Formal amendments would enhance clarity.

A practitioner looking at language in a statute can presume that terms such as “navigable waters of the United States,” “seaward boundary of a state,” “territorial limits of the United States,” “territorial sea,” “territorial waters,” or “waters subject to the jurisdiction of the United States” will be applied to the three miles of marine water from basepoints.

III. COASTAL ZONE MANAGEMENT ACT

§ 31:13 History and Purpose

After the Santa Barbara oil spill on January 28, 1969, impacted miles of coastline, the public pressured Congress to act and create the CZMA, which was designed to protect America’s coastlines while still allowing for prudent development.¹ States assert control over coastal waters and seabeds in conformity with the Submerged Lands Act.² The 1969 Stratton Commission was already in the process of reviewing policies related to oceans and coasts, and expressed concern that the coasts had increasingly unmanaged commercial, recreational, and residential development that was significantly impacting the ecological integrity of the coast.³

Most of the nation’s marine and Great Lakes coasts are governed by state coastal management programs. Participation under the Act is voluntary, and federal standards are not imposed if a state does not develop a plan that conforms with the federal guidelines. Almost every coastal state and territory participates and once their coastal zone management plan is approved, these entities can apply for federal

[Section 31:12]

¹See, e.g., 46 U.S.C. § 2101(23) (“‘navigable waters of the United States’ includes all waters of the territorial sea of the United States as described in Presidential Proclamation No. 5928 of December 27, 1988”); 16 U.S.C. § 1437(k) (“The area of application and enforceability of this chapter includes the territorial sea of the United States, as described in Presidential Proclamation 5928 of December 27, 1988, which is subject to the sovereignty of the United States, and the United States exclusive economic zone, consistent with international law.”).

⁴Ocean Dumping Act, 33 U.S.C. § 1402(b) (defining “ocean waters” to include waters “lying seaward of the base line from which the territorial sea is measured,” but never defining the territorial sea).

[Section 31:13]

¹CZMA, 16 U.S.C. §§ 1451-1466.

²43 U.S.C. §§ 1301-1315 (quitclaiming all federal property rights, but not reserved rights related to commerce/navigation, in the three-mile territorial sea to coastal states and confirming federal government rights for other waters and seabed floor).

³STRATTON COMMISSION, OUR NATION AND THE SEA (1969).

grants. Alaska does not participate in the federal program. Coastal states can legally challenge federal agency actions that are inconsistent with adopted plans (see Section 16 below on federal consistency).

The Act was amended in the 1970s in response to the energy crisis from the oil embargo to allow for more domestic energy development. It was amended again in 1990 to incorporate additional coastal management efforts, including the Coastal Nonpoint Pollution Control Program.⁴ The 1990 reauthorization amendments also created the Coastal Zone Enhancement Program, which focuses on eight areas of particular coastal concern, including coastal wetlands, development in high hazard areas, public access, marine debris control, impacts of cumulative and indirect impacts of coastal development, special area management planning, ocean resources planning, and coastal energy siting.⁵

§ 31:14 Coastal Zone Boundaries

The coastal zone for purposes of the CZMA is defined by an inland boundary, a seaward boundary, interstate boundaries, and areas that are excluded from the coastal zone. The inland boundary is defined by those lands that are necessary to be controlled in order to avoid any direct and significant impact on the state's coastal waters or that are likely to be impacted by or vulnerable to sea-level rise.¹ The inland boundary must include "waters under saline influence," salt marshes and wetlands, beaches, transitional and intertidal areas, and islands.² The inland boundary may include watersheds, "areas of tidal influence that extend further inland than waters under saline influence" (e.g., estuaries, deltas, and rivers), and Indian lands not held in trust by the federal government.³ In most places in the United States, the coastal management program will extend beyond just the immediate coastal zone. In some Pacific island regions, the entire state or territory is considered to be within the coastal zone boundary. Other factors that may determine the inland boundary, particularly in urbanized areas, are the "dependency of uses on water access" and "visual relationships."⁴ The lakeward or seaward boundary will be to the outer limit of state title and ownership under the Submerged Lands Act or other acts in the case of territories.⁵

Certain federal lands are excluded from the coastal zone, including lands controlled by the federal government through a lease or other instrument or that are held in trust by the federal government.⁶ A coastal zone permit may still be required for a nonfederal party who intends to conduct activities on excluded federal lands. Federal consistency review will be required for federal actions taken on federal lands excluded from the coastal zone boundary.⁷

Rep. 20563 (1987) ("even if all federal lands are excluded from the CZMA definition of 'coastal zone,' the CZMA does not

States are responsible for designing and implementing a coastal management program,¹ but are not required by the CZMA to create these programs.² See Table 1 for a list of approved coastal management programs. If a state opts to create a program,³ then the program must identify coastal resources that need to be managed or protected; have “specific, comprehensive, and enforceable” policies in place;⁴ determine “specific use and special geographic areas” subject to management;⁵ identify inland and seaward areas subject to the program;⁶ and provide for “consideration of the national interest in the planning for and siting of facilities that meet more than local requirements,” including energy facilities.⁷ The program must also include “legal authorities” and organizational arrangements for implementation, provide for public participation in permitting and consistency determinations, and contain enforceable policies to implement the Coastal Nonpoint Pollution Control Program.

Programs are expected to identify “special management areas,” which must include “areas of particular concern” and areas for preservation or restoration. “Areas of special concern” may include (1) “areas of unique, scarce, fragile or vulnerable habitat”; (2) areas of “unique or fragile, physical figuration” (Niagara Falls); (3) areas of “historical significance, cultural value, or scenic importance”; (4) areas of high natural productivity or essential habitat for fish and wildlife; (5) areas of substantial recreational value; (6) coastal-dependent facilities; (7) industrial or commercial development relying on unique “hydrologic, geologic or topographic significance” (oil industry); (8) competition between shoreline utilization and water uses; (9) areas subject to hazards; and (10) areas needed to replenish coastal lands and resources such as flood plains, aquifers, estuaries, coral reefs, beaches, and mangroves.⁸

The program must also include a planning process for shorefront access and “protection of, and access to public beaches and other public coastal areas,”⁹ plus a planning process for “assessing the effects of, and studying and evaluating ways to control, or lessen the impact of, shoreline erosion, including potential impacts of sea-level rise, and to restore areas adversely affected by such erosion.”¹⁰ The CZMA has been an important tool in ensuring that the public has access to state coastlines. For example, the California Coastal Act, which implements California’s responsibilities under the CZMA, includes § 30211, preventing development that interferes with the public’s right of access to the sea, including “the use of dry sand and rocky

automatically preempt all state regulation of activities on federal lands.”); *Secretary of the Interior v. California*, 464 U.S. 312, 323, 104 S. Ct. 656, 78 L. Ed. 2d 496, 20 Env’t. Rep. Cas. (BNA) 1201, 14 Env’tl. L. Rep. 20129 (1984) (CZMA is expected “to reach at least some activities conducted in those federal enclaves excluded”).

[Section 31:15]

¹16 U.S.C. §§ 1451 et seq.

²States typically participate in the development of coastal management programs because there is federal support for statewide management efforts, there are opportunities for learning from other states, and states have the ability to review federal actions that impact state coastal uses and resources for consistency with the state program.

³All coastal states except Alaska have a coastal management plan.

⁴15 C.F.R. § 923.1(c)(2).

⁵15 C.F.R. § 923.1(c)(3).

¹⁰15 C.F.R. § 23.25.

coastal beaches to the first line of terrestrial vegetation.”¹¹

State programs can vary greatly in terms of who participates in the decisionmaking as a lead agency and authority. Under a given coastal management plan, a permit may be required for a land use or a water use, including residential development, commercial development, industrial development, transportation, agriculture, recreation/tourism, marine-related facilities, and dredging. States can also use their management powers to regulate actions outside of the defined coastal zone boundary that impact coastal resources. Under the most common coastal management plan approach, state-level agencies, in compliance with state law, handle the planning and permitting, manage financial awards, and monitor the management of state coastal resources.¹² Where local governments have permitting authority, a state coastal management agency must ensure that local governments meet standards and criteria developed by a state. In this situation, a state coastal management agency must be prepared to take over from the local government.¹³ Under the management program, state or local staff members will review state or local permit applications to ensure that a permit will be issued consistent with the program.

Once a coastal zone management program has been developed, the U.S. Department of Commerce, through NOAA’s Office of Coastal Management, must determine whether the program meets the standards of the CZMA. The program must also be evaluated through environmental impact statements (EISs) produced under the National Environmental Policy Act.

The federal government then reviews the program on a regular basis to determine whether a state is implementing the approved program. Every review results in a written evaluation with an assessment of whether a state is properly implementing and enforcing an approved program. If a state is found to be out of compliance with its coastal zone management plan, then NOAA will work with the state on a schedule for compliance. Approval is not withdrawn unless a state fails to take actions to comply.¹⁴

Table 1: List of Approved Coastal Management Programs (CMPs) With Administrative Agencies and Jurisdiction

Coastal Management Program (date introduced)	Administration (lead agencies)	Jurisdictional Reach of CMP
Alabama Coastal Area Management Program (1979)	Alabama Department of Conservation and Natural Resources and Alabama Department of Environmental Management	Inland to the continuous 10-foot contour for two counties ¹⁵

¹¹California Coastal Act § 30211.

¹²An example of this approach is the Rhode Island Coastal Management Program, which operates through the Coastal Resources Management Council.

¹³An example of this approach is the Louisiana Coastal Management Program.

¹⁴16 U.S.C. § 1456; *State of Cal. By and Through California Coastal Com’n v. Mack*, 693 F. Supp. 821 (N.D. Cal. 1988). States have successfully appealed NOAA findings in reviews of coastal management programs. NOAA required California to prepare guidelines that would provide more precision for a party seeking a consistency determination on an activity on the outer continental shelf (OCS). The California Coastal Commission refused to create these guidelines and NOAA withheld funding. California prevailed in court against NOAA on the argument that its plan had been properly approved and that the proposed modification was a program change.

³⁷OHIO REV. CODE ANN. § 15.1506(A).

³⁸OR. ADMIN. R. 141-085-0510 (14).

Pennsylvania Coastal Management Program (1980)	Department of Environmental Protection	63-mile Lake Erie shore (from 900 feet in urban areas and up to three miles in rural areas) and Delaware River Estuary (from 660 feet in urban areas to 3.5 miles in rural areas) ³⁹
Puerto Rico Coastal Management Program (1978)	Department of Natural and Environmental Resources	1,000 meters inland and seaward up to 9 nautical miles, including islands and cays ⁴⁰
Rhode Island Coastal Management Program (1979)	Coastal Resources Management Council	Entire state (generally 200 feet inland from coastal feature) ⁴¹
South Carolina Coastal Management Program (1979)	Department of Health and Environmental Control	All lands within critical areas: coastal waters, tidelands, beaches, and dune system ⁴²
Texas Coastal Management Program (1996)	Coastal Coordination Advisory Committee in the General Land Office	Area seaward of Texas coastal facility designation line and up to three marine leagues into Gulf of Mexico ⁴³
U.S. Virgin Islands Coastal Management Program (1979)	Department of Planning and Natural Resources	Entire territory ⁴⁴
Virginia Coastal Management Program (1986)	Department of Environmental Quality	Includes 29 coastal counties, 17 cities, and 42 incorporated towns ⁴⁵
Washington Coastal Management Program (1976)	Department of Ecology	15 coastal counties ⁴⁶
Wisconsin Coastal Management Program (1978)	Bureau of Intergovernmental Relations and Wisconsin Coastal Management Council in the Department of Administration	15 counties facing Lake Superior, Lake Michigan, and Green Bay ⁴⁷

States can amend their approved coastal management program by requesting a review by NOAA, who must approve or reject an amendment within 120 days.⁴⁸ Until either 120 days has passed with no rejection or the amendment is approved, the amendment cannot be put into effect.⁴⁹

Under each plan, the public has the right to participate in coastal decisionmaking

as part of a plan's permit decision processes and consistency decisions.

§ 31:16 Federal Consistency

For every state with a federally approved coastal zone management plan, any applicant for a federal permit who wishes to conduct activities that will impact the land or water resources of the coastal zone directly or indirectly must certify to the federal permitting agency that the activity is consistent with the state's plan and submit to the state a copy of the certification.¹ No federal agency activities are "categorically exempt" from the federal consistency requirement.² Once a state has reviewed the submitted consistency certification, then it will inform the federal agency whether the certification is sufficient under the plan. If a state fails to provide feedback to a federal agency within six months of receiving the certification, then the proposed activity being permitted is presumed to be consistent with the state's plan.³

If the activity is exploration, development, or production on a lease under the Outer Continental Shelf Lands Act (OCSLA), a state is presumed to concur with the certification of an activity as consistent if it fails to respond within three months after receipt of a copy of certification.⁴ The Secretary of Commerce has the authority to override a state's objection if the activities in question are consistent with the CZMA or are necessary for national security.⁵ Federal consistency also applies for federal actions with reasonably foreseeable coastal effects that are not covered by an outer continental shelf (OCS) plan or do not require a permit or license.⁶ The term "effect on any coastal use or resource" is defined in the regulations as:

[A]ny reasonably foreseeable effect on any coastal use or resource . . . Effects are not just environmental effects, but include effects on coastal uses. Effects include both direct effects which result from the activity and occur at the same time and place as the activity, and indirect (cumulative and secondary) effects which result from the activity and are later in time or farther removed in distance, but are still reasonably foreseeable.⁷

Disputes over consistency determinations can be addressed either through a Department of Commerce mediation process or through an appeal process.⁸ Parties cannot proceed to litigation on a consistency decision without at least appealing the decision to NOAA. There is no citizen suit provision available under the CZMA.

§ 31:17 Coastal Nonpoint Pollution Control Program

States with federally approved coastal programs must submit a coastal nonpoint source pollution control program to the Secretary of Commerce and the U.S.

[Section 31:16]

¹16 U.S.C. § 1456(c)(3)(A).

²The CZMA was amended in 1990 to overturn the decision in *Secretary of the Interior v. California*, 464 U.S. 312, 104 S. Ct. 656, 78 L. Ed. 2d 496, 20 Env't. Rep. Cas. (BNA) 1201, 14 Env'tl. L. Rep. 20129 (1984), and make it clear that states could seek consistency reviews for activities taking place on the OCS, including oil and gas exploration and production. H.R. Rep. No. 101-964, at 970 (1990) (Conf. Rep.).

Environmental Protection Agency (EPA) for all measures intended to restore and protect coastal waters, including the use of best available economically achievable technology to address runoff from agriculture, silviculture, and cities, and the implementation of pollution controls associated with shoreline erosion, marinas, and recreational boating.¹ EPA, in consultation with NOAA and the Director of the U.S. Fish and Wildlife Service (FWS), publishes guidance for management measures associated with sources of nonpoint pollution in coastal waters.²

§ 31:18 Related CZMA Statute—Coastal Barrier Resources Act

In 1982, the Coastal Barrier Resources Act was passed to reduce development along coastal barriers (e.g., bay barriers, barrier spits, barrier islands) in order to protect aquatic habitats from waves and tides.¹ Under the Act, the Secretary of the Interior reviews maps with coastal barriers and updates them to reflect changes in size and location. No new federal expenditures should take place to provide human-support infrastructure (e.g., roads, boat landings, bridges, sewage plants), and no new federal flood insurance can be issued.² Federal funds may be used for exploration, extraction, or transportation of energy resources, and for maintenance of existing public roads and facilities.³

IV. MARINE MAMMAL PROTECTION ACT

§ 31:19 History and Purpose

Alarmed by the number of dolphins being killed as bycatch by the tuna purse seine fishery, Congress began hosting hearings about the conditions of marine mammals in 1971.¹ Congress agreed to take action with the adoption of the MMPA,² premised on the need to act to avoid extinction and to take action so that species will not “diminish beyond the point at which they cease to be a significant functioning element in the ecosystem of which they are a part.”³ The primary objective of management of marine mammals “should be to maintain the health and stability of the marine ecosystem. . . [and] it should be the goal to obtain an optimum sustainable population keeping in mind the carrying capacity of the habitat.”⁴

§ 31:20 General

The MMPA covers mammals that are either “morphologically adapted to the marine environment,” including whales, dolphins, porpoises, seals, sea otters, and manatees, or primarily inhabit the marine environment, like polar bears and

³16 U.S.C. § 1361(2).

⁴16 U.S.C. § 1361(6).

walruses.¹ The Act also covers any part of any such animal, including its fur or skin.

The MMPA is administered by the National Marine Fisheries Service (NMFS) (also known as NOAA Fisheries), who is responsible for cetaceans and all other pinnipeds excepts walruses. FWS is responsible for sea otters, manatees, walruses, polar bears, and other similar animals. The Marine Mammal Commission provides oversight, with three members appointed by the president.

The MMPA preempts state laws, including importation of any marine mammals that are less restrictive than the MMPA.² States can pass laws and regulations more restrictive than federal laws and regulations. States may be able to manage marine mammals, but must have a program recognized by the federal government in place that is capable of determining the population status of an affected species and articulating whether a taking will be permitted and under what conditions.³ Even if management authority is transferred, no taking is permitted until after a state conducts a hearing to determine if a species is within its “optimal sustainable population” range and how that level can be maintained if animals are taken.⁴

V. OCEAN DUMPING ACT (TITLES I AND II OF MARINE PROTECTION, RESEARCH, AND SANCTUARIES ACT)¹

§ 31:21 History and Purpose

The purpose of the Ocean Dumping Act is to regulate ocean disposal of materials in U.S. waters, including territories.¹ It specifically prevents or limits dumping of “any material which would adversely affect human health, welfare, or amenities, or the marine environment, ecological systems, or economic potentialities.”² The Act also regulates transportation plus “dumping” if the dumping occurs in “the territorial sea or the contiguous zone of the United States.”³ The Act was amended in 1988 to prohibit dumping of municipal sewage, industrial waste, and medical waste.

§ 31:22 Definitions

The Ocean Dumping Act is inclusive, covering “dredged material, solid waste, incinerator residue, garbage, sewage, sewage sludge, munitions, radiological, chemical, and biological warfare agents, radioactive materials, chemicals, biological and laboratory waste, wreck or discarded equipment, rock, sand, excavation, debris, and industrial, municipal, agricultural, and other waste.”¹ The Act does not cover “sewage from vessels” as regulated under the CWA. Oil is only regulated when it has been taken on board for the purpose of being dumped; a party cannot receive a

³33 U.S.C. § 1401(c).

[Section 31:22]

¹33 U.S.C. § 1402(c).

permit for dumping oil.²

“Dumping” is defined as a “disposition of material” unless the disposition is already regulated under the CWA, the Rivers and Harbors Act, or the Atomic Energy Act. “Dumping” does not cover “routine discharge of effluent incidental to the propulsion of, or operation of motor-driven equipment on, vessels.”³ “Dumping” likewise does not cover construction of fixed structures or other placement of devices for purposes other than disposal. Oyster shells may be deposited as long as they are done so for the purpose of “developing, maintaining, or harvesting fisheries resources” and are regulated under federal or state law.⁴

§ 31:23 Permits

Four federal agencies govern the Ocean Dumping Act, including EPA, the U.S. Army Corps of Engineers, NOAA, and the Coast Guard.

The Ocean Dumping Act requires the EPA Administrator to ensure compliance with the 1972 London Convention on the Prevention of Marine Pollution by Dumping of Wastes and Other Matters, which covers numerous materials, including mercury, DDT, polychlorinated biphenyls, and persistent plastics. EPA has primary authority and may issue permits for anyone transporting non-dredge material from the United States for purposes of dumping in ocean waters under U.S. jurisdiction. EPA also exercises authority over any non-dredge dumping activities by U.S. agencies or U.S.-flagged vessels, or any vessel sailing from a U.S. port transporting non-dredge materials. Permits are not available for radiological, chemical, and biological warfare agents; high-level radioactive waste; persistent inert synthetic materials that may float in the water and impact other ocean users; sewage sludges; industrial wastes; dangerous materials (e.g., mercury, cadmium, oil, carcinogenic material); or medical waste.¹ EPA designates specific ocean dumping sites.² All designated sites must have a site management and monitoring plan. Further requirements for permits are discussed further in Chapter 13, Sections 138-140. The Coast Guard is the agency generally engaged in enforcement. Citizen suits may be brought.

The Corps of Engineers takes primary authority for regulating ocean disposal of dredged spoils.³ Most ocean dumping today is dredged material associated with maintaining navigation. Sediments must be tested before dumping to ensure that the dumping activity will not cause significant harmful impacts to human health or the environment. The Corps’ review for health “impacts” is based on EPA developed criteria.

VI. NATIONAL MARINE SANCTUARIES ACT (TITLE III OF MARINE PROTECTION, RESEARCH, AND SANCTUARIES ACT)

§ 31:24 History and Purpose

The purpose of the National Marine Sanctuaries Act (Sanctuaries Act) is “to identify and designate” marine sanctuaries, which are of “special national significance,” and “to provide authority for comprehensive and coordinated conservation and management of these marine areas, and activities affecting them, in a manner

²33 U.S.C. § 1402(c).

³33 U.S.C. § 1402(f).

⁴33 U.S.C. § 1402(f).

[Section 31:23]

¹33 U.S.C. § 1412(a); 33 U.S.C. § 1414b.

²33 U.S.C. § 1412(c).

³33 U.S.C. § 1413.

which complements existing regulatory authorities.”¹ Original conceptions of marine sanctuaries proposed by the president’s Science Advisory Committee suggested that the sanctuaries might operate like designated wildernesses.² Early proposals for sanctuaries included bans on oil and gas drilling. The final version of the statute, which was signed into law on October 23, 1972, did not prohibit industrial developments within a designated sanctuary. The Sanctuaries Act has been controversial with environmental conservation groups, who are concerned that multiple uses in sanctuaries is incompatible with conservation needs. Oil and gas developers and commercial fishing industries have been concerned with sanctuary management plans inhibiting multiple uses within designated sanctuaries.

Congress has amended the Act numerous times over the years. Notable substantive amendments took place in 1980, 1992, and 2000. In 1980, governors from territories were given the same right as state governors in the designation process and requiring that all activities that would be subject to regulation within a geographic area to protect a marine sanctuary would be included within the terms of a designation. The Coast Guard was given the authority for enforcement actions within marine sanctuaries to ensure adequate compliance with sanctuary management plans. In 1988, Congress added a section providing that any person or vessel that causes damage to a sanctuary resource is liable for response costs, cleanup costs, and damages. Any civil penalties or damage costs were expected to be used for sanctuary restoration or reimbursements of costs associated with restoration.

In 1992, Congress passed the Oceans Act, which amended the Marine Protection, Research, and Sanctuaries Act by shortening the name of the Act to the National Marine Sanctuaries Act and by mandating cooperation with foreign countries and international organizations. The amendments also extended the jurisdiction of the Act to cover waters within the EEZ,³ recognized long-term monitoring and research as part of the purpose of sanctuaries, authorized advisory councils to be established to help assist the Secretary of Commerce in designating and managing sanctuaries,⁴ and allowed for an additional factor—whether existing regulatory authorities in the area are adequate—to be considered in determining whether to create a sanctuary.⁵

The amendments also hold an individual who destroys or injures any protected sanctuary resource liable (including *in rem* liability) to the United States for the response costs, damages, and interest on those costs.⁶ Other prohibited activities include violating any provision of any permit issued for activities within a national marine sanctuary, possessing a sanctuary resource illegally, or interfering with enforcement of the Act.⁷ The amendments also assigned to the Secretary of Commerce the authority to undertake response actions and issue civil penalties, and clarified that forfeited property can be used “to provide temporary storage, care, maintenance, and disposal of any sanctuary resource or other property seized in connection with a violation” of the Act.⁸ Remaining funds can be used to manage and improve the impacted marine sanctuary, pay a reward for an informant, or

manage any marine sanctuary.⁹

Minor amendments were made to the Act in 1996, including allowing for public-private partnerships between sanctuary programs and private companies. In 2000, Congress adopted more extensive amendments, including requiring the Secretary of Commerce, before designating a new sanctuary, to publish a finding that the new sanctuary will not have a negative impact on the sanctuary system as a whole because there are sufficient resources to implement existing sanctuary management plans.¹⁰ The section on prohibited activities further clarified that it was illegal to offer for sale, purchase, import, or export any sanctuary resource.¹¹ In addition to pre-existing civil penalties, criminal offenses were added for resisting or interfering with enforcement of the Act or submitting false information as part of an enforcement action.¹²

§ 31:25 Designation Process

Sanctuaries may be proposed by the Secretary of Commerce.¹ Congress may also designate marine sanctuaries.²

The Sanctuaries Act requires that any proposed sanctuary be listed in the *Federal Register*, including any proposed regulations to implement the sanctuary and a draft management plan.³ For a proposed sanctuary, a draft EIS must be prepared along with a resource assessment that will include the present and potential uses of the area.⁴ The draft management plan must include the terms of the proposed designation;⁵ proposed mechanisms to coordinate regulatory and management authorities; goals and objectives for managing sanctuary resources; responsibilities for management; resource studies; an evaluation of joint state/federal management if any part of the sanctuary is in the territorial limits of a state or within maritime limits of a state; and estimated costs associated with the designation.⁶ For each newly proposed sanctuary, the Secretary must publish a finding that the proposed new sanctuary will not have a negative impact on the overall sanctuary system because there are sufficient resources to implement all of the sanctuary management plans, including site characterizations.

In conjunction with the sanctuary designation, regional fishery management councils created under the Magnuson-Stevens Fishery Conservation and Management Act (MSA) are given the opportunity to prepare draft regulations for fishing within any waters that might overlap between a designated sanctuary and the EEZ. The fisheries regulations must rely on the national standards in the MSA as long as they are “consistent and compatible with the goals and objectives of the proposed

⁶16 U.S.C. § 1434(a)(2)(C).

designation.”⁷ The Secretary will make draft regulations if a council declines to make a decision on the need for regulations or “fails to prepare the draft regulations in a timely manner.”⁸

The public has the opportunity to be involved with at least one public hearing in the coastal area or areas most affected by the proposed designation of the area.⁹

Today, there are 15 existing sanctuaries, and several more have been proposed.¹⁰ Table 2 provides a list of existing sanctuaries as of May 2024 and their governing regulations.

Table 2: List of Existing National Marine Sanctuaries as of May 2024 With Governing Regulations

Name	Coastal Location	Year	Size (square miles)	Program Regulations and Management Plan
Monitor	North Carolina	1976	.78	15 C.F.R. 922 Subpart F

Wisconsin Shipwreck Coast ¹⁶	Wisconsin	2021	962	15 C.F.R. 922 Subpart T

Designations take effect usually no later than 30 months after the date of notice declaring the site to be an active candidate for sanctuary designation is published in the *Federal Register*.¹⁷ If the notice has not been published, then NOAA is expected to publish why findings have not yet been published. When a sanctuary has been designated, the Secretary does not have the right to terminate “any valid lease, permit, license, or right of subsistence use or of access” that legally exists on the date of designation.¹⁸ The exercise of a lease, permit, license, or right may be regulated by the Secretary “consistent with the purposes for which the sanctuary is designated.”¹⁹

§ 31:26 Federal Agency Consultations

For actions governed under a federal agency, including private activities that “are likely to destroy, cause the loss of, or injure any sanctuary resource,” the Sanctuaries Act requires federal agencies to provide a written statement describing activities and potential effects at least 45 days before an approval of an action.¹ NOAA requires that project proponents recommend “reasonable and prudent alternatives,” which may include moving the activity outside of the sanctuary boundaries.² These alternatives will be provided to an agency head who is expected to either follow the alternative or explain in writing why it will not be following the proposed alternatives.³

§ 31:27 Management Plans and Permits

Site-specific sanctuary management plans are created for each area with site-specific regulations, such as prohibiting the alteration of the seabed or the taking of marine mammals or birds. Specific rules can include being within 100 yards of a humpback whale.¹ Activities are permitted through the use of special use permits that provide “conditions of access to and use of any sanctuary resource.”² All permits must only allow for those activities that are “compatible with the purposes for which the sanctuary is designated and with protection of sanctuary resources” and that are conducted in a such a way “that does not destroy, cause the loss of, or injure

sanctuary resources.”³ Permits are renewed on a five-year basis.⁴

VII. MAGNUSON-STEVENSON FISHERY CONSERVATION AND MANAGEMENT ACT

§ 31:28 History and Purpose

After World War II, foreign fishing vessels harvested fish in the waters off the coast of the United States, impacting fishing communities. While the United States participated in negotiating a variety of treaties to address overfishing, these treaties were not fully implemented, and the United States became increasingly concerned about the sustainability of its coastal fisheries. In 1976, Congress adopted the MSA to extend U.S. fishery jurisdiction to 200 miles offshore, in keeping with developments under UNCLOS to create a maritime EEZ.¹ The original Act offered a large amount of discretion on how fisheries councils created under the Act might incorporate social, economic, or ecological factors into existing fishing levels.

The Act was revised in 1996 with the passage of the Sustainable Fisheries Act to ensure that councils make conservation of fish stocks their first priority in any fisheries management plan, develop plans to prevent overfishing, and restore stocks that are overfished. As part of the Act, every council was also required to identify essential fish habitat. In 2002, regulations related to essential fish habitat were adopted so that management councils could identify “habitat areas of particular concern” where ecological functions are vulnerable to degradation.² In 2006, the Act was amended again to ensure that councils take immediate actions to end overfishing.³

§ 31:29 Definitions

Under the MSA, “fish” refers to “finfish, mollusks, crustaceans, and all other forms of marine animal and plant life other than marine mammals and birds.”¹ “Fishing” refers to the action of catching, taking, or harvesting of fish in addition to “any operations at sea in support of, or in preparation for” the standard definition of fishing, and covers transshipment.² “Overfishing” refers to “a rate or level of fishing mortality that jeopardizes the capacity of a fishery to produce the maximum sustainable yield on a continuing basis.”³ The Secretary of Commerce determines if a fishery has been overfished or is approaching a condition of being overfished based on trends in fishing effort, fishery resource size, and other factors.⁴

“Maximum sustainable yield” is not defined in the Act, though it is understood in fisheries management practice to refer to the largest catch that can be harvested

³16 U.S.C. § 1441(c)(1), (c)(3).

⁴16 U.S.C. § 1441(c)(2).

[Section 31:28]

¹See *supra* Section 9 of this chapter. The 1983 presidential proclamation created a 200-mile EEZ that replaced the “fishery conservation zone” created by the original MSA. Proclamation No. 5030, The Exclusive Economic Zone of the United States of America, 48 Fed. Reg. 10605 (Mar. 14, 1983).

continuously from a stock under prevailing environmental and fishery conditions.⁵ The term “optimum,” as in “optimum yield,” which appears in the National Fishing Standard One and is a requirement of every fisheries management plan, refers to the amount of fish providing “greatest overall benefit to the Nation” for food production and recreation while “taking into account the protection of marine ecosystems.”⁶ The maximum sustainable yield is expected to be readjusted based on any “relevant social, economic, or ecological factor.”⁷ If a fishery needs to be rebuilt, then “optimum” refers to the number of fish necessary “for rebuilding to a level consistent with producing the maximum sustainable yield in such fishery.”⁸

“Essential fish habitat” refers to all “waters and substrate necessary to fish for spawning, breeding, feeding or growth to maturity.”⁹ Fisheries management plans must include the habitat or habitat types for each life stage of a managed species. Notably, “[i]f a species is overfished and habitat loss or degradation may be contributing to the species being identified as overfished, all habitats currently used by the species may be considered essential in addition to certain historic habitats that are necessary to support rebuilding the fishery and for which restoration is technologically and economically feasible.”¹⁰

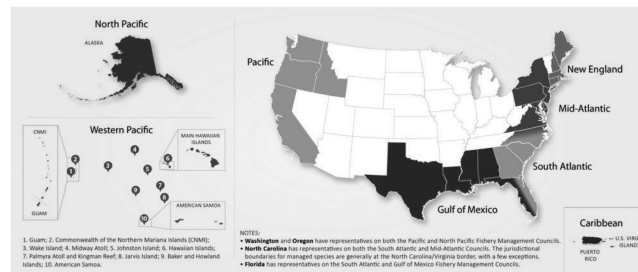

Notably, the MSA covers bycatch but defines it as “fish which are harvested in a fishery, but which are not sold or kept for personal use, and includes economic discards and regulatory discards.”¹¹ This definition does not include incidental catch such as birds and turtles.

§ 31:30 Regional Fishery Management Councils

The MSA created eight regional fishery management councils that are responsible for developing management plans.¹ Figure 3 provides a map of all of the councils.

FIGURE 3:

¹North Pacific Fishery Management Council (<https://www.npfmc.org/>); Pacific Fishery Management Council (<https://www.pcouncil.org/>); Western Pacific Management Council (<http://wpcouncil.org/>); Gulf of Mexico Management Council (<https://gulfcouncil.org/>); Caribbean Fishery Management Council (<https://caribbeanfmc.com/>); South Atlantic Fishery Management Council (<https://safmc.net/>); Mid-Atlantic Fishery Management Council (<https://www.mafmc.org/>); New England Fishery Management Council (<https://www.nefmc.org/>).

Each council is organized individually. There is a Council Coordination Committee that meets twice a year to discuss issues relevant to the implementation of the MSA. Every council is expected to adhere to 10 “national standards” (listed in Section 31 below) when designing its fishery management plans. Table 3 provides a list of the existing councils and the fishery management plans that they are responsible for reviewing and implementing.

Table 3: Organization and Fishery Management Plans Under the Review of U.S. Regional Fishery Management Councils

Fishery Management Council (headquarter)	Jurisdiction	Organization*	Fishery Management Plans
New England (Newburyport, Massachusetts)	Federal waters (3 to 200 nautical miles) off Maine, New Hampshire, Massachusetts, Rhode Island, and Connecticut	18 voting members: Regional Administrator of Greater Atlantic region; 5 state officials; 12 members nominated by governors and appointed by Secretary of Commerce	Northeast Multispecies Atlantic Sea Scallop Monkfish (joint) Atlantic herring Skates Small Mesh Multispecies Deep-Sea Red Crab Spiny Dogfish (joint) Atlantic Salmon
Mid-Atlantic (Dover, Delaware)	Federal waters off New York, New Jersey, Pennsylvania, Delaware, Maryland, and Virginia	21 voting members: 7 from states' fish and wildlife agencies; 13 private citizens knowledgeable in “recreational fishing, commercial fishing, or marine conservation”	Summer Flounder/Scup/Black Sea Bass Mackerel (Atlantic and chub)/Squid (longfin and Illex)/Butterfish Surfclam/Ocean Quahog Bluefish Golden and Blueline Tilefish Spiny Dogfish (joint) Monkfish (joint)
South Atlantic (Charleston, South Carolina)	Federal waters off North Carolina, South Carolina, Georgia, and east Florida to Key West	17 members: Southeast Regional Administrator of NMFS; designees of South Atlantic state marine resource agencies; 8 citizens (2 per state)	Coastal Migratory Pelagics (Mackerels) Coral and Live Bottom Habitat Dolphin Wahoo Golden Crab Sargassum Shrimp Snapper Grouper Spiny Lobster
Gulf of Mexico (Tampa, Florida)	Federal waters off the coasts of Louisiana, Mississippi, Alabama, Texas, and west coast of Florida	17 voting members: Southeast Regional Administrator of NMFS; designees of Gulf state marine resource management agencies; 11 members nominated by state governors and appointed by Secretary of Commerce	Coastal Migratory-Pelagics Coral Essential Fish Habitat Red Drum Reef Fish Shrimp Spiny Lobster Stone Crab
Caribbean (San Juan, Puerto Rico)	EEZ off Puerto Rico and U.S. Virgin Islands	7 voting members: Southeast Regional Administrator of NMFS; 4 members appointed by Secretary of Commerce on recommendations of governors; 2 principal officials from Puerto Rico and U.S. Virgin Islands responsible for marine fisheries	Puerto Rico St. Croix St. Thomas/St. John

Pacific (Portland, Oregon)	Federal waters off Washington, Oregon, and California	14 voting members: chosen by governors of the four states (including Idaho) and always includes state and tribal representatives	Fishery Ecosystem Plan Salmon Groundfish Coastal pelagic species Highly migratory Species
Western Pacific (Honolulu, Hawai'i)	Federal waters off Hawai'i, America Samoa, Guam, Commonwealth of Northern Mariana Islands, and 8 additional islands (Howland Island, Kingman Reef, Jarvis Island, Baker Island, Wake Island, Johnston Atoll, and Palmyra Atoll)	13 voting members: 8 members appointed by governors and approved by Secretary of Commerce; 4 state officials; representative from NMFS	America Samoa Hawai'i Mariana Pacific Remote Islands Area Pelagic
North Pacific (Anchorage, Alaska)	Federal waters in the Gulf of Alaska, Bering Sea, and Aleutian Islands	11 voting members: 7 members appointed by Secretary of Commerce on recommendation of governors of Alaska and Washington; 3 officials from Alaska and Washington and Oregon; Alaska Regional Director of NMFS	Bering Sea/Aleutian Islands Groundfish Gulf of Alaska Groundfish Bering Sea/Aleutian Islands Crab Scallop Salmon Arctic Fishery Management Area

*Many of the councils have four non-voting members comprised of representatives of other commissions with jurisdiction over the stocks being managed (e.g., Atlantic States Marine Fisheries Commission, Gulf States Marine Fisheries Commission, or Pacific States Marine Fisheries Commission²), the U.S. Fish and Wildlife Service, the U.S. Department of State, and the U.S. Coast Guard.

§ 31:31 Fishery Management Plans

Unless the fishery is overfished, every fishery management council has the discretion to decide whether a particular fishery needs to have conservation and management measures.¹ If the fishery is overfished, a council must submit a plan, plan amendment, or proposed regulations to end or prevent overfishing and to rebuild the overfished stock.² When the council either decides to act or is required to act, it must develop a fishery management plan that includes some basic economic and scientific information,³ management objectives,⁴ and management measures.⁵ The public is invited to comment on these plans during a 60-day notice-and-comment period,

²These commissions were set up as interstate compact agencies by acts of U.S. Congress in the 1940s. The Atlantic States Marine Fisheries Commission includes members from Maine, New Hampshire, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, North Carolina, South Carolina, Georgia, and Florida. The Gulf States Marine Fisheries Commission includes members from Texas, Louisiana, Mississippi, Alabama, and Florida. The Pacific States Marine Fisheries Commission includes participation from California, Oregon, Washington, Idaho, and Alaska. These commissions do not have regulatory or management authority.

[Section 31:31]

¹16 U.S.C. § 1852(h).

²16 U.S.C. § 1854(e)(3).

³16 U.S.C. § 1853(a)(2) (information that must be covered includes number of vessels, fishing gear types, actual/potential revenues of the fishery, nature and extent of foreign fishing rights, exis-

after which NOAA has 30 days to approve, disapprove, or partially approve the plan.⁶ If NOAA fails to act in this period, the plan is presumed to be approved.

Every plan must have “objective and measurable criteria” to determine whether or not a particular fishery is deemed to be overfished and needs to be rebuilt.⁷ Catch limits are established annually to reflect fishing level recommendations by scientific committees or other equivalent process with or without peer review.⁸ Plans must also include a standardized reporting methodology for bycatch.⁹ Further, plans must be consistent with the following 10 “national standards” of fishery management:

- (1) Conservation and management measures shall prevent overfishing while achieving, on a continuing basis, the optimum yield from each fishery for the United States fishing industry.
- (2) Conservation and management measures shall be based upon the best scientific information available.
- (3) To the extent practicable, an individual stock of fish shall be managed as a unit throughout its range, and interrelated stocks of fish shall be managed as a unit or in close coordination.
- (4) Conservation and management measures shall not discriminate between residents of different States. If it becomes necessary to allocate or assign fishing privileges among various United States fishermen, such allocation shall be (A) fair and equitable to all such fishermen; (B) reasonably calculated to promote conservation; and (C) carried out in such manner that no particular individual, corporation, or other entity acquires an excessive share of such privileges.
- (5) Conservation and management measures shall, where practicable, consider efficiency in the utilization of fishery resources; except that no such measure shall have economic allocation as its sole purpose.
- (6) Conservation and management measures shall take into account and allow for variations among, and contingencies in, fisheries, fishery resources, and catches.
- (7) Conservation and management measures shall, where practicable, minimize costs and avoid unnecessary duplication.
- (8) Conservation and management measures shall, consistent with the conservation requirements of this chapter (including the prevention of overfishing and rebuilding of overfished stocks), take into account the importance of fishery resources to fishing communities by utilizing economic and social data that meet the requirements of paragraph (2), in order to (A) provide for the sustained participation of such communities, and (B) to the extent practicable, minimize adverse economic impacts on such communities.
- (9) Conservation and management measures shall, to the extent practicable, (A) minimize bycatch and (B) to the extent bycatch cannot be avoided, minimize the mortality of such bycatch.

tence of Indian treaty fishing rights); 16 U.S.C. § 1853(a)(7) (information that must be covered includes description of essential fish habitat for a fishery, including spawning, breeding, and feeding regions, and steps to preserve habitat).

⁴16 U.S.C. § 1853(a)(3) (“maximum sustainable yield and optimum yield from, the fishery”).

⁵16 U.S.C. § 1853(a)(11) (reducing bycatch); 16 U.S.C. § 1853(a)(10) (plan for preventing overfishing and rebuilding a fishery); 16 U.S.C. § 1853(a)(15) (establishing annual catch limits, implementing regulations or annual specifications to prevent overfishing).

⁶16 U.S.C. § 1854(a)(3).

⁷16 U.S.C. § 1853(a)(10).

⁸16 U.S.C. § 1852(h)(6), (g)(1)(E).

⁹16 U.S.C. § 1853(a)(11).

- (10) Conservation and management measures shall, to the extent practicable, promote the safety of human life at sea.¹⁰

The national standards may appear to create conflicts. In such an instance, National Standard One will prevail because it aligns most closely with the purpose and objective of the MSA to prevent overfishing and rebuild stocks.¹¹ Effective actions to end overfishing must have a more than 50% chance of succeeding to meet MSA standards.¹² Councils have some flexibility in how they interpret the standards given the language “to the extent practicable.”

In an essential fish habitat, councils have a number of options for managing adverse effects due to fishing, including fishing equipment restrictions, time closures, area closures, and harvest limits.¹³ A fishery management plan should also address non-fishing activities that may adversely impact the essential fish impacts, cumulative impacts, conservation and enhancement actions, prey species, habitat areas of particular concern, and research and information needs.¹⁴

If a fishery needs to be rebuilt, then the council must announce a time period by which the trend of overfishing will be reversed and stocks will be rebuilt. This period should be “as short as possible, taking into account the status and biology of any overfished stocks of fish, the needs of fishing communities, recommendations by international organizations. . . , and the interaction of the overfished stock of fish within the marine ecosystem.”¹⁵

In addition to the mandated portions of a fishery management plan, councils can decide to include other mechanisms, including setting a cap on the number of vessels that participate in a fishery¹⁶ or creating a limited access privilege program with individual quotas for fishermen that can be revoked by the government.¹⁷ In order to create a “limited access” program, a council must demonstrate that the program will contribute to rebuilding or reducing capacity.¹⁸ The time period should be within 10 years, unless the “biology of the stock of fish, other environmental conditions, or management measures under an international agreement” suggest that 10 years is not feasible.¹⁹

Changes to a fishery management plan can be made by amendment as long as the amendments are consistent with meeting the national standards.²⁰ If a council fails to provide a plan and NOAA Fisheries determines that conservation measures are needed for a fishery, then NOAA Fisheries has the power to take over management

of a fishery.²¹ Likewise, if NOAA Fisheries decides that a fishery is overfished, it may implement a fishery management plan, if a council after notification fails to submit its rebuilding plan within one year.²²

§ 31:32 Citizen Challenges

Citizens can challenge fishery management plans and regulations to implement such plans in federal court under the Administrative Procedure Act.¹ It has been difficult to bring these challenges, and agencies are given deference if they provide scientific rationales for their conservation and allocation decisions.² Fishing communities have brought challenges querying whether the councils have taken adequate regard of fishing communities and minimizing adverse economic impacts. The courts have emphasized that conservation of stocks to address or avoid overfishing is a primary goal of the MSA with all of the national standards supporting this goal.³ NMFS must address economic impact, but it does not have to make individualized assessments for each geographic location; it can conduct an analysis of the impact of a plan as a whole.⁴

The Court of Appeals for the Federal Circuit did not find a takings claim for a fishing operation when a vessel permitted to harvest and process fish under a permit issued under an MSA limited access privilege program was constrained by harvesting restrictions under a waiver to the Jones Act.⁵ Marine permits are revocable privileges and not compensable property interests.

§ 31:33 Foreign Fishing

While the MSA primarily functions as domestic fishing legislation, it also governs the actions of foreign fishing in the U.S. EEZ. If there is additional capacity after domestic harvesting as determined in a fishery management plan, a foreign fishing vessel based on a fishing treaty may be able to participate in a U.S. fishery subject to a variety of conditions (e.g., deploying vessel monitoring systems or using fisheries observers).¹ Foreign fishing is not authorized from a vessel whose nation does

not extend “substantially the same fishing privileges” to U.S. fishing vessels.²

§ 31:34 Port State Measures Implementation Act

As the second largest exporter of fish in the world, the United States may be contributing to global illegal, unreported, and unregulated fishing as traceability is problematic in many fisheries. The United States is a Party to the Food and Agriculture Organization’s Agreement on Port State Measures to Prevent, Deter, and Eliminate Illegal, Unreported, and Unregulated Fishing.¹ This treaty created minimum standards for port states to control foreign fishing vessels and foreign transport ships supporting fishing vessels. The agreement was implemented into U.S. law by the Port State Measures Implementation Act.² Under the Act, NOAA and the Coast Guard were empowered to designate ports where fishing vessels and fishing-support vessels may enter and request confirmation that fishing cargo is taken in compliance with conservation and management measures.³ The Secretary of the Department of Homeland Security may deny entry to a vessel to a U.S. port for landing, transshipment, processing of fish, refueling, resupplying, maintenance or drydocking if it is a listed illegal, unreported, or unregulated (IUU) fishing vessel, or if the Secretary of Commerce believes that a given vessel may have engaged in IUU fishing.⁴ Vessels may be allowed entry if it is essential for the safety or health of the crew, safety of the vessel, scrapping of the vessel, or in conjunction with an inspection or enforcement action.⁵ The Secretary of Commerce has both civil and criminal enforcement authority under the Act. For enforcement purposes, there is a rebuttable presumption that “all fish, or components thereof, found on board a vessel that is used or seized . . . were taken, obtained, or retained as a result of IUU fishing or fishing-related activities in support of IUU fishing.”⁶

§ 31:35 Other Fishery Related Laws

Congress has adopted a number of other specific fisheries related laws that are part of U.S. fisheries management. U.S. obligations under the International Convention for the Conservation of Atlantic Tunas (ICCAT) have been domesticated into U.S. laws through the Atlantic Tunas Convention Act. Under this Act, the United States authorizes implementing ICCAT recommendations to be implemented under the MSA.¹

The Northern Pacific Halibut Act domesticates U.S. responsibilities under the Convention for the Preservation of the Halibut Fishery of the Northern Pacific Ocean and Bering Sea.²

Congress passed the Billfish Conservation Act in 2012 and amended it in 2018 to prohibit individuals from generally offering billfish (with an exemption for swordfish)

or billfish products for sale or having custody, control, or possession of these fish and related products.³ Exceptions are made for billfish caught by U.S. fishing vessels and landed and retained in Hawaii or the Pacific Insular Areas, as well as billfish landed by foreign vessels in the Pacific Insular Areas that are exported to markets outside the United States or retained within Hawaii and the Pacific Insular areas for local consumption.⁴

In 1987, Congress passed the Driftnet Impacting Monitoring, Assessment, and Control Act.⁵ Beginning in 2022, NOAA began a five-year transition period to phase out the use of large-scale driftnet fishing.⁶ The United States has been committed for decades to a moratorium on large-scale driftnet fishing on the high seas.⁷ Since 1993, it has denied port privileges to vessels deploying large-scale driftnets on the high seas as part of the High Seas Driftnet Fisheries Enforcement Act.⁸

In 2010, the United States adopted the Shark Conservation Act requiring better implementation of shark conservation efforts, including prohibitions on the removal of shark fins and discarding of shark carcasses at sea.⁹ The United States enforces shark conservation mechanisms under provisions already adopted as part of the High Seas Driftnet Fishing Moratorium.

The Whaling Convention Act implements U.S. obligations under the International Convention for the Regulation of Whaling, including the current moratorium on commercial hunting.¹⁰ Subsistence hunting is permitted and licensed under this Act.¹¹

In addition to the efforts under the Port State Measures Implementation Act, the United States has adopted the Seafood Import Monitoring Program, which requires importers to provide traceability data for 13 species groups, to combat IUU fishing.¹² Different entities provide different information for the record.¹³

VIII. ACT TO PREVENT POLLUTION FROM SHIPS

§ 31:36 History and Purpose

Ships are responsible for a significant portion of water and air pollution at sea, including up to 18-30% of global nitrogen oxides and 9% of sulfur oxides. The Act to Prevent Pollution From Ships was passed in 1980 to implement the International Convention for the Prevention of Pollution From Ships (MARPOL 73/78), a treaty developed through the International Maritime Organization. This Act focuses on both operational discharges from oceangoing ships flagged to the United States and

¹¹16 U.S.C. § 916d; 50 C.F.R. § 230.5.

¹²500 C.F.R. § 300.324. Species subject to the program include Atlantic cod, Atlantic blue crab, mahi mahi, grouper, red king crab, Pacific cod, red snapper, sea cucumbers, sharks, shrimp, swordfish, and tunas (albacore, bigeye, skipjack, yellowfin, and bluefin).

¹³Producing entities must provide name and flag state of harvesting vessels, evidence of authorization to fish or farm, vessel identifier, name of aquaculture facility, and type of fishing gear used. For each shipment, the shipper must provide species of fish, landing dates, point of landing, quantity of product, areas of wild-capture or harvest, and names of groups that received fish. Importers must include names and affiliations, international fisheries trade permit numbers, information on transshipment, and records on processing, re-processing, and commingling of products.

foreign-flagged vessels while they are located in designated U.S. waters. The Act was most recently updated in 2008 to include restrictions on vessel air pollution.

§ 31:37 Implementation of MARPOL Annexes

MARPOL has six annexes covering different sources of operational pollution. The United States implements five of the six annexes (oil, noxious substances, hazardous substances in packaged form, garbage, and air pollution). It enforces Annex I on oil and Annex II on noxious liquid substances. These annexes require ships to limit discharges, monitor for discharges, and keep reports on discharges and transfers (e.g., oil record books).¹ A vessel that is more than 12 nautical miles from land may discharge oil as long as it meets certain criteria, such as the oil does not originate from cargo pump room bilges, the oil is not mixed with oil cargo residues, the vessel is not within a special area, the vessel is proceeding, the effluent without dilution contains less than 15 parts per million, and the ship has appropriate oil separation equipment.² Within three nautical miles of the shore, the CWA applies and a discharger must notify U.S. agencies in the case of a discharge. The U.S. agencies will notify state agencies.³ A vessel that is less than 12 nautical miles from land may also discharge oil subject to additional equipment requirements.⁴ Annexes I and II apply to all ships operating within the internal waters and the territorial sea of the United States.⁵

Annex V of MARPOL regulates garbage disposal and prohibits any dumping of plastic or garbage mixed with plastic in U.S. jurisdictional waters.⁶ It applies to all ships operating within the internal waters, territorial sea, and EEZ of the United States.⁷ Limited exceptions are made for U.S. Armed Forces ships, including Coast Guard and Navy vessels.⁸ Depending on a vessel's location, what is legal to dump varies. For example, food waste, cargo residues, and cleaning agents that are not dangerous to the marine environment may be discharged beyond 12 nautical miles.⁹

Annex VI of MARPOL applies to air emissions from ships. Based on this annex, the United States requires limits on nitrogen oxides from marine diesel engines and limits on sulfur content within marine fuels. Non-U.S. ships may be inspected under the U.S. port state control jurisdiction. EPA and the Coast Guard enforce penalties against U.S. and foreign flagged ships that violate emission standards within the U.S. EEZ or the North American and U.S. Caribbean Sea Emissions Control Area.¹⁰ To be subject to U.S. law, foreign flagged ships must be either operating under the authority of a Party to Annex VI or be in or en route to a U.S. port, shipyard, offshore terminal, or internal waters.

The United States is not a party to Annex IV of MARPOL and relies instead on

§ 312 of the CWA to regulate sewage discharges from vessels within U.S. navigable waters. The Shore Protection Act of 1988 also governs certain sewage discharges related to municipal and commercial waste.¹¹

§ 31:38 Enforcement

EPA and the Coast Guard enforce the Act to Prevent Pollution From Ships through a combination of civil penalties and criminal enforcement mechanisms. Because it is notoriously difficult to detect certain pollution evasion tactics on vessels, the Act provides for payments of up to half of the assessed penalties to whistleblowers who provide information about falsified recordkeeping, manipulation of monitoring systems, garbage dumping, and other violations that may lead to penalties.¹ Citizen suits are possible under the Act.²

IX. OIL POLLUTION ACT

§ 31:39 History and Purpose

Adopted in the wake of the catastrophic Exxon Valdez spill that significantly impacted ecosystems within the Prince William Sound in Alaska after spilling 11 million gallons of crude oil, OPA addresses prevention, response, and compensation for oil pollution from both vessels and facilities that are located in U.S. waters, including the U.S. EEZ.¹ In terms of prevention, every operator of an oil handling, storage, or transportation facility must have an “oil-spill response plan,” which will address the availability of spill containment and cleanup equipment.²

§ 31:40 Definitions

OPA applies to oil of any kind or in any form as long as it does not contain hazardous substances that are subject to the Comprehensive Environmental Response, Compensation, and Liability Act.¹ Under OPA, there are a variety of potentially responsible parties. In relation to a vessel, a responsible party includes any person who owns, operates, or demise charters the vessel as well as any owner of oil being transported in a tank vessel with a single hull.² In the case of offshore facilities, such as an oil rig, the lessee or permittee of an area where the facility is located or the holder of an easement in state waters or on the OCS is a responsible party.³ Foreign facility owners and leaseholders, deepwater port licensees, and pipeline owners may also be responsibility parties.

§ 31:41 Liability

Responsible parties who discharge or have a substantial threat of discharging oil from a vessel or facility are held liable for removal costs and damages, including

costs incurred by any person that are consistent with the National Contingency Plan.¹ There is no liability under OPA for discharges that have been permitted by federal, state, or local law, or are from a public vessel.² Damages that are covered include destruction of natural resources, economic losses from destroyed real or personal property, loss of subsistence use of a natural resource, lost revenues, lost profits and impaired earning capacity, and increased public services during or after removal activities.³

Liability for natural resource damages is limited to the U.S. government, states, Indian tribes, and foreign governments.⁴ For these types of damages, payments may include “the cost of restoring, rehabilitating, replacing or acquiring the equivalent of the damaged natural resource,” the decrease in value of natural resources during the restoration phase, and the cost of assessing the damages.⁵

Different liability for removal costs is assigned for different classes of vessels.⁶ For example, a double-hulled tank vessel is limited in liability to \$16 million if it is larger than 3,000 gross tons or \$4 million if it less than 3,000 gross tons.⁷ Other non-tanker vessels are limited to a cap of \$800,000 in damages. Mobile offshore drilling units are initially treated as tank vessels, but are subsequently treated as facilities for liability if removal costs and damages from an incident exceed the cap for vessels.⁸ The president establishes through regulation the liability limits for onshore facilities.⁹

Where a responsible party is incapable or unwilling to respond to a significant oil discharge, the government may intervene and use trust funds to respond. These trust funds come from a tax on oil. The lead response agency for spills in coastal waters and deepwater ports is the Coast Guard; EPA has jurisdiction over oil spills occurring within inland waters.¹⁰

X. OTHER CONTINUING PRIORITY ISSUES FOR U.S. OCEAN GOVERNANCE AND THE ENVIRONMENT

§ 31:42 Coastal and Marine Spatial Planning

Coastal and marine spatial planning (CSMP) is a topic of increasing interest among ocean users. The concept of CSMP is to identify existing and future uses of ocean, coastal, and Great Lakes regions and identify mechanisms for reducing conflict, reducing environmental impacts, and protecting ecosystem services. In 2010, the president’s Interagency Ocean Policy Task Force recommended a framework for effective CSMP to address user conflicts and sustainable use of

¹⁰40 C.F.R. pt. 112.

ocean, coastal, and Great Lakes resources.¹ The 2010 Task Force hoped that CSMP would provide for a more comprehensive and ecosystem-based approach to planning for a variety of uses and users.² The framework would cover the territorial sea, the EEZ, and the continental shelf, and be based on certain shared principles, including ecosystem-based management, inclusive and transparent engagement with public and other interested groups (particularly underserved communities), integration with existing CSMP efforts, use of best science, adaptive management, and the precautionary approach.³ The proposal was to conduct CSMP regionally at a large-marine ecosystem scale through a CSMP Development Agreement.⁴ The National Ocean Council would certify coastal and marine spatial plans.⁵ The plans would work to coordinate efforts across different levels of governance and different interest groups, and would not be regulatory.⁶ The intent was to accomplish this planning work in five years.⁷ Nothing came of the plan with the arrival of the Trump Administration, who rescinded the National Ocean Policy.⁸

Several coastal states have marine spatial planning laws. Massachusetts, under its Ocean Act, required the Executive Office of Energy and Environmental Affairs to develop a plan as part of its coastal zone management plan.⁹ Rhode Island has a federally recognized Special Area Management Plan.¹⁰ Oregon has done some marine spatial planning around the siting of wave energy.¹¹ Washington has a Marine Water Planning and Management Act, and has produced an evolving Marine Spatial Plan.¹²

The increase in renewable energy siting in offshore locations is likely to create more opportunities for the application of marine spatial planning. Some conflicts will be priority conflicts that may need rapid resolution, such as ongoing vessel strikes of endangered North Atlantic right whales.¹³

§ 31:43 Plastics

While many U.S. cities and some states have rules reducing the amount of single-use plastic production and distribution, there is no federal policy on plastic management. The United States is currently participating in the Intergovernmental Negotiating Committee on Plastic Pollution. Treaty negotiations have commenced. In addition to existing anti-dumping rules under the Marine Protection, Research, and Sanctuaries Act¹ and the Act to Prevent Pollution From Ships² designed to reduce marine pollution, the United States passed in 2006 the Marine Debris Research, Prevention, and Reduction Act.³ The Act focuses on identifying sources of marine debris and means to prevent adverse impacts from debris on the marine environment and navigational safety. To achieve this, Congress created a Marine Debris Prevention and Removal Program located within NOAA to map marine debris, assess impacts, prevent debris sources, and remove marine debris.⁴ One of the focus areas of the Act is lost and discarded fishing gear, which can create harms for navigation and ecosystems.⁵ Under the Act, Congress charged the Coast Guard with taking additional enforcement actions to reduce violations of and improve compliance with MARPOL Annex V to prevent harmful discharges of plastic and other vessel garbage.⁶ To manage the Act, Congress created an Interagency Marine Debris Coordinating Committee, with participation from federal agencies as well as states, tribes, NGOs, industries, and universities.⁷

§ 31:44 Acidification

A major threat for global oceans is acidification. With oceans absorbing 560 billion tons of carbon dioxide, the acidity of surface waters has increased by 30%.¹ This has major implications due to the impact on carbonate ions for the health of calcifying animals, including corals and shellfish. Ocean acidification can exacerbate existing ocean warming, oxygen deficient zones, and harmful algal blooms. Areas with particular susceptibility include the northeastern Pacific Ocean; the Arctic seas, especially the Bering Sea and western Arctic Ocean; and the U.S. west coast.

The United States has laws mandating coastal and ocean acidification research, including the NOAA Ocean Acidification Program,² but does not yet have any specific plan to combat acidification at the federal level beyond existing efforts to reduce greenhouse gas emissions.

The U.S. executive, through the interagency Ocean Policy Committee, has adopted an Ocean Climate Action Plan (OCAP) with an emphasis on creating a carbon neutral future that may include offshore wind and marine energy, green maritime shipping, sequestration of carbon dioxide in sub-seabed geological formations, and

restrictions have been proposed.

marine carbon dioxide removal (CDR).³ The OCAP recommended that a U.S. Ocean Acidification Action Plan be implemented. This plan was published in December 2023, and calls upon agencies to mitigate ocean acidification by reducing emissions and excess nutrients, increase monitoring and research, prioritize resilience and adaptation strategies, and increase collaboration.⁴ The plan encourages further land-based nutrient reduction, including from wastewater treatment plants. The plan also calls for more research on the development potential of “blue carbon” habitats as a nature-based solution to absorb excess carbon dioxide emissions and on marine CDR approaches, including direct capture, ocean alkalinity enhancement, and algae-based capture. Several states and at least one tribe have ocean acidification plans.⁵

§ 31:45 Deep Seabed Mining

With the recent emphasis on developing technologies to help the economy transition to a low-carbon economy that may depend on metals, there has been an increased interest in deep seabed mining. The regime that covers deep seabed mining in areas beyond national jurisdiction (the Area) is UNCLOS, which requires exploration permits to be sponsored by a State and submitted to the International Seabed Authority.¹ Under the Deep Seabed Hard Mineral Resources Act of 1980, NOAA has the power to issue licenses for exploration and permits for exploitation in the Area to U.S. citizens and corporations for four types of nodules: manganese, nickel, cobalt, and copper.² NOAA is required to conduct an EIS prior to providing any license or permit for sea mining activities under the Act.³ The text of the Act does not require the payment of royalties.

The United States also permits seabed mining in U.S. waters, which also include the territorial sea after a 2022 amendment to OCSLA.⁴ The Bureau of Ocean Energy Management has the authority to issue leases for marine minerals and leases for sand and gravel. OCSLA regulations describe payments of royalties on mineral production.⁵ Some states have passed rules prohibiting mining in certain waters.⁶

§ 31:46 Aquaculture

Aquaculture accounts for about half of the seafood produced today, and is considered to be a major part of food security strategies for high quality protein. The National Aquaculture Act of 1980 was adopted to improve aquaculture opportunities in the United States.¹ Aquaculture is defined as “the propagation and rearing of aquatic species in controlled or selected environments, including, but not

limited to, ocean ranching (except private ocean ranching of Pacific salmon for profit in those States where such ranching is prohibited by law).² Aquaculture species include finfish, shellfish, and plants.³ Under this Act, the United States agreed to begin developing national aquaculture development plans to make recommendations on locations for development, water quality management, aquaculture feed, and processing.⁴ The Act created a subcommittee to coordinate national activities around aquaculture.⁵ As of 2024, the federal government plays a limited role in aquaculture, with most aquaculture activities taking place in waters under state jurisdiction and subject to state laws. If aquaculture was to be scaled up, particularly in federal waters, several federal agencies would have jurisdiction over offshore aquaculture, including EPA (implementing the CWA)⁶ and the Corps of Engineers (implementing OCSLA).⁷ NMFS may give advice on aquaculture, but it does not have the authority to regulate aquaculture under the MSA.⁸

XI. CONCLUSION

§ 31:47 Generally

Ocean governance in the United States is complex. There are many interests that at times conflict. In particular, there are concerns about ongoing economic development versus conservation needs. Dozens of agencies, both federal and state, currently try to coordinate across a complex seascape of ports, marine sanctuaries, fishing areas, and energy production sites. The existing U.S. laws and regulations address various components of ocean governance with varying degrees of success. Some areas, such as illegal, unreported, and unregulated fishing, prove particularly challenging as the United States grapples with trying to regulate activities that originated far from U.S. shores. The recent effort to try a “whole of government” approach to ocean management may offer some needed mechanisms for coordination across users, with sometimes very different priorities for ocean access and sustainable use.
